question, by every thought and by every speech utterance (*ibid.*, 30): it is the *quid* (*mā*), the "that which" (*alladhī*) and the thing (*shayʾ*). It does not have to be vouched for, since it is the thing itself which vouches for everything, or it is by means of it that one vouches for what one vouches for. This being as such can be divided, without one needing recourse to any category, in several ways: these divisions of it are like intrinsic accidents (*ka 'l-ʿawāriḍ al-khāṣṣa*), whilst divisions according to categories are *like* kinds (*ka 'l-anwāʿ*). It can thus be divided in one and in multiples (*al-waḥīd - al-kathīr*), in force and in action (*ḳuwwa - fiʿl*), in universal and particular (*kullī - djuzʾī*), in what is eternal and what arises from a temporal origin (*ḳadīm - muḥdath*), in what is completed and what is incomplete (*tāmm - nāḳiṣ*), in cause and effect (*ʿilla-maʿlūl*) and in possible and necessary (*mumkin - wādjib*). This list has been made up from the metaphysics of the *Shifāʾ* (i, 13) and from the *Kitāb al-Nadjāt* (ed. Ṣabrī al-Kurdī, 1938, 199). The last pair of oppositions in this division will mark out the Avicennan ontology through the distinction of the Being necessary by itself (*wādjib al-wudjūd bi-dhātihi*), which is to be identified with God, and the being possible by itself (*mumkin al-wudjūd bi-dhātihi*), necessary by something outside of itself, i.e. the being of the universe. Consequently, starting from this general ontology, Ibn Sīnā explains the origins of various beings, first of all the heavenly ones (intellects, spheres, souls of the spheres) by a process of emanation (*fayḍ*), as far as the Intellect acting as Agent, the intellect of the sphere of the moon; and then of the sublunary world, which is made out of material elements by a progression from minerals to man, thanks to the shapes received from the Intellect acting as Agent which is *Wāhib al-ṣuwar* (*Dator formarum*). Thanks to reason, man is capable of returning to God, to such a point that God is, as the Ḳurʾān says (LVII, 3), the First and the Last. From the domain of metaphysics, one passes on to that of connection with the heavens, then with physics, by a descending movement; then, beginning with connection with minerals, one passes on to that with plants, and from animals to that with the soul, as far as the rational soul, by means of an upward movement which ends up by a mysticism of the mind which corresponds in its point of arrival with that which was metaphysics at its departure point. For Ibn Sīnā, as for Plato, all reality is legitimately deducible from metaphysical principles, even though the imperfect nature of the human understanding does not in fact allow an integral deduction of the universe.

2. Ibn Rushd's viewpoint. This is a case of recovering the pure Aristotelianism, stripped of all Platonic or Neoplatonic influence. Since being is not a generic concept, it cannot be defined and apprehended in itself, but only by means of categories. Thus for Ibn Rushd, the problem is to know what one can say about it and how one can speak of it. "Aristotle's aim in this book (Δ) is to distinguish the details of the significations to which the names (*al-asmāʾ*) refer, significations which one thinks about in that science (metaphysics) and which hold there the position of the subject of an art (*manzilat mawḍūʿ ṣināʿa*) in relationship to that art. These names are those which are uttered in regard to a single thing according to different points of view (*bi-djihāt mukhtalifa*). This is why he makes out of speculation on the meaning of these names one section of that science (*Tafsīr*, ii, 475). It is thus that one calls everything connected with health "healthy": balanced temperament, exercise, remedial measures, "the same thing is valid for the name of the being (*mawdjūd*) in relationship to substance and other categories" (*ibid.*, i, 303-4). It is possible therefore to have a single science of all the diverse beings, on condition that one understands the names designating them analogically. This is what has been called the analogy of proportionality; being in regard to substance is what being is in regard to substance is what being is in regard to quantity, etc. "Just as the things which are connected (*tansubu*) with the curative arts fall, on examinations, into one and the same science, i.e. medicine, likewise all the things which are connected with being are the object of speculation in a single science (*ibid.*, i, 307). But metaphysics can also be justified by relying on the analogy of attribution, substance being the first analogue of being: "Thus the name of being (*huwiyya*), a synonym of *mawdjūd*, although it is used of different species of being, is only used for each of them through the fact of the connection which it enjoys with the prime being (*al-huwiyya al-ūlā*) which is substance". To be first accordingly means here to be the first analogue. "The categories are connected with the substance, not in that they are considered to be their agentive cause any more than their ultimate one, but in the sense that they subsist in it (*ḳāʾima bihi*) and that the substance is for them a subject (*mawḍūʿ*)" (*ibid.*, 305). Now substance is a basic concept and in the measure that one accordingly brings together the study of being with the study of substance, "since it has been posited that for every unique concept there is a unique science . . . there results necessarily that there is a unique science of being" (*ibid.*, 309). Metaphysics, being the study of being as such (Ibn Rushd, who prefers *huwiyya* to *mawdjūd*, often remarks that its object is *al-huwiyya bi-mā hiya huwiyya*), ought probably to contain within itself all the aspects of being. Nevertheless, being in the shape of the accident (*bi-'l-ʿaraḍ*) and being in thought (*fi 'l-fikr*) are two defective entities (*nāḳiṣatāni*). The aim of metaphysics is to examine "the real being which exists outside the soul" and it is "the substance which is the basic principle of this being" (*al-djawhar huwa mabdaʾ hādhihi 'l-huwiyya*). This conforms to the importance which the substance assumes basically in metaphysical speculation (cf. *ibid.*, iii, 1402). Beginning by the study of substances which are apprehendable by the sense and are mobile and corruptible, and then of substances which have these same characteristics except that they are incorruptible (the heavens), Ibn Rushd hopes to arrive, with Aristotle, at a substance which is not apprehendable by the senses, is incorruptible and is immobile, the Prime Mover, the cause of all the movements of the universe.

Ibn Rushd thus carries beyond the apprehendable world an idea of substance which he has drawn from physics and which seems to him to be the basis of all existence: all that exists is substance, an exact correspondence here below. Ibn Sīnā, on the contrary, thinks that substance, like all other categories, must receive the quality of existence in order to exist, and that it can only receive existence by acquiring quantity, quality and all the other categories, for a substance which had neither quantity, quality and so forth, would be nothing. So it cannot in itself be taken as the first analogue or the representative of being conceived as existence. For Ibn Sīnā, the Necessary being is not a substance since it exists by itself, the *Ḳayyūm* of the Ḳurʾān

(II, 255, III, 2). On the other side, we have seen that the problem for the metaphysician is to know who established the existence of its object. Ibn Sīnā believes that this object, being implied in all sciences, does not need be to vouched for by one of them. Moreover, it is for metaphysics to provide the role of supplying the other sciences with the basis of their object. Ibn Rushd criticises this viewpoint, but by relying on his own one, namely that the first philosophy poses the question to itself about substance as the first analogue of being. "Ibn Sīnā, believing in the truth of the doctrine which does not want any of the sciences to set forth its own principles, and taking that *simpliciter*, believes that it is the task of the person who concerns himself with the first philosophy to give a clear exposition of the existence of substance apprehendable by the senses, eternal or not. He say that the natural scientist posits by hypothesis that nature exists (*yaḍaʿu waḍʿan anna 'l-ṭabīʿa mawdjūda*) and that the scholar of divine science is the one who gives the demonstrable proof of its existence" (*Tafsīr*, iii, 1423-4). Ibn Rushd then replies: "Yes, the specialist in the first philosophy seeks for the principles of substance as substance and sets forth clearly that the separateness of substances is the principle of the physical substance. But in making clear this search, he constantly calls for (*yuṣādiru*) what physics clearly sets forth, whether in regard to the substance which can be generated and is corruptible, in the first book of the *Physics* (189 B 30-191 b 34), where it is demonstrated that it is made up of matter and form, or whether in regard to the eternal substance, in Book viii (260 a 20 ff.), where it is set forth that the driving force of that substance is stripped of all matter. Then he clearly lays down that the principles of the substance which are neither the Universal ideas (*al-kulliyyāt*) nor the Numbers (*al-aʿdād*) [of Plato]" (*ibid.*, 1424-5). One should mention a final divergence between the two philosophers. Ibn Rushd notes that Aristotle, in the tenth book of the *Metaphysics*, has an enquiry into the unit, the multiple, the identical (*huwa huwa*), the similar, the opposite and into still further notions "which bring out the general concomitants (*al-lawāḥiḳ al-ʿāmma*) of the being as such" (*Tafsīr*, iii, 1403). In effect, metaphysics is a speculation about the being as such and about the "things" which are concomitant with it" (*al-umūr al-lāḥiḳa lahu*) (*ibid.*, iii, 1395). Now we have seen that what is concomitant with being for Ibn Rushd is the division of being for Ibn Sīnā. It seems that this fundamental divergence holds good for all the other oppositions.

Ibn Sīnā's metaphysics is consequently open to a region beyond the world, the earth and the heavens; it makes a mystical system possible. For Ibn Rushd, on the contrary, although metaphysics studies the principles of beings which are objects of other sciences, it is not the foundation of those sciences, but their completion. He writes in his *Tafsīr*, ii, 701, "Since ... each science only concerns itself with studying a certain being which is its special object, it is clear that there must necessarily exist a science which studies the absolute being (*al-huwiyya al-muṭlaḳa*); if there were not, our knowledge of things would not be completely exhaustive (*lam tustawfa maʿrifat al-ashyāʾ*)" (*Tafsīr*, ii, 701). Furthermore, whilst Ibn Rushd seeks for the first cause of the movements of substances apprehendable by the senses, corruptible or incorruptible, and finds it in the immobile Prime Mover, Ibn Sīnā sets himself the task of "making an enquiry into the first cause from which every being is brought about by causality (*kullu mawdjūd maʿlūl*) in as much as it has been the result of causality, and not simply in as much as it is a mobile being (*mawdjūd mutaḥarrik*) or a quantifiable being (*mawdjūd mutakammim*) (*Shifāʾ*, *Ilāhiyyāt*, i, 14). But there is a problem there; it is not possible for metaphysics to speculate on causes in as much as they are causes *simpliciter* (*al-asbāb bi-mā hiya asbāb muṭlaḳa*), in the first place because this science treats of notions" "which do not raise the question of proper accidents owed to these causes as such, such as the notions of universal and particular, of act and capability, of possibility and necessity" (*ibid.*, 7); and then because the science of causes taken *simpliciter* presupposes that the existence of causes has been established for the things which have a cause (*ithbāt al-asbāb li 'l-umūr dhawāt al-asbāb*). Ibn Sīnā adopts here a very clear view of the problem of causality: it is not sufficient for the existence of a cause to be demonstrated in the eyes of reason. The existence of causes and effects is not proved by an intuition of causality; it comes from the division of being into the necessary and the possible. The first cause is thus the being necessary by itself. This is why there exists a being necessary so that all other beings have causes, since these exist even at the time when they are only possibilities. Now if one adopts as the point of departure experience of things apprehendable by the senses, all the causes that one will find are at the same time effects. One would not therefore be able, by tracing back the series of cause-effects, to reach the first cause, whether one went back infinitely or whether one came to a stop, as did Aristotle in his search for the Prime Mover, by an arbitrary decision: ἀναγκη στηναι! On this point, Ibn Sīnā has set forth a highly original idea in his *Ishārāt* (ed. Sulaymān Dunyā, Cairo 1958, iii, 454-5). It concerns the position of the cause which is not an effect, in relation to the series of cause-effects. If it forms part of their ensemble (*djumla*), it is necessarily an extreme limit (*ṭaraf*). But if one takes a series made into a hierarchical chain (*silsila murattiba*) of causes and effects which is made up only of cause-effects, "there is a need for an external cause for this ensemble, but undoubtedly in continuity with it in regard to limit (*iḥtādjat ilā ʿilla khāridja ʿanhā, lākinnahā tattaṣilu bihā ... ṭarafan*)". Ibn Sīnā envisages the case where this succession is infinite, and then the cause-effects would form an infinitely limited ensemble. This ensemble is the universe; God is its "limit", but He is exterior to it. On the contrary, Ibn Rushd's Prime Mover is probably at the peak of the hierarchy of substance, but it is a substance and forms part of the world of substances. Just as metaphysics finishes off the sciences, likewise God supports the universe like the keystone of an arch.

(R. Arnaldez)

MA CHUNG-YING (*Matthews' Chinese-English Dictionary*, Revised American Edition 1969, characters nos. 4310, 1505, 7489), also known as Ğa Ssu-ling, or "Little Commander" (*Ğa* is an affectionate diminutive used in colloquial Kansu Chinese—see the *Hsin-Hua tzu-tien*, Peking 1971, 124; Ssu-ling: see *Matthews'*, nos. 5585, 4043), the youngest and best-known of the five Chinese Muslim warlords comprising the "Wu Ma" clique [*q.v.*] which controlled much of Northwest China during the latter half of the Republican Period (1911-49).

Little is known of Ma Chung-ying's early years.

He was born at Linhsia (formerly Hochow) in south-eastern Kansu, *ca.* 1910 (there is a contradiction in the *Biographical dictionary of Republican China*, which holds that Ma was born in 1911, but that he became a junior officer in 1926 "at the age of seventeen"; *op. cit.*, 463, col. 1). Little is known of Ma's immediate family, but it is clear that he shared the same paternal grandfather as the Kansu-Chinghai warlords Ma Pu-ch'ing (*Matthews'*, nos. 4310, 5363, 1168) and Ma Pu-fang (*Matthews'*, nos. 4310, 5363, 1815), and that he was thus a scion of the powerful Ma family of Pieh-tsang, a small village some 30 km. west of Linhsia (Mei, *op. cit.* in Bibl., 660). Ma Chung-ying was also distantly related to the Kansu-Ninghsia warlords Ma Hung-k'uei (*Matthews'*, nos. 4310, 2386, 3651) and Ma Hung-pin (*Matthews'*, nos. 4310, 2386, 5259), the most powerful representatives of the Ma family of Han-chia-chi, a large village some 25 km. south-west of Linhsia. Together these five Hui warlords were to become famous—or infamous—as the "Wu Ma" Northwestern Muslim clique.

Ma Chung-ying first entered military service during 1924 when, at about the age of fourteen, he joined the local Muslim militia. One year later, in August 1925, troops of the "Christan General", Feng Yü-hsiang, invaded Kansu. The invading forces, under the command of Feng's subordinate Liu Yü-fen, formed a part of the Northwest Army, more commonly known as the First *Kuominchün* ("National People's Army"), a vast rabble which is estimated to have numbered in excess of 100,000 men during the late summer of 1925. Feng intended, through his subordinate Liu, to colonise large tracts of Kansu with Kuominchün soldiers; he also intended to finance his struggle against the Northeastern warlord Chang Tso-lin with taxes raised and opium cultivated in the Northwest. Not unnaturally, these aims found little favour with the people of Kansu, Ninghsia and Chinghai; nor were the local warlords much inclined to support Feng Yü-hsiang.

In 1926, one year after the Kuominchün invasion of Kansu, Ma Chung-ying received his first commission as an officer in the forces commanded by one of his uncles, Ma Ku-chung (Boorman and Howard, *op. cit.* in *Bibl.*, 463). During the same year, Liu Yü-fen, who was in occupation of the provincial capital at Lanchow, was attacked by a combination of local warlords from eastern Kansu (Sheridan, *op. cit.* in *Bibl.*, 195-6). Fighting was prolonged and severe, but the Muslim warlords of western Kansu seem to have remained aloof from the struggle, and Liu eventually succeeded in reimposing Kuominchün rule on the province. During his conflict, Ma Chung-ying, still only sixteen or seventeen years of age, is said to have "laid siege to and captured Linhsia on his own initiative" (Boorman and Howard, *ibid.*). Liu Yü-fen ordered troops under the command of Ma Lin (a great-uncle of Ma Chung-ying) to recapture Linhsia, but the young soldier easily defeated them, winning for himself a reputation as a military strategist and the nickname "Little Commander". Ma Chung-ying's triumph was short-lived, however, for his uncle and commanding officer Ma Ku-chung had not ordered the occupation of Linhsia, and he dismissed his nephew for insubordination. The "Little Commander" learned this lesson well; he withdrew to the Sining area of Chinghai and began to build up his own forces.

The Kuominchün "pacification" of Kansu left large areas of the province devastated, but failed to break the rebellious spirit of its people. In 1927 north-western Kansu was racked by a violent earthquake; this, combined with the increased use of good arable land for the cultivation of the opium poppy and arbitrary tax increases imposed by Liu Yü-fen, caused widespread famine. Early in the spring of 1928 the patience of the Northwestern Muslims ran out, and the standard of revolt was raised against the Kuominchün by the Muslim leader Ma T'ing-hsiang (*Matthews'*, nos. 4310, 6404, 3076; see Sheridan, 250). Ma Chung-ying (who according to one source had fled to Sining, together with a group of his followers, because of an illicit affair with a young Mnslim girl from a strictly orthodox family; see Ekvall, *op cit.* in *Bibl.*, 946) rapidly became involved in this revolt against the Kuominchün. The city of Linhsia, which remained in Kuominchün hands, was besieged three times by Muslim forces. Robert Ekvall, an American who travelled through south-eastern Kansu at this time, records that "The revolt had by this time assumed all the aspects of a holy war. Chanting prayers, forty or fifty thousand fighters went into battle with fanatical zeal . . . the young rebel leader Ma Chong-ing (*sic*) seemed to bear a charmed life and by his reckless courage gained the utmost in obedience and devotion from his ruffian troops. The Chinese (i.e. the Kuominchün) were panic-stricken at the desparate courage of the Moslems, but eventually, by machine-gun fire and light artillery, proved superior" (Ekvall, 946-7). The Kuominchün was unable, however, to crush the Muslim revolt entirely; no sooner had the rebellion been suppressed in one area, than it broke out afresh in another. By September 1928 over 100,000 people had died (Sheridan, *loc. cit.*). Anti-Kuominchün feeling amongst the Muslims gradually gave way to racial hostility against all Han Chinese. On 14 February 1929, about 20,000 Muslims forced their way into Tangar, a city of some 5,000 families in western Kansu. An American eyewitness described the scene as follows: "[The Muslims] forced an entrance by ladder over the north wall. Immediately by they began to murder the Chinese in the most brutal way, cutting over the head with swords . . . The Muslims were in the city only about two hours, but during that time the official figures show more than 2,000 killed, 700 wounded, and $ 2,000,000 damage" (Sheridan, 251). Kuominchün reprisals against the Muslims were equally bloody. According to American diplomatic reports (see Sheridan, *ibid.*), the ravages of war and famine reduced people to cannibalism; between 1926 and 1929 as many a 2,000,000 people may have died. One casualty was Ma Chung-ying's father, who was executed on the orders of Liu Yü-fen in the winter of 1929 (Boorman and Howard, *ibid.*).

In 1929 Ma Chung-ying, his position strengthened by several victories over the forces of the Kuominchün, approached the Nationalist leader Chiang Kai-shek with a request that his private army should be recognised as a Kuomintang frontier unit. At about this time, Feng Yü-hsiang declared himself independent of the National Government at Nanking; as a result of this, Ma Chung-ying's distant relative Ma Hung-k'uei, the strongest of the "Wu Ma" clique, declared in favour of the nationalist cause. Ma Chung-ying went to Nanking, where he enrolled briefly at the military academy. In 1930 he returned to Kansu where he was appointed garrison commander at Kanchow (Changyeh) in the far north-west, near the frontier of Sinkiang [*q.v.*]; from here he controlled a small fief, including the towns of Suchow and An-hsi, which "freed him from any financial

worry and allowed him to prepare his army for an expedition to Sinkiang" (Nyman, *op. cit.* in Bibl., 101). Before striking out into Singkiang, however, Ma seems to have made another bid to extend his personal power base in Kansu. Once again he met with failure, this time at the hands of his uncle Ma Pu-fang (Norins, *op. cit.* in *Bibl.*, 41).

In 1930 Sinkiang, China's largest province, was under the control of Chin Shu-jen, an avaricious and incompetent warlord from Kansu; over 90% of Chin's subjects were Muslims, but the Han Chinese warlord seems to have nurtured a fierce hatred for all Muslims, whether of Hui or Turkic ethnic origin. Chin's anti-Muslim sentiment may well have derived from the various Hui risings in Kansu; certainly, when a combination of famine and war drove starving Han Chinese refugees to flee from his native Kansu to Sinkiang in the late 1920s, Chin welcomed them with open arms. Less than 200 km from the north-western frontier of Ma Chung-ying's fief in Kansu lay the ancient oasis city of Ḳomul (Ḳomul [*q.v.* in Suppl.]). When Chin Shu-jen seized power in Sinkiang during 1928, Ḳomul (Chinese name Hami) was still a semi-independent state, ruled by the aged monarch Maḳsūd S̲h̲āh, the last autonomous K̲h̲ānate in Central Asia. When Maḳsūd died of old age in 1930, Chin Shu-jen, who held the heir-apparent hostage in Urumchi, the provincial capital, announced the abolition of the K̲h̲ānate and its full absorption within China. Chinese officials took over the administration of Ḳomul, and Chin began to settle Han Chinese refugees from his native Kansu on arable land expropriated from the indigenous Uyg̲h̲ur [*q.v.*] farmers. Local unrest grew rapidly, and in 1931, following the abduction of a local Muslim girl by a Han Chinese tax collector, open rebellion broke out.

One of the leaders of the Ḳomul revolt, a Uyg̲h̲ur called Yulbars K̲h̲ān [*q.v.*] travelled to Suchow in north-eastern Kansu where he met Ma Chung-ying (now officially Commander of the 36th Division of the Kuomintang, though Yulbars comments that there were so many Mas in this force that it was commonly called the *Ma-chia-chün*, or "Ma Household Army"; see Yulbars, *op. cit.* in *Bibl.*, 87-8). Ma agreed to enter the fray, ostensibly to help his Uyg̲h̲ur co-religionists and in 1931 he led his troops into Sinkiang in an open challenge to Chin Shu-jen. Ma was wounded during the autumn, and withdrew temporarily to Kansu to recuperate. In August 1932 Ma's troops again entered Sinkiang. Initially, they cooperated with the Uyg̲h̲urs in their struggle against Chin Shu-jen. Ma's crack cavalry units, generally considered to have been amongst the best troops in China, fought their way to the outskirts of Urumchi before being repulsed by White Russian mercenaries under the command of Chin Shu-jen (see Wu, *op. cit.* in *Bibl.*, 73-100); meanwhile, Uyg̲h̲ur forces under Yulbars K̲h̲ān and K̲h̲ōd̲j̲a Niyāz Ḥād̲j̲d̲j̲ī took control of the greater part of southern Sinkiang, and an "East Turkestan Republic" was proclaimed at Kās̲h̲g̲h̲ar [*q.v.*].

In April 1933 the incompetent Chin Shu-jen was ousted by Sheng Shih-ts'ai, his Chief-of-Staff. The new warlord, whose home province was Liaoning in the far Northeast, enjoyed the support of a group of some 3,000 battle-hardened Manchurian troops who had been driven into Siberia by the invading Japanese and repatriated to Sinkiang by the Soviet authorities. During the remainder of 1933, Ma Chung-ying's forces made two further attempts to take Urumchi, and despite judicious use of his White Russian and Manchurian troops, Sheng was forced to appeal to the Soviet Union for aid. In January 1934, Soviet military units entered Sinkiang and attacked Ma Chung-ying's cavalry with aeroplanes and, apparently, poison gas. The Muslim warlord was forced to fall back on Turfan, but instead of withdrawing to his old base in north-eastern Kansu he took the decision to try and hold southern Sinkiang.

This decision brought the Kansu Muslims into direct conflict with the Uyg̲h̲ur Muslims of Sinkiang, their erstwhile allies. There had been indications of such a split for some time; as soon as fighting on the northern front had become bogged down before Urumchi, units of Ma's forces had advanced into the Tarim Basin where his troops "aroused the antagonism of the Turki natives by looting and plundering" (Boorman and Howard, 464). It rapidly became clear to most of the Uyg̲h̲ur population (though notably not to Yulbars) that Ma was just another Kansu warlord, and not the saviour of the Muslims of Sinkiang they had hoped for. (There was never any question of Ma being viewed as a *mahdī*, and there seems to be no reason for assuming that he considered himself as such. Nyman, 101-3, is certainly mistaken in suggesting this.) The retreating Ma Chung-ying fell back on Kās̲h̲g̲h̲ar, where he destroyed the nascent Islamic "East Turkestan Republic"; he then transferred command of his forces to his brother-in-law, Ma Hu-shan (*Matthews'*, nos. 4310, 2161, 5630), and, in a move which still remains shrouded in mystery, crossed the frontier into the Soviet Union during July 1934. His brother-in-law, Ma Hu-shan, went on to occupy the whole of the southern rim of the Tarim Basin; here, as the "Commander-in-Chief of the 36th Division of the Kuomintang", Ma established a strange Hui-ruled fief on the borders of Tibet. Ma Hu-shan's statelet, "Tunganistan" [*q.v.*] was to endure until 1937, when his forces melted away and he took refuge in British India.

It is not clear why Ma Chung-ying should have deliberately chosen to enter the Soviet Union when his military position was far from hopeless—after all, he had been driven back from Urumchi by Soviet forces. Ma's eventual fate is uncertain; an article published anonymously in the *Journal of the Royal Central Asian Society* during 1935 states that he "died on arrival at Moscow", however, it is more likely that he was held by Stalin as a weapon in reserve against Sheng Shih-ts'ai, the Soviet puppet in Sinkiang. Ma may have been executed by Stalin at Sheng's request when the latter visited Moscow in 1938; certainly, he was never seen again, though for many years stories of his imminent return circulated amongst both the Uyg̲h̲urs of Sinkiang and the Hui of Kansu.

MA HUA-LUNG (*Matthews' Chinese-English dictionary*, Revised American Edition 1969, characters nos. 4310, 2211, 4258), also known MA CH'AO-CHING (*Matthews'*, nos. 4310, 233, 1171), a Chinese Muslim leader and exponent of the "New Teaching" who played an important part in the great mid-13th/19th century Muslim risings against the Ch'ing dynasty.

Ma Hua-lung was born at an unknown date during the first half of the 13th/19th century, probably at Ch'in-chi-p'u (Hartmann, *op. cit.* in *Bibl.*, 14), a walled city in Ninghsia [*q.v.*] province situated on the right bank of the Yellow River some 80 km. south of Ninghsia city (the modern Yinchwan). We know little of Ma's personal background. Po Ching-wei, a member of the Shensi gentry who participated in the struggle against Ma (and therefore a hostile source), states that "Ma Hua-lung's family lived at Chin-chi-p'u for generations"; seemingly, Ma came from a well-to-do family background, for he was "the leading rich man in the area, as well as a person with a military title which he earned by substantial contributions to the government". Furthermore, he was a man of considerable political and religious significance, for Po tells us that he was "very much respected and trusted by the Moslems in Ninghsia ... [and] ... he was a sweeping influence over the Moslems of the other provinces too" (Po Ching-wei, *Feng-hsi-ts'ao-t'ang-chi*, iii, 7-11; cited in Chu, *op. cit.* in *Bibl.*, 346-7).

In Ma Hua-lung's time, Chin-chi-p'u, said to have been a Muslim centre "for more than a thousand years" (Bales, *op. cit.* in *Bibl.*, 218), and described as the "Medina of Chinese Islam" (Wright, *op. cit.* in *Bibl.*, 111), indicating a significance secondary only to that of Hochow (often described as the "Mecca of Chinese Islam"), was a prosperous trading centre which thrived on the tea and salt trade with Mongolia. Bales, 243, notes that "it was a purely Muslim city and no Chinese official was resident there. The officials lived at Lingchow" (a small city some 30 km. to the north).

Ma Hua-lung's lineage is unclear. He does not appear to have been directly related by blood to Ma Ming-hsin [*q.v.*] of An-ting, but he was certainly a spiritual descendant of the latter. Muḥammad Tawāḍuʿ (*op. cit*, in *Bibl.*, 117) states that he was the sixth s͟hayk͟h of the Naḳs͟hbandī ṭariḳa founded by Ma Ming-hsin *ca.* 1175/1761 near Lanchow. Ma Hua-lung's father, Ma Erh (*Matthews'*, nos. 4310, 1751), the fifth s͟hayk͟h in Ma Ming-hsin's *silsila*, is said to have died "a lingering death" (Wright, 109) at the hands of the Chinese; Ma Hua-lung was thus both a spiritual and a direct blood descendant of Ma Erh, the fifth head of the Naḳs͟hbandiyya-D͟jahriyya order in Northwest China (see, however, Israeli's 1974 thesis, 273-324, for an alternative analysis).

It seems that, after the harsh suppression of "New Teaching" adherents in the Kansu-Chinghai borderlands resulting from the defeat of the 1196/1781 and 1198/1783 Muslim risings, the surviving "New Teaching" leaders moved eastwards towards Ninghsia. According to Fletcher (*op. cit.* in *Bibl.*, 77), it was Ma Hua-lung who made Chin-chi-p'u into the foremost "New Teaching" centre in all of China. From this bastion he was able to exercise an influence on the Chinese *umma* far in excess of that wielded by Ma Ming-hsin during his prime, for during the three-quarters of a century following the death of the latter, the "New Teaching" had spread from the Kansu-Chinghai border area across much of China. Seemingly, Ma Hua-lung played an important part in this process of proselytisation, for in a memorial addressed to the Imperial authorities at Peking requesting the prohibition of the "New Teaching", Tso Tsung-t'ang, the Ch'ing commander who eventually crushed the 1862-78 Muslim rebellion in Northwest China, complained that Ma, who styled himself the *Tsung-ta A-hung* ("General Grand *Mullā*", *Matthews'*, nos. 6912, 5943, 1, 2931), had "sent out people to spread this evil religion everywhere". According to Tso, these missionaries, known as *hai-li-fei* (*Matthews'*, nos. 2014, 3865, 1850, possibly a corruption of the Arabic Ṣūfī term *k͟halīfa*, see Israeli, *op. cit.*, 1974, 298), were "disguised as businessmen" (Tso Tsung-t'ang, *Memorials*, cited in Chu, *op. cit.* in *Bibl.*, 1966, 156-8). In fact, Muslim merchants dominated the North China caravan trade, and it is more than probable that many of the "New Teaching" *hai-li-fei* were also legitimate merchants. Tso continued: "According to the testimony of lately captured Muslim rebels, there are missionaries of the New Teaching in Peking, Tientsin, Heilungkiang, Kirin, Shansi and Hupeh" (Tso, *Memorials, ibid.*); it is also probable that the "New Teaching" had spread across Szechwan (where it was definitely established) to Yunnan [*q.v.*] where it may have played some part in the "Panthay" [*q.v.*] Muslim rebellion of Tu Wen-hsiu [*q.v.*].

During the great Muslim rebellion of 1862-78 [see AL-ṢĪN], four main centres of Muslim power were to emerge in Northwest China (excluding only the Turkic areas of Sinkiang which were either to pass under the rule of Yaʿḳūb Beg [*q.v.*] of Kās͟hg͟har [*q.v.*], or to maintain a precarious independence under incompetent local leadership in Dzungaria

(see Bales, 224, "Sketch map of main Muslim centres"). These were: (1) Ma Hua-lung's base at Chin-chi-p'u, the chief centre of the "New Teaching"; (2) Hochow and the surrounding area, a predominantly "Old Teaching" centre under the leadership of Ma Chan-so (*Matthews'*, nos. 4310, 125, 59); (3) Hsining and the surrounding area, a region of mixed "Old" and "New Teaching" allegiances under the leadership of Ma Kuei-yüan (*Matthews'*, nos. 4310, 3610, 7728); and (4) a region centering upon Suchow, described by Bales, 224, as "non-sectarian", under the leadership of Ma Wen-yu (*Matthews'*, nos. 4310, 7129, 4196). (Note, however, that elsewhere [227], Bales describes both the Hsining and Suchow Muslims as being "mostly inclined to the New Sect".) In marked contrast to these Kansu and Chinghai Muslim leaders, Pai Yen-hu [*q.v.*], the most important of the Shensi Muslim leaders, was a guerilla fighter with no permanent base. Of this plethora of Muslim leaders, however, it is interesting to note that in the opinion of Tso Tsung-t'ang: "only one man . . . could command followers from Heilungkiang to Sinkiang, and he was Ma Hua-lung" (Tso, *Memorials*, cited in Chu, 1955, 343).

The initial Northwestern Muslim challenge to the Ch'ing Empire came in Shensi, where between 1862 and 1864 Pai Yen-hu and other local Muslim leaders conducted a fast-moving cavalry campaign against the Manchu general To-lung-a. The Ch'ing forces scored some early successes in southern Shensi, but in 1864 To-lung-a was killed, and during the following months the Muslim revolt spread with great rapidity across the whole of Northwest China.

During the early years of the revolt, Ma Hua-lung, whose base at Chin-chi-p'u was situated well behind the main battle front in southern Shensi, succeeded in maintaining a precarious neutrality (at least in the eyes of some local Ch'ing officials, see Chu, 1955, 345), whilst simultaneously increasing the fortifications around Chin-chi-p'u and building up the armed forces at his command. It was widely rumoured that Ma Hua-lung had masterminded the capture of Ninghsia city by rebel forces in 1863, but some Ch'ing officials still remained unconvinced of Ma's complicity. Tso Tsung-t'ang, the military veteran who was appointed Governor-General of Shensi and Kansu in 1868, with specific orders to crush the Muslim revolt, had no such doubts. Tso "regarded the Chin-chi-p'u centre as one of first importance and determined to concentrate upon the reduction of the Muslims in that area. He had no illusions whatever about Ma Hua-lung, but was certain that he was the ringleader among all the Kansu Muslims, and he determined to proceed on that basis" (Chu, 1955, 346).

Tso estimated that he would require five years to reconquer Shensi and Kansu; he launched his attack in November 1868, aiming primarily to capture Chin-chi-p'u, with Hochow as a secondary target. It was a savage campaign, with little quarter given or asked. Tso played upon the traditional rivalries between adherents of the "Old" and "New" teachings by giving amnesty to followers of the "Old Teaching" who surrendered (a policy which paid off, for in 1872 Ma Chan-so, commander of the "Old Teaching" centre based on Hochow, surrendered to Tso shortly after inflicting a crushing defeat on the Imperial forces; for his pains he was made a general in Tso's army and went on to play an important part in the "pacification" of Kansu); in marked contrast Tso "never treated with a single 'New Sect' leader, but executed every one that fell into his hands" (Bales, 280).

Throughout 1869, Tso's armies advanced slowly across Shensi and into eastern Kansu, driving the highly-mobile Muslim cavalry of Shensi before them. In early 1870 the Imperial forces arrived before Chin-chi-p'u; the assault was to be long and hard, for "over the whole plain was a network of canals, all the villages were fortified, and the Moslems had erected numberless stockades covering every approach to Chinchipu" (Bales, 243; for details of the campaign, see 231-65). Tso built a huge moat and accompanying rampart around Chin-ch'i-p'u, and set about reducing the Muslims through a combination of bombardment and starvation. Ma Hua-lung's position was made critical by his earlier decision to send a large force of his followers into Shensi in a bid to draw off Tso's armies from Chin-chi-p'u, an action which caused Bales, Tso's biographer, to comment: "Had Ma Hua-lung enjoyed a reasonable talent for generalship along with his many other endowments, he could have driven Tso Tsung-t'ang out of Kansu, perhaps from Shensi as well, and delivered an irreparable blow to the Imperial cause" (247).

By January 1871 the population of Chin-chi-p'u was starving; the defenders had been reduced to eating human flesh. On 6 January Ma Hua-lung left his stronghold behind the city walls and presented himself, accompanied by a single servant, at the headquarters of Liu Chin-t'ang, the Imperial commander. Ma asked that all blame for the resistance at Chin-chi-p'u be laid on him, and that his followers should be spared. After prolonged interrogation by the victorious Ch'ing commanders, Ma was executed, together with twelve members of his immediate family, by the "slicing process"; some eighty of the lesser Muslim leaders were beheaded. Chin-chi-p'u was depopulated, and the surviving Muslims were sent, *en masse*, into exile or slavery. Tso Tsung-t'ang went on to reconquer western Kansu, and by 1878, ten years after the commencement of his offensive in Shensi, he succeeded in reconquering Kāshghar, the last major town of Northwest China.

After his execution on 2 March 1871, Ma Hua-lung became a martyr for followers of the "New Teaching". The victorious Ch'ing forces made strenous attempts to stamp out Ma's adherents (it has been estimated that between 1862 and 1878 the Muslim revolt and the Ch'ing reconquest resulted in over 10 million deaths; see Chu, 1966, p. vii), but to no avail. According to W. A. Saunders, a Christian missionary who was active in Kansu during the Republican period, Ma's body was buried at Chen-chi-p'u, but his head was taken, presumably in secret, to Hsüan-hua-kang, near Chang-chia-ch'uan in south-eastern Kansu. When Saunders visited Hsüan-hua-kang in 1934 he found Ma's tomb to be "quite an imposing affair of carved brick with a kind of 'Li Pai Sz' (temple) as an entrance" (*op. cit.* in *Bibl.*, 70). Saunders records that "worship" was made at the tomb every year on Ma Hua-lung's birthday, a practice strongly denounced by local Muslims belonging to the "Old Teaching". It is not known whether Ma's tomb at Hsüan-hua-kang still exists.

Bibliography: The most important contemporaneous Chinese sources for the Muslim rebellion of 1862-78 are the complete works of Tso Tsung-t'ang, *Tso Wen-hsiang-kung Ch'üan-chi*, 1888-97, published together with a biography of Tso written by Lo Cheng-chün, *Tso Wen hsiang-kung Nien-p'u*; details of these works are to be found in Chu Wen-djang's 1966 study of the Muslim rebellion in Northwest China at p. 211. A collection of anecdotes taken from the oral recollections of a Muslim

mullā who lived through the great rebellion as a child is to be found in Shan Hua-p'u's *Shen-Kan Chieh-yü-lu*, in Pai Shou-i's 1952 collection, iv, 303 ff.; this source, based partially on personal experience and partially on hearsay, is indicative of the paucity of Muslim sources for this period. A further useful contemporaneous Chinese source is Po Ching-wei's *Feng-hsi-ts'ao-t'ang-chi*, Nanking 1924, the collected works of a member of the Shensi gentry who served with the imperial forces and was present during the siege of Chin-chi-p'u. An interesting, but not always reliable, contemporaneous western source is F. von Richthofen's *Baron Richthofen's letters (1870-1872)*, Peking 1941. See also: H. M. d'Ollone, *Recherches sur les Musulmans Chinois*, Paris 1911, esp. 273-4; Wu Tseng-ch'i, *Ch'ing-shih kang-yao* ("A summary of Ch'ing history"), Shanghai 1913, esp. *chüan* 12; M. Hartmann, *Zur Geschichte des Islam in China*, Leipzig 1921; W. A. Saunders, *Hsüan Hua Kang*, in *Friends of Moslems in China* (Hankow), viii/4 (1 October 1934), 69-71; W. L. Bales, *Tso Tsung-t'ang: soldier and statesman of Old China*, Shanghai 1937, esp. 231-65; Muḥammad Tawāḍuʿ, *al-Ṣīn wa 'l-Islām*, Cairo 1945; Ma Hsiao-shih, *Hsi-pei Hui-tsu ko-ming chien-shih* ("A short history of the revolutions of the Northwestern Muslim people"), Shanghai 1951, esp. 1-15 (Ma Hsiao-shih, a Hui Muslim, emphasises links between the Muslim rebellion in Shensi and the Taiping rebels); Pai Shou-i, *Hui-hui min-tsu ti hsin-sheng* ("The rebirth of the Muslim people"), Shanghai 1951, esp. 65-70; Pai Shou-i, *Hui-min ch'i-i* ("The righteous uprisings of the Muslim people"), 4 vols, Shanghai 1952, see vols. iii and iv for the Northwest China rebellions; Chu Wen-djang, *The Policy of the Manchu government in the suppression of the Moslem Rebellion in Shensi, Kansu and Sinkiang from 1862 to 1878*, Ph. D. thesis, Univ. of Washington 1955 (the greater part of this thesis was later published [see Chu, 1966], but several important appendices were omitted from the published version, most notably supplement IV, "Ma Hua-lung and the New Sect", which may be found at 343-60 of the unpublished thesis); Mary C. Wright, *The last stand of Chinese conservatism: the T'ung-Chih restoration, 1862-1874*, Stanford 1957, repr. MA HUAN (*Matthews' Chinese-English dictionary*, Revised American Edition 1969, characters no. 4310, 2266), Chinese Muslim interpreter and traveller who flourished during the 9th/15th century and who was the author of *Ying-yai sheng-lan* ("The overall survey of the ocean's shores"), the best-known account of the early and mid-9th/15th century Ming Chinese maritime expeditions to South-east Asia, South Asia, the Arabian Peninsula and East Africa.

Ma Huan was born *ca.* 782/1380 in Kuei-chi, a district of Shao-hsing city, Chekiang Province. His home was about 24 miles south-east of Hang-chou, and a mere 7 miles from the southern shore of Hang-chou bay, one of the principal centres of navigation in 9th/15th century China (Mills, *Ma Huan* [see *Bibl.*], 34). Ma Huan probably came from a poor background, though "his derogatory description of himself as a 'mountain-woodcutter' need not be taken literally" (Mills, *loc. cit.*). Seemingly, Ma Huan did not belong to a Muslim family, but chose to adopt Islam when a young man—thus his surname "Ma", so common amongst Chinese Muslims, must have been purely coincidental. He must have received a good education in Chinese, for "there are classicisms in his book, and he was acquainted with the contents of Wang Ta-yüan's *Tao-i chih-lüeh* ("A synoptical account of the Islands and their Barbarians", 751/1350), of certain Chinese classics, and of 'Buddhist books'" (Mills). (On the other hand Duyvendak, in his *Ma Huan re-examined*, 9, describes *Ying-yai sheng-lan* as being "written in an almost colloquial style by an unlearned Mohammedan".)

During his youth Ma Huan seems to have adopted Islam, and to have assumed the *tzu* (courtesy-name) of Tsung-tao (*Matthews'*, nos. 6896, 6136); possibly as a result of becoming a Muslim he began a study of Arabic and/or Persian, enabling him to become proficient as a translator and interpreter. As a result of the acquisition of these skills, he was appointed to the staff of the great Chinese Muslim admiral Cheng Ho in 815/1412. It is interesting to note that Ma Huan's appointment came one year before the fourth of Cheng Ho's voyages (816-18/1413-15), the first to sail beyond South Asia to the Persian Gulf.

Ma Huan accompanied Cheng Ho on this fourth voyage—as with the latter's three previous voyages a "maritime expedition" in every sense of the word; the Chinese Muslim admiral had under his command a fleet of 63 ships bearing 28,560 men. The expedition visited various parts of the Malay Archipelago, Sri Lanka, Bengal, South India, the Maldive Islands and Hormuz in Persia. The young Ma Huan must have been greatly interested in the various lands he saw, for together with his colleague and life-long collaborator Kuo Ch'ung-li (*Matthews'*, nos. 3746, 1528, 3886), he made local journeys in the various countries he visited, and recorded details of his impressions.

On his return to China in 818/1415, Ma began work on a book based on the notes made by Kuo Ch'ung-li and himself. In 819/1416 he completed the first version of his book (he was to make numerous additions and corrections over the years), and wrote a foreword and a commemorative poem. In his 819/1416 foreword he notes that:

"I collected [notes about] the appearance of the people in each country, the variations of the local customs, the differences in the natural products and the boundary limits. I arranged (my notes) in order so as to make a book, which I have entitled *The overall survey of the Ocean's shores*" (Mills, *op. cit.*, 70).

Ma Huan did not accompany Cheng Ho on his fifth expedition of 820-2/1417-19; he does not explain why. In 824/1421, however, he once again voyaged with Cheng Ho on his sixth expedition, returning in 825/1422. In addition to returning to most of those countries visited during the fourth expedition, Cheng Ho's sixth expedition took Ma Huan to Ẓufār and Aden; a part of the great Chinese fleet (which comprised 41 ships and an unknown number of men) visited Mogadishu and Brava in Somalia, but Ma Huan does not seem to have accompanied

this branch expedition. Mills notes that Ma Huan probably added sections on Ẓufār and Aden to his book after his return to China in 825/1422 (*op. cit.*, 35).

Ma Huan, although still a relatively young man, probably accepted that his journeys to the Indian Ocean were over when the emperor Jen Tsung forbade further expeditions to that remote region in 828/1424; however, when the Hsüan-te emperor revoked this edict in 834/1430 and ordered the ageing Cheng Ho to undertake his seventh and final expedition to the "Western regions", Ma Huan was once again employed as an interpreter.

Cheng Ho's seventh expedition is better documented than any of the preceding six. We know that more than 100 large ships took part in the voyage, and that a total of 27,550 men sailed with him. The fleet left Nanking in 835/1431, and returned to China in 837/1433. Once again, Cheng Ho and/or his emissaries visited Southeast Asia, Bengal, Southern India, the Persian Gulf, the Arabian Peninsula and East Africa. On this voyage we know that Ma Huan sailed with a branch of the main fleet to Bengal, and thence to Kozhikode (Calicut) in South India. It seems very likely that from Kozhikode Ma Huan was sent, with six other Muslim emissaries, to Mecca. Mills has calculated that Ma Huan left Kozhikode about mid-836/1432, and arrived in Mecca about three months later; he then spent a further three months in Mecca before rejoining Cheng Ho's main fleet at Kozhikode in 837/1433.

On his return to China, Ma Huan added a lengthy and accurate account of Mecca to his *Ying-yai sheng-lan*. He notes that the inhabitants of *T'ien fang* ("the Heavenly Square", a clear reference to the Kaʿba) are "stalwart and fine looking"; they "bind up their hands", whilst their womenfolk "wear a covering over their hands, and you cannot see their faces". He describes the *Ḥaram* and the Kaʿba in detail, noting that the pilgrims tear pieces from the *kiswa* (sc. the mantle used to cover the Kaʿba) as souvenirs, just as occurs today. He also mentions the Prophet's tomb at Medina, though his error in situating the well Zamzam near the latter rather than at Mecca causes Duyvendak to question whether Ma Huan did, in fact, ever visit the Ḥijāz (*Ma Huan re-examined*, 73). An excellent translation of Ma Huan's account of Mecca may be found in Mills, 173-8.

To the best of our knowledge, Ma Huan never again left China. He continued working on the *Ying-yai sheng-lan*, in collaboration with Kuo Ch'ung-li, and the completed work was eventually published *ca.* 855/1451. Ma Huan is thought to have died some nine years later. Unfortunately, the 1451 edition of Ma Huan's book has long been lost, and our present knowledge of the *Ying-yai sheng-lan* rests on three later editions, all dating from the latter half of the Ming dynasty (Mills, 37-41).

(A. D. W. Forbes)

MA MING-HSIN (*Matthews' Chinese-English Dictionary*, Revised American Edition 1969, characters nos. 4310, 4534, 2735), also known as Muḥammad Amīn, a Chinese Muslim leader of the mid-12th/18th century who was instrumental in the development and spread of the "New Teaching", a neo-orthodox reformist movement in Chinese Islam which swept Northwest China in the latter half of the 12th/18th century, and which played an important part in the great mid-13th/19th century Muslim revolt of Ma Hua-lung [*q.v.*].

Ma Ming-hsin was born at an unknown date during the first half of the 12th/18th century at An-ting, a small town some 90 km. south-east of Lanchow, the capital of the Chinese province of Kansu [*q.v.*]. The site of Ma's birthplace makes it probable that he was a Hui (Chinese-speaking) Muslim, though his travels in Turkestan led Hartmann (*op. cit.* in Bibl., 28, n.) to describe him as a native of that region, whilst his rôle as a religious reformer amongst the Salar Turks [*q.v.*] of southwestern Kansu and eastern Chinghai has also led to his identification as a Salar (see Mary C. Wright, *op. cit.*, in Bibl., 108). Confusion over Ma's ethnic origins may have been further compounded by his adoption of an Arabic soubriquet, a practice common amongst the Hui.

Ma Ming-hsin seems to have first come to the attention of the Chinese authorities in 1175/1761, when he returned to Kansu after a prolonged period of travel and study in Central Asia and Arabia. During the course of these travels Ma made the pilgrimage to Mecca and visited the Yemen, where he was initiated into the Nakshbandī ṭarīḳa (Tawāḍuʿ, *op. cit.* in *Bibl.*, 115). It seems probable that he returned to Kansu via the major Nakshbandī centre of Bukhārā, as well as through the lesser Nakshbandī centres of Kāshghar [*q.v.*] and Yarkand. On his return, Ma proclaimed himself the "Possessor of the True Teaching" (Hartmann, in *Bibl.*, 123, n. 128), and armed with a "magnetic personality" (Ford, *op. cit.* in *Bibl.*, 154) and the prestige naturally accruing to *ḥādjdjī* on this distant periphery of the Muslim World, he began to expound a heterodox form of Islam with the avowed aim of reforming the Chinese *umma*.

Within a short period of time, Ma was expelled from his native An-ting for "causing trouble" (Ford, *ibid.*). He went next to preach amongst the Salars, a Turkic people with a reputation for fierceness and independence who inhabit the hills to the south of the Yellow River in the Chinghai-Kansu borderlands. In the Salar hills, Ma gained the support of two local *mullās* Su-ssu-shih-san and Hu-ma-liu-hu. His teaching, which rapidly gained widespread popular support, became known as the "New Teaching" (*hsin chiao*, *Matthews*, nos. 2737, 719) to differentiate it from the various forms of established Islamic practice in Kansu, which in turn became known as the "Old Teaching" (*lao chiao*, *Matthews*, nos. 3833, 719, or *chiu chiao*, nos. 1205, 719). According to Hsü (in *Bibl.*, 23), Ma Ming-hsin's "New Teaching" was distinguished by the following characteristics: (1) loud chanting of the scriptures, as opposed to the soft chanting of the old sect (i.e. followers of the "Old Teaching"); (2) prayers with head-shaking and body movement in dance-like manner, sc. foot-stamping, hand-waving, and face turning up towards heaven; (3) belief in miracles, visions, apparition of spirits, and prediction of good or bad omens; and (4) the worship of saints or their tombs.

Until recently, the identity of the "New Teaching", though obviously Ṣūfī in inspiration, remained unclear (see Wright, 108, together with relevant footnotes). Recent research undertaken by Saguchi and Fletcher, however, indicates that Ma Ming-hsin introduced to Kansu a sub-group of the Naḳshbandī *ṭariḳa* which practiced *dhikr djahrī* (vocal recollection) as opposed to the *dhikr khafī* more usually associated with the Naḳshbandiyya. This sub-group, which is generally known as the Naḳshbandiyya-Djahriyya, can be traced back to Khōdja Maḥmūd Andjīr Faghnawī, who introduced the "*dhikr* of those who act publicly" (*dhikr ʿalāniyya*) to the Naḳshbandī *ṭariḳa* in *ca.* 715/1315 (Fletcher, *Central Asian Sufism*, 79-80). The "New Teaching", or Kansu form of Naḳshbandiyya-Djahriyya, seems to have laid great emphasis on *karāmāt* (thaumaturgic and charismatic gifts [see KARĀMĀT); thus Ma Ming-hsin came to be regarded as a saint by his followers.

The followers of the "New Teaching" seem to have adopted an agressively militant attitude towards other Muslims. An anonymous government official who participated in the defense of Lanchow during the Muslim rebellion of 1196/1781 notes of the adherents of the "New Teaching" that "When anyone hesitated to join them, they would all rise to attack him, threatening him with sword and spear until he gave way. Even if the rejector were the father and the believers were the sons, the sons would kill the father". (*P'ing-Hui chi-lüeh*, *Hui-min ch'i-i*, iii, 9-10). As a result of this militancy, relations between the "Old" and "New" factions grew to be extremely bitter.

The Chinese authorities first seem to have become aware of these sectarian tensions during 1176/1762, when leaders of the rival factions in the Salar region laid charges against each other before the Chinese magistrate. The leaders of both groups were found guilty and banished from the area. In 1183/1769 the charges were renewed, and this time the penalties incurred were heavier against the "New Teaching" (Wright, 108). It is not clear whether Ma Ming-hsin was personally involved in either of these incidents.

During this period, the town of Hsün-hua, located in the Salar hills on the right bank of the Yellow River some 95 km. upstream from Hochow, (the modern Linsia), emerged as the centre of the "New Teaching". In 1196/1781 sectarian tension in Hsün-hua boiled over, and followers of the "New Teaching" leader Su-ssu-shi-san attacked and killed at least forty adherents of the "Old Teaching" (Schram, *op. cit.* in *Bibl.*, 64). Government troops despatched from Lanchow to quell the disturbances were defeated by Su-ssu-shi-san's followers, and the successful rebels occupied the city of Hochow.

The provincial authorities in Lanchow responded by sending a force of five hundred men to occupy Ti-tao, a small town on the right bank of the Tao River some 85 km. south-east of Hochow. In this action, the provincial forces scored their first real success by capturing Ma Ming-hsin, the founder and spiritual leader of the "New Teaching". Ma was taken to Lanchow, where he was incarcerated; shortly thereafter rebel forces from Hochow, believed to number upwards of 2,000 men, crossed the Tao River and besieged Lanchow. They succeeded in cutting the floating bridge across the Yellow River, thus isolating relief forces from Northern Kansu, and demanded the release of Ma Ming-hsin. The Chinese commandant refused to hand Ma over, but took him to the city walls whence he might address the besieging forces (de Groot, *op. cit.* in Bibl., 312-13). The anonymous government official who witnessed this scene records that "When Ma Ming-hsin was taken to appear on top of the city walls, all the Muslims who saw him from below rolled down from their horses and prostrated themselves on the ground. They called him a saint and wept" (*P'ing-Hui chi-lüeh*, *ibid.*). This display seems to have made an adverse impression on the Chinese commandant, who "had him killed at once, in order to keep down sedition within the walls" (de Groot, 314). Ma's son was seemingly killed with him (Schram, *ibid.*).

Ma's death did not bring about the end of the rebellion, but served only to increase the bitterness of his followers. The Chinese troops stationed in Kansu proved incapable of suppressing the rebels, a task which fell initially to Salar followers of the "Old Teaching", later assisted by Mongol troops from Alashan and Chinese troops from Szechwan. Some three months after the murder of Ma Ming-hsin, Ch'ing troops surrounded the foremost of the surviving "New Teaching" leaders, the Salar *mullā* Su-ssu-shi-san, at his stronghold in the Hua-lin mountains. Su was captured and executed, and with his death the rebellion came to an end. The Chinese authorities banned the "New Teaching" and instituted a series of bloody reprisals against its surviving adherents. An edict issued by Ch'ien-lung after the imperial victory in the Hua-lin mountains exhorts his officials as follows: "Of these rebels not a trace, however slight, must remain. All insurgents yet at liberty shall be hunted out . . . and their wives, daughters and babies now incarcerated in the provincial capital, in Hochow, in Hsün-hua and other places, shall be thoroughly examined for the better realisation of this object; and finally, the transports to the pestilential places of banishment shall start with all possible speed" (de Groot, 315). The Ch'ing authorities massacred whole families and clans with "New Teaching" affiliations, but to no avail. The "New Teaching" leaders went underground, and within three years a still bloodier *hsin-chiao* rising, under the leadership of T'ien Wu [*q.v.*] broke out in the Kansu-Chinghai region. The "New Teaching" or Ma Ming-hsin was also to prove instrumental in the great mid-13th/19th century rebellion of Ma Hua-lung [*q.v.*].

Bibliography: Details of contemporaneous

Chinese sources may be found in C. L. Pickens, *Chinese annals*, pp. 30-3 of his *Annotated bibliography of literature on Islam in China*, Hankow 1950; this source is especially useful for details of the 1196-9/1781-4 Muslim risings contained in the *Ta-Ch'ing Kao-tsung Shun-huang-ti shih-lu* (i.e. the official edicts of the Ch'ien-lung period). See also Wei Yüan, *Sheng-wu chi* ("History of the Imperial wars"), 1842, *chüan* 7 (cited in Ford, *op. cit.* below). For further details, see D. D. Leslie, *Islam in China to 1800: a bibliographical guide*, in *Abr-Nahrain*, xvi (1976), 25 (Section H, "Imperial Edicts"). Further primary sources, including the *P'ing-Hui chi-lüeh* ("Brief record of the pacification of the Muslims", Kansu, *ca.* 1196/1781) may be found in Pai Shou-i, ed. *Hui-min ch'i-i* ("The righteous uprisings of the Muslim people"), published in 4 vols., Shanghai 1952, of which vols. iii and iv refer to events in the Chinese northwest during the 18th and 19th centuries.

Secondary sources dating from the late 19th and early 20th centuries include: C. Imbault-Huart, *Deux insurrections des Mahométans du Kansou*, in *JA*, ser. 8, vol. xiv (1889), 494-525; J. J. M. de Groot, *Sectarianism and religious persecution in China*, Amsterdam 1903-4; M. Broomhall, *Islam in China: a neglected problem*, London 1910, see esp. 150-1; H. M. d'Ollone, *Recherches sur les musulmans chinois*, Paris 1911; and M. Hartmann, *Zur Geschichte des Islam in China*, Leipzig 1921. More recent works include Mu Shou-ch'i, *Kan-Ning-Ch'ing shih-lüeh* ("A brief history of Kansu, Ninghsia and Chinghai"), Lanchow 1936, *chüan* 18, p. 37; *chüan* 19, p. 6 etc. (cited in Ford, *op. cit.* below); in Arabic, Muḥammad Tawāḍuʿ, *al-Ṣīn wa 'l-Islām*, Cairo 1945; Pai Shou-i, *Hui-hui min-tsu ti hsin-sheng* ("The rebirth of the Muslim people"), Shanghai 1951, see esp. 46-7; Chu Wen-djang, *The policy of the Manchu government in the suppression of the Moslem rebellion in Shensi, Kansu and Sinkiang from 1862 to 1878*, Ph. D. thesis, Univ. of Washington, 1955 (the greater part of this thesis was later published [see Chu, 1966], but several important appendices were omitted from the published version, most notably Supplement IV, "Ma Hua-lung and the New Sect", which may be found at 343-60 of the unpublished thesis); Mary C. Wright, *The last stand of Chinese conservatism: the T'ung-Chih restoration, 1862-1874*, Stanford 1957, repr. New York 1969, see esp. 107-13 of the 1969 edition; L. J. Schram, *The Monguors of the Kansu-Tibetan frontier*, in *Transactions of the American Philosophical Society*, li/3 (1961), 63-5. A particularly important source is Saguchi Toru's *Jûhaci-jûkyû seiki Higashi Torukisutan shakaishi kenkyû* ("The social history of Eastern Turkestan in the 18th/19th centuries"), Tokyo 1963. Also of importance is Immanuel C. Y. Hsu's *The Ili crisis: a study of Sino-Russian diplomacy, 1781-1881*, Oxford 1965, see esp. 23-4, and 197, n. B. The most recent sources include: Chu Wen-djang, *The Moslem rebellion in Northwest China, 1862-78*, The Hague-Paris 1966; J. Ford, *Some Chinese Muslims of the seventeenth and eighteenth Centuries*, in *Asian Affairs*, lxi/2 N.S. vol. v/12 (1974), 144-56 (for Ma Ming-hsin, see esp. 153-6); R. Israeli, *Chinese versus Muslims: a study of cultural confrontation*, Ph.D. thesis, Univ. of California, Berkeley 1974; J. Fletcher, *Central Asian Sufism and Ma Ming-hsin's New Teaching*, publication unknown, 1976 (?), 75-96; Israeli, *Established Islam and marginal Islam in China: from eclecticism to syncretism*, in *JESHO*, xxi/1 (1978), 99-109. MĀ WARĀʾ AL-NAHR (A.) "the land which lies beyond the river", i.e. beyond the Oxus or Āmū-Daryā [*q.v.*], the classical Transoxiana or Transoxania, so-called by the conquering Arabs of the 1st/7th century and after in contrast to Mā dūn al-Nahr, the lands of Khurāsān [*q.v.*] this side of the Oxus, although the term Khurāsān was not infrequently used vaguely to designate all the eastern Islamic lands beyond western Persia.

1. THE NAME

The frontiers of Mā warāʾ al-nahr on the north and east were where the power of Islam ceased and depended on political conditions; cf. the statements of the Arab geographers on Mā warāʾ al-nahr in G. Le Strange, *The lands of the Eastern Caliphate*, Cambridge 1905, 433-4; W. Barthold, *Turkestan down to the Mongol invasion*, London 1928, 64 ff. The phrase Mā warāʾ al-nahr passed from Arabic literature into Persian. As late as the 9th/15th century, Ḥāfiẓ-i Abrū [*q.v.*] devotes a special chapter (the last) to Mā warāʾ al-nahr in his geographical work. Under the influence of literary tradition, the phrase Mā warāʾ al-nahr was used down to quite recent times in Central Asia itself (e.g. by Bābur, in his *Bābur-nāma*, ed. Beveridge, see index; by Mīrzā Ḥaydar Dughlāt later in the 10th/16th century in his Taʾrīkh-i Rashīdī, tr. Elias and Ross, *A history of the Moghuls*, London 1895, 79, 95 ff., 150, etc.; and by the Uzbek Muḥammad Ṣāliḥ, cf. *Sprav. knizhka Samarkandskii oblasti*, v, 240 and *passim*), although to the people of Central Asia the lands in question were on their side of and not across the river. (W. BARTHOLD)

2. HISTORY

Pre-Islamic Transoxania comprised, in the widest sense, Soghdia (Arabic *Ṣughd* [*q.v.*], essentially the basin of the Zarafshān river) and the lands as far as the Sīr Daryā basin, northwestwards to Khʷārazm [*q.v.*] and eastwards to Farghāna [*q.v.*] and across the Tien Shan Mountains into Eastern or Chinese Turkestan (on the general concept of "Turkestan", Eastern and Western, see TURKISTĀN). For these regions in classical times, see W. Tomaschek, in *PW*, ii, cols. 2804-13 (Baktra, Baktriane, Baktrianoi), iii, cols. 2406-8 (Chorasmia). All this was still largely an Iranian region, with such Middle Iranian languages flourishing there as Khʷārazmian and Soghdian, both written in scripts going back to the Aramaic alphabet; Bactrian in the upper Oxus provinces of Ṭukhāristān, Čaghāniyān, Khuttal(ān) and Wakhsh [*q.vv.*], written in a modified Greek alphabet; and Khotanese and Tokharian dialects in the Tarim basin of Eastern Turkestan, written in scripts of Indian origin. In Soghdia, however, the strong cultural influence of Sāsānid Persia may have given Persian a foothold in the main cities at least. Narshakhī states that just after the time of the conquest of Bukhārā by Ḳutayba b. Muslim (sc. in *ca.* 94/712-13), the people there used Persian (*pārsī*) for reciting the Ḳurʾān, though no doubt Soghdian remained for some time to come the main language of daily intercourse (*Taʾrīkh-i Bukhārā*, ed. Mudarris Riḍawī, Tehran 1939, 57, tr. R. N. Frye, *The history of Bukhara*, Cambridge, Mass. 1954, 48). Just over two-and-a-half centuries later, al-Muḳaddasī, 335, calls the speech of Bukhārā *darī*, i.e. Persian; this must nevertheless still refer to urban speech patterns only, for Soghdian lasted much longer in the countryside.

In regard to religion, no single faith was dominant. Buddhism was still in full bloom in Eastern Turkestan and still strong in the upper Oxus provinces, where it was the faith of the northern branch of the Hephthalites [see HAYĀṬILA] who put up such a strenuous resistance to the Arabs in the later 1st/7th and early 2nd/8th centuries, and where Balk͟h [*q.v.*] was still a major Buddhist centre; but it had, for some time, been waning in Soghdia. When the Chinese Buddhist pilgrim Hiuen-Tsang arrived in Samarḳand in *ca.* 630, he found the Zoroastrians completely in the ascendant there and the Buddhist monasteries deserted; the restorative measures which he took can only have arrested this decline temporarily. For as in the linguistic field, cultural pressures from Sāsānid Persia must have given Zoroastrianism an access of prestige and power in Transoxania, even though direct Sāsānid military authority did not extend beyond Marw (cf. W. Barthold, *Histoire des Turcs d'Asie Centrale*, Paris 1945, 33-5). Manicheism and other dualist faiths were tolerated, and their adherents found an especially sympathetic haven in Eastern Turkestan and among the Uyg͟hur Turks, as numerous surviving religious texts from the Tarim basin attest; as late as *ca.* 372/982 the *Ḥudūd al-ʿālam*, tr. Minorsky, London 1937, 113, § 25.13, records the presence in Samarḳand of a conventual house of the Manichaeans, *k͟hānagāh-i Mānawiyān*, with *auditores* or *nig͟hūs͟hāk*. Mazdakites are mentioned also in Samarḳand, and if the followers of the late 2nd/8th century heretic al-Muḳannaʿ, the "wearers of white" (see below) were Mazdakites (or Manichaeans?), their adherents still persisted at Kis͟h and Nak͟hs͟hab in the time of the continuator of Nars͟hak͟hī Aḥmad b. Muḥammad b. Naṣr (*Taʾrīk͟h-i Buk͟hārā*, 88-9, tr. 75). The Christian presence was strong. A bishop is mentioned at Marw in 334 A.D. and there was probably one in Samarḳand by the 6th century. Nestorians, Jacobites and Melkites were all represented in Transoxania. When the Sāmānid *amīr* Ismāʿīl b. Aḥmad [*q.v.*] conquered Talas in 280/893, a "great church" was transformed into a mosque (*ibid.*, 102, tr. 86-7). The absence of any one preponderant faith meant that there did not exist in Transoxania a dominant priesthood as there was in Sāsānid Persia, though religious scholars (*aḥbār*: al-Ṭabarī, ii, 1237) are mentioned in K͟hwārazm at the time of Ḳutayba's incursions of 93/712, perhaps Zoroastrian priests; but resistance there to the Arabs was on grounds of local patriotism rather than on a religious basis.

Socially, there was an influential class of merchants in such Soghdian towns as Buk͟hārā, Paykand and Samarḳand, which was involved in long-distance trade operations with the Turkish peoples of the Siberian steppes and with the Chinese. The Arab invasions would not seriously hamper these trade movements, and indeed, the Soghdian merchants eventually found new markets within the Islamic caliphate for the goods which they imported from Inner Asia. The landed aristocracy of *dihḳān*s was dominant in the countryside and smaller towns, and the pattern of large estates in K͟hwārazm, along the Oxus channels and their canals, revealed by Soviet archaeology, was probably repeated in the irrigated lands of the Zarafs͟hān valley and the upper Oxus ones. The local Iranian princes of Transoxania mentioned in the sources, such as those in rural Īlāḳ [*q.v.* in Suppl.], S͟hās͟h [*q.v.*] and Farg͟hāna, and in cities like Samarḳand and Buk͟hārā, comprised the more powerful members of the *dihḳān* class and bore Iranian regnal titles such as *ik͟hs͟hīd* [*q.v.*] from Old Persian *k͟hs͟hāyat͟hiya-* "king, ruler"), e.g. in Soghdia and Farg͟hāna. Such a land-owning class (which may be called, not anachronistically, one of feudal magnates) of *dihḳāns* was the backbone of resistance to the Arabs, and continued to play a leading social role—eventually as an Islamised caste—in Transoxania till the end of the Sāmānid period, during which political authority was still to a considerably extent decentralised; its decline only came with the influx of Turkish steppe peoples in the 5th/11th century and after.

The Arabs who had invaded Persia and overthrown the Sāsānid empire penetrated to Ṭuk͟hāristān in ʿUt͟hmān's caliphate, during the governorship in K͟hurāsān of ʿAbd Allāh b. ʿĀmir [*q.v.*], and al-Balād͟hurī, *Futūḥ*, 408, records, on the authority of Abū ʿUbayda, a plunder raid across the Oxus to Māymurg͟h near Samarḳand in 33/653-4. It would have been obviously unwise to commit major Arab forces across the river until some progress had been made against the resistance of the Hephthalites in Cisoxania and until a key point like Balk͟h had been captured (first raided in 32/653, but not fully secured till the time of Ḳutayba, see BALK͟H) and the Oxus crossing-points of Āmul-i S͟haṭṭ [*q.v.*] and Zamm taken.

In the spring of 54/674 Muʿāwiya's general ʿUbayd Allāh b. Ziyād [*q.v.*] crossed the Oxus, attacked Paykand and defeated the army of the local Soghdian ruler of Buk͟hārā, the Buk͟hār-K͟hudā. Yazīd I's governor, Salm b. Ziyād (61-4/681-3) was the first Arab commander actually to winter across the river. Any hopes of Arab progress in Transoxania were dashed by the civil wars which broke out in the heart of the caliphate on Yazīd's death and the protracted resistance to the Umayyad government in Damascus of the anti-caliph ʿAbd Allāh b. al-Zubayr, even though the Soghdian cities remained disunited and their nominal suzerain the Chinese emperor was unable, despite embassies despatched to Peking and appeals for help, to supply any assistance.

It was the great Ḳutayba b. Muslim al-Bāhilī [*q.v.*] who was the first Arab general to establish a firmer Arab hold over Transoxania. Appointed governor of the east by al-Ḥad͟jd͟jād͟j in 86/705, he was to enjoy a ten years' tenure of power, spanning the caliphate of al-Walīd b. ʿAbd al-Malik, a reign particularly significant for the extension of Muslim power in both east and west. Ḳutayba first campaigned successfully in the Upper Oxus provinces at the invitation of the ruler of Čag͟hāniyān, who sought aid against local rivals (86/705). Between 87/706 and 90/709 he conquered Paykand and Buk͟hārā, installing in the latter city a local prince Tug͟hs͟hāda as his vassal, and received the submission of Tark͟hān of Samarḳand and his successor G͟hūrak. Mosques were now built in Buk͟hārā, Samarḳand, etc., in order to encourage the implantation of Islam and the inhabitants of Buk͟hārā were forced to give up half the houses of the *madīna* or *s͟hahrastān* as billets for the incoming Arab garrison; but according to Nars͟hak͟hī, 57, tr. 48, Ḳutayba had to pay the local inhabitants two *dirhams* a time to attend the Friday prayers. It was first in 88/707 that Ḳutayba had to repel Turkish forces which appeared in Transoxania when the people of Buk͟hārā appealed to the powerful Ḳag͟han of the Eastern Turks, whose name is known only in the Chinese transcription of Mo-čʾo; and a further Turkish invasion into Soghdia in 93/712, at the invitation of the people of Samarḳand, repulsed by Ḳutayba in the following year, may be that mentioned in the early Turkish Orkhon inscriptions (Khočo-Tsaidam, Kültigin I E 39) as the one undertaken by

the prince Kültigin which penetrated as far as *Tāmir Kapïgh*, the "Iron Gate" (sc. the present Buzgala defile between Kish and Tirmidh), "in order to organise the Soghdian people" (the connection of these seems fairly certain, as proponed by Marquart and Barthold; cf. R. Giraud, *L'empire des Turcs célestes, les règnes d'Elterich, Qapghan et Bilgä (680-734)*, Paris 1960, 44, 182-3, who also notes that this same inscription (Kültigin I, E 31) mentions an earlier expedition to the Iron Gate under Tonyuḳuḳ in 701). Ḳutayba further sent two expeditions against Khwārazm in 93/712, when the Khwārazm-Shāh was killed, although it was long before Islam became firmly implanted there [see KHWĀRAZM]. His forces also campaigned in the Sïr Daryā valley in Ushrūsana [*q.v.*] and Shāsh, meeting no resistance from the Turks, although the brief report in al-Ṭabarī, ii, 1276, of a raid by one of his commanders as far as Kāshghar, on the other side of the Tien Shan, seems improbable (see H. A. R. Gibb, *The Arab invasion of Kashghar in A.D. 715*, in *BSOS*, ii [1923], 467-74).

The Turks' ability to intervene once more in Transoxanian affairs was for a while hampered by internal disputes between the Eastern and Western Turks, but after 716, a forceful ruler, Su-lu, made himself leader of the Western Turks or Türgesh. In 106/724 he inflicted a sharp defeat, the so-called "Day of thirst", on the Arab commander Saʿīd b. ʿAmr al-Ḥarashī who had invaded Farghāna, in the Sïr Daryā basin, and this reduced aggressive activity on the part of the Arabs for a decade or two. It is from these years, immediately after the fall of Ḳutayba, that there dates the important cache of documents in Soghdian, the archives of Dīvāstič, prince of Pandjkent on the upper reaches of the Zarafshān, kept at his stronghold on Mount Mugh, sacked in 104/722-3 by the Arabs (al-Ṭabarī, ii, 1447-8; cf. A. L. Mongait, *Archaeology in the U.S.S.R.*, Moscow 1959, 289-95). In the ensuing years, the Arabs, now on the defensive, were pushed back by the joint efforts of the Soghdian princes and the Turks, so that by 110/728 the Arabs only held Samarḳand and Dabūsiyya. The Arabs themselves were divided after 116/734, when the rebellion of al-Ḥārith b. Suraydj al-Mudjāshiʿī [*q.v.*] broke out, first in Ṭukhāristān and then in Transoxania (where al-Ḥārith allied with the Ḳaghan of the Türgesh, Su-lu), lasting for several years. There was also much discontent amongst that part of the indigenous Transoxanian population which had been converted to Islam but which nevertheless found itself still liable to pay the poll-tax for the benefit of the Arab treasury.

Arab fortunes only revived under the energetic and experienced—he had fought under Ḳutayba—governor Naṣr b. Sayyār al-Kinānī [*q.v.*] (120-30/738-48), who made a generous financial settlement for the new converts and for those inhabitants who had apostasised from Islam when Arab military control had been relaxed and looked like disappearing altogether, and who brought al-Ḥārith b. Suraydj to terms in 126/744. He carried Arab arms into Farghāna again, but spent most of his efforts in pacifying Soghdia and in conciliating its people. Arab embassies to the Chinese court were resumed by Naṣr after an hiatus in the period 115-23/733-41, and the regulation of commercial contacts may have been one of the motives involved (see Gibb, *Chinese records of the embassies of the Arabs in Central Asia*, in *BSOS*, ii [1923], 619-22).

Naṣr was forced to abandon both Transoxania and Khurāsān by the growing menace of the ʿAbbāsid *daʿwa* under Abū Muslim [*q.v.*], and pro-ʿAbbāsid governors were installed in the East from 130/748 onwards. This internal revolution amongst the Arabs must have been welcomed by the *dihḳāns* of Transoxania, disturbed at the waning of their political and social influence through the increased momentum of conversions to Islam. In 133/750-1 there was, moreover, a pro-ʿAlid rising among the Arab garrison of Bukhārā, bloodily suppressed by the new ʿAbbāsid governor Ziyād b. Ṣāliḥ al-Khuzāʿī [*q.v.*]. Although the Bukhār-Khudā had co-operated with the Arab authorities against the insurgents, he was afterwards executed on Abū Muslim's orders.

Meanwhile, the dissensions into which the Türgesh steppe confederation had fallen in 738 with Su-lu's defeat in battle at the hands of the Chinese and his assassination by a rival Turkish chief, permitted a recrudescence, now on a scale much more threatening than ever before to the Arabs, of Chinese activity in Central Asia. In 748 Chinese forces captured the Türgesh capital of Sūyāb, in the Ču river valley to the north-east of Farghāna, and in 749 executed the local ruler of Shāsh for "the non-fulfilment of his duties as a vassal". For several decades, virtually since the first coming of the Arabs, the Soghdian rulers and the princes of Ṭukhāristān (including among the latter the Yabghu, Arabic Djabbūya) had been sending embassies to China appealing for help against the invaders. Now in 750-1 the Korean general Kao-hsien-chih was sent by the Chinese governor of Ḳuča in Eastern Turkestan, firstly against rebels in the Pamirs region of Gilgit [*q.v.* in Suppl.], and then into Farghāna. Here the Chinese army, assisted by the Turkish Ḳarluḳ [*q.v.*], met an Arab force under Ziyād b. Ṣāliḥ at Athlakh or Aṭlakh near Talas in 133/751, and was soundly defeated, with heavy losses of killed and captured (see D. M. Dunlop, *A new source of information on the Battle of Talas or Aṭlakh*, in *Ural-altäischer Jahrbücher*, xxxvi [1965], 326-30). Amongst the prisoners-of-war were Chinese artisans who are supposed to have taught the people of Samarḳand the art of paper-making (al-Thaʿālibī, *Laṭāʾif al-maʿārif*, tr. Bosworth, *The book of curious and entertaining information*, Edinburgh 1968, 140, and KĀGHAD). This marked the end of Chinese attempts to assert their hegemony west of the Tien-Shan; to the subsequent entreaties of the Iranian princes of Transoxania and Khwārazm for help against the Arabs, the T'ang emperors, pre-occupied by succession quarrels 755-63, were compelled to return non-committal answers. Arab authority was thus made reasonable firm in Transoxania for the first time, since the local potentates no longer had any strong allies either in the Turkish steppes (the Eastern Turkish confederation had collapsed with the death of the Ḳaghan Mo-ki-lien in 744, to be replaced by that of the Uyghurs, who were essentially concerned with Mongolia and Eastern Turkestan) or in the Far East. That the masses of population in Transoxania were as yet far from wholly reconciled to Arab political and social domination was to be demonstrated by various outbreaks of religio-political protest in the early ʿAbbāsid period (see further on these, below), but Arab authority was by that time never seriously jeopardised.

For the detailed history of this first century or so of Arab domination in Transoxania, see F. H. Skrine and E. D. Ross, *The heart of Asia, a history of Russian Turkestan and the Central Asian khanates from the earliest times*, London 1899, 34-89; Gibb, *The Arab conquests in Central Asia*, London 1923; Barthold, *Histoire des Turcs d'Asie Centrale*, 47 ff.;

idem, *Turkestan down to the Mongol invasion*[3], London 1968, 180-96; R. Grousset, *L'empire des steppes*[4], Paris 1952, 150-72; A. D. H. Bivar, in G. Hambly *et alii*, *Central Asia*, London 1969, 63-8.

Under the first ʿAbbāsids, Transoxania gradually became integrated politically as a province of the caliphate as a whole. The first governors appointed there by the victorious Abū Muslim speedily began intriguing against their patron at the instigation of the caliph Abu 'l-ʿAbbās al-Saffāḥ, who became deeply suspicious of his over-mighty subject. Abū Muslim accordingly executed Sibāʿ b. al-Nuʿmān al-Azdī in 135/752-3 at Āmul, whilst the fugitive Ziyād b. Ṣāliḥ was executed, to Abū Muslim's satisfaction, by the Iranian *dihḳān* of Bārkath, on the route from Samarḳand to Ushrūsana. Discontent among Abū Muslim's own followers after his death at the caliph al-Manṣūr's hands in 137/755, discontent which came to regard the murdered leader as a semi-divine, messianic figure who would return and establish a reign of justice (cf. G.-H. Sadighi, *Les mouvements religieux iraniens au IIe et au IIIe siècle de l'hégire*, Paris 1938, 134 ff.), united sectarian Islamic and non-Islamic religious dissent with politico-social resentment at Arab domination; these combined strands made Transoxania a much-troubled region in the ensuing decades. The rapidly-changing series of Arab governors sent out to govern Khurāsān and Transoxania (see the list in Zambaur, *Manuel*, 48) were mostly intent on lining their own pockets during their expectedly brief tenure of power there rather than on trying to bring about a community of interest between the Arab central government representatives and the local populations. Several governors debased the local silver currency, although it is favourably recorded by Narshakhī that the governor Ghiṭrīf b. ʿAṭāʾ [*q.v.* in Suppl.], appointed to Khurāsān in 175/791 by his own nephew Hārūn al-Rashīd, introduced the useful reform of alloy *dirhams*, called *Ghiṭrīfī*, to replace the old, largely-vanished coinage of the Bukhār-Khudās (see Barthold, *Turkestan*, 203-6).

Most of what we know about Transoxania's specific history in this period from the advent of the ʿAbbāsids to the rise of the Sāmānids is concerned with various rebellious there. In the caliphate of al-Mahdī, *ca.* 159-60/776-7 and during the governorships of Ḥumayd b. Ḳaḥṭaba al-Ṭāʾī and Abū ʿAwn ʿAbd al-Malik b. Yazīd, there occurred the outbreak of the Khāridjī *mawlā* Yūsuf al-Barm al-Thaḳafī at Bukhārā and in the countryside of Bādghīs, and later, in the time of al-Maʾmūn, Yūsuf's grandson Manṣūr b. ʿAbd Allāh also rebelled; such Khāridjī activity was an aspect of the general vitality of Khāridjī doctrines in Khūrāsān and Sīstān at this period. More serious at the time and with a protracted aftermath was the movement of the "wearers of white garments" (*al-mubayyiḍa, ispīdh-djāmagān*), followers of the "veiled prophet" al-Muḳannaʿ [*q.v.*], whose real name was Hāshim b. Ḥakīm or ʿAṭāʾ, a former partisan of Abū Muslim's. The revolt, erupting during Ḥumayd's governorship, is treated at length by Narshakhī (77-89, tr. 65-76; Barthold, *Turkestan*, 198-200; Sadighi, *op. cit.*, 163-86; B. S. Amoretti, *Sects and heresies*, in *Camb. hist. of Iran. iv. From the Arab invasion to the Saljuqs*, ed. R. N. Frye, Cambridge 1975, 498-503). It attracted widespread support in Soghdia, at Kish and at Nakhshab or Nasaf, whilst in Bukhārā, the son of the Bukhār-Khudā Tughshāda, Bunyāt, renounced official Islam and joined the movement. It is not easy to discern from the sources the exact nature of al-Muḳannaʿ's religious doctrines. He himself may have been originally a Zoroastrian, but his ideas may have come to include neo-Mazdakite elements and perhaps even Manichaean ones; and certainly, Abū Muslim, whose avatar al-Muḳannaʿ claimed to be, was accorded an exalted, almost divine position. The outbreak was suppressed during the governorship of al-Musayyab b. Zuhayr al-Ḍabbī (163-6/780-3), but the "wearers of white garments" persisted in the rural areas of Transoxania and Khurāsān for at least two centuries after this. The years 191-4/806-9 were characterised by the revolt centred on Transoxania, but with partisans joining his standard from the upper Oxus provinces of Čaghāniyān and Khuttal and from Khwārazm, of Rāfiʿ b. Layth, the grandson of Naṣr b. Sayyār. The motive behind this seems to have been purely personal, without any religious or ideological impulse, and doubtless the prestige of Rāfiʿ's descent from the popular Naṣr b. Sayyār brought him support. The Arab governor of Samarḳand was killed, and Rāfiʿ secured help from the Iranian prince of Shāsh, from the Ḳarluḳ and the Toghuz-Oghuz Turks of the steppes and from Tibet before he submitted voluntarily to al-Maʾmūn and secured pardon (see Barthold, *Turkestan*, 200-1).

Thus intervention by the Turks in Transoxanian affairs continued during the early ʿAbbāsid period, but not on the same scale as during the Umayyad one. The disintegration of Türgesh power in the Western Turkestan steppes was followed by the ascendancy of the Toghuz-Oghuz, precursors of the Oghuz or Ghuzz [*q.v.*] who are mentioned in the 4th/10th and 5th/11th century Islamic sources as harrying the borders of Sāmānid Transoxania and then emerging to form the tribal backing of the Saldjūḳs [*q.v.*] when they overthrew Ghaznawid power in Khurāsān and entered northern Persia and the central lands of the Middle East. In the early ʿAbbāsid period, the Toghuz-Oghuz had their pasture grounds on the confines of Khwārazm and also along the lower Sīr Daryā. The Ḳarluḳ, possibly the ancestors of the later Ilek Khāns [*q.v.*] or Ḳarakhānids, took over the eastern Sīr Daryā basin and Semirečye (Turkish Yeti Su, "the land of the seven rivers"), acquiring in 766 Sūyāb, the former capital of the Türgesh. Islamic Transoxania suffered sporadically from their incursions, and these Turks continued also to give help on occasion to insurgent local Iranian princes and to rebels like Rāfiʿ b. Layth. To protect the settled agricultural lands, walls were built to the north of Bukhārā and in Shāsh; in Īlāḳ, in the great southern bend of the Sīr Daryā, the construction of a wall from the mountains to the river is ascribed to ʿAbd Allāh b. Ḥumayd b. Ḳaḥṭaba, governor of Khurāsān in 159/776 after his father's death. As shows of strength, the Arabs periodically sent expeditions into Farghāna; Ghiṭrīf b. ʿAṭāʾ sent thither an army to drive out the forces of the Yabghu of the Ḳarluḳ, and Faḍl b. Yaḥyā al-Barmakī (177-9/793-5) exacted the submission of the Afshīn or prince of Ushrūsana, who according to Gardīzī, had never before acknowledged the suzerainty of any outside ruler. The caliph al-Mahdī received at one point the homage of various Central Asian rulers, amongst whom are mentioned the Ikhshīd of Soghdia, the Afshīn of Ushrūsana, the prince of Farghāna, the Yabghu of the Ḳarluḳ, the Ḳaghan of the Toghuz-Oghuz, etc., but this cannot have meant much in practice. This was also a period when, because of the early ʿAbbāsids' dependence on their Khurāsānian guards, Transoxanian fighting men entered the caliphal army in considerable numbers; in the reign

of al-Muʿtaṣim, the Afs͟hīn of Us͟hrūsana, Ḥaydar, was to play a leading role in suppressing the revolt of Bābak al-K͟hurramī [*q.v.*] in northwestern Persia until his own spectacular fall in 226/841 [see AFS͟HĪN].

Of special concern to us here is the contemporary rise to power, under the overlordship of the Ṭāhirids, of the Sāmānids, who laid the foundations for what became a powerful amīrate, at first in Transoxania and then also, in the 4th/10th century, in K͟hurāsān (204-395/819-1005). Whether the semi-mythical ancestor of the Sāmānids, the person given the title of Sāmān-K͟hudā, was really a scion of the Sāsānids or not (see Bosworth, *The heritage of rulership in early Islamic Iran and the search for dynastic connections with the past*, in *Iran, JBIPS*, xi [1973], 59-9) is impossible to decide, but the family was clearly a typical Iranian *dihḳān* one hailing from Ṭuk͟hāristān. A Sāmān-K͟hudā of the late Umayyad period is said to have accepted Islam at the hands of the governor Asad b. ʿAbd Allāh al-Ḳasrī (105-9/723-7), and in the caliphate of al-Maʾmūn, his four grandsons, Nūḥ, Aḥmad, Yaḥyā and Ilyās received, as rewards for their fidelity to al-Maʾmūn's interests, the governorships of Samarḳand, Farg͟hāna, S͟hās͟h and Harāt respectively. The Harāt branch was unable to maintain power south of the Oxus, and the Sāmānids developed essentially as the dominant power in Transoxania, being designated governors, in effect independent rulers there, by the caliph in 261/875 after the downfall of the Ṭāhirids at the hands of the Ṣaffārids Yaʿḳūb and ʿAmr b. Layt͟h [*q.vv.*]. For a detailed consideration of the Sāmānid dynasty and its history, see SĀMĀNIDS, and for the present, a useful general survey by Frye, *The Sāmānids*, in *Camb. hist. of Iran*, iv, 136-61.

Here it may merely be noted that it was a cardinal feature of Sāmānid policy, from the time of the real founder of the dynasty's fortunes, Ismāʿīl b. Aḥmad (279-95/892-907) [*q.v.*], onwards, to maintain those frontiers of Transoxania which faced the steppes against the pagan Turks and thereby to provide a bastion against nomadic pressure from Inner Asia. Ismāʿīl in 280/893 led a punitive expedition against the Ḳarluḳ, taking an immense plunder (presumably of beasts and slaves) from them at Talas (modern Dzhambul), and he also brought to heel the prince of Us͟hrūsana. Other outlying Iranian principalities were however normally allowed to subsist as vassals, sending tribute and/or presents to the *amīrs*, of the Sāmānids. This was the case with the Afrīg͟hid K͟hʷārazm-S͟hāhs, the Ṣaffārids in Sīstān, the Farīg͟hūnids in Gūzgān, the Abū Dāwūdids in Balk͟h, the Muḥtād͟jids in Čag͟hāniyān, etc., and whilst the *amīrs* remained vigorous and incisive, this was no source of weakness. Contemporary geographers describe the fringes of Transoxania as dotted with *ribāṭs* [*q.v.*] against the pagan Ḳarluḳ, Og͟huz and Kimāk [*q.v.*], where *g͟hāzīs* or enthusiasts for the faith, from the Transoxanian towns, could work off their energies in the defence of Islam. In Isfīd͟jāb [*q.v.* in Suppl.], on the northernmost frontier of Islam, as many as 1,700 *ribāṭs* are mentioned, partly manned by volunteers from Nak͟hs͟hab, Buk͟hārā and Samarḳand. Even when some of these Turks had been nominally converted to Islam, *ribāṭs* as centres for offensive and defensive operations were still necessary; al-Muḳaddasī, 274, tells how two places on the middle Sīr Daryā, in the district of Isfīd͟jāb, were frontier points (*t͟hag͟hrān*) against the Türkmens (*al-Turkmāniyyūn*) who had only become Muslims "out of fear". It was also from these frontier-posts that Ṣūfīs and other zealots set off into the *terra incognita* of the steppes as evangelists, such as the missionary from Nīs͟hāpūr, one Abu 'l-Ḥasan Muḥammad al-Kalimātī, who worked amongst the Ḳarluḳ in the middle years of the 4th/10th century and who played some part in the conversion of the founder of the Ḳarak͟hānid line, Satuḳ Bug͟hrā K͟hān, the Islamic ʿAbd al-Karīm (Barthold, *Turkestan*, 175-8, 254-6).

Transoxania flourished under the Sāmānids, and there was a dying-down of sectarian religious and socio-political protest movements during their time, compared with the previous period, although these did not entirely disappear. The geographers and travellers praise the ease of life there, the plentifulness of provisions, the comparatively light hand of government and incidence of taxation and tolls. There was quite a complex central administration in the capital Buk͟hārā, known to us from the accounts of Nars͟hak͟hī and of the encyclopaedist of the sciences Abū ʿAbd Allāh al-K͟hʷārazmī [*q.v.*], with a cluster of *dīwāns* or government departments adjacent to the palace built in Buk͟hārā by Naṣr b. Aḥmad (301-31/913-43); the model for these was doubtless the ʿAbbāsid bureaucracy in Bag͟hdād (see Nars͟hak͟hī, 31-2, tr. 25-7; Bosworth, *Abū ʿAbdallāh al-K͟hwārazmī on the technical terms of the secretary's art ...*, in *JESHO*, xii [1969], 113-64). Because of the province's frontier position, the people of Transoxania are described as tough, bellicose and self-reliant; also, perhaps because of the continued social influence of the *dihḳān* class, the ancient Iranian virtues of hospitality and liberality were kept up (see Bosworth, *The Ghaznavids, their empire in Afghanistan and eastern Iran 949-1040* Edinburgh 1963, 27-34). Culturally, both the Samanids themselves and the local, petty courts of the empire encouraged the persistance of Iranian oral and literary traditions, seen in the birth and florescence of New Persian lyrical and heroic poetry (by S͟hahīd Balk͟hī, Rūdakī, Daḳīḳī, etc.) which characterised the 4th/10th century and prepared the way in the early part of the following century for such figures as Firdawsī and the G͟haznawid lyric poets (see G. Lazard, *The rise of the New Persian language*, in *Camb. hist. of Iran*, iv, 595-632). At the same time, Transoxania shared to the full in the Arab-Islamic heritage of the caliphate as a whole. Several of the compilers of the canonical collections of *ḥadīt͟hs*, the *sunan*, were from Transoxania and K͟hurāsān, and their scholars played a large role in the consolidation and elaboration of orthodox Sunnī theology (*kalām*) and law (*fiḳh*). Similarly, the fourth section of al-T͟haʿālibī's literary anthology, the *Yatīmat al-dahr*, shows how brilliantly Arabic poetry and artistic prose were cultivated in K͟hurāsān, Transoxania and K͟hʷārazm (see V. Danner, *Arabic literature in Iran*, in *Cambr. hist. of Iran*, iv, 566-94; Bosworth, *The interaction of Arabic and Persian culture in the 10th and early 11th centuries*, in *al-Abḥāth*, xxvii [1978-9], 60, 68 ff.).

As in other fields, during the period 750-1000 Transoxania acquired strong economic and commercial links with the heartlands of the caliphate, including with the supreme centre of consumption, ʿIrāḳ and its capital Bag͟hdād. Instead of the old military systems of the Arab *muḳātila* and then of the early ʿAbbāsids' K͟hurāsānian guards, the caliphs began in the 3rd/9th century to surround themselves with Turkish slave troops [see D͟JAYS͟H. i and G͟HULĀM. i]. Hence the trade in Turkish slaves, who passed from the Inner Asian steppes through Transoxania to the slave markets there, became highly important, Turkish slaves were an integral part of the annual

tribute which the Ṭāhirids, whose governorate involved responsibility for Transoxania, forwarded to Baghdād; according to Ibn Khurradādhbih, 28, 20,000 were sent each year, their value amounting to 600,000 *dirhams*. In the Sāmānid period, a century or so later, al-Muḳaddasī, 340, states that the Sāmānid government issued special licenses (*adjwiza*) for the transit across their lands of Turkish slave boys and collected dues for them at the Oxus crossings. The detailed list of the products of the Inner Asian steppes, the Siberian forest zone and the Volga basin given by idem, 323-6, has been conveniently translated by Barthold, *Turkestan*, 235-6. Transoxania and Khwārazm processed and sewed together the furs of the forest lands, these being highly-prized, luxury articles in Islam [see FARW], and were important centres for the manufacture of cotton and other textiles. Particularly mentioned are the silks and satin brocades of Samarḳand; the towels of Karmīniya; the cloth of the village of Zandana, near Bukhārā used for the livery of the Sāmānids' palace guards; the cottons of Ṭawāwīs, also near Bukhārā; and the cotton garments of Wadhār near Samarḳand. Narshakhī, 24, tr. 19-20, mentions a *ṭirāz* [*q.v.*] factory (*kārgāh*) in Bukhārā, where carpets, cloth, etc. were woven for the caliphs and which were also exported as far as Syria, Egypt and Byzantium; it may have been founded when al-Ma'mūn was governor in Marw, but by Narshakhī's time (or by that of his continuator?) was no longer in use (see R. B. Serjeant, *Islamic textiles, material for a history up to the Mongol conquest*, Beirut 1972, 92-106). Another luxury item which came into the caliphate, certainly by sea but also probably overland through Central Asia and Transoxania, was Chinese porcelain, including the "imperial" variety, *čīnī faghfūrī* as the Ghaznawid historian Abu 'l-Faḍl Bayhaḳī calls it, imported in the time of Hārūn al-Rashīd (see P. Kahle, *Chinese porcelain in the lands of Islam*, in *Opera minora*, Leiden 1956, 354); whilst from Khwārazm, the local *bārandj* melons were so coveted as to be exported for al-Ma'mūn and al-Wāthiḳ in leaden containers packed with snow (al-Thaʿālibī, tr., *The book of curious and interesting information*, 142). The direct interest of the caliphs and their ministers in Central Asia, as well as being seen in the *bayt al-ṭirāz* at Bukhārā, to which the caliphs' tax-collectors came each year to collect the stipulated taxation of the city in textiles, is paralleled by the fact, mentioned by Ibn Faḍlān, that in the opening years of the 4th/10th century, the caliph al-Muḳtadir's vizier Ibn al-Furāt [*q.v.*] had an extensive estate at Artakhushmīthan in Khwārazm, administered by a local Christian steward or *wakīl* (*Reisebericht*, ed. A. Z. V. Togan, Leipzig 1939, § 1, text 3-4, tr. 2-3, and Excursus 5a, 110-11).

The increasingly acute internal dissensions within the Sāmānid amīrate of the later 4th/10th century, when powerful Turkish commanders like the Sīmdjūrīs, Fā'iḳ and Begtuzun secured an ascendancy in the state, making and unmaking *amīrs* at will, and when an internal financial crisis, bringing sharp increases in taxation, manifested itself, heralded the fall of the dynasty. The decisive factor here was the appearance on the northern frontiers of Transoxania, now unguarded, of the Ḳarluḳ. The Ḳarluḳ were converted to Islam in *ca.* 349/960, and from their centres at Kāshghar and Balāsāghūn [*q.vv.*] (the latter in the Ču valley, perhaps near modern Frunze) began to take advantage of the amīrate's weakness. Apparently with some encouragement—as, in former times, against the Arab governors—from the local Iranian *dihḳāns*, the Ḳarluḳ temporarily occupied the capital Bukhārā in 382/992. Further incursions followed, and in the end, the Ḳarakhānids or Ilek/Ilig Khāns, as the ruling family of the Ḳarluḳ begins to be called, divided up the Sāmānid dominions with Maḥmūd of Ghazna [*q.v.*], the Ḳarakhānids taking Transoxania and the Ghaznawids Khurāsān (see Barthold, *Turkestan*, 246-71; idem, *Histoire des Turcs d'Asie Centrale*, 59 ff.; Grousset, *L'empire des steppes*, 198-203).

For a detailed account of the political and dynastic changes in Transoxania over the next two centuries or so before the coming of the Mongols, see ILEK-KHĀNS and for the next wave of Inner Asian peoples to enter Semirečye and Transoxania, the Kitai (Chinese Ki'-tan or Liao) from the Mongolian fringes of northern China, see ḲARĀ KHIṬĀY; and since the history of the Great Saldjūḳs, suzerains of Transoxania in the sultanates of Malik-Shāh and Sandjar [*q.vv.*], impinges on that of Transoxania, see further SALDJŪḲS.

The long-term political, social and ethnic effects of the installation of Turkish and Mongol peoples like these in Transoxania were profound The pastoralisation of the land outside the oases and irrigated river valleys may have begun in the Ḳarakhānid period, since we know about royal hunting-grounds (*ghuruḳs*) being set up. The process certainly took effect under the Mongol Čaghatayids and the Tīmūrids, when urban life declined in the province after the savage sackings of towns by the Mongols in the 7th/13th century. Political authority was now decentralised, with tribally-organised nomadic confederations, often without firmly-fixed capitals, directing affairs, instead of the centralising states and autocratic rulers of the Perso-Islamic tradition. This is, indeed, one aspect of the fact that, with the fall of the Sāmānids, the ancient bastion which had for centuries protected the Iranian and Middle Eastern heartlands from the incursions of steppe people was now removed. Transoxania became a corridor of entry for these hordes—Ḳarakhānids, Saldjūḳs, Mongols, etc.—until the advent of the Ṣafawids in Persia, who, though themselves of Türkmen stock, constituted a powerful and resolute barrier state which increasingly had the advantages of better firearms and military techniques [see BĀRŪD, v] and could accordingly withstand the assaults of the Shaybānid Uzbeks or Özbegs and others from across the Oxus and the Atrek.

But by this time, sc. the 10th/16th century, the passing of the previous five or six centuries had almost completely accomplished the process of ethnic and linguistic Turkicisation in Transoxania and Khwārazm, the old "Iran extérieur". The continued influx of Turks gradually swamped the Iranians or Tādjīks [*q.v.*], as the Turks called them in distinction from themselves, and the population became mixed, with the Turkish element emerging uppermost, as it also did eventually at the other end of the modern Turkish world, i.e. in Ādharbāydjān and Anatolia. It was the same in regard to language. It is unclear exactly when Soghdian died out, but this must have been roughly contemporaneous with the fall of the Sāmānids; and the New Persian which had been replacing Soghdian during the Sāmānid period subsequently vanished also from most of Transoxania. In Khwārazm, Turkicisation began in Saldjūḳ times, although the indigenous Iranian languages persisted until the 8th/14th century (see Barthold, *Histoire des Turcs d'Asie Centrale*, 109-10). Only in the upper Oxus regions of what were the

mediaeval provinces of Čaghāniyān, Khuttal and Wakhsh did an Iranian-speaking population persist now speaking the form of New Persian known as Tādjīk/Tadzhik [see IRAN. iii. Languages, in Suppl.], and living in what is now the Tadzhik SSR, their numbers amounting to under 1 3/4 millions (1970 census). It is also during these centuries of the Turkicisation of Transoxania that the region becomes known, at least in popular parlance, as Turkistān [*q.v.*].

Transoxania and Eastern Turkestan or Kāshgharia were of course the first Islamic lands which Čingiz Khān encountered when he came westwards with the Mongol hordes. Balāsāghūn [*q.v.*], the main urban centre of Semirečye, was occupied after it had already suffered a severe plundering by the Ḳarā Khiṭāy. Bukhārā was ravaged in 616/1220, and soon afterwards, Otrār or Utrār [*q.v.*], the former Fārāb [*q.v.*], in the Sīr Daryā basin, and Samarḳand were attacked before Čingiz pushed on into Khurāsān in pursuit of the Khʷārazm-Shāh ʿAlāʾ al-Dīn Muḥammad [see KHʷĀRAZM-SHĀHS]. Gurgāndj [*q.v.*] in Khʷārazm was bravely defended, but fell to the Mongols (618/1221) and was later named Urgenč. The Great Khān Ögedey (1227-41) appointed governors in Transoxania for Nakhshab, Bukhārā and Samarḳand, and the sedentary indigenous population was at the beginning of his reign ruled by his representative Maḥmūd Yalawač Khʷārazmī [*q.v.*], appointed to collect the taxation there. Djuwaynī praises Maḥmud Yalawač's just rule and that also of his son Masʿūd Beg [*q.v.*], stating that Bukhārā reached its former level of prosperity (the latter governor was, for instance, the founder of the Masʿūdiyya *madrasa* in Bukhārā), though in fact there was a popular, anti-Mongol rebellion there led by one Maḥmūd Tārābī, only ended by the appearance of a large Mongol army (636/1238-9) (see Barthold, *Turkestan*³, 381-519; Grousset, *L'empire des steppes*, 293 ff., 324-8; Hambly, *The career of Chingiz Khan* and *The Mongol empire at its zenith*, in *Central Asia*, 86-113).

Transoxania, together with those steppe lands to the north henceforth to be known as Mogholistān [*q.v.*] or Mughulistān, came within the *ulus* or patrimony of Čingiz's second son Čaghatay, together with Eastern Turkestan (Khʷārazm came within the *ulus* of Djoči, the eldest son, together with western Siberia and South Russia); but the Čaghatay khānate was not properly constituted till some time after Čaghatay's own death in *ca.* 1241. Čaghatay and his descendants took little interest in the sedentary and urban life of Transoxania. Pre-Mongol Turkish landowners and chiefs, the successors of the Iranian *dihḳāns*, remained influential in the countryside; the descendants of the Ḳarakhānids remained in power in Farghāna, it seems (Barthold, *Histoire des Turcs d'Asie Centrale*, 118-19). In Mogholistān, to the north of the Ili river, there was a distinct decline of urban life in favour of pastoralisation (see *ibid.*, 149-53). Urban traditions in Transoxania were much stronger, and especially notable in the towns there is the prominent role, from Ḳarakhānid times onwards, of local Ḥanafī religious leaders functioning as headmen (*ruʾasāʾ*, sing. *raʾīs*), usually with the title of *ṣadr* or *ṣadr-i djahān*. Leaders with this title are found in Bukhārā, Samarḳand, Khudjand, Uzgend, Shāsh and Almalīgh; the best-known of these were the Āl-i Burhān in Bukhārā (till the revolt of Maḥmūd Tārābī in 636/1238) and their successors, the Āl-i Maḥbūbī (till the mid-8th/14th century) (see O. Pritsak, *Āl-i Burhān*, in *Isl.*, xxx [1952], 81-96, and ṢADR). Because of this lack of interest in the settled lands on the part of the Čaghatayid khāns, the nomadic traditions of the Mongols lasted longer amongst them, as also amongst the Golden Horde in South Russia and the Ḳïpčaḳ steppes [see DASHT-I ḲÏPČAḲ in Suppl.], than in the Persia of the Il-Khānids or the northern China of the Great Khāns. The Čaghatayid khāns' favoured encampments were in Semirečye, in the Ili basin, with the town of Almalīgh [*q.v.*], between the Tien-Shan and Lake Balkash, as their administrative centre; this town flourished and is favourably described by western travellers to the Great Khāns' court until it was destroyed in the civil strife amongst the Mongols in the 8th/14th century. Kebek (*ca.* 1318-26), though still, like the previous khāns, resistant to Islam, moved his capital to Transoxania proper and built a palace near Nakhshab in the Kashka Daryā valley, although this did not entail renunciation of the nomadic life; from the Mongol term for "palace", *ḳarshī*, the nearby town of Nakhshab came to receive the name which it still bears today, that of Ḳarshī/Karshi [see ḲARSHI]. Kebek's move must nevertheless have favoured the eventual conversion of the Čaghatay khāns to Islam, from the time of Tarmashīrīn onwards (1326-34). Čaghatayid rule lasted in Transoxania till the rise of Tīmūr (see below), and in other parts of Central Asia till after then, but Tīmūr's successes were facilitated by increased disunity amongst the Čaghatayid family, with Čaghatayid puppet rulers placed on the throne by Turkish *amīrs*. For an account of the khānate, see ČAGHATAY KHĀN and ČAGHATAY KHĀNATE;; Barthold, *Histoire des Turcs d'Asie Centrale*, 153 ff., 169-72; Grousset, *L'empire des steppes*, 397-420; Hambly, *The Chaghatai khanate*, in *Central Asia*, 127 ff.

Tīmūr, a Barlas Turk from Kish in Transoxania, succeeded by force of arms to the Čaghatayid heritage there. In 771/1370 he became *de facto* ruler of Transoxania, ruling in the name of fainéant descendants of Ögedey, sc. Soyurghatmïsh (771-90/1370-88) and then his son Maḥmūd (770-?816/1388-?1413). He linked himself by marriage to the Čaghatayid royal house, including to a daughter of Khiḍr Khōdja (d. 801/1399) of Mogholistān, who was reputedly a son of the last significant Čaghatayid khān Tughluḳ Tīmūr (760-71/1359-70). Under the rule of Tīmūr's descendants, above all, that of Shāhrukh (807-50/1405-47), Transoxania enjoyed much material prosperity, with Samarḳand and Bukhārā becoming lively centres of artistic and literary life, of painting and book-production, and of poetry in both Persian and in Eastern Turkish or Čaghatay. Samarḳand was the city which Tīmūr preferred to all others as his main capital. European travellers like the Spanish envoy Clavijo (1403) describe the splendour of his court, and fine buildings in Samarḳand, of which the Gūr Amīr mausoleum and the Bībī Khānum mosque survive, attest the high aesthetic level of early Tīmūrid architecture. The reign of Tīmūr's grandson Ulugh Beg [*q.v.*] (ruler in Transoxania from 814/1411, at first as Shāhrukh's deputy, to 853/1449) is associated with his foundation of a short-lived observatory in Samarḳand and the compilation of astronomical tables (see Barthold, *Ulugh-Beg*, tr. V. and T. Minorsky, in *Four studies on the history of Central Asia*, ii, Leiden 1958, 129-34). As his second capital, Tīmūr developed Shahr-i Sabz in the Kashka Daryā valley, in the heart of the area of the Barlas Turks and near his own birthplace, starting there the construction of impressive buildings, including his own tomb (see Barthold, *Shahr-i*

Sabz from Tīmūr to Ulūgh Beg, tr. J. M. Rogers, in *Iran, JBIPS*, xvi [1978], 103-26, xviii [1980], 121-43). Popular Islam, in the form of a cultivation of Ṣūfī mysticism and the growth of a network of dervish orders, especially flourished in Transoxania during Čaghatayid and Tīmūrid times, and the *shaykh*s and their orders enjoyed the patronage of the Tīmūrid rulers. Thus the Naḳshbandī *shaykh* Khwādja ʿUbayd Allāh Aḥrār (806-95/1404-90) strengthened the nascent *ṭarīḳa* in Transoxania, benefiting particularly from the favour of Tīmūr's great-grandson Abū Saʿīd and his son Sulṭān Aḥmad; the Naḳshbandiyya were henceforth to play a major role in the history of Islam in Central Asia [see AḤRĀR, KHWĀDJA,, in Suppl.). Meanwhile, the Čaghatayids managed to survive during these years in the lands beyond Transoxania, and under Esen Buḳa II (833-67/1429-62) flourished in Mogholistān and Eastern Turkestan, being hostile however to the later Tīmūrids. For the detailed history of this period, see Barthold, *Histoire des Turcs d'Asie Centrale*, 165-84; Grousset, *op. cit.*, 486-546, 568-80; Mahin Hajianpur, *The Timurid empire*, in *Central Asia*, 150-62; TĪMŪR and TĪMŪRIDS..

In 906/1500, Muḥammad Shaybānī, the scion of a line of Mongol khāns, the descendant of Djoči's youngest son Shīban (one part of whom had remained in Siberia as khāns and another part of whom had moved southwards into Transoxania, forming the horde of the Uzbeks [*q.v.*] or Özbegs), seized power in Transoxania from the last Tīmūrids. Transoxania was, indeed, to become the permanent home of the Shaybānids and the Uzbeks, this last Turkish people giving their name to the modern Uzbek SSR, in which they probably form some 70% of the present population. The Shaybānids brought into Transoxania a Turkish following amongst whom the nomadic steppe traditions remained strong and who were virtually untouched by Iranian cultural and religious influences, as had been most of their predecessors there. It was the strength of popular religion, that of the dervishes and Ṣūfīs, already notable in Tīmūrid times (see above), rather than that of the orthodox *ʿulamāʾ*, which characterised Islam there in the time of the Uzbeks. Like Tīmūr, they exalted the cult of the Ṣūfī saint Aḥmad Yasawī [*q.v.*], whose tomb in the lower Syr Daryā valley at Yasī had long been a popular pilgrimage place for Turks from all over Inner Asia. The Shaybānids in fact made Yasī their capital for a while, and under them it received its new name of Turkistān, indicative of its importance to the Central Asian Turks in general.

Politically and diplomatically, Sunnī Transoxania under the Uzbeks was in the 10th/16th and 11th/17th centuries frequently involved in warfare with the powerful and aggressive Shīʿī monarchy of Ṣafawid Persia. As so many earlier Turco-Mongol dynasties had done, the Shaybānids coveted the rich province of Khurāsān, and invaded it on several occasions. But Muḥammad Shaybānī (905-16/1500-10) and successors of his like Abu 'l-Ghāzī ʿUbayd Allāh (940-6/1534-6) failed to overcome the experienced troops of Shāh Ismāʿīl and Shāh Ṭahmāsp, who had a greater appreciation of the value of the modern weapon of firearms and who had seasoned troops in their Ḳïzïlbash Türkmens and then in their Georgian, Armenian, etc., slave guards. The long-term result of this warfare was the virtual sealing-off of Transoxania from the rest of the Islamic world through the erection by the Ṣafawids of this bulwark on their northeastern frontier. Although Turks from Central Asia and Afghāns streamed into Muslim India as mercenaries, adventurers, etc., the traffic was largely one-way. Hence Transoxania became culturally introverted and impoverished, since the steppelands of South Russia and western Siberia were by the 17th century beginning to come under Russian, Christian control, and the popular Islam of such orders as the Yasawiyya, the Čishtiyya and the Naḳshbandiyya, though intense in religious fervour and emotion, was weak in intellectual content. Only in the sphere of Eastern Turkish or Čaghatay literature may it be said that Transoxania made a significant contribution to the cultural stock of Eastern Islam at this time. It was a flexible and expressive enough language for Bābur [*q.v.*] to write his memoirs in it; to produce a lively folk-poetry, seen e.g. in the verses of the 18th century Göklen Türkmen bard Makhdūm Ḳulī; and to give rise to a genre of historiography amongst the Shaybānids, the Djānids or Ashtarkhānids and the Mangïts of Bukhārā and the ʿArabshāhids of Khīwa in the former Khwārazm, although such outstanding figures as the 10th/16th century Shaybānid historian Ḥāfiẓ Tanïsh [*q.v.* in Suppl.] continued to write for preference in Persian. For the detailed history of the Shaybānids, see Hambly, *The Shaybanids*, in *Central Asia*, 163-74; Barthold, *Histoire des Turcs d'Asie Centrale*, 185 ff.; and SHAYBĀNIDS.

In the course of the 10th/16th century, Bukhārā and Khīwa formed themselves into separate, often mutually-hostile khānates, and then in the early 18th century, a third Uzbek khānate arose in the Farghāna valley, that of Khoḳand. The three principalities were to have separate existences, punctuated by much squabbling and internecine warfare, till the Russian occupation of Central Asia in the second half of the 19th century, Bukhāra and Khīwa remaining, however, as virtual protectorates of Russia until the aftermath of the Bolshevik Revolution.

The history of these khānates can be followed under BUKHĀRĀ, KHWĀRAZM, KHĪWA, KHOḲAND; see further DJĀNIDS, ḲUNGRĀT, MANGÏTS, and also ÏNAḲ in Suppl.

Bibliography: Given in the article.

(C. E. BOSWORTH)

MĀʾ (A.) "water". The present article covers the religio-magical and the Islamic legal aspects of water, together with irrigation techniques, as follows:

1. Hydromancy
2. Water in classical Islamic law
3. Hydraulic machines
4. Pre-20th century irrigation in Egypt
5. Irrigation in Mesopotamia
6. Irrigation in Persia
7. Irrigation in North Africa and Spain
8. Irrigation in the Ottoman empire
9. Irrigation in pre-20th century Muslim India
10. Irrigation in Transoxania
11. Economic aspects of modern irrigation
12. Ornamental uses in Muslim India

1. HYDROMANCY

As a vehicle for the sacred, water has been employed for various techniques of divination, and in particular, for potamonancy (sc. divination by means of the colour of the waters of a river and their ebbing and flowing; cf. Fr. Cumont, *Études syriennes*, Paris 1917, 250 ff., notably on the purification power of the Euphrates, consulted for divinatory reasons); for pegomancy (sc. omens given by rivers, springs, floods, a feature of Babylonian divination, cf.

A. Boissier, *Choix de textes relatifs à la divination babylonienne*, Geneva 1905-6, i, 235-50; Fr. Nötscher, in *Orientalia*, Serie prior, li-liv [1930], 121 ff., 137 ff., 146 ff., 131 ff., 141); hydromancy (called *istinzāl*, according to Doutté, *Magie et religion*, 389); lecanomancy (sc. divination from the waves set up on any shiny, liquid surface, such as water, blood, milk, honey, oil or petroleum, cf. Nötscher, in *loc. cit.*, 110-11, 118-19); and crystallomancy and cataoptromancy (sc. omens drawn from the features appearing upon any polished, reflecting surface, cf. J. Hunger, *Becherwahrsagung bei den Babyloniern*, in *Leipziger Semitische Studien*, i/1, Leipzig 1903; G. Furlani, in *Aegyptus* [1927], 287-92).

The lack of perennial water courses in Arabia and the infrequency of springs prevented the development of such divinatory techniques as these amongst the Arabs. We have nothing to confirm that the reflective surfaces of waters in oases were ever used for these. Water, like perfume, was used in the rituals over the making of pacts and alliances [see LAʿAḲAT AL-DAM], but these procedures had no divinatory character at all.

2. WATER IN CLASSICAL ISLAMIC LAW

In Islamic law there are seven kinds of water which it is lawful to use for drinking or ablution: water from rain, snow, hail, springs, wells, rivers and the sea. These sources may, however, be rendered impure by the presence in them of unclean objects.

Questions of ownership and the right to take water depend on the nature of its source, whether natural or artificial watercourses, wells or springs (freshwater lakes are not generally discussed in the sources owing to their scarcity in the Islamic lands). Ownership of a source of water implies ownership of its *ḥarīm* (reserved area), consisting of that portion of land adjacent to the water source sufficient to enable the source to be used. One *ḥadīth* defines the extent of the *ḥarīm* of a well as 40 cubits on every side, but other measurements are also given.

The *Sharīʿa* distinguishes three types of water source which may be the subject of use or ownership:

1. Water from rivers, which may be (a) great rivers, such as the Tigris and Euphrates, which are of such a size that they can be used by all for drinking and irrigation to any extent; (b) lesser rivers, in which case two possibilities may be distinguished:

(i) where there is generally enough water for all users but where it is possible to cause shortage to other users by e.g. digging a canal to take water from higher up the river than other users (whether this is allowed or not must be decided after inquiry into the consequences); or

(ii) where damming or the allocation of fixed times is necessary to provide enough water for irrigation. In such cases, the river is normally regarded as the joint property of the riparian cultivators, and the question of how much water may be retained by the highest riparian cultivator depends on differing circumstances, such as the season of the year, the type of crop irrigated, etc. (c) canals. These are the property of the landowner or landowners in whose property they are situated; where they are the common property of several landowners, none of them may make unilateral changes in arrangements for sharing the water, or by building a mill or bridge over it, etc.

2. Wells: (a) Wells dug for the public benefit; here the water is freely available to all, the digger merely having the right of first comer. (b) Wells dug by persons for their own use, e.g. wells dug in the desert by tribesmen. Such persons have first right to the water while they are living in the vicinity, but are obliged to give water to persons suffering from thirst. After they move away, the water becomes freely available to all. (c) Wells dug by persons intending them to be their own property. Ownership, however, cannot be claimed until water has actually been found, and if the well needs lining, until it has been lined. The owner of the well has a duty to give water to anyone suffering from thirst. This is illustrated by a tradition which records that ʿUmar made some owners of water pay the *diya* for a man who died of thirst after they had refused his request for water.

3. Springs: (a) Natural springs: these are treated as analogous to permanently flowing rivers. If the water supply is limited, the first person to undertake irrigation in the area has priority; otherwise the water has to be shared equally. (b) Springs opened up by digging: the person who does this becomes the owner, together with the surrounding *ḥarīm*. (c) Springs opened up by persons on their own property. In such cases, the only claim against the owner is that of persons suffering from thirst. If the owner has a surplus of water, he may be obliged to give it gratis to other men's cattle, but not for irrigating crops.

A person who possesses water in a vessel is its sole owner, and he is not obliged to give it to others gratis; he is, however, obliged to relieve someone suffering from thirst in return for a recompense.

3. HYDRAULIC MACHINES

There is ample evidence from written and archaeological sources for the widespread use in pre-Islamic times of all the main hydraulic machines, described below, in all the areas that were to form part of the Muslim world. The *shādūf* was known in ancient times. The *sāḳiya*, although it did not become fully effective before the introduction of the pawl in the 4th or 5th century A.D., was known in Roman times. Both machines are still in use today. The noria (*nāʿūra*) and the vertical undershot mill-wheel are both described by Vitruvius, without any claim to originality (*On architecture*, Loeb Classics, ed. F. Granger, 1970, ii, 303-7). Vertical mill-wheels were sometimes mounted on boats moored to the banks of rivers (N. Smith, *Man and water*, London 1975, 140). The origins of the horizontal, vaned mill-wheel are still obscure: it may have been referred to by a Greek writer of the 1st century B.C., and it was in use in Ireland in the 7th century A.D. (Smith, *op. cit.*, 142). It is described in a Byzantine treatise, probably of the 7th century A.D., extant only in Arabic versions (Wiedemann, *Aufsätze*, ii, 50-6, see

Bibl.). Hand-operated force pumps were used by the Greeks and Romans; these had single vertical cylinders that were placed directly in the water without suction pipes (Vitruvius, 311-12, quoting Ctesibius, who lived *ca.* 200 B.C.). The problem of the origins and diffusion of these machines is largely unresolved, but our chief concern here is that they were all in existence in the 1st/7th century.

The *s̲h̲ādūf* is a simple machine consisting of a wooden beam pivoted on a raised fulcrum. At one end of the beam is a bucket, at the other end a counterweight. The bucket is dipped into the water, then the beam is rotated by means of the counterweight and the contents of the bucket are emptied into a cistern or supply channel. The flume-beam swape is a development of the *s̲h̲ādūf*. Instead of a solid beam, a channel is connected rigidly to the bucket; when this is raised the water runs through it into the outlet.

The *sāḳiya* is more complex, and indeed has over two hundred components parts. It consists essentially of a large vertical wheel erected over the water supply on a horizontal axle. This wheel carries a chain-of-pots or a bucket chain. On the other end of its axle is a gear-wheel that engages a horizontal gear-wheel to which the driving bar is attached. The animal is harnessed to the free end of this bar, and as it walks in a circular path, the gears and the wheel carrying the chain-of-pots rotate. The pots dip in succession into the water and when they reach the top of their travel they empty into a channel. The noria (sometimes confused with the *sāḳiya*) is a large wheel driven by water. It is mounted on a horizontal axle over a flowing stream so that the water strikes the paddles that are set around its perimeter. The water is raised in pots attached to its rim or in bucket-like compartments set into the rim. The large norias at Ḥamāt in Syria can still be seen today; the first known mention of norias at Ḥamāt is by Aḥmad b. al-Ṭayyib in 271/884-5 (Suter, 33).

The Vitruvian mill-wheel turns a vertical gear-wheel that meshes with a horizontal gear-wheel to which the driving shaft is attached. The horizontal vaned mill-wheel is fixed directly to the driving shaft; there are no gears. It cannot be mounted directly in the stream since the water must be directed on to its vanes from a pipe or channel.

There can be no doubt that all these machines were in continuous use in Islam from the early conquests until the introduction of modern technology. (As mentioned above, the *s̲h̲ādūf* and the *sāḳiya* are still in use; they are cheaper and more easily maintained than motor-driven pumps.) The evidence comes from treatises on machines, references in the works of historians and geographers, and archaeological investigations. For a selection of the available evidence, the reader is referred to the *Bibl.* under Wiedemann, *Aufsätze*; Schiøler; Hill 1 and 2. The remaining discussion will be confined to developments of particular importance in the history of technology.

Mills were used in Islam for other purposes beside the grinding of corn and other seeds, e.g. for crushing sugar cane and for sawing timber (A. Y. Hassan, *Taqī al-Dīn and Arabic mechanical engineering* [in Arabic], Aleppo 1976, 51, quoting al-Nuwayrī and Ibn ʿAsākir). This suggests that rotary motion was converted to reciprocating, probably by means of trip-hammers. More examples of similar applications may be discovered when a systematic study of the historical and geographical works is undertaken. Another area of interest is the use of the overshot mill-wheel, in which the water is conducted through a channel to the top of the wheel, which has bucket-like compartments around its rim. The overshot wheel works mainly by the weight of the water, whereas the Vitruvian one is operated by its force. In many conditions, the former is the more efficient of the two. Its use is recommended by a certain al-Murādī in a treatise composed in Andalusia in the 5th/11th century (D. R. Hill, *A treatise on machines*, in *Journal for the History of Arabic Science*, i/1 [Aleppo 1977], 33-46. In this paper the treatise was wrongly attributed to the well-known astronomer Ibn Muʿād̲h̲). S̲h̲ams al-Dīn al-Dimas̲h̲ḳī, d. 727/1327, describes a similar wheel in operation near Tabrīz (ed. M. A. F. Mehren, 188). The overshot wheel did not come into general use in the West until about the 8th/14th century. Al-D̲j̲azarī [*q.v.* in Suppl.] often uses small overshot wheels in his devices, but these are usually scoop-wheels, a kind of primitive Pelton wheel, the scoops being fixed to the ends of spokes that radiate from a solid disc.

It is reasonable to infer that the scoop-wheels used by al-D̲j̲azarī were miniature versions of wheels in full-size machines, an inference that is strengthened by the fact that he uses such a wheel in one of his water-raising machines (Category V, Ch. 3). The visible part of this is a *ṣāḳiya*, which is provided with a model cow to give the impression that this is the source of motive power. The actual power, however, is provided in a lower, concealed chamber and consists of a scoop-wheel and two gear-wheels. This system drives the vertical axle that passes up into the main chamber, where two further gear-wheels transmit the power to the chain-of-pots wheel. Such devices (without the model cow) were in everyday use. A similar machine was in continuous use on the River Yazīd above Damascus from the 7th/13th century until about 1960 for water supply and irrigation. It was restored to working order by the staff and students of Aleppo University (Hassan, *op. cit.*, 58-9).

Al-D̲j̲azarī describes four other water-raising machines in Category V. Chs. 1,2 and 4 deal with flume-beam swapes operated by animal power through gear trains. The first two of these incorporate segmental gears. The earliest known occurrence of these gears in Europe is in the astronomical clock completed by Giovanni de' Dondi in 1365. The fifth machine is a slot-rod pump, driven through gears from a paddle wheel. It is remarkable for having two horizontally opposed cylinders and true suction pipes. Taḳī al-Dīn (10th/16th century) describes a similar pump, but equally remarkable is his six-cylinder "Monobloc" pump (Hassan, *op. cit.*, 47-50). The vertical cylinders are fitted into a single wooden block which rests in the water. Delivery pipes lead out from the sides of the cylinders, near their tops, and are brought together into a single outlet. Each cylinder has a clack-valve at the bottom. The pistons are provided with weights at the top and lever arms at the sides. The lever-arms are supported at fulcrums and their free ends extend inside the perimeter of a scoop-wheel. As the water strikes the scoop-wheel it rotates, the scoops bear down in succession on the lever arms and the pistons rise and fall in continuous succession.

It should be apparent from the foregoing brief discussion that Islamic engineers were active in the construction and development of hydraulic machines for water-raising and power supply throughout the mediaeval period and beyond. Similar activity took

place in Europe, India and East Asia. Each region used the machines that were best suited to its needs, to the local hydraulic conditions, and to the available constructional materials.

Bibliography: (in addition to works mentioned in the text): two treatises are available in annotated English translations by D. R. Hill, *The Book of knowledge of ingenious mechanical devices by al-Jazarī*, Dordrecht 1974, see esp. 32, 95-6, 179-98, 275; and *The Book of ingenious devices by the Banū Mūsā*, (fl. Baghdād mid-3rd/9th century), Dordrecht 1979, see 222, 226, for horizontal water-wheels; there is an Arabic-English glossary that includes many terms used in hydraulic engineering; an Arabic edition of al-Djazarī, also with Arabic-English glossary, is now available, ed. A. Y. Hassan, Aleppo 1979; Abu ʿAbd Allāh al-Khwarazmī, *Mafātīḥ al-ʿulūm*, ed. van Vloten, 246-55 (this section contains definitions and brief descriptions of parts used in hydraulic and other machines); E. 4. Pre-20th century irrigation in Egypt

Until the 20th century, irrigation in Egypt remained much as it had been in Pharaonic times. The continuity of practice stemmed from the dependence on the annual Nile floods, which provided Egypt not only with water for irrigation but also with the alluvial soil deposits to renew the fertility of the cultivated lands. The great river, however, does not only bestow its gifts, but may also be the cause of misfortune to the country. Up to modern times and before major dams and irrigation projects were undertaken, a high Nile promised the richest increase to the fields, while with a low Nile came the inevitable dread of a year of famine.

ʿAbd al-Laṭīf al-Baghdādī (d. 629/1231) discussed this phenomenon and the rôle of the Nile in the irrigation and the agricultural situation in mediaeval Egypt. He states that after the water of the Nile overflowed and covered the soil for several days, it receded to let the peasants plough and sow the fields. No further irrigation was needed until the crops were ready to be harvested. If the Nile exceeded some fingers beyond 20 cubits (*dhirāʿ*s), some areas became submerged like lakes for a long time and the proper time for sowing passed without calculation being possible. Also, lands could not be cultivated if the Nile did not rise sufficiently to reach the minimum of the necessary flood (16 cubits). In such cases, the amount of land covered with water was insufficient, the size of the crop did not meet the needs of one year and there was a scarcity of food more or less great in direct ratio to the water level above or below sixteen cubits.

No one in pre-20th century Egypt felt secure before the flood reached the height of 16 cubits and when all necessary land had been naturally irrigated by the Nile. Until it reached that level, the news of its height was kept secret from the common people. It seems that this was a custom introduced by the Fāṭimid Caliph al-Muʿizz in 362/973, when he prohibited the announcement in the streets of Cairo of the exact rising of the Nile before it had reached 16 *dhirāʿ*s. This was to prevent tension, fear and financial crises among the inhabitants; cf. al-Maḳrīzī, *Khiṭāṭ*, Cairo 1270/1853-4, i, 61, The person who was in charge of the Nilometer (*ṣāḥib al-miḳyās* [see miḳyās]) used to call the increasing level of the Nile water in fingers without telling the exact cubit. Only when the water level reached the height of 16 cubits, normally in the Coptic month Misrā (July-August), could the *ṣāḥib al-miḳyās* proclaim it to the people in Cairo, and the sultan then had the right to impose the *kharādj* on the cultivated land, cf. al-Ḳalḳashandī, *Ṣubḥ al-aʿsha*, Cairo 1914, iii, 293-4, 297; al-Nuwayrī, *Nihāyat al-arab*, Cairo 1923, i, 264; al-Maḳrīzī, *Khiṭaṭ*, i, 60, 273; H. M. Rabie, *The financial system of Egypt A.H. 564-741/A.D. 1169-1341*, London 1972, 73 and the sources cited therein.

Pre-20th century irrigation in Egypt did not rely only on the floods, but also on the yearly digging and cleaning of the irrigation canals and the maintenance of the irrigation dams. Both al-Nuwayrī (i, 265) and al-Maḳrīzī (*Khiṭaṭ*, i, 61) state that without such maintenance there would be little benefit from the Nile. Al-Maḳrīzī (i, 74-5) traces the importance of canals and irrigation dams in controlling the Nile in pre- and early Islamic periods. It was one of the most important functions of both the sultans and the holders of the *iḳṭāʿ*s [*q.v.*] under the Ayyūbids and the Māmlūks to dig and clean the canals and to maintain the irrigation dams (the *djusūr*). The sources provide us with ample information about the efforts of the sultans in Egypt in digging and cleaning canals. The irrigation dams (the *djusūr*), which were of paramount importance for the irrigation of the fields, were classified into two types in mediaeval Egypt: the small irrigation dams (*al-djusūr al-baladiyya*) and the great irrigation dams (*al-djusūr al-sulṭāniyya*). The first were important for conveying water from one field to another in the village. Each *muḳtaʿ* (holder of an *iḳṭāʿ*) with his clerks was responsible for the upkeep of these irrigation dams within the confines of his *iḳṭāʿ*. As for the great irrigation dams which were constructed for the benefit of the provinces, the sultan was responsible for them, at least in theory. In practice, especially under the Mamlūk sultans, the *muḳtaʿ*s assisted the sultan in the construction of this type of dam by supplying peasants, oxen, harrows and tools, cf. Ibn Mammātī, *Ḳawānīn al-dawāwīn*, ed. A. S. Atiya, Cairo 1943, 232-3, 344; al-Ḳalḳashandī, *Ṣubḥ*, iii, 449; al-Maḳrīzī, *Khiṭaṭ*, i, 101.

Because of the importance of the great irrigation dams, both the Ayyūbid and the Mamlūk sultans used to select distinguished and able *amīr*s and officials to supervise the work of their maintenance. Al-Nābulusī (d. 660/1261) states in the *Kitāb Lumaʿ al-ḳawānīn al-mudiyya* (ed. C. H. Becker and C. Cahen in *Bulletin d'études orientales*, xvi [1958-60], 39-40) that every year the Ayyūbid sultan al-Malik al-Kāmil used to send him with 3 or 4 *amīr*s to the Djīza province during the flood period in order to keep the dams of that province in good condition. It seems that the Ayyūbid sultan sent officials like al-Nābulusī to other Egyptian provinces for the same purpose. Under the Mamlūks there was an office called *kashf al-djusūr*

(office of inspection of irrigation dams) for each province in Egypt. The holder of this office, called *kāshif al-djusūr*, was an *amīr* who was aided by assistants in the construction and maintenance of the irrigation dams in the province under his charge, cf. al-Ḳalḳashandī, *Ṣubḥ*, iii, 448-9.

Each year before the advent of the Nile flood, not only had the canals to be dug and the irrigation dams to be constructed and repaired, but also the land to be cultivated had to be prepared. The methods of that preparatory work as well as the tools used were more or less the same traditional ones known to have been used by the Egyptian peasants for thousands of years. As for irrigation, al-Nuwayrī and al-Maḳrīzī state that when the Nile rose during the flood period, the water covered all cultivated lands. One could only reach the villages, which were established on hills and mounds, by boat or on the great irrigation dams. When the soil had had sufficient water, the *khawlī*s (stewards) and the *shaykh*s (village headmen) supervised the cutting off of the irrigation dams from specified places at certain times in order to draw off water from the fields, thus letting it flow benefit other places, cf. al-Nuwayrī, i, 264-5; al-Maḳrīzī, *Khiṭaṭ*, i, 61; see also al-Masʿūdī, *Murūdj al-dhahab*, Beirut 1965, i, 375; Nāṣir-i Khusraw, *Safar-nāma*, ed. and tr. C. Schefer, 39, tr. 118. al-Ḳazwīnī (d. 692/1283), *Āthār al-bilād wa-akhbār al-ʿibād*, ed. Wüstenfeld, Göttingen 1848, 175, mentions that when the water of the Nile receded gradually after being on soil for forty days, the peasants began sowing.

The crops which were cultivated after the Nile flood season in mediaeval Egypt did not need any more irrigation than their inundation during the flood period, cf. Ibn Ḥawḳal[1], 97; al-Iṣṭakhrī[1], 49. This was the most common method of irrigation, called *bi 'l-sayḥ* by al-Nābulusī, *Taʾrīkh al-Fayyūm*, ed. B. Moritz, Cairo 1899, 63, and *māʾ al-rāḥa* by al-Maḳrīzī, *Khiṭaṭ*, i, 102. The last term is still used by the contemporary *fallāḥ* to denote irrigation without artificial implements. Crops watered in this manner were called "winter crops" in order to distinguish them from the summer ones which the peasants began sowing during the Coptic month Baramhāt (February-March) and which relied on irrigation by artificial means such as water-wheel, shadoof, etc., cf. Ibn Mammātī, 248.

Al-Makhzūmī in the *Minhādj* and al-Maḳrīzī in the *Khiṭaṭ* distinguish between the winter and summer crops when discussing the times of sowing and harvesting. al-Makhzūmī states that the winter crops were wheat (*ḳamḥ*), barley (*shaʿīr*), beans (*fūl*), bitter-vetch (*djulbān*), lentils (*ʿadas*) and flax (*kattān*). al-Maḳrīzī adds to al-Makhzūmī's list of winter crops chick peas (*ḥummuṣ*), clover (*ḳurṭ*), onions (*baṣal*), garlic (*thūm*) and lupin (*turmus*). For summer crops al-Makhzūmī mentions unripe melons (*faḳḳūs*), water-melons (*biṭṭīkh*), kidney beans (*lūbiya*), sesame (*simsim* or *samāsim*), cotton (*ḳuṭn* or *aḳṭān*), sugar-cane (*ḳaṣab al-sukkar*) and colocasia antiquorum (*ḳulḳās*). Although al-Maḳrīzī lists the same for summer crops, he adds aubergines (*bādhindjān*), indigo (*nīla*), radishes (*fudjl*), turnips (*lift*), lettuce (*khaṣṣ*) and cabbage (*kurunb*), and puts both the unripe melon and water-melon under the one name *biṭṭīkh*; cf. al-Makhzūmī, *Kitāb al-Minhādj fī ʿilm kharādj Miṣr*, ms. B.M. London Add. 23483, ff. 30b-33b; al-Maḳrīzī, *Khiṭaṭ*, i, 101-2.

There were many methods known in pre-20th century Egypt to irrigate the soil under the summer crops. They were inherited from older times and continue until today, with the exception of one which was very primitive and arduous. This was the transportation of water to the fields in buckets, jars, etc., hung from the necks of the oxen. This method was mentioned by al-Nābulusī as the means of irrigation for the two villages Dimashḳīn al-Baṣal and Damūh, known as Kūm Darī, in the Fayyūm province, cf. *Taʾrīkh al-Fayyūm*, 99, 101. This method, which was a continuation of a Pharaonic technique, seems to have been known in other Egyptian villages.

The other methods of irrigation used by the mediaeval Egyptian peasant employed any one of four artificial irrigation contrivances, namely, the *naṭṭāla*, the *dāliya*, the *sāḳiya* and the *tābūt*. These four contrivances were used in Egypt before the advent of the Arabs and are still in current use.

There is no mention of what was known as the *naṭṭāla* in the available classical sources, but the existence of such a device in Ancient Egypt, as well as its depiction in the *Description de l'Égypte, État moderne*, Planches, Tome deuxième, Paris 1817, *Arts et métiers*, Pl. vi (4), proves its existence in pre-20th century Egypt. It is still in use in Egypt, as well as in many African countries. Two men stand face to face, each holding two cords of palm-fibre ropes to which is attached a wide, shallow waterproof basket. This basket, made from twisted palm leaves or leather, is known in Egypt by the name *ḳaṭwa*. The two men holding the ropes bend slightly toward the water, dip the basket and fill it. Then they straighten while turning to the field, thus raising the basket which is emptied into the mouth of the irrigation canal, cf. Lane, *An account of the manners and customs of the modern Egyptians*, London 1871, ii, 27.

The *dāliya* or shadoof is a kind of draw-well which was used in Pharaonic Egypt and in mediaeval ʿIrāḳ, and is still used in Egypt and other eastern countries for raising water for irrigation. It usually consists of two posts, beams of the acacia tree or shafts of cane, about five feet in height. These posts are coated with mud and clay and then placed less than three feet apart. The two beams are joined at the top by a horizontal piece of wood, in the centre of which a lever is balanced. The shorter arm of the lever is weighted with a heavy rock or dried mud, while at the end of the longer arm hangs a rope carrying a leather pail. The peasant stands on a platform on the river bank and pulls down the balanced pole until the pail dips into the water and is filled. A slight upward push, which is helped by the counter-weight, raises the bucket above the irrigation canal, into which it is emptied.

As for water-wheels, al-Muḳaddasī (4th/10th century) states that there were many *dawālīb* (pl. of *dūlāb*, a Persian word which denotes a water-wheel) on the banks of the Nile for irrigating orchards during the low waters. He also says that the *ḳādūs* was the bucket of the *dūlāb*, cf. *Aḥsan al-taḳāsīm*, 208. In the next century, Nāṣir-i Khusraw mentions in his *Safar-nāma*, 39, French tr. 118, that "up the Nile there are different cities and villages, and they have established so many *dūlāb*s that they are difficult to count."

In mediaeval Egypt, there were two words used to denote wooden water-wheels, i.e. the *sawāḳī* (sing. *sāḳiya*) and the *maḥāl* (sing. *maḥāla*). al-Nābulusī, *Taʾrīkh al-Fayyūm*, 11, 27, 31, 48, 52, 54, 63, 94, 126, mentions that some villages in the Fayyūm province had *sawāḳī* to raise irrigation water. In Bādja, for example, he states that there were *sawāḳī* which were running day and night. In the *Kitāb Lumaʿ al-ḳawānīn*, 48-9, al-Nābulusī warns the Ayyūbid Sultan al-Malik al-Ṣāliḥ Ayyūb of the negligence and dis-

honesty of officials with which his own long experience in the work of offices had made him conversant. Specifically, he reports that acacia trees, which were a state monopoly, have been illegally cut down to construct *sawāḳī*, presses and other instruments.

Al-Nuwayrī, *Nihāyat al-arab*, viii, 253-4, writing in the Mamlūk period, states that wells were dug in the land, apparently supplied by water from the underground bed of the Nile. At the mouth of these wells the *sawāḳī*, made from acacia or other trees, were installed. Al-Nuwayrī also states that these irrigation wheels were called *al-maḥāl* in Egypt, while at Ḥamā in Syria they were called *al-nawāʿir* (sing. *nāʿūra*). He differentiates, as does al-Ḳalḳashandī, *Ṣubḥ*, iv, 80, 140, in a later period, between the two kinds, by stating that the *nawāʿir* were run by water current, while the *maḥāl* by oxen.

The Arabic word *maḥāl* (sing. *maḥāla*) denotes the huge pulley which is used for raising water from wells, cf. Ibn Manẓūr, *LA*, Beirut 1956, xi, 620-1. However, al-Maḳrīzī in the *Khiṭaṭ*, i, 102, uses it to refer to the water-wheel. When discussing the irrigation of sugar-cane when the Nile water is low, al-Maḳrīzī says that each of these *maḥāl* can raise the water to irrigate eight *faddāns* of sugar-cane, providing that the waterwheel is installed close to the Nile and that eight excellent beasts are available to work it. When the wells are established at a distance from the Nile, each of the *maḥāl* cannot irrigate more than 4 to 6 *faddāns*. Al-Maḳrīzī also refers to the *ḳādūs*, which al-Muḳaddasī earlier explained as the bucket of the water-wheel.

It is apparent that the ordinary, contemporary Egyptian water-wheel is more or less the same as the mediaeval one, since it does not differ appreciably from the one depicted in the *Description de l'Égypte, État moderne*, ii, i, 501-2; *Planches*, Tome deuxième, *Arts et métiers*, Pl. v. The flat horizontal wheel of the *sāḳiya* is turned counter-clockwise by a single beast or pair of oxen. The flat wheel's rough cogs engage a vertical wheel which carries a long chain of earthen pots (*ḳawādīs*). These clay pots are suspended from ropes and are lowered, mouthdownward, into the water. Following the path of the wheel, the pots scoop up water which they spill out into the irrigation channel as they arrive at the top of the wheel on their circular journey. The work of the peasant or his son is to goad the beast, to watch the turning wheel, and to avoid wasting water on the way to the field.

As for the *tābūt* (water-screw), it was apparently invented by the Greek mathematician and inventor Archimedes (*ca.* 287-212 B.C.) while studying in Egypt. Observing the difficulty in raising water from the Nile, he is said to have designed this screw to facilitate the irrigation of the fields.

The water-screw has been continuously in use in Egypt when the level of water is not very low, from the times of the Ptolemys until the present. It consists of a wooden cylinder (about 6-9 feet in length) hooped with iron. While the spiral pipe is fixed between the inside wall of the *tābūt* and an iron axis, its upper extremity is bent into a crank and its lower end turns on a stake set under the water. One or two peasants crouch at the water's edge, endlessly turning the crank handle. The water rises from bend to bend in the spiral pipe until it flows out at the mouth of the canal.

However, using the primitive implements of the *naṭṭāla*, the *dāliya*, the *sāḳiya* and the *tābūt*, the pre-20th century peasant in Egypt irrigated the land and managed to produce the necessary crops to maintain the economy of the country. Many of the techniques and implements that he devised or used have proved to be efficacious to such a degree that they are still extant.

(HASSANEIN RABIE)

5. IRRIGATION IN ʿIRĀḲ

Since it is impossible here to look at the use of water in all its aspects and in regard to all the problems which it raises, the present section merely deals with irrigation in the same way as is done for other regions of the Islamic world.

Taken as a whole, ʿIrāḳ is a flat plain irrigated by two great rivers, whose risings and fallings lack however the comparative regularness of the Nile. Since the Euphrates (al-Furāt [*q.v.*]) flows at a higher level than that of the Tigris (Didjla [*q.v.*]), the canals which, from ancient times, have connected them run at an oblique angle in relationship to them. Aerial photography, together with other sources of information, has allowed Adams to supplement and complete, for the left bank of the Tigris,

the information of the mediaeval authors and, especially, of Ibn Sarafyūn (Serapion). In regard to the zone between the two great rivers, periods of neglect before and after the coming of Islam have transformed part of central ʿIrāḳ into a marshland, the Baṭīḥa [*q.v.*], the drainage of which has not been possible. The rivers and the great canals, constructed and maintained by the state, were important routes for communication, which were not impeded by the bridges of boats across them or by the mills. The upkeep of the smaller canals was the responsibility of local people. An ancient system of customary law regulated the amount and the periods of water used amongst the holders of land along the banks, and specially-appointed officials had the task, through the manipulation of sluices and water-gates, of securing this regulation. The interest shown about irrigation questions by mediaeval authors arises from the fact that, both for the land-tax and for local dues, irrigated land was distinguished from non-irrigated land.

The anonymous author of the *Kitāb al-Ḥāwī* (5th/11th century) has provided us, in the shape of mathematical problems, with some interesting details about the administration of the canals and about hydraulic machinery in mediaeval ʿIrāḳ. He describes various kinds of waterwheels, *dawlāb*, *gharrāfa*, *shādhūf*, giving their capacity for drawing up water and then spreading it for irrigation purposes, according to the season, and the numbers of men and animals required to work them. Then he moves on to the "balancing out of ground" intended to fix the levels of canals which have to be dug out (see E. Wiedemann, *EI*[1], art. MĪZĀN). Finally, he raises the question of the construction and upkeep of the raised canal banks, which he calls *bazand*, a pre-Islamic term not listed in the classical dictionaries, hence often wrongly read. It is necessary to know the volume of earth, reeds and brushwood which has to be transported, which is counted according to a special unit, the *azala* = 100 cubic cubits "of balance", and it is to be understood that an *azala* is procured by 33 "spade loads", handled by two men, one digging and the other transporting the earth, etc. in sacks. The provision of materials and the labour, which seem never to have been done by slaves, are paid according to an official tariff.

6. IRRIGATION IN PERSIA

The distribution and density of population and the development of agriculture in Persia throughout history have been closely dependent upon the availability of water, and the nature of the irrigation systems has influenced both the siting of settlements and the pattern of society. Precipitation is scanty and seasonal; it is concentrated on the periphery of the country, as also are the major perennial rivers.

As a general rule, rainfall, which occurs between October and May, decreases from the north to the south of the country and from west to east, but in a number of areas the high relief of the Alburz and the Zagros mountains has modified this pattern. Along the Caspian Sea coast and the northern flanks of the Alburz, precipitation reaches more than 1,800 mm. near the mouth of the Safīd Rūd; annual totals fall to less than 500 mm. on the east side of the Caspian near Gunbad-i Ḳābūs. Along the western flanks and summits of the Zagros Mountains, precipitation amounts are thought to exceed 800 mm. on some of the higher peaks, and large areas to the west of Shīrāz receive more than 400 mm. In the north-western highlands, between the two belts of high precipitation, there is a zone of moderate precipitation of 250-400 mm. In the centre of the country occupied by the Dasht-i Kawīr and the Dasht-i Lūṭ, great sterile deserts, precipitation totals almost everywhere less than 100 mm., though a higher precipitation is found on the eastern borders of the *kawīr* in the highlands around Bīrdjand and Zāhidān. Everywhere, with the exception of the Caspian littoral, low and episodic rainfall is a major constraint on agriculture, hence the importance of artificial irrigation.

Dependable supplies of surface water exist only in isolated districts around the margins of the country, but there is nowhere an annual surplus of water, and seasonal surpluses, except in the north and west, are insignificant. Run-off is episodic, and occurs only because precipitation momentarily exceeds the infiltration capacity of the surface. The flow of water in streams and rivers throughout the country is seasonal and highly variable from year to year. Peak flows are too late for winter crops and the minimum discharge occurs when summer crops are in greatest need of moisture. The control of water by artificial irrigation is therefore immensely important for agricultural production and prosperity. Without artificial irrigation the cultivation of plants native to regions where summer rainfall is normal, such as cotton, millet, rice and sugar would not be possible.

There are few great rivers in Persia—the great hydraulic civilisations have no place there. The largest are the Kārūn and the Karkha [*q.vv.*] which flow into the Persian Gulf, draining almost all the area between Ābādān and Kirmānshāh. Further south are the basins of the Mand [*q.v.*] and the Shūr, which also drain into the Persian Gulf and the Gulf of Oman respectively. The Safīd Rūd flows into the Caspian, as also do the Aras [see AL-RASS] and the Atrek [*q.v.*]. The water of the two last-named, which flow along the modern Russo-Persian border in the north-west and the north-east respectively, is shared with Russia. The central zone of Persia, covering the largest part of the country, is an area of internal drainage. Small rivers flow into the closed basins of Lake Urumiyya (Riḍāʾiyya) in Ādharbāydjān, into the Hāmūn in Sīstān and into dry lakes and saline marshes in structural basins in the East Zagros, the depression between the Zagros and the volcanic axis extending from Ḳumm to Kirmān, the Djaz Muriyān basin, the southern Lūṭ, Balūčistān, the eastern highlands north of Bīrdjand and in the frontier zone with modern Afghānistān. South-west of the central desert is the basin of the Zāyanda Rūd, which supports Iṣfahān and to the south of this, the basin of the Kur. The discharge

of most streams in the central zone is small. Many of the larger streams, gathering in high mountains, have steep and irregular profiles. Leaving the mountains, they dwindle quickly as a result of evaporation, seepage and diversion for irrigation, leaving dry channels, the underflow of which now and then supports an exotic agricultural efflorescence. From ancient times, the water of these rivers and streams has been used for irrigation and has formed the basis on which flourishing civilisations have been established in pre-Islamic and Islamic times. The history of the water use of the Kur in the Marwdas͟ht plain illustrates the importance of the role played by irrigation in the establishment of the early Persian empires in that region and the changes in the prosperity of the region and the density of settlement which took place over the centuries as a result of fluctuations in the upkeep of dams and irrigation channels (see further, G. Kortum, *Die Marvdasht-Ebene-Fars*, Kiel 1976). For the most part, the rivers flowing into the southern end of the Caspian Sea, apart from the Oxus [see ĀMŪ DARYĀ] appear to have been less used for irrigation in early and mediaeval times than the rivers in central, southern and eastern Persia. Ḥamd Allāh Mustawfī states that little of the water of the D̲j̲urd̲j̲ān River was used for irrigation and most of it ran to waste (*Nuzhat al-ḳulūb*, ed. G. Le Strange, 214). Similarly, hardly any of the water of the Safīd Rūd was used for irrigation, except for that little which watered the lands lying immediately along its bed; most of it was wasted (*ibid.*, 217); and the same, he alleges, was true of its tributary, the S̲h̲āhrūd (*ibid.*, 218), though this was not so in the case of the rivers of the two Ṭārums, which also flowed into the Safīd Rūd: in summer most of their waters were used for irrigation and little flowed into the Safīd Rūd (*ibid.*, 221).

The smaller basins of the arid centre of Persia and the south-east, together with the fringes of the *kawīr*, receive incoming water mainly by piedmont seepage of many small ephemeral streams. The traditional method of tapping this water is by *ḳanāt* [*q.v.*], which, with its associated network of canals, is characteristic of irrigation on the Persian plateau; hence too the frequent siting of settlements on gentle slopes some distances from the foot of the hills that feed the *ḳanāt*s. From earliest times, the material basis of the population on the Persian plateau has been provided by *ḳanāt* water (H. Goblot, *Essai d'une histoire des techniques de l'eau sur le plateau Iranien*, in *Persica*, viii [1979], 120). The various systems of irrigation—by river, *ḳanāt*, spring or storage dam—are not mutually exclusive; many districts use more than one.

The configuration of settlements has been decided in many cases by the nature of the water supply. Where water is scarce, villages tend to be concentrated; elsewhere they may be more scattered. They frequently flank water-courses and cluster about the outlet of *ḳanāt*s or round springs. The area immediately round a town or village is usually intensively cultivated with irrigation—even in the dry farming regions there is often a small irrigated area in or near a town or village. Beyond the cultivated land there is sometimes a periphery of marginal land which may be cultivated in years when the water supply is extraordinarily plentiful. Similarly, mountain villages in regions where the rainfall is sufficient for cultivation usually have an irrigated area, however small. In mountain valleys, the villages tend to be situated on rocky slopes rising above the intensely cultivated valley floors or to straggle along the mountain streams. Mountain slopes are often skilfully terraced, and much time and labour is expended on the construction and repair of dry stone retaining walls for the cultivated plots (cf. X. de Planhol, *Geography of settlement*, in *The Cambridge history of Iran*, i, ed. W. B. Fisher, Cambridge 1968, 419-20. The need for regular attention to the upkeep of irrigation works has, further, been an important factor in making the village, rather than the isolated farmstead, the typical form of settlement throughout most of Persia.

Artificial irrigation may already have existed in late Neolithic times. By the Achaemenid period, there was an extensive network of *ḳanāt*s, and with the extension of irrigation there was an expansion of agriculture. It is probable that drainage schemes were also undertaken in different parts of the empire. Later, the Seleucids brought more land under cultivation by clearance and drainage and applied new techniques to irrigation (R. Ghirshman, *Iran from the earliest times to the Islamic conquest*, Harmondsworth 1954, 239). In Islamic times, control of water for irrigation remained crucial to prosperity and settlement.

Such control is a highly complex matter, and requires for its successful implementation not only technical skill but also political stability. The heavy load of solids carried by streams in spate makes storage and control both difficult and costly. Flash floods often destroy irrigation works, especially those connected with *ḳanāt*s, while spring floods may also cause much damage in lowland districts. On the plateau, the lowering of the stream-beds through normal erosion results in the lowering of the water-table itself and leaves irrigation canal intakes above the new water level. In modern times, the lowering of the water-table by the extraction of water by pump operation connected with the sinking of semi-deep wells has led to many *ḳanāt*s falling into disuse, especially round the central desert but also in other regions. Inadequate drainage, on the other hand, often leads to a rising water-table under irrigated lands, water-logging, salinisation and alkalinisation, which result in considerable loss of output. These processes vary widely in different districts and different years. In some regions, notably K̲h̲ūzistān and Sīstān, deterioration of the soil because of a change in the water-table due to over-lavish irrigation and inadequate drainage, or both, has been a major problem. Another problem is that ground water in some districts may be heavily charged with soluble salts and be too saline for use in irrigation. This is the case in many districts on the borders of the central desert and in the Persian Gulf littoral.

Natural conditions and agricultural practices cannot alone, however, explain the fluctuation in the history of irrigation in Persia. The shifting of centres of political authority which accompanied dynastic changes and demographic changes resulting from invasion and the increase in dead lands because of the slaughter or flight of their inhabitants have also played a part. A breakdown in the control of water, for whatever reason or reasons, was inevitably followed by a decline in prosperity. The decay of K̲h̲ūzistān, which culminated under the ʿAbbāsids, is an illustration of this. Under the Sāsānids, the waters of the Kark̲h̲a, Diz and Kārūn had been utilised by an elaborate system of barrages, tunnels, inverted syphons, lifting devices and canals (see below). Cereals, sugar cane, rice and dates were produced in abundance. In the last fifty years or so

of Sāsānid rule, irrigation was neglected. Under the rule of the Orthodox Caliphs and the Umayyads, adequate attention was not paid to artificial drainage of the irrigated land, and under the ʿAbbāsids the province declined—rising water-tables under irrigated land may have been responsible for the attempts of the ʿAbbāsids to irrigate new lands of poorer quality. Water-logging, alkalinisation and salinisation, and the hazards of flood, all contributed to the decline of the region which occurred in post-ʿAbbāsid times (see further R. McC. Adams, *Agriculture and urban life in early southwestern Iran*, in *Science*, cxxxvi, 3511 [1962], 109-22). Changes in prosperity in other regions brought about by a failure to control irrigation have been, perhaps, less spectacular but none the less important. The decay of irrigation and drainage not only resulted in an increase of waste and unproductive land, but may also have led to the spread of malaria [see MALĀRYĀ], thus contributing to a decline in population and output.

Water utilisation: technical features. Irrigation works, plain take-offs, dams [see BAND], weirs, lifting devices, artificial reservoirs and *ḳanāt*s, supplemented by principal and secondary canals, are to be found all over the country; and some are ancient structures.

(i) *Dams*. Several large dams existed in Khūzistān in Sāsānid times, including the bridge dams at Shūshtar and Dizful, built by Shāpūr I and Shāpūr II or Ardashīr II respectively, the dam on the Djarrāḥī near Khalafābād, and the dam on the Mārūn at Arradjān (on the last, see H. Gaube, *Die südpersische Provinz Arraǧān/Kūh Gīlūyeh*, Vienna 1973, 189-90). They continued in use for varying periods after the fall of the Sāsānids. Repairs and reconstructions were numerous, and the Romano-Sāsānid work at Shūshtar and Dizful was partially replaced by pointed-arch bridges. The dam at Shūshtar, known as the Band-i Mīzān, had a length of 1,700 ft. and raised the water to the level of the city of Shūshtar, which was situated on a rocky outcrop on the east bank of the Kārūn. The dam was built partly by Roman prisoners of war taken in Shāpūr I's victory over Valerian in A.D. 260. It had a rubble masonry core set in hydraulic mortar; the facing was of large, cut masonry blocks, held in place by both mortar and iron clamps set in lead. It was pierced by numerous sluices for the purpose of releasing water in time of excessive flow. It took three years to build, during which time the Kārūn River was diverted through two by-pass channels. One of these, the Āb-i Gargar, winds its way south for some twenty-five miles and then rejoins the Kārūn. When the work of the dam was completed, the entrance to the Āb-i Gargar was closed by a second dam, the Ḳayṣar dam. This was made of large stone blocks mortared and clamped together, and six sluices were provided to control the flow of water into the Āb-i Gargar. Part of the bridge at Shūshtar and the Band were swept away by floods several times during the 19th century. Muḥammad ʿAlī Mīrzā, when governor of Kirmānshāh, undertook repairs to it in the early 19th century (J. M. Kinneir, *Geographical memoir of the Persian empire*, London 1813, 98-9). When Curzon visited Shūshtar in 1889, there was a gap of over seventy yards in width in the middle of the bridge, which had been swept away by a flood in 1885. The efforts of Niẓām al-Salṭana, the governor of ʿArabistān, to repair it proved abortive (*Persia and the Persian question*, London 1892, ii, 374-5). A further canal, the Miyān Āb canal, was cut, apparently to divert water through a tunnel made in the face of the castle rock in order to irrigate the high-lying lands to the south of the city, the level of the water of which was regulated by dams. As a result of the rupture in the Band-i Mīzān and the bridge, the river bed was lowered at the point where it formerly fed the canal and the land which is was intended to irrigate became derelict (Curzon, *op. cit.*, ii, 376).

The Dizful dam, a replica of the Shūshtar dam, was 1,250 ft. long. When Curzon visited Dizful, the dam was in a dilapidated condition, two of its arches having recently fallen in (*op. cit.*, ii, 303). After it fell into decay, all local irrigation depended upon rough dams of stone and brush-wood, which were reconstructed after every flood (H. Wulff, *The traditional crafts of Persia*, Chicago 1967, 248; N. Smith, *A history of dams*, London 1971, 59, 81, 82; A. K. S. Lambton, *Landlord and peasant in Persia*, repr. Oxford 1969, 216).

South of Shūshtar, where the Āb-i Diz and the Āb-i Gargar flow into the Āb-i Shutayt, the main channel of the Kārūn, another Sāsānid dam, the Band-i Ḳīr, of which only the name survives, was located. The name is of interest because it suggests that bitumen (*ḳīr*) may have been used to make the dam watertight and solid. Another dam on the Āb-i Gargar, called the Pul-i Bulaytī, was added to the Shūshtar system in Islamic times. This was a power dam; mills were installed in tunnels cut through the rock at each side of the channel, the dam providing the necessary head of water to drive the mill wheels (see Curzon, *op. cit.*, i, 372-4). A third bridge dam was built, also in Sāsānid times, over the Karkha at Pā-yi Pul. It fell out of use when it burst in 1837. Its remains were seen by Sir Aurel Stein in 1938 (Sir Aurel Stein, *An archaeological journey to Western Iran*, in *Geogr. J.* [October 1938], 327).

At Ahwāz [*q.v.*], there was another great dam (but not a bridge dam), probably over 3,000 ft. long. and about 25 ft. thick. Its remains were to be seen until recently. Al-Muḳaddasī describes the dam as being wonderfully constructed from blocks of rock behind which the water was held back. He states that the water was divided into three canals, which watered the fields of the estates of the people of the city, and that without the dam Ahwāz would not have been populous and that its canals could not have been used (*Aḥsan al-taḳāsīm*, 411; see also Curzon, *op. cit.*, ii, 347-8). The collapse of the dam in the 9th/15th century brought ruin to the city.

Numerous storage dams and their remains are to be found in many parts of Persia. Although their overall contribution to irrigation was not as great as that of *ḳanāt*s, or of the dams in Khūzistān, they were of considerable local importance and enabled land which could not otherwise have been cultivated to become productive. One of the most interesting systems is that on the Kur River in Fārs, which has provided irrigation for the Kurbāl district to a greater or lesser extent for some 2,000 years. The most famous dam of this complex is the Band-i Amīr, built about 349/960 by the Būyid ʿAḍud al-Dawla [*q.v.*], probably on earlier, possibly Achaemenid, foundations. Prior to its reconstruction, the water of the Kur could not be raised to irrigate Upper Kurbāl. Al-Muḳaddasī, who wrote soon after the dam was built, and Ibn al-Balkhī [*q.v.* in Suppl.], who wrote rather under 150 years later, describe the dam in similar terms. The latter states that ʿAḍud al-Dawla brought engineers and workmen to the place in order to build the dam and spent much money on its construction. The dam was made of

stone set in mortar, reinforced by iron anchors, which were set in lead. Upstream and downstream the river-bed was paved for several miles, and the supply canals extended for over ten miles, serving 300 villages in the Marwdas͟ht plain. Ten water-mills were built close to the dam, the crest of which was wide enough to allow two horsemen abreast to ride across it (al-Muḳaddasī, 444; Ibn al-Balk͟hī, *Fārs-nāma*, ed. G. Le Strange, London 1921, 151-2; see also G. Le Strange, *Description of the province of Fars in Persia at the beginning of the 12th century A.D.*, London 1912). Upstream from the Band-i Amīr there were five other major dams for the irrigation of Lower Kurbāl. These included the Rāmd̲j̲ird dam, built on Achaemenid foundations, which was almost as large as the Band-i Amīr, and five downstream, the last of which, the Band-i Ḳaṣṣār, was only a few miles from Lake Bak͟htagān into which the Kur flows (A. Houtum-Schindler, *A note on the Kur River in Fars, its sources and dams and the districts it irrigates*, in *Proc. Royal Geogr. Soc.* [1891], 287-91; see also N. Smith, *op. cit.*, 83-5, and Kortum, *op. cit.*). By the 6th/12th century, the Band-i Amīr, the Band-i Ḳaṣṣār and the Rāmd̲j̲ird dam had fallen into a state of decay and were repaired by the Sald̲j̲ūḳ governor of Fārs, the Atābeg D̲j̲alāl al-Dīn Čawlī Saḳāw (Le Strange, *Lands of the Eastern caliphate*, 277-8). The Rāmd̲j̲ird dam was again rebuilt towards the end of the 6th / beginning of the 13th century, and there were several reconstructions after that date (Smith, *op. cit.*, 85).

In the eastern provinces of Persia there were also a number of dams and irrigation works on the Oxus or Āmū Daryā [*q.v.*] and on other great rivers and lesser streams. Some of these were repaired, and others constructed by the Muslims. Sīstān was dependent almost wholly upon the control of the water of the Hīrmand (Helmund) River [see HILMAND]. Zarand̲j̲, the capital of the province under the ʿAbbāsids, was situated near the original capital of Rām S͟hahristān (Abras͟hahriyār), which according to tradition, had been abandoned when a dam across the Hīrmand had burst and the water had been permanently diverted from the Rām S͟hāhristān canal (Le Strange, *op. cit.*, 339-40). From the works of the Muslim geographers, it would appear that Zarand̲j̲ was irrigated by six dams on the Hīrmand near where it enters Lake Zarab. Some of these may have been of Sāsānid origin. The Muslims added various water-wheels to the system. In 785/1383 Zarand̲j̲ and its irrigation works were destroyed by Tīmūr, as was also the Band-i Rustam on the Hīrmand River near Bust, the water of which had served to irrigate all the western lands of Sīstān. Failure to repair and maintain the elaborate system of canals and dams on the Hīrmand River resulted in much of the land formerly irrigated and drained being converted into reed beds and swamps. The headwaters of the Hīrmand and the main stream are at the present day in Afg͟hānistān. After entering Persian Sīstān, the river divides into two branches, the Pariyān and the Sīstān rivers. The former flows in a northerly direction, and with its tributaries waters northern Sīstān. The latter flows through southern and south-western Sīstān. Near the Afg͟hān frontier, the Kahak dam diverts water into the Pariyān, while another dam lower down, the Band-i Zahāk, diverts more water for irrigation. The use of the water of the Hīrmand and the construction of new dams has been the subject of bitter controversy between Persia and Afg͟hānistān. The first award of the river waters between them was made in 1872. In 1950 the Helmand River Delta Commission was set up (though subsequently disbanded).

The water of the Murg͟hāb River in K͟hurāsān was diverted by numerous dams and canals for irrigation. Al-Iṣṭak͟hrī relates that one march south of Marw, its bed was artificially dyked with embankments faced by wooden works which kept the river-bed from changing. Under the Sald̲j̲ūḳs, the number of dams and dykes on the Murg͟hāb was increased. These were later destroyed by the Mongols and the oasis of Marw converted into a desert swamp, according to Ḥāfiẓ Abrū (Le Strange, *op. cit.*, 397, 402). He states that after Tīmūr's conquest of K͟hurāsān, various of the *amīrs* and pillars of the state each made a canal leading off from the Murg͟hāb, in order to irrigate the land, and that when he was writing, i.e. at the beginning of the 9th/15th century, twenty of these were in existence. He discribes the city as being in a flourishing condition (*D̲j̲ug͟hrāfiyā-yi Ḥāfiẓ Abrū, ḳismat-i rabʿ-i K͟hurāsān: Harāt*, ed. Māyil Harawī, Tehran A.H.S. 1349/1970-1, 34).

One of the most important periods in mediaeval Persia in the construction of dams appears to have been the Īlk͟hān period, when, in the late 7th/13th century and early 8th/14th centuries, several dams were constructed. The great achievement of this period was the construction of a number of arch dams. One at Kibar (Kivar), some 15 miles south of Ḳumm, is the oldest surviving example of this type of structure so far located. Built in a V-shaped gorge, which narrows about halfway down to a deep gully, the dam is 85 ft. high and 180 ft. long at the crest, the thickness of which is between 15 and 16½ ft. The air-face, the radius of curvature of which is 125 ft., is vertical except near the face where there is a slight slope in the downstream direction. The dam has a core of rubble masonry set in mortar (*sārūd̲j̲*) made from lime crushed with the ash of some desert plant, which makes it hydraulic and results in a strong, hard and highly impervious mortar ideal for dams. The dam has a vertical series of openings on the water-face connected by shafts and galleries to provide passage for the water through the dam walls (though their precise function is uncertain). Two other arch dams, probably also belonging to the Īlk͟hān period are situated near Ṭabas, the S͟hāh ʿAbbāsī, east-north-east of Ṭabas, so called because it was repaired in the Ṣafawid period, presumably by S͟hāh ʿAbbās I or S͟hāh ʿAbbās II, and the Kurīt dam, to the south of Ṭabas. The latter is remarkable for its height of some 120 ft. (H. Goblot, *Du nouveau sur les barrages Iraniens de l'époque mongole*, in *Arts et Manufactures*, no. 239 [April 1973], 15-20; *idem*, *Kébar en Iran sans doute le plus ancien des barrages-voûtes*, in *Science-Progrès*, no. 3358 (February 1965); idem, *Sur quelques barrages anciens et la genèse des barrages-voûtes*, in *Revue d'Histoire des Sciences*, cahier no. 6; Smith, *op. cit.*, 65-8). Another dam, a large gravity dam at Sāwa, was also built in the Īlk͟hān period. Ḥamd Allāh Mustawfī states that it was constructed on the orders of S͟hams al-Dīn Muḥammad Ṣāḥib-Dīwān [see D̲J̲UWAYNĪ, S͟HAMS AL-DĪN MUḤAMMAD] (*Nuzhat al-ḳulūb*, 221). It was situated in a valley south-east of Sāwa and east of the point where the Ḳarāčāy (Gāvmāha) joins two streams from Sāwa and Āwa respectively. Although the limestone rock at the side of the valley was sound (as far as is known), the base of the dam was built on river alluvium consisting of sands and gravel, which go down 90 ft, before bed-rock is reached. Consequently, as soon as the reservoir began to fill, the pressure above the foundations drove the

water through the alluvium and the water established a permanent outlet for itself. The dam was abandoned, but the structure survived (Smith, *op. cit.*, 64-5). It is not without interest that a number of dams and irrigation works were constructed about the same time in Yünnan by Saʿīd Adjall, who apparently became governor of Yünnan in A.D. 1274 (J. Needham, *Science and civilisation in China*, iv/3, Cambridge 1971, 297).

The dating of the gravity dams at Ḳuhrūd and Ḳamṣar near Kāshān and at Farīmān and Ṭuruḳ in Khurāsān is uncertain. The Ḳuhrūd dam is attributed to Shāh ʿAbbās and the Ḳamṣar dam to Djalāl al-Dīn b. Muḥammad Khʷārazm-Shāh (ʿAbd al-Raḥmān Ḍarrābī, *Tārīkh-i Kāshān*, ed. Īradj Afshār, Tehran A.H.S. 1335/1956, 8, 40-1, 42, 43). The Gulistān dam in Khurāsān was made by the Tīmūrid Abū Saʿīd Mīrzā (855-72/1452-67) (*Asnād wa mukātabāt-i tārīkhī-yi Īrān az Tīmūr tā Shāh Ismāʿīl*, ed. ʿAbd al-Ḥusayn Nawāʾī, Tehran A.H.S. 1341/1962, 313). The Salāmī Dam in Khurāsān was constructed by Ghiyāth al-Dīn Kurt (706-25/1306-24) (N. M. Clevenger, *Dams in Ḫorāsān, some preliminary observations*, in *East and West*, N.S., xix [1969], 393). These dams were still in use in the 1960s, but most of them furnished very little water because their reservoirs were heavily silted up.

Under the Ṣafawids, there was renewed activity in dam-building and other constructions for irrigation. Shāh Ṭahmāsp (930-84/1524-76) attempted to divert the water of the Kārūn into the Zāyanda Rūd by a connecting tunnel through the mountain ridge which separates them. The work was abandoned owing, it was said, to the foul atmosphere of the workings. Shāh ʿAbbās I (996-1038/1587-1629) revived the project, but abandoned the idea of a tunnel in favour of an open cutting. It is reported that at times he employed 100,000 men on this undertaking, but the scheme came to naught. Shāh ʿAbbās II (1052-77/1642-67) made another attempt, in which he was advised by a French engineer named Genest. A dam, 300 ft. long and about 100 ft. high was built across the Kārūn to divert the water of the river while the channel was cut. Smith thinks that Genest may have had in mind more than a mere diversion of the river and that he may have hoped to reduce the amount of excavation through the mountains by raising the level of the river. The scheme, however, was also abandoned after 100 ft. of the connecting channel between the two rivers had been cut. The idea was revived during the reign of Riḍā Shāh Pahlawī. Work was begun on the cutting of a tunnel connecting the two rivers. Known as the Kūhrang tunnel, it was finished in 1953 (Smith, *op. cit.*, 72-3). The increase in the flow of water in the Zāyanda Rūd which resulted has enabled more land to be cultivated in the districts through which the river flows. Shāh ʿAbbās II also built, on the foundations of an earlier weir, the Khʷādjū Bridge over the Zāyanda Rūd in Iṣfahān. It is a combination of a weir with sluice gates and flood arches above these, with a permanent roadway on the top (Wulff, *op. cit.*, 248; Smith, *op. cit.*, 73-4).

(ii) *Wells and lifting devices*. A variety of lifting devices operated by men and animals to raise water from rivers, streams and wells have been widely used in the past, especially in Khūzistān, the Persian Gulf littoral, Fārs, in the neighbourhood of Iṣfahān, in some districts in eastern Persia and on the shores of Lake Urumiyya (Riḍāʾiyya). They are still used, but have been largely superseded by power-operated wells. Man-operated wells consist of a windlass set over the well with a large leather bag attached to it. Those operated by draught animals are worked by one or more draught animals such as oxen, mules and, less frequently, buffaloes, each draught animal having one or more men working with it. The constructing of these devices varies slightly in different regions, but the general principle is the same. Their operation is both laborious and inefficient. A wooden wheel is set in two brick or stone built pillars, or two heavy upright posts, above the well, connected by a wooden scaffold. Two pulleys are run on axles attached to the scaffold, over which a main and an auxiliary rope run into the well; the wheel end of the main rope is attached to a hook and a ring carrying a wooden cross from which a large leather bag is suspended. This runs out into a narrow spout to which the auxiliary rope is attached. The draught animal is harnessed to the ropes and sets the wheel in motion by walking up and down a runway beginning at the well-head and descending at an angle of about 20 degrees. By this action, the bag is let into the well. When it is full, it is lifted to the surface and empties itself in front of the well into a trough which carries the water into the irrigation channel. In some wells, a big wooden horizontal cog-wheel, geared to a vertical wheel which turns a bucket-carrying wheel set on the same axle in the water is set in motion by an ox or mule walking round and round a circular runway made about the well (see further Wulff, *op. cit.*, 256-8, and Lambton, *Landlord and peasant*, 227-8; and also C. Cahen, *Le service de l'irrigation en Iraq au début du XIe siècle*, in *BEO*, xiii [1949-50], 118-19). Curzon describes how water was lifted for irrigation from the Kārūn above Ahwāz, where the river was confined within banks from 20 to 30 ft. high. Pools were hollowed in the river bank and water was drawn up by means of leather skins and a pulley worked by oxen pacing up and down an inclined plane on the top of the bank (*op. cit.*, ii, 356-7).

(iii) *Cisterns, water tanks and ponds*. These are to be found in regions in which water supplies are scarce and are especially common in districts on the edge of the central desert, though they are also to be found elsewhere, notably in Fūmināt. They are supplied by water from *ḳanāts*, underground springs or rain-water. Some are made with stones or bricks and cement and are often of a considerable size. ʿAbd al-Raḥīm Ḍarrābī states that almost all the villages and hamlets in Kāshān had small cisterns (*istakhr*); that of Niyāsar was 100 *dharʿ* by 50 *dharʿ* and 2/2 *dharʿ* deep. He describes the purpose of an *istakhr* as follows: "In some hamlets (*mazāriʿ*) the water is less than [the amount required for] a plot of land (*kardū*) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be inundated, because when the quantity of water is small, as soon as it enters the land it sinks in and the plot will not be inundated. Accordingly, water is held back in a cistern (*istakhr*). When the latter is full, it is emptied, or whatever amount is needed for the land is let into the irrigation channel until the desired result is achieved. Or it may be that the water of a hamlet is sufficient for the first rotation period but it is desired to lead the water to a piece of land (*dasht*) or fields (*mazāriʿ*) which are distant, and so half or more of the water will be lost in the channel between the mouth of the *ḳanāt* and the land to be irrigated, with the result that the plot will not be inundated (unless a greater head of water is first held back in a cistern). Or it may be that a village

has [sufficient water] in the first rotation period for three or four pieces of land, and it wishes to divide the water into three or four irrigation channels, some giving more water and some less. A cistern is therefore necessary, so that the requisite amount can be let into each irrigation channel, or so that water from two or three sources can be let into different channels and then divided (*saridja-paymā'ī namāyand*)" (*Tārīkh-i Kāshān*, 66-7). Ḥamd Allāh Mustawfī describes how small catchpools were made on the edge of the cultivated area round Tūn to catch rain water which was used for grain cultivation (*Nuzhat al-ḳulūb*, 143-4).

Irrigation practices and water distribution and measurements. Irrigation practices range from heavy perennial irrigation, land watered less heavily through the year or parts of the year, to land watered once or twice a season through the capture of flash floods or water stored in a cistern. The usual method of irrigation is by inundation; for some crops, trench irrigation is used. In the case of rivers, the water is diverted into canals and sub-canals and cross-canals, whence it is led into the fields to be irrigated. The division is made according to established rights of priority, usually (but not always) starting upstream and ending downstream. The water of other sources, if it is prolific, is also divided into various channels and led to different users simultaneously. The division of the water between several users is assured by a variety of mechanical devices, distributors, or runnels with inlets of a fixed size or by the allocation of fixed periods of time. Where water is divided by a weir between a number of villages or users, the size of the orifices at the rim of the weir varies according to the share of the water permanently allocated to the different users. Water is led into individual fields, plots or gardens by breaching the banks of the canals (usually with a spade) for the appropriate length of time.

The rotation period of the water (*dawr-i āb*) normally begins in early October with the start of the agricultural year and is fixed at so-and-so many days. Within that period, so many shares, defined in days, hours, or minutes, are allocated to the different districts, villages, fields, or plots of land watered by the source in question. A common way of measuring the unit of time is by a kind of hour-glass, the time-unit being the time it takes for a small copper bowl with a hole at the bottom to fill and sink in another large basin (see further al-Māwardī, *Les statuts gouvernementaux*, tr. E. Fagnan, Algiers 1918, 389-90; E. Stack, *Six months in Persia*, London 1882, ii, 264 ff.; Lambton, *Landlord and peasant*, 212-13, 218-20, 408; Wulff, *op. cit.*, 254-6; Ḍarrābī, *op. cit.*, 53-4; B. Montazami, *Irrigation in Iran: éléments pour une approache matérialiste*, in *Zaman*, i [1979], 38 ff.). Stack mentions that in some of the villages of Firaydan, the water distribution was regulated in the daytime by the length of a man's shadow and at night by the stars (*op. cit.*, ii, 269).

Since the water of rivers is subject to diminution at certain seasons of the year, and in both rivers and *ḳanāts* may be reduced in a series of dry years, much care is exercised over the division and allocation of the water in order to satisfy cropping needs. In the case of *ḳanāts*, the rotation period may be lengthened in periods of water shortage and the amount of water per share reduced. In general, the scarcer the water, the more detailed and complicated the distribution of water; and the greater the fragmentation of the ownership of the water, the more meticulous and elaborate the organisation of its distribution.

Water laws and water rights. So far as the *sharī'a* is concerned, water laws belong to *mu'āmalāt* as opposed to *'ibādāt* and are based on *'urf* or custom enshrined in the traditions and given sanction as the practice, or supposed practice, of the Prophet and his companions and their immediate successors and, in the case of the Shī'a, of the *imāms*. These practices reflect not only the conditions and needs of Arabia at the time of the Prophet, but also those of other regions into which the Muslims later penetrated. They do not, therefore, present a coherent and uniform basis for a body of water laws, but rather a series of unrelated decisions, sometimes in conflict with each other. In general terms, irrigation was governed in theory by the *sharī'a*, but in practice and in matters of detail local custom prevailed and was extremely varied. In the law books, there are references to irrigation in the books on *zakāt*, *'ushr*, *khums* and *kharādj*, *iḥyā' al-mawāt* (the revivification of dead lands), *ḥarīm* ("borders"), *mushtarakāt* (things held in common), *bay'* (sale), *makāsib* ("earnings"), *ghaṣb* (usurpation), *muzāra'a* [*q.v.*] (crop-sharing agreements) and *musāḳāt* [*q.v.*] (agreements for the sharing of fruit and other trees). The general principles concerning water laws are accepted by both Sunnīs and Shī'is, but there are differences in matters of detail between them and between the different law schools which, in view of the fact that water laws are based on custom, is not surprising.

(i) *The right of thirst* (*shafa*). By virtue of the *ḥadīth* which states that Muslims are partners in water, fire, and grass, the use of water is considered as common (*mubāḥ*) to all men, but it may be appropriated by "occupation" (*iḥrāz*), e.g. by collecting rain water in a vessel placed outdoors to that end. It cannot, however, be "occupied" until it has ceased to run, i.e. until it is placed in a vessel or water-tight well or basin (Aghnides, *Mohammedan theories of finance*, Lahore 1961, 515. See also Zayn al-Dīn b. 'Alī al-'Āmilī al-Shahīd al-Thānī, *Rawḍat al-bahiyya fī sharḥ lum'at al-Dimashḳiyya*, lith. 1271/1854-5, 267). Water in rivers, *ḳanāts*, wells and basins which are not water-tight is, therefore, considered to be *mubāḥ*, even if the rivers, *ḳanāts*, wells and basins should be private property. Everyone is entitled to use such water for drinking purposes for himself and for his animals, provided that the animals do not exhaust the whole supply. The sale of the water of privately-owned rivers, *ḳanāts*, wells and basins (for drinking purposes) is permitted by some jurists, though all appear to consider it better to give such water than to sell it (Aghnides, *op. cit.*, 516, and see also Muḥammad b. al-Ḥasan al-Ṭūsī, *al-Nihāya fi 'l-fiḳh wa'l-fatāwā*, ed. Sayyid Muḥammad Bāḳir Sabzawārī, Tehran 1333-41/1954-6, 2 vols., ii, 282). The right of all men to use water is confined to drinking purposes and does not extend to its use for irrigation.

(ii) *The right to use irrigation water*. According to the Sunnī *fuḳahā'*, the water of the great rivers belongs to the Muslims in common (Abū Yūsuf, *Le livre de l'impôt foncier*, tr. E. Fagnan, Paris 1921, 148) and according to the Shī'ī *fuḳahā'*, to the *imām*. Their water may be used by anyone for irrigation and power provided its use in this way does not harm the community, and anyone may divert water from the great rivers by means of a canal, unless such diversion is prejudicial to interests already acquired. In the case of the lesser rivers, the water of which is sufficient to irrigate the land along its banks without

the construction of dams, anyone may lead off water in a canal to irrigate other land, provided such action is not prejudicial to existing interests. If the water of a river cannot be used for irrigation without the construction of dams, lands higher up have, according to most authorities, Sunnī and Shīʿī, a prior right to those situated lower down (cf. al-Māwardī, 386 ff. and Muḥammad b. al-Ḥasan al-Ṭūsī, *al-Nihāya*, ii, 283). The Ḥanafīs, on the contrary, hold that lands situated lower down the river have a prior right over those situated higher up, while the Mālikīs lay down that land situated higher up has the prior right of irrigation until the water reaches as high as the ankles, but if the land lower down has been developed earlier and there is a danger of its crops being destroyed, it has a prior right over land higher upstream. These various views are reflected in existing practice. As to the amount of water that may be drawn off, the Prophet is said to have allowed a level as high as the ankle, and this tradition is widely followed. Al-Māwardī, whose exposition is concerned with the practice of water management rather than the theory, holds that the amount varies with the nature of the land, the kind crop, the time of sowing, the season and whether the flow of the river is permanent or intermittent (*op. cit.*, 388; see further Aghnides, 517, Lambton, *Landlord and peasant*, 210-11).

The right to use water flowing in artificial beds, such as the water of a canal dug by the people of a village, belongs exclusively to the owners of the bed of the canal, and others may not use the water for irrigation. The manner of use is established by the agreement of the co-owners. The construction of mills and bridges, etc., requires the consent of all the co-owners. If a mill has been legally built on the stream of a third party, the owner of the stream cannot divert the water except with the permission of the owner of the mill (al-Muḥaḳḳiḳ, *al-Mukhtaṣar al-nāfiʿ*, ed. Muḥammad. Taḳī Dānishpazhūh, Tehran A.H.S. 1343/1964, 306). The use of the water of wells and artificial reservoirs belongs exclusively to those who made them, and others may not use their water for irrigation. The use of the water of springs is also the exclusive right of the owner of the land in which the spring lies. The general view of the Shīʿī *fuḳahāʾ* appears to be that *ḳanāt*s, springs and wells situated in private property, or made in dead land with the intention of reclaiming the land, belong to the person or persons who made them and that they can be transmitted by sale and inheritance and can be constituted into *waḳf*. There was not, however, unanimity of opinion on this. Some, including Muḥammad b. al-Ḥasan al-Ṭūsī, maintain that the water of a well, *ḳanāt* or canal does not become the property of whoever dug the well or made the *ḳanāt* or canal, and that such actions only give a right of priority in the use of the water.

Transmission and sale of water rights and water sources. Most jurists permit the transmission of water rights and water sources, so far as they are private property. From this, it follows that water rights often become highly fragmented. The jurists also permit the constitution of water rights and water sources, so far as they are on private property, into *waḳf*. Many *ḳanāt*s and canals and rights to a share of the use of various sources of water have been so constituted. The Yazd region is particularly illustrative of this practice. From the number of shares into which many of the *ḳanāt*s of Yazd were divided, it would seem that their ownership was highly fragmented (cf. *Djāmiʿ al-khayrāt*, ed. Muḥammad Taḳī Dānishpazhūh and Īradj Afshār, in *Farhang-i Īrān-zamīn*, ix [1345/1966-7], *passim*). Their constitution into *waḳf* prevented further fragmentation.

Dead lands. The revivification of dead lands (*iḥyāʾ al-mawāt*) normally involves the irrigation of the land. Thus al-Māwardī states that land to be revivified for cultivation must be irrigated if it is dry, and drained if it is marshy (*op. cit.*, 380, 382; Aghnides, 500-1; see further Zayn al-Dīn b. ʿAlī al-ʿĀmilī al-Shahīd al-Thānī, *op. cit.*, 265-7). Revivification confers ownership, and canals dug to bring water to dead lands belong to those who dug them (al-Māwardī, 389), and wells or *ḳanāt*s made in dead lands in order to revivify them belong to those who made them. If irrigated with *ʿushr* water, revivified land paid *ʿushr*, and if reclaimed with *kharādj* water, *kharādj* (al-Māwardī, 382 ff.). Al-Muḥaḳḳiḳ, discussing the conditions for the revivification of dead lands, states that there is no *sharʿī* text governing these and that reference is to be had to custom. If the intention is the cultivation of the land, ownership is established either by *taḥdjīr*, or by bringing water to the land by a water-wheel or some similar method (*Sharāʾiʿ al-islām*, ed. ʿAbd al-Ḥusayn Muḥammad ʿAlī, Nadjaf 1389/1969, 4 vols., iii, 275-6). New canals and *ḳanāt*s to bring irrigation water to dead lands are subject to the laws governing *ḥarīm*.

Ḥarīm. The ownership of landed property involves also a right over the land which borders it, where this is necessary for the full enjoyment of the property. So far as irrigation is concerned, this is of vital importance in respect of springs, streams, *ḳanāt*s and water channels. Accordingly, "borders" are laid down for such forms of property, within which a third party may not undertake new irrigation works, though some jurists lay down that "borders" can only exist in land to which no one has a prior right. The extent of the "borders" varies according to the nature of the water source and according to the nature of the soil (al-Māwardī, 390, 392, 395, Abū Yūsuf, 152-3, al-Muḥaḳḳiḳ, *Sharāʾiʿ*, iii, 272-3). Al-Muḥaḳḳiḳ permits 1,000 cubits (*arsh*) for a *ḳanāt* if the soil is soft and 500 cubits if it is firm (*al-Mukhtaṣar al-nāfiʿ*, 306).

Muzāraʿa and musāḳāt [*q.vv.*]. The first is a crop-sharing agreement and the second an agreement for the exploitation of fruit trees and other trees, under which the two parties each have a share in the proceeds. Agreements of this type were known in pre-Islamic Persia. Under the former, water is traditionally regarded as one of the five elements (the other four being land, draught animals, seed and labour) affecting the proportion in which the crop is divided between the two parties to the agreement, the landlord and the peasant. In theory, one share went to each of the five elements, but in practice there was much variation in the shares going to either party, though the ownership or provision of water always played an important part in the division of the crop in the case of irrigated land. *Musāḳāt* was an agreement made between the owner of a garden and another party, who would undertake to irrigate the trees and who would receive in return a specified share of their fruit. It could also be concluded for trees or plants which did not bear fruit, but the produce of which was capable of exploitation, such as the henna or tea plant. It could also be concluded for newly-planted trees which would not bear fruit for some years. The responsibility for cleaning *ḳanāt*s and irrigation channels under a *muzāraʿa* or

musāḳāt varied according to local custom. The digging of new wells and canals was normally done at the expense of the landowner. These agreements might be written agreements, but were probably often oral agreements based on local custom. They might be for one or more years. In some quarters there appear to have been a prejudice against long-term agreements. Sayyid Rukn al-Dīn Muḥammad b. Niẓām (d. 732/1331-2), who constituted much property—shares in *ḳanāt*s, real estate and landed estates—into *awḳāf* in Yazd, laid down that no *muzāraʿa* or *musāḳāt* should be concluded for more than one year (*Djāmiʿ al-khayrāt*, 174). A similar stipulation is made in the *waḳfiyya* of the Shaykh al-Islām Ghiyāth al-Dīn Muḥammad Kadjadjī, dated 782/1380-1 (*Waḳfiyya-yi Kadjadjī*, in *FIZ*, xxi [1354/1976], 8).

Taxation. It is difficult to lay down the connection between the provision of irrigation and taxation, because no general principle prevailed. Probably in most districts, tax was assessed on the land (together with its water), though in the case of land watered by the great rivers and some of the lesser rivers, water dues were paid to the state. Apart from the source from which it comes, water is also divided by the jurists into *ʿushr* water and *kharādj* water, according to whether it is found in *ʿushr* or *kharādj* land. There is, however, some difference of opinion among the jurists over the status of the water of the great rivers and the implications of its status for tax purposes (see further al-Māwardī, 282-3; Aghnides, 359, 366-7). Land reclaimed with *ʿushr* water paid *ʿushr* and with *kharādj* water, *kharādj* (see above, s.v. Dead lands). When in the course of time the distinction between *ʿushr* land and *kharādj* land became blurred, the distinction between *ʿushr* water and *kharādj* water also ceased to be of practical effect. What was crucial in assessing the tax-bearing capacity of the land was not the hypothetical status of the water, but the method by which it was irrigated (cf. al-Māwardī, 315 ff.). Crops irrigated by water carried on the back of a beast or raised by a lifting device paid half-*ʿushr*, while lands watered by river, spring or *ḳanāt* water or rain paid full *ʿushr* (Abū Yūsuf, 82-3, al-Muḥaḳḳiḳ, *Mukhtasar al-nāfiʿ*, 71). In the later centuries, when tax was often assessed on the crop, not on the area of land, many authorities permitted the deduction of expenses, which included those on irrigation, before the *kharādj* of the government was reckoned. In some districts, notably Yazd, where the ownership of land and water was often in separate hands, the revenue assessment was based on a calculation of the water supply only. In its simplest form, a certain rate was imposed per unit of water (*ṭāḳ*, *tasht*, *djurʿa sabū*, *saridja*). The rate varied from village to village; reassessments were seldom made, but the incidence of taxation might be increased by the imposition of additional quotas. Wells in some districts in southern Persia in the 19th century paid a wheel tax (*sar čarkhī*) (Stack, *op. cit.*, ii, 259). In the case of the reclamation of dead lands, tax concessions related to the nature of the water supply are from time to time recorded. The Īlkhānid Ghāzān Khān (694-703/1295-1304), who attempted to bring about a revival of agricultural prosperity, classified dead lands into three groups according to the labour required on irrigation works, and gave them tax concessions for three years (see *Landlord and peasant*, 91).

Water rights and the religious officials: the settlement of disputes. Water, perhaps because it is closely associated with *ʿushr* and *kharādj*, which are among the *ḥuḳūḳ Allāh*, generally speaking came within the purview of the religious officials. The regulation of the water of the Harī Rūd in the 8th/14th century is said to have been carried out by the Shaykh al-Islām Niẓām al-Dīn ʿAbd al-Raḥīm Khʷāfī, and that of the Zāyanda Rūd in the 11th/17th century is attributed to Shaykh Bahāʾī (Bahāʾ al-Dīn Muḥammad al-ʿĀmilī) (see below). So far, however, as the religious officials gave decisions and issued *fatwā*s for the settlement of disputes over water (which were of frequent occurrence), they relied for the execution of these, as they did in decisions over other matters, on the officials of the government. Thus when ʿAbd Allāh b. Ṭāhir (213-30/828-44) found that there was no body of laws on *ḳanāt*s, he assembled the *fuḳahāʾ* of Khurāsān and ʿIrāḳ (not the *ʿummāl-i ʿurf*) to write a book on laws governing *ḳanāt*s [see KANĀT]. Similarly, from a letter preserved in the *ʿAtabat al-kataba*, probably written just before or just after the fall of Sandjar in 552/1157, it would appear that the assessment of water rates (*ḳānūn-i āb*) was the concern of the officials of the religious institution in the person of the local judge (*ḥākim*) (Muntadjab al-Dīn Badīʿ al-Kātib Djuwaynī, *ʿAtabat al-kataba*, ed. Muḥammad Ḳazwīnī and ʿAbbās Iḳbāl, Tehran 1329/1950, 96-7; see also *Landlord and peasant*, 74). An undated letter in the *Dastūr al-kātib* of Muḥammad b. Hindūshāh Nakhdjawānī, which is dedicated to Sulṭān Uways b. Shaykh Ḥasan-i Buzurg (757-77/1356-74), mentions the *fatwā*s of the *ʿulamāʾ* concerning the destruction of a dam on the Mihrān Rūd at Tabrīz. This had been built to divert water to a newly-founded village and had resulted in the river-bed becoming silted up so that flooding took place in Tabrīz. The answer to the letter states "Let action be taken in accordance with the *fatwā*s of the *imām*s of religion and let these not be transgressed or altered" (ed. A. A. Alizade, i/2, Moscow 1971, 482-3). Whether the letter actually existed or was composed by Muḥammad b. Hindūshāh, it can be taken as a typical example of contemporary practice (as it should be rather than as it was). In some cases, royal *farmān*s were issued for the settlement of water disputes—and not necessarily always those of a major nature. A short *farmān*, dated Dhu 'l-Ḳaʿda 952/Jan.-Feb. 1546 issued by Shāh Ṭahmāsp, regulates a dispute over water rights between Kharānīḳ and Sulṭānābād, two villages in Ādharbāydjān. It orders the peasants and crop-sharers of Kharānīk to act towards the peasants of Sulṭānābād in accordance with the *sharṭ-nāmača* concerning their water rights as fixed by Djalāl al-Dīn Maʿṣūm Beg Ṣafawī, the *mutawallī* of the holy shrine (? of Ardabīl) (B. G. Martin, *Seven Ṣafawid documents from Azarbayjan*, in S. M. Stern, ed., *Documents from Islamic chanceries*, Oxford 1965, 185 ff.). In this case, it would seem likely that one or both of the villages may have been *waḳf*, since Maʿṣūm Beg, the *mutawallī*, had been called in to regulate their shares, and if they were Ṣafawid *awḳāf*, this would explain why a royal *farmān* was issued to decide a dispute between two small and unimportant villages. In the case of the great rivers, the decision of water disputes was in the hands of *mīrāb*, who was an official of the state and those of the *ʿummāl-i ʿurf* (see below).

The upkeep of rivers. The *mīrāb*. The responsibility for the upkeep of the great rivers was vested in the *imām*. Cleaning or dredging and repair of their banks was carried out by the *imām* and paid for by the public treasury. If there were no funds available for such work, he could compel the Muslims to give

their services for the purpose. The cleaning and repair of canals from the great rivers leading water to individual villages was the responsibility of the owners of the canals. If they refused to carry out the necessary work, they could be compelled to undertake it, since neglect of their duty might result in injury to the community and might diminish the supply of water to those who had a right to it (Abū Yūsuf, 144, 148; see also N. B. E. Bailie, *The land tax of India, according to the Moohummudan law, translated from the Futawa Alumgeeree*, London 1873, 49-50). In the provinces, responsibility for the control of the waters of the great rivers was in practice delegated to the provincial governor. With the fragmentation of the caliphate and the rise of local dynasties, this responsibility passed to those who held power locally. There was, therefore, no uniformity of system and information concerning water control and irrigation is patchy. It was presumably the theory that the *imām* had the right to compel the Muslims to give their services for the repair and cleaning of the great rivers which gave sanction to the practice of levying corvées for irrigation works, either of a seasonal nature, as in Sīstān (though it would appear that in the early centuries an allocation was made on the *kharādj* for irrigation works, see *Tārīkh-i Sīstān*, ed. Malik al-Shuʿarāʾ Bahār, Tehran A.H.S. 1314/1935-6, 30-1), or of an occasional nature. Thus when ʿIzz al-Dīn Muḳaddam made plans to restore prosperity in Harāt in 653/1237-8 after the depredations of the Mongols, he held a meeting in the Friday mosque and assembled the men of Harāt to work in corvées (*ḥashar*) on the irrigation channels which had silted up (Isfizārī, *Rawḍat al-djannāt*, ed. Muḥammad Kāẓim Imām, Tehran A.H.S. 1339/1960-1, ii, 110-11; cf. also Sayf b. Muḥammad b. Yaʿḳūb al-Harawī, *Tārīkh-nāma-yi Harāt*, Calcutta 1944, 111). Some centuries later, Faḍl Allāh b. Rūzbihān Khundjī (d. 927/1521), while still taking the view that expenditure on irrigation works came under the heading of *maṣāliḥ al-muslimīn* and was therefore a legitimate charge on *kharādj* revenue, nevertheless sought to legitimise the raising of special taxes (*nawāʾib*) for such expenditure. He writes, "What is taken in Khʷārazm from the generality of men for the repair of dams on the Oxus or for the building of walls round the kingdom or other such matters of public interest is a debt which must be paid and a claim which is rightly due, and refusal to pay is not permissible; such taxes are not unjust" (*Sulūk al-mulūk*, B.L. ms. Or. 253 [microfilm copy], 119).

There are from time to time references to special departments in charge of irrigation, but, on the whole, it would seem that their existence was the exception rather than the rule. In western Persia, there appears to have been a *dīwān-i āb* in the 4th/10th century at the time of the rise of the Būyids. The *Tārīkh-i Ḳumm* states that when the Gīlānīs and Daylamīs conquered Ḳumm they abolished the *dīwān-i āb* (Ḥasan b. Muḥammad b. Ḥasan al-Ḳummī, tr. into Persian by Ḥasan b. ʿAlī b. Ḥasan b. ʿAbd al-Malik, ed. Djalāl al-Dīn Ṭihrānī, Tehran A.H.S. 1313/1934, 53). The only Būyid who appears to have been concerned to foster agricultural prosperity and hence to have paid attention to the upkeep of irrigation works was ʿAḍud al-Dawla (d. 372/982), the builder of the Band-i Amīr. Ibn Miskawayh states that he cleaned canals which were silted up, built mills on them, and mended dams (*Tadjārib al-umam*, ed. L. Caetani, Leiden 1909-17, vi, 509 ff.). About the same time, there was in the eastern provinces an extensive water administration for the Murghāb River, which was under the jurisdiction of the rulers of Ghardjistān. A specially appointed *amīr* was in charge of the upkeep of dykes on the river and the regulation of the water supply. He had 10,000 workmen and horse guards under him. Al-Iṣṭakhrī states that he enjoyed greater respect than the *wālī* (*Masālik al-mamālik*, 261-2; Le Strange, *Lands*, 397-8). Under Yaʿḳūb b. Layth in Sīstān, there appears to have been a *mīrāb*, who was a government official. Cases against him, in the event of his abusing his power, were heard in the *dīwān-i maẓālim* (*Tārīkh-i Sīstān*, 266). Under later dynasties, such as the Saldjūḳs, Khʷārazm-Shāhs, Īlkhāns and Tīmūrids, control was, no doubt, exercised over the great rivers by the government, though the sources contain very little information on this subject (see *Madjmūʿa-yi munshaʾāt-i ʿahd-i Saldjūḳiyān wa Khʷārazmshāhiyān wa awāʾil-i ʿahd-i Mughul*, ms., photo-copy in the National Library, Tehran, 80b-81b for a diploma from Il Arslān for the *mīrāb* of Bukhārā, and see H. Horst, *Die Staatsverwaltung des Grossselǧūqen und Ḫōrazm-šāhs*, Wiesbaden 1964, 137). So far, however, as agriculture was fostered by individual rulers, this implied some degree of water control.

Information on the division of the Harī Rūd in the 10th/16th century is contained in an essay written by Ḳāsim b. Yūsuf al-Harawī, who wrote the *Irshād al-zirāʿa* in 921/1515-16. He mentions in this essay an earlier division of part of the river made by the Shaykh al-Islām Niẓām al-Dīn ʿAbd al-Raḥīm Khʷāfī, who had been entrusted with this matter after complaints of alleged inequalities and illicit diversions of the water were made to Muʿizz al-Dīn Ḥusayn b. Ghiyāth al-Dīn Muḥammad Kart (d. 771/1369), the local ruler of Harāt (*Risāla-yi ṭarīḳ-i ḳismat-i āb-i ḳulb*, ed. Māyil Harawī, Tehran A.H.S. 1347/1968-9, 12 ff.). This division was apparently revised about one hundred years later in the reign of the Tīmūrid Abū Saʿīd Mīrzā, and it seems that it is this revision which was followed by the *mīrāb*s when Ḳāsim b. Yūsuf was writing and which he describes in his essay (*ibid.*, 15). He gives the regulation of the water in each *bulūk* or district, and the water rights of the villages and gardens watered by the canals of the *bulūk* and the dues of the *mīrāb*. He also records the number of men (*nafar*) to be provided by each *bulūk*, presumably for work on the upkeep of the canals.

Thanks to two late Ṣafawid administrative handbooks and a *ṭūmār* on the regulation of the water of the Zāyanda Rūd, attributed to Shaykh Bahāʾī (Bahāʾ al-Dīn Muḥammad al-ʿĀmilī), who died in 1031/1622, we know something of the irrigation system of the Zāyanda Rūd and the work of the *mīrāb* in Ṣafawid and post-Ṣafawid times. As in the case of other rivers, the division is based on ancient custom. Traditionally, the water of the Zāyanda Rūd is supposed to have been regulated by Ardashīr b. Bābak and there were also, no doubt, various later divisions (cf. Ḥusayn b. Muḥammad b. Abi 'l-Riḍā Āwī, *Tardjuma-yi Maḥāsin Iṣfahān*, ed. ʿAbbās Iḳbāl, Tehran A.H.S. 1328/1949-50, 48). Shaykh Bahāʾī's *ṭūmār* mentions an earlier allocation of the water. The *ṭūmār* was in force until 1936, though it is doubtful whether it was in uninterrupted operation from Ṣafawid times onwards. Under the *ṭūmār*, the water was allocated to the *bulūk*s or districts watered by the river according to a fixed rotation, which varied at different periods of the year, having regard to the cropping needs of each *bulūk*. Within the *bulūk*s, the water was led off in canals to the villages

and lands in the *bulūk*, each portion of the village lands having the right to the water for a fixed period of time (Lambton, *The regulation of the waters of the Zāyanda, Rūd*, in *BSOS*, ix [1939], 663-73) within the rotation period. The *mīrāb* in charge of the water was an important official, ranking among the higher officials of the bureaucracy and the court. That he enjoyed such pre-eminence was due in part to the fact that Iṣfahān was the capital of the empire and the land watered by the Zāyanda Rūd, or most of it, came under the *khāṣṣa* administration, which was in charge of the *maḥāll*, those districts round Iṣfahān which were directly administered by the central government and in which were to be found also land and water resources which had been constituted into *awḳāf* or which were the private property (*khāliṣa*) of the shah. The duty of this *mīrāb* was to order the peasants, on the eve of the Naw Rūz, to clean the *mādīs* (as the major canals in Iṣfahān were called), lesser canals (*anhār*) and channels (*djadāwil*) which belonged to them, according to established custom. He was to see that the water of the Zāyanda Rūd reached all the districts round Iṣfahān which had a water right (*ḥaḳḳ āba*) in turn and according to the share customarily allocated to them from ancient times. The appointment and dismissal of those in charge of the *mādīs* (*mādīsālārs*) was his responsibility. He was also charged with the decision of disputes and claims concerning the water of the river, though certain disputes of a general nature affecting all the landowners and peasants were referred, according to the royal order, to the *wazīr* of the supreme *dīwān*; in such cases, the *kalāntar*, *mustawfī* and *wazīr* of Iṣfahān would go with the *mīrāb* and the *wazīr* of the supreme *dīwān* to the districts, examine the *mādīs*, canals, channels and runnels and decide the *ḥaḳḳ āba* of each district on the basis of the *dīwān* registers and settle any claims according to common sense, custom and the practice of former years. In accordance with this practice, many orders and decrees (*arḳām wa aḥkām*) had apparently been issued and had become customary practice. Apart from the customary dues (*rusūm*) which the *mihrāb* received in each district on account of the first water given to wheat (*khāk āb*) and the water given to wheat when it was nearly ripe (*dūn āb*), a small amount (*ḳadrī*) was allocated to him by the *khāṣṣa* administration (*sarkār-i khāṣṣa-i sharīfa*) in cash and kind, which he received annually (Muḥammad Taḳī Dānishpazhūh, *Dastūr al-mulūk-i Mīrzā Rafīʿā wa Tadhkirat al-mulūk-i Mīrzā Samīʿā*, in *Tehran University, Rev. Fac. des lettres et sciences humaines*, xvi/4 [A.H.S. 1348/1969], 432-3; see also *Tadhkirat al-mulūk*, facs. text, tr. and explained by V. Minorsky, London, Leiden 1943, 81a-b). The accounts of European travellers who visited the Ṣafawid court also show the *mīrāb* to have been an important official. Tavernier states that his office was one of the best offices of the court and much sought after, and he who obtained it was obliged to give large presents (*Voyages en Perse*, Paris 1970, 67, 236). Chardin writes that his emoluments amount to 4,000 *tūmān*s per annum (*Voyages*, iv, 100). Mīrzā Ḥusayn Khān b. Muḥammad Ibrāhīm Taḥwīldār, writing in 1877, states that the office of *mīrāb* and that of bailiff (*mubāshir*) of the royal *ḳanāts* (*ḳanawāt-i khāliṣa*) existed, but that "at the present time there is no-one (holding these offices). Authority lies with the officials of the *bulūkāt* (i.e. the districts watered by the river) and it is not necessary for there to be someone holding these offices as a special charge" (*Djughrāfiyā-yi Iṣfahān*, ed. Manoochihr Sotoodeh, Tehran, A.H.S. 1342/1963-4, 128).

The *mīrāb* in other large cities was also often a person of considerable local importance and influence. In Shīrāz in the 12th/18th and 13th/19th centuries, there was a hereditary tendency in the office (as there was in many other local offices), the office of *mīrāb* of Shīrāz having been held for many generations in the same family (Fāsāʾī, *Fārs-nāma-yi Nāṣirī*, lith., 1313/1895-6, 2 vols in one, ii, 74-5).

Apart from the great rivers, water management was carried out by small-scale local efforts. In the case of the lesser rivers, *ḳanāt*s and springs, the administration and control of the water was normally in the hands of the users. They might or might not appoint a *mīrāb*, who might also have assistants whose duty was to supervise the allocation of the water to the users served by the individual canals. In some districts, a *mīrāb* was appointed only when water was abnormally scarce. He and his assistants were paid by dues collected locally or sometimes by a share of the crop (see further Lambton, *Landlord and peasant*, 222 ff.). In *arbābī* districts (districts in which large landowners predominated) the *mīrāb* was commonly the servant of the *arbāb*.

Modern developments. Land and water were sensitive issues, and under Riḍā Shāh Pahlawī fundamental changes were not, on the whole, introduced. The administration of rivers and the collection of water dues, the basis and rate of which varied on the different rivers, was under the Department of Irrigation of the Ministry of Agriculture. The civil code, various parts of which were promulgated between 1925 and 1935, is largely based, so far as land and water are concerned, upon Shīʿī law. A number of other laws concerning the use of water, some based on *sharʿī* practice and custom, others of a more innovative nature, were passed. Provision for the registration of water rights was made in 1929 and, in 1937, the *ḳānūn-i ʿumrān* of 25 Ābān 1316 (the law for agricultural development) was passed. This defined *ʿumrān* as the greatest possible agricultural development by means of, *inter alia*, the making and repair of *ḳanāt*s, the reclaiming of waste lands, the maintenance of irrigation channels and the drainage of marshes. Although on the statute book, this law was never put into operation because of the opposition some of its provisions were likely to create among those who held land (Lambton, *op. cit.*, 192-3). The law of 29 Urdī Bihisht 1322 (1943) authorised the establishment of an irrigation institute under the supervision of the Ministry of Agriculture and contained provisions for a widespread control of irrigation by the state. These were put into operation somewhat erratically. A number of dams and barrages were planned, and some constructed by the government and by private enterprise, notably at Simnān, Rawānsar, Shabānkāra, Āhū Dasht and Ḥamīdiyya. Little real progress was made and no hydrographic survey, which was a prerequisite to the efficient management of water by the state, was undertaken (see Lambton, *op. cit.*, 187, 192-3, 196 ff., 225-6). There was also some forcible diversion of water to Tehran from neighbouring villages by Riḍā Shāh (ʿAbd Allāh Mustawfī, *Sharḥ-i zindagi-yi man*, Tehran A.H.S. 1324-5/1945-6, 3 vols., iii, 328 ff.). After the Second World War, there was heavy investment by the government in irrigation under the various development plans, especially dams, mainly for energy but also for irrigation, among them the Diz dam (the Riḍā Shāh Kabīr dam), the Safīd Rūd dam (the Muḥammad Riḍā Shāh dam) and the Karadj dam (see further H. Bobek, *Unterentwickelten Landes alter Kultur*, Frankfurt am Main-

Berlin-Bonn 1964). The land reform of 1962 laid down special provisions for the transfer of water rights and the upkeep of irrigation works. These provisions were also put into operation somewhat erratically, and there were conflicts of interest between the land reform administration and various ministries, especially the Ministry of Water and Power, which was set up in 1964. A water nationalisation law was passed in September 1968, which attempted to alter the system of water control radically (see further Lambton, *The Persian land reform 1962-66*, Oxford 1969, 275 ff.; C. Salmanzadeh, *Agricultural change and rural society in southern Iran*, Menas Press Ltd. 1980; D. A. Caponera, *Water laws in Moslem countries*, FAO, Rome 1973, 74 ff.).

Irrigation and society. Although it is difficult to generalise on the subject of irrigation in Persia, some few observations can be made on the influence which irrigation has had on society. It was possible through irrigation to introduce new crops and to intensify and diversify agriculture. This agricultural specialisation became the basis of the flourishing civilisations which developed at different periods in the history of Persia. But this process was not uniform over the whole country. Generally speaking, the exploitation of water resources on the plateau would seem to have been more intensive than in the periphery or in regions with a concentration of nomadic or semi-nomadic tribes. The early centuries of Islam were marked by the growth of cities and towns, round which there was, in many cases, an expanding area of irrigated land, the agricultural surplus of which provisioned the cities and towns. The list of the crops grown in the 3rd/9th and 4th/10th centuries given in the work of the Muslim geographers bears witness to a highly-developed agriculture, which depended on irrigation. In the later centuries also, agriculture flourished from time to time, though seldom over the whole of the country at the same time. Periods of expansion alternated with periods of recession, which were the result of natural calamities or political vicissitudes. With the neglect or destruction of irrigation works, land went out of cultivation and the area under grain crops expanded relative to that under cash crops, as appears to have happened in the early period of Mongol domination. Be that as it may, agriculture up to modern times was the major source of the revenue of the state. It was also the basis of the wealth of the ruling classes and of the livelihood of the majority of the population. The well-being of the state and the people was thus dependent upon a well-maintained irrigation system, and prudence, if nothing else, demanded that attention should be given to the upkeep of irrigation. S̲h̲arʿī law recognises this, and permits the expenditure of *k̲h̲arād̲j̲* on the upkeep of irrigation works (even if, in practice, funds were often not available, or not made available, and the work was done by corvées). Treatises on the theory of government recognise, in general, that the economic foundation of the state was a flourishing agriculture and that the upkeep of irrigation works was therefore incumbent upon the ruler. The sources do, in fact, frequently mention, in general terms, the efforts of individual rulers and their ministers to spread and foster agriculture, to make *ḳanāt*s and to repair irrigation channels; and they also mention the decay and destruction of irrigation works in time of war and insecurity.

This dependence of the state and society upon agriculture and of agricultural prosperity upon an irrigation system which was inherently fragile had certain consequences. In the first place, it produced a certain caution towards experiment and change (whether in the political or the economic field) among those whose income and livelihood depended upon agriculture. The maintenance of irrigation works demanded regular care. This could only be given in conditions of political security. Canals, if not cleaned, silted up and dykes, if not repaired, were breached by flood-water. If the destruction brought by flash floods and storms was not immediately made good, irrigation water decreased. Similarly, without some degree of political security there was no investment in *ḳanāt*s, the digging of which was a highly-skilled operation and the upkeep of which demanded constant attention. There was thus a general tendency to seek security in stable and orderly government backed by coercive force. Secondly, the rotation system of the water, fixed in advance and determined by rules observed by the users, imposed the acceptance of a common discipline. Usurpation and the illicit diversion of water brought strife into the life of the local community and disaster to those who were deprived of their due turn and share of the water. This, too, led to an appreciation of order, and since the responsibility for the distribution of water, except in the case of the great rivers (which were controlled by the state), rested upon the local community, who appointed their own water officials, it fostered the cohesion of local groups and communities and encouraged local particularism.

Drinking water. The right to use water for drinking purposes according to the S̲h̲arīʿa has been set out above under the right of thirst. The drinking water of villages and towns comes mainly from springs, *ḳanāt*s and wells. In the villages, springs are the main source, and from them water is fetched by the users in skins and earthenware water-pots. In the towns, as for example Iṣfahān, many houses had their own wells from which drinking water was drawn. Large houses in many towns had a storage tank (*āb-anbār*), built of fired bricks and lined with water-proofed mortar (*sārūd̲j̲*), in the basement and an open tank (*ḥawḍ*) in the courtyard. These were filled whenever the householder's turn to water from the *ḳanāt* or other sources came. Their water was used for household purposes but not primarily for drinking. In districts where water was short or brackish, drinking water might be brought from a distance on the backs of animals (cf. Curzon's description of the water supply of Bushire, *op. cit.*, ii, 234). Covered cisterns (*āb-anbārs*) are common in towns and villages where water is short, especially on the borders of the central desert. They are also to be found along the roads, sometimes associated with caravansarais. Some have their own springs, but more usually *ḳanāt* water or rain water is stored in them. Domed circular structures, some 50-70 ft. in diameter, reaching 15-20 ft. or more below the surface of the ground, they are a characteristic feature of local architecture (see Wulff, *op. cit.*, 258-59).

Many, perhaps most, towns on the plateau, especially as they grew in size, were supplied by *ḳanāt*s. Ḥamd Allāh Mustawfī records that the water of Ḳazwīn was originally from wells. The first *ḳanāt* was made, he states, by Ḥamza b. Ilyasaʿ, who became governor of the town under Maḥmūd b. Sebüktigin. The water of this *ḳanāt* reached most of the quarters of the town. Subsequently, a number of other *ḳanāt*s were made to serve various quarters of the town. Ḥamd Allāh lists eight (all of which

were *waḳf*) and states that according to the conditions laid down by their founders (*wāḳifān*), their water was to be used for drinking purposes and for *ḥammāms* and was not to be let into gardens or cultivated land (*Tārīkh-i guzida*, ed. ʿAbd al-Ḥusayn Nawāʾī, Tehran, A.H.S. 1339/1960, 781). In some places, notably Yazd, *ḳanāt*s flow through the houses and the householders have the right to use the water for drinking purposes. Nāṣir-i Khusraw mentions that some of the houses in Arradjān also had a *ḳanāt* running through them (*Sefer Nameh. Relation du voyage de Nassiri Khosrau*, ed. and tr. C. Schefer, Paris 1881, Persian text 81; Gaube, *op. cit.*, 44). This was also the case in Shūshtar (ʿAbd Allāh b. Nūr al-Dīn al-Shūshtarī, ed. Khān Bahādur Mawlābakhsh, *Tadhkira-yi Shūshtar*, Tehran repr. n.d., 10-11).

The provision of drinking water was considered a meritorious action. Many individuals made *ḳanāt*s and constituted them into *awḳāf* for the drinking water of a town or one of its quarters. For example, a *waḳfiyya*, dated 941/1534, constitutes part of the water of the river of Astarābād into a *waḳf*. The founder (*wāḳif*) laid down that the water, when it reached the town, should be let into the houses and cisterns (*ḥawḍhā*) and *ḥammāms* and that as soon as one place had taken water, the remainder should be let into the next place, and that in times when water was scarce, no one should use more than was necessary. The founder also stipulated that rice should not be cultivated with the water of the *waḳf*, which was to flow into the town (*Astarābād-nāma*, ed. Masīḥ Dhabīḥī, publications of *Farhang-i Īrānzamīn*, no. 12 [1348/1969], 269). Many *āb-anbārs* were also constituted into *waḳf* by those who built them. There are also many drinking fountains (*saḳḳā-khāna*) in the bazaars and streets of the towns similarly constituted into *waḳf* (cf. ʿAbd al-Ḥusayn Sipintā, *Tārīkhča-yi awḳāf-i Iṣfahān*, A.H.S. 1346/1967, 360).

A shortage of drinking water in many villages and towns, especially in southern Persia, was a common occurrence (cf. Gaube, *op. cit.*, 54, 80). Bihbihān, for example, appears to have been short of water in the middle of the 17th century, the people relying on rain-water for two months in winter and spring (*ibid.*, 100). In Dihdasht, snow was brought from nearby mountains to supplement the drinking water supply (*ibid.*, 105). In modern times, with the increase in urbanisation, water shortages have been a serious problem in many towns. In the middle of the 19th century, Ḥādjdjī Mīrzā Āḳāsī, Muḥammad Shāh's first minister, wished to investigate the possibility of sinking wells with a view to assuring the water supply of Tehran, which was then supplied almost entirely by *ḳanāt*s, but nothing came of this (Great Britain, Public Record Office, F.O. 60:115, Sheil to Aberdeen, no. 106, Tehran, 20 September 1845). In recent years, the water supply of Tehran has been supplemented by water stored in reservoirs behind dams on rivers flowing from the mountains to the north of the city (see further, Planhol, *op. cit.*, 451 ff.).

Drinking water in the towns came under the general supervision of the *muḥtasib*. If water conduits were in a state of disrepair, it was his duty to repair them, or, if there was no money in the public treasury, to order the townspeople to do so. Similarly, if the source of drinking water was fouled, he could order them to rectify the matter (al-Māwardī, *op. cit.*, 524; R. Levy, *The social structure of Islam*, Cambridge 1957, 337). In modern times, the regulation of the water supply of the towns has been under the municipalities, and in recent years there has been canalisation in most of the towns.

7. Irrigation in North Africa and Muslim Spain

Since the purely geographical aspect of the topic of water (amount of rainfall, hydrography, etc.) has been or will be treated in the articles on Muslim Spain or al-Andalus [*q.v.*], Algeria, Morocco and Tunisia, the present article is limited to a consideration of the supplying of drinking water to the towns and villages, as it appears from the mediaeval texts, in addition to a consideration of the customary rules concerning the ownership, use and repartition of water used for irrigating gardens. The topic of modern irrigation, one especially involving the construction of large dams begun during the colonial period of North Africa, will not be examined, but a few words will be said about prayers for obtaining rain, since the procedures followed in the Maghrib were neglected in the article istisḳāʾ.

The works of the mediaeval historians and geographers give hardly any information on the system adopted in the rural areas, but for al-Andalus, there exists a rich geoponic literature [see filāḥa] which has been recently utilised by Mme. L. Bolens (*Agronomes andalous du Moyen-Âge*, Geneva and Paris 1980, 144-82 in regard to irrigation; see also Lévi-Provençal, *Hist. Esp. mus.*, iii, 278-82). Following the latter authority, Mme. Bolens notes that irrigation in Spain bears the stamp of the Islamic period and that, in particular, a large part of the relevant technical vocabulary is Arabic or modelled on Arabic expressions, even if the very characteristic irrigation pattern still remaining in the *huerta* of Velencia does not stem from the Arabs, as J. Ribera showed (*El sistema de riegos en la huerta valenciana no es obra de los árabes*, in *Disertaciones y opúsculos*, Madrid 1928, ii, 309-13).

In regard to the towns and the places of some importance, a geographer like al-Muḳaddasī (ed. and tr. Ch. Pellat, *Description de l'Occident musulman au IVe-Xe siècle*, Algiers 1950) rarely neglects to mention the source of the local inhabitants' drinking water (*shurb*): springs, wells or cisterns in which rain water was collected, and, less frequently, rivers, streams or simple perennial watercourses. Women who did not have either a tank or a private well (equipped with a water-raising apparatus in a more or less developed form) had to have recourse to one of these sources for drinking water, filling there their pitcher, unless some charitable soul had constructed, as a work of piety, a public fountain (*sabīl*) in form of a *waḳf*.

In general, gardens within the urban boundaries were irrigated by means of canals (*sāḳiya*, pl. *sawāḳī*) led off the watercourses or, when there were only wells, by means of simple channels leading from basins filled with water by means of norias [see nāʿūra] or more simple water-raising contrivances [see biʾr. iii]. It is surprising that al-Muḳaddasī, usually so meticulous, does not speak about the installations and arrangements at Fās, remarkable as they are. This capital city had indeed not merely a large number of springs (Leo Africanus [*q.v.*], tr. A. Épaulard, i, 204, numbers them at 600, whose water was "distributed for various requirements and led to the houses, places of worship, colleges and hostelries"), but also a river, the Oued (*wādī*) Fās, where "the Fāsīs have taken off water which they need for driving mills, carrying away their rubbish, filling their fountains and basins, and irrigating their gardens. To achieve this end, they undertook considerable construction works, whose ancient date does not allow us to get an exact idea about them" (see R. Le Tourneau, *Fès avant le protectorat*, Casablanca 1949, 232-9). It is a fact that the town has long had a network of water channels, some above ground and some below, which take the water as far as individual houses, as well as drains crossing the various quarters. Inevitably, disputes often took place between the people of Fās and the country-dwellers on the river banks upstream from the town, since the latter had no right theoretically to take off water. There existed a special legal structure to regulate these conflicts, whilst, for the upkeep of these water channels, special workers (the *ḳwādsiyya*, from *ḳādūs* "pipe", pl. *ḳwādes*) were placed under the authority of an *amīn al-māʾ al-ḥulw* for the drinking water and an *amīn al-māʾ al-muḍāf* for the drains (see I. S. Allouche, *Un plan des canalisations de Fès ...*, in *Hespéris*, xviii [1934], 49-73).

Although the town's population had at its disposal an unusual abundance of water, the water brought into the houses was not generally drinkable. Hence at Fās, as in other Moroccan towns, one used to see going around a picturesque class of water-carriers (*gərrāba*, pl. of *gərrāb*, from *əgrba* < *ḳirba* "water skin"), who attracted attention by their eye-catching appearance, the tinkling of their little bells and the copper vessels in which they handed out drinking water from their dripping water skin to thirsty passers-by without asking the slightest return; in order to make a living, they had a regular clientèle to whose homes they delivered drinking water. The installation of a modern water distribution system had reduced the activities of these *gərrāba*, who have now become largely a tourist attraction.

In Spain, Muslim travellers were able to note the Roman aqueducts which brought water from quite considerable distances, but the Arabs in turn did not fail to construct water channels, in particular to bring water from the sierra to the mosque of Cordova. (On underground channels, known in Spain, and especially at Madrid, as well as in certain regions of North Africa, see ḳanāt. ii.)

However, the most original installations, it seems, are in the region of al-Ḳayrawān, in Byzacena (Tunisia), and are attributable not to the Phoenicians or Romans, as has been thought, but to the Arabs, who developed an earlier-existing system by practising, during the four centuries before the Hilālian invasion (mid-5th/11th century), a real policy for water. We have here in one part water channels open to the sky, and in another, reservoirs meant for "storing up streams of running water and, in some cases, water from certain springs and certain underground water-levels". These reservoirs have as a feature two basins, one for decantation, one as a reserve, and sometimes, a third one for drawing water from it (see A. Solignac, *Recherches sur les installations hydrauliques de Kairouan et des steppes tunisiennes du VIIe au XIe siècle* (*J.-C.*), in *AIEO Alger*, x [1952], 5-273).

Water gathered up in this fashion was used extensively for irrigation, which has always been the great care of peasants in regions where the scarcity of rain and of perennial running streams has compelled them to make do with unwatered cultivated lands [see baʿl] and to lavish all their attention on gardens and orchards outside the towns and villages, where, thanks to a more or less thick network of canals and channels, they ended up by making a real oasis (see e.g. G. Deverdun, *Marrakech des origines à 1912*, Rabat 1959, 10 ff.; A. Bechraoui, *La vie rurale dans les oasis de Gabès* (*Tunisie*), Tunis 1980, 69-86).

In general, water is so important in the eyes of the peasant that ownership of it is sometimes independent of that of the soil. Two main ways of acquisition are in effect possible: (a) personal ownership acquired by purchase or inheritance of the piece of land where there is a spring, well, etc., of which the owner can dispose at his own will, subject to his respecting certain rights of use; and (b) collective ownership, in which one part is appropriated to each patch of land which can be irrigated by water belonging to the community. The sale or lease of the estate implicitly includes the disposal of a corresponding part of the water, but the land's owner can also sell or lease out the land whilst reserving to himself a right of usage which he can then dispose of how he likes, compelling the buyer or lessee to obtain by some other means the water which he needs.

The customary law which governs the utilisation of the water has very precise provisions which often go back to the period before the arrival of Islam; indeed, the provisions regarding, in particular, the rights of usage affecting the land owners and the water supply, are clearly similar to those of classical Islamic law, which in fact only confirmed those of the customary regulations (see e.g. A. Hanoteau and A. Letourneux, *La Kabylie et les coutumes kabyles*², Paris 1893, ii, 249-53, 278-9).

The division of the individual shares is also subject to strict rules, which nevertheless do not always ensure absolute equality between the participants and which do not sufficiently guard against wastage which might well be avoided. The measuring-out is done in various ways. E.g. a copper vessel with a hole pierced in it may be placed in a tank, etc. filled with water; when the vessel itself is full and sinks to the bottom of the tank, a stipulated fraction of the time-share in the water is finished. When the water comes from a basin with vertical sides, one may use a rule whose length is equal to the basin's depth and which is graduated, i.e. it bears notches whose spacing corresponds to a given volume of water. Other methods are still in use. When the share of water supply, whose duration and periodicity vary according to the differing regions and, of course, according to the amount of water available, comes to an end, the arrival channel is blocked up with a mere clod of earth, or a rudimentary sluice-valve, under the control of a person responsible, who may be a child (see e.g. E. Laoust, *Mots et choses berbères*, Paris 1920, 409-38, for the Berbers, whose customs here hardly differ from those of the Arabs).

Given the fact that periods of persistent drought are far from rare and often take on catastrophic proportions when the wells and springs become totally dried up, the people are driven to perform a certain number of ceremonies of a sympathetic magical character in the hope of getting rain. The most widespread, with variations, comprises the making of a kind of doll out of the wooden scoop normally used for ladling water and the parading of it round the villages suffering from drought, whilst pronouncing incantations and sprinkling the doll with water. In Berber regions, the ceremony ends with a prayer in which the name of Allāh is associated with a personnage who may be an ancient god, one of whose names, *təlghenža* (and vars.) is patently derived from that of the scoop, *agh̲ənža*; the doll is also called *taslit unzar*, "the rain's bride". with *anzar* possibly the name of a male fertility god (see for Morocco, E. Laoust, *op. cit.*, 205-53), where, in addition, are discussed rites meant to drive away rain, hail, etc.). Numerous other studies have been made of these rites in North Africa in general, in which the mannikin or image carried round the villages bears differing names; see A. Bel, *Quelques rites pour obtenir la pluie en temps de sécheresse*, in *Actes du XIVᵉ Congrès des Orientalistes*, Algiers 1905, 49-98; E. Doutté, *Marrakech*, Paris 1905, 383-90; idem, *Magie et religion dans l'Afrique du Nord*, Algiers 1909, 584-96; E. Westermarck, *Ceremonies and beliefs . . . in Morocco*, 105-26; W. Marçais, *Textes arabes de Takroûna*, Paris 1925, 197-225.

Bibliography: summary references have been given in the article; the basic work remains that of J. Brunhes, *L'irrigation . . . dans la péninsule Ibérique et dans l'Afrique du Nord*, Paris 1902. See also BIʾR and ḤIYAL in Suppl. (ED.)

8. Irrigation in the Ottoman Empire

The Ottomans followed the detailed provisions of the Islamic law according to the Ḥanafī school, as exemplified mainly in the *Kitāb iḥyāʾ al-mawāt* and the *ḥaḳḳ al-s̲h̲urb* (see *Mawḳūfātī s̲h̲arḥi*, ii, Istanbul 1318, 271-22, and *Mad̲j̲alla*, 1262-9, 1270-91; and 1224-53 also). The basic notion is that water, like wild vegetation and fire, is *mubāḥ*, that is, open to the use of the public at large. Seas, large-size lakes, great rivers, and subterranean waters are considered to belong absolutely to this category. Everyone is free to make use of these waters so long as no harm is entailed for anyone else. In this case, the individuals had to bear all the necessary labour and expense. But usually the state was responsible for large-scale waterworks on the great rivers. For that purpose it was permitted to make use of public revenues except for *ṣadaḳa* [*q.v.*]. If the state treasury was unable to finance such works, which were considered essential to the public good, the state could appoint a superintendent (*nāẓir*), who was authorised to employ the local population, if necessary by force, to construct them (*Mawḳūfātī*, ii, 220).

Proprietorship was recognised over certain types of waters which were regulated and protected. *Mamlūk* or privately owned waters were distinguished as either *nahr ʿāmm*, in which the waters remaining after use by the owners were free for public use, and *nahr k̲h̲āṣṣ*, where the water was exclusively for the use of the owners. *S̲h̲ufʿa* [*q.v.*], pre-emptive right, is in effect in the second case. The reclamation of waste land was legally recognised for individuals, Muslims or *d̲h̲immīs*, who might dig out water-channels (*k̲h̲arḳ* or *d̲j̲adwal*) or wells, or who might find a spring or drained flooded land. In the Ḥanafī school, such ownership is established only with the permission of the *imām* or sultan, with the condition that the reclamation process be completed within three years. In the Ottoman Empire possession rights were recognised to those who reclaimed waste land without permission. Reclamation projects were given prior approval by the sultan by special diplomas called *temlīk-nāmes* which recognised proprietary rights on waste land as well as on running water and springs within the area delimited by the document. A prescribed amount of land, called *ḥarīm*, and surrounding newly-constructed water conduits, springs, or wells, was recognised as the legal property of the owner of the water.

Water in the *k̲h̲arḳ*s and *ḳanāt*s [*q.v.*] was subject to private ownership, and no one could make use of it without previous permission of the owner. In the case of those waters under joint ownership of a number of partners, none of the partners could open new water channels, construct mills, or change the

sequence or direction of water-use without the consent of the other partners. When given, such permission could be revoked at any time. Water was divided between the partners according to the size of their respective land holdings. Partners on the upper reaches of the river were not allowed to dam up the water and thereby cause shortage on the lower reaches. If a dam had to be constructed, water rights were distributed starting at the lower reaches and working upstream from there. The owner of a body of running water had certain rights when it flowed through somebody else's land. The owner of the land was forbidden to obstruct the flow of the water and had to permit the owner of the water to carry out necessary repair work on his land. *Ḥaḳḳ-i shurb*, the right to make use of water at a given interval, could be the subject of inheritance or devise, but could not be either sold, bequeathed, rented, or given away as charity. However, in Ottoman practice we find examples of owners of water, of individuals or of a *waḳf* foundation, where the water might be sold for use in irrigation. What the state was concerned about was to prevent speculation in the price of water and to prevent the depriving of those who had *ḥaḳḳ-i shurb* in favour of those paying higher prices (*Erzerum ḳānūn-nāmesi*, dated 1540, in Barkan, *Kanunlar*, 70).

In addition to the prescription on water use in Islamic law, the Ottomans continued practices and regulations which they found in the conquered lands and enacted new legislation. These concerned the water supply for cities, water distribution, especially in areas with water shortages, and rice growing, which became a major state enterprise involving water use on a large scale. General Ottoman policy regarding water use and water works was determined to a great extent by the Ottoman land tenure system, which left the direct exploitation of agricultural land primarily to the *reʿāyā* farming small units. The state did not participate directly in large-scale water or land reclamation projects or in agricultural production, except for the water supply in the cities and for rice growing. Such projects were usually initiated and carried out in the form of *waḳf* endowments by members of the Ottoman house or of the upper echelons of the ruling class. There was no government agency responsible for water projects or regulations for water use. The construction of aqueducts and maintenance of water ways was under the supervision of the *ser-miʿmārān-i khāṣṣa*, head architect in charge of public works. Under his authority, and directly under a *nāẓir* or superintendent, were the *su yoldjularī*, technicians in charge of the maintenance of water pipe system in Istanbul.

Rice cultivation as a major irrigation activity. Here one can see how the Ottomans realised large-scale irrigation projects. In rice growing, abundant water supply and maintenance of water courses for constant watering of the rice paddies were crucial, so that the real object of possession or assignment was not so much the land but rather the use of the water. In the surveys, the possession or assignment of the *kharḳ* > *arḳ* or *nahr*, the channel for irrigation, was granted by the government to individuals as *mulk* or *tīmār* [*q.v.*]. Often the possession of a *kharḳ* determined who would possess a certain land (cf. *Kanunlar*, ed. Barkan, 12). Since the water was distributed in limited quantities, the government strictly regulated the amount of rice seed to be planted, and it recorded in the survey books the amount for each *kharḳ*. Many channels for the irrigation of rice paddies, *anhār-i čeltük* (*čeltik*), were named either after the person responsible for their opening or after their possessors. Because of the unusually large consumption of rice, the Ottomans encouraged from the beginning the extension of rice growing, either by establishing direct government control over water-courses, or by granting possession or proprietorship of waste (*mawāt*) lands, particularly in the flooded areas. Official sources conclusively show that rice was widely cultivated in the Maritsa, Mesta (Karasu) and Vardar valleys in the 9th/15th century. The growth of government revenues from rice growing in various regions in the Balkans is shown in Table 1 based on the *muḳāṭaʿa* [*q.v.*] registers from this period (see M. Tayyib Gökbilgin, *Edirne ve Paşa livâsı*, Istanbul 1952, 125-53).

The principal rice growing areas in Anatolia and their respective revenues in 1045/1636 are shown in Table 2 (see R. Murphey, *The functioning of the Ottoman army under Murad IV*, unpubl. dissertation, Univ. of Chicago 1979).

An Italian source of 880/1475 (F. Babinger, *Die Aufzeichnungen des Genuesen Iacapo de Promontorio-de Campis . . .*, Munich 1957, 65) estimated at 15,000 gold ducats the revenues from rice production. Idrīs-i Bidlīsī (*Hasht bihisht*, the conquest of Filibe, Murād I's reign) states that the sultan's share of the rice production in the Maritsa valley amounted to *ca.* 80,000 gold ducats in the time of Bāyezīd II. Besides those mentioned above, there were other important rice-growing areas in the Sakarya river valley and its tributaries in the provinces of Khudāwendigār, Sulṭān-önü, Bolu, Ankara and Kütahya. Archival

TABLE I

Estimated revenue for three-year period in Ottoman *aḳčas* (50 *aḳčas* = approx. 1 Venetian ducat)

	866/1461-2	885/1480-1	895/1490	903/1497-8
Maritsa valley and its tributaries (Filibe, Tavuslu, Yanbolu, Aḳča-Ḳizanlïk, Burgaz, Čorlu, Ergene, etc.)	1,679,920	2,650,000	2,750,000	
The Struma (Serres, Drama, etc.) and the Vardar (Veria with the Trikkala plain added by 887/1482) district	8,000,000	9,000,000 (in 887/1477-8)		1,040,000
Menlik and Temir-ḥiṣār in the Vardar valley		220,000 (in 882/1477-8)		
The village of Aḳshani on the Struma river		105,000 (in 889/1484)		

TABLE 2

Estimated annual revenue in *aḳčas* (240 *aḳčas* = approx. 1 ducat)

Upper Cilicia (Sīs, and its environs)	69,650
The Kelkit river valley (Niksar)	180,000
The Sonisa area	140,000
The Ḳîzîlîrmaḳ delta (Boyabat)	1,333,547
The Devres river valley (Tosya)	233,333
The upper Gediz river valley	283,333
The Menderes river valley and its tributaries (Aydîn, Čine, etc.)	198,332
The Baḳîr river valley (Bergama)	133,333
The Gediz river valley (Demirdji, Adala, etc.)	160,000

sources (*khudāwendigār waḳf defteri*, Tapu ve Kadastro Genel Müd., Ankara no. 585) prove that already under Orkhan (726-63/1326-62) the Ottoman state was concerned in extending rice-growing in the conquered areas, and either a part or all of the inhabitants of many villages were made *čeltükdji*, those of rice growers endowed with a special status. From the earliest surviving survey of Albania dated 835/1431-2 (*Sûret-i defter-i sancak-i Arvanid*, ed. H. İnalcık, Ankara 1954, 3a, 8b, 75, 145), we know that some water *arḳ*s designed for rice-growing were by that time assigned as *tīmār* to the *sandjaḳ-beg* and to *su-bashî*s. Rice-growing was introduced or extended in the lands conquered by subsequent Ottoman sultans. In his efforts to expand state revenues, Meḥemmed II [*q.v.*] greatly extended rice cultivation in the Balkans and took under the direct control of the central treasury most of the rice-growing lands in Rumeli as well as in Anatolia (see his order about rice-growing areas made *beylik*, i.e. state-owned, in İnalcık, *Fâtih Mehmed'in fermanları*, in *Belleten*, xliv, 697, doc. no. 1 dated Shaʿbān 883/October-November 1478, and also the regulation in *Ḳānūnnāme-i sulṭānī ber mūceb-i ʿörf-i ʿOsmānī*, ed. R. Anhegger and H. İnalcık, Ankara 1954, 81-2). Despite his general policy of returning lands seized under his father, Bāyazīd II did not completely relinquish state control over such rice-growing lands.

In extending the area of rice cultivation, which involved primarily the construction of irrigation works, there were two main methods: state enterprise and private initiative. In order to create state rice fields, the government assigned a group of ordinary *reʿāyā* to a permanent status as *khāṣṣa čeltükdji* (*čeltikdji*), labourers of the sultan on the state's rice fields. In the surveys, they are listed also under the names of *kürekdji* or *ortaḳdjî*. Once recorded as *čeltükdji* in the surveys, neither these labourers nor their offspring could change their status (see the *Ič-Il Ḳānūn-nāme*, ed. Barkan, 54; *Ḳānūn-nāme*, Süleymaniye Library Reisülküttab no. 1004, 24). They are also included under similar groups which served in tne mines, in the salt-beds or as guardians of the mountain passes in return for exemption from certain taxes, principally the *ʿawāriḍ-i dīwāniyya* or extraordinary impositions. In other words, they constituted a labour force under the direct control of the state. In the province of Anatolia alone, one-seventh of the population was included in this tax-exempt category. The condition of a *čeltükdji* was quite onerous, since apart from the hardships borne by him in irrigating and cultivating the rice, he had to surrender half of his production to the state treasury. The seed was supplied by the state and taken back at the time of harvest. State proprietorship of water channels was considered to be the justification for the exploitation of their labour. This organisation seems to have reached its final form in a later period in the Ottoman empire, since in the early records labourers in rice cultivation were often state-owned slaves, the *khāṣṣa ortaḳdjî*. In the eastern provinces, forced labour was imposed upon the *reʿāyā* household to work in the rice fields and repair canals for a fixed number of days every year (usually three or four days, see the *ḳānūn-nāme*s of Diyārbekir and Malaṭya, ed. Barkan 113, 147). This practice, apparently retained from pre-Ottoman times, caused widespread discontent among the *reʿāyā*, free peasants. Upon the complaint of the Christian *reʿāyā* in the province of Trebizond and in other places against such corvées (*salghun*), the Ottomans introduced the system of registered *čeltükdji* or *kürekdji* as described above. In need of labour forces for extended rice fields in the marginal lands, as in Cicilia or in the lowlands of the Aegean or Pamphylian plains, the state also tried to use the labour of tribal groups by settling them in the vicinity. In any event, some nomadic groups had already been occupied for some time in growing rice in the flooded lands, and sought to retain this profitable source of income for themselves (see the *ḳānūn-nāme* of Sīs, ed. Barkan, 202; *ḳānūn-nāme*, Istanbul University Library no. T.Y. 6941, 78). In Rumeli, some nomadic groups were simply registered as *čeltükdji* (ed. Barkan, 263). Thus the concern of the state in converting flooded lands into rice-growing fields by preparing irrigation canals gave rise to groups whose status was quite different from that of the rural population of the Ottoman Empire in general.

When the conduits or *kharḳ*s of harnessed waters were assigned as *tīmār* to members of the military class, they were entitled to get a tithe of the rice production. But in addition, many of them, imitating the state system, took half of the rice production when they supplied the seed and other expenses for irrigation. Since this widespread practice often caused abuse of the peasant's labour, and shortages in the limited water supply, the state tried to regulate and control this kind of cultivation.

Also, rice cultivation and connected irrigation works were extensively applied in the *mawāt* lands reclaimed by members of the ruling class and *waḳf* founders, both large and small. The state, granting absolute proprietary rights, encouraged such land reclamation projects, which mostly involved the discovery and harnessing of water sources. In such cases, the *kharḳ*s were made the property of the individual. But all such projects had to be submitted and approved by the sultan, not only in order to comply with the *sharʿī* law, but also for such practical considerations as the protection of the *reʿāyā* against exploitation of their labour and of their water sources. The large-scale irrigation projects initiated by the members of the ruling class in the abandoned flooded areas in the Sakarya river valley are particularly interesting in this respect (the main source for this is the above-mentioned *waḳf*-register of Khudāwendigār). In one such project (see the same register published in part by Barkan in *Vakıflar Dergisi*, ii [1942], 364-5), the promoters proposed and asked the approval of the sultan for constructing a dam on the Sakarya river, and to excavate canals 17,000 *dhirāʿ*s (11.65 km) in length, and estimated that the irrigated land would take 75 *mud* (approx. 38.5 tons) of seed to plant. The labour was expected to be supplied by the free peasants of the area in exchange for a half-share in the harvest, excluding the tithe

due to the *tīmār* holders. Cotton and other crops were also expected to be cultivated on the reclaimed land. Apart from the tithe to be paid to the *tīmār* holders, and the profit accruing to the *reʿāyā*, the promoters promised to undertake the expenses of repairing the caravan highway passing through this flooded area and to construct a caravanserai and five fountains. The sultan gave his approval to this project, subject to the willingness of the *reʿāyā* of the area to work on the reclaimed land.

We find numerous examples of such irrigation and land reclamation projects in the Ottoman empire, always made subject to the approval of the sultan, and made conditional on the consent of the local population and *tīmār* holders to co-operate. Such projects, with large potential yields, were almost always proposed and realised as *waḳf* endowments. This method was the predominant form of land reclamation and irrigation in the Ottoman Empire. Except for rice cultivation, the state seldom took a direct part in organising such irrigation projects. Such irrigation projects were undertaken more extensively in the period of the rise of the *aʿyān* and the local dynasties in the 18th century. Under the impact of European commercial expansion during the period, they made efforts to put into cultivation previously unused swampy lands. It was during the *Tanẓīmāt* [*q.v.*] period that, under the influence of current ideas from Europe, the state became systematically interested in land improvement and in the extension of agriculture. A Council for Agricultural and Industrial Affairs, the Zirāʿat wa Ṣanāʾiʿ Med̲j̲lisi, had already been created in 1254/1838. In a questionnaire distributed in 1259/1843, the state attempted to find out the amount of land left out of cultivation due to flooding, and European experts were sent to the Dobrudja, Cyprus, and other parts of the empire, and reports were submitted with suggestions for the improvement of agriculture. The increased European demand for cotton from the Levant during the American Civil War spurred the Ottoman government to introduce broad measures to increase cotton production in the watery plains in Cilicia, the Aegean coasts, and in Macedonia. This development caused shrinkage in rice cultivation in these areas. Apart from the extensive irrigation works in the Konya plain which were open for use in 1331/1913, no substantial drainage or irrigation project was accomplished by the state until the Republican period. As late as 1945, the area of irrigated land in Turkey was limited to 20,000 hectares.

Regulations on water distribution. In Anatolia and Rumeli, where water supply was generally adequate for agriculture for 9-10 months out of the year, fixed regulations for water distribution as in Iran and in the Fertile Crescent were not common. In the dry regions of the central and eastern Anatolian plateau, and during the summer months starting from July, certain regulations were worked out for the distribution of available water sources among individuals. Such arrangements, stemming from pre-Ottoman times, were particularly common in the neighbourhood of large towns where numerous orchards and gardens were to be found. According to the observations of modern geographers, in certain parts of Anatolia where traditional methods survived, the organisation of water distribution was dictated by shortages of water both regionally and seasonally, by the extension of irrigated agriculture, or by aggregation of population (X. de Planhol, *De la plaine pamphylienne aux lacs pisidiens*, Paris 1958, 146, 323-8). As to sharing of spring water between several villages, there was usually no formal regulation, unless recurrent disputes forced the government to intervene as an arbiter and to work out regulations. Such disputes usually appeared as arguments over the use of pasture lands, and it was the *ḳāḍī*'s court which was responsible for settling them in accordance with the *s̲h̲arʿī* rules, as was the case with all matters involving water distribution. This explains the lack of universally-applied regulations enacted by the government.

As a general policy, the Ottomans avoided imposing regulations on water use, and abolished pre-existing taxes and dues on water (see the *ḳānūn-nāme* of Malaṭya, Barkan, 113). In some districts, the Ottomans retained older regulations for distribution of water, for irrigating gardens and fields, and for water supply to the city. In the province of Ḳaramān, where the Ottomans found the most developed system of water distribution for urban areas, a *mīr-āb* or superintendent of water was chosen to supervise the application of these regulations. To distribute water according to the provisions of the *s̲h̲arīʿa* regarding the *ḥaḳḳ-i s̲h̲urb*, right in the use of water, and *s̲h̲ufʿa*, or pre-emptive right, was the *mīr-āb*'s responsibility. To ensure complete equity, the *mīr-āb* appointed, with the approval of the community, several *mutawallīs* who oversaw the distribution of the shares. He was also assisted by *s̲h̲āgirds* who performed the work during the actual irrigation process. The regulations tried to prevent various abuses, such as taking water out of turn by bribing the *mīr-āb* and others, which reflect the acute competition between the users of water during the summer months. Each user of distributed water paid a fixed fee to the *mīr-āb* (for the rates see the *ḳānūn-nāme* published in *JESHO*, xi/1, 116), who acted as tax-farmer for the government. The revenue deriving from *mīr-ābiyye*, together with certain connected dues for Konya, amounted to 90,000 *aḳčas* in 907/1501 (see Başvekâlet Arşivi, Tapu no. 40) and to 150,000 *aḳčas* in 1046/1636 (see R. Murphey, *op. cit.*). The function of *mīr-āb*, apparently originally a Persian institution (see Iṣṭak̲h̲rī, Persian tr. ed. I. Afshar, Tehran 1347, 206-7; *Tadhkirat al-mulūk*, ed. V. Minorsky, London 1943, 84), was performed in other parts of Anatolia sometimes under the name of *su ag̲h̲asī* (see Ewliyā Čelebi, ii, 397, iii, 29). Ewliyā Čelebi made the remark that, if it were not for the *su ag̲h̲asī*, the populace would have murdered one another. (For the organisation of water use within the village, see X. de Planhol, *op. cit.*, 325-6.)

As to the techniques used in harnessing water, the Anatolian peasant usually used the simple method of channelling water from the rivers through *k̲h̲arḳ*s or *arḳ*s, but the methods of drawing up water by means of animal-powered wheels or *dōlāb*s and small dams were used. (For an interesting example of building dams for irrigation in the Ḳaramān province, see *JESHO*, xi/1, 123.)

City water systems. The supply of water to the towns was the second main area of concern for the Ottomans. The Ottoman water system in the towns before 857/1453 has not been studied. However, it is known that after the conquest of Istanbul the Ottomans developed quite a sophisticated water system for the city, and applied this system too in other cities in the empire, notably in Jerusalem and Mecca. In Istanbul, the most complex and best-studied example, we see that the system consisted of collecting in reservoirs or *bends* (Pers. *band*) the waters from the two hilly areas in the outskirts

of the city, namely the Khalḳalī valley and the Belgrad forest, and then bringing this water underground in huge pipes and over aqueducts to high points in the city. Water towers or *su terāzī*s were constructed to keep the water at a high level and water depots, *maṣlaḳ*s and *maḳsam*s, distributed the water in different directions. In order to construct and maintain the system, an extensive organisation grew up under the chief architect or *khāṣṣa miʿmār-bashī* and the superintendent of the water conduit workers or the *su yoldjularī nāẓīrī*. The construction and maintenance of the water works was financed and organised by *awḳāf*, either of individuals or of sultans. The main water conduits and aqueducts came into being to bring water to the complexes surrounding the great mosques which, as we know, served as the nuclei for the development of the city [see ISTANBUL]. The mainstay of this water system was created through efforts under two sultans, Meḥemmed II and Süleymān I. In the winter of 861/1456 Meḥemmed II gave orders "to bring into the city from the countryside an abundance of water through aqueducts" (Kritovoulos, *History of Mehmed the Conqueror*, tr. Riggs, Princeton 1954, 105). The Byzantine water works, pipes and aqueducts which had been left to fall into ruin during the last centuries of the empire, were re-discovered and used by the Conqueror to create the first Ottoman water system (see Tursun Beg, *The History of Mehemmed the Conqueror*, ed. İnalcık and Murphey, Chicago 1978, 55-6). Dalman and Wittek (*Der Valens-Aquadukt*, 11) maintain that these works were concentrated on those areas of the Khalḳalī valley closest to the city. The Ḳīrḳ-Česhme or forty fountains constructed by the Conqueror at the Valens acqueduct or Bozdoghan-Kemeri received its water from this conduit. The rapid increase in the city's population, first under Bāyezīd II and then under Süleymān I [see ISTANBUL], together with the construction of major mosques under these sultans, led to a search for water sources at a greater distance. It was under Süleymān I that the second major water project was carried out, this time collecting mainly the waters of the Kāghīdkhāne valley which also had been used for the water supply of Byzantium up until 1204 (Dalman and Wittek, 1-9). Dalman and Wittek (14-15) show that the main aqueducts or *su-kemeri*s on this line were the work of the architect Sinān, who built them first in 961/1554 and then a second time in 971/1564 after heavy rains had destroyed them. In constructing their water works, the Ottomans made use of the remains of the Byzantine water conduits and aqueducts as well as employing native Greek experts (a certain master called Kiriz Nicola is mentioned by Selānīkī, *Taʾrīkh*, 5) among the *su yoldjularī*. It may be suggested at this point that the Ottomans borrowed from the Roman-Byzantine system some hydrological techniques and, combining them with their own traditions evolved quite a complex organisation to supply water for their huge capital city. Sultan Süleymān's extensive water pipeline brought to the city and to his newly-constructed mosque abundant water, which was distributed to a number of new fountains. A report by Sinān himself of Ṣafar 976/August 1568 (Âtif Efendi Library, ms. 1734, fols. 256b-261b) gives the following details about the situation at that date. The water newly supplied by both the Kāghīdkhāne and Ḳīrḳ-Česhme water pipelines amounted to 81 *lüle* (one *lüle* is traditionally defined as the amount of water passing through a pipe of given dimensions in 24 hours, or approximately 60 m³, see Dalman and Wittek, 20-1). At the time of low water level, out of 95 private and public fountains existing at this date, 64 had been recently constructed. The 95 fountains took up 38 *lüle* of the total water supply (in 1945, İ. Tanışık found in Istanbul alone 219 public fountains of Ottoman times). In addition, Istanbul had 15 *maṣlaḳ* using 5 *lüle* and 1 *ḳamish* (one-fourth of a *lüle*), 18 wells using 5 *lüle* and 1 *masura* (one-eighth of a *lüle*). The remainder of the water went to the Palaces and gardens of the Sultan and grandees in the city, as well as to the public bath houses. The basic system was expanded upon by suceeding sultans, particularly in connection with newly-constructed mosques (see for an example, *Taʾrīkh-i djāmiʿ-i sharīf-i Nūr-i ʿOthmānī*, in *TOEM* Suppl., Istanbul 1335-7/1917-19, 26-31). They constructed new reservoirs and water lines, extending those already in existence in the two main areas of Kāghīdkhāne and Khalḳalī.

Water sources found and brought to the city through government initiative belonged to the *mīrī waḳf* or state-controlled endowments and were placed under the control of the relevant *waḳf*'s administration, which was also responsible for meeting repair expenses. Fearing lest the water supply specified for the use of imperial mosques, palaces and public fountains be cut short, *mīrī waḳf* waters were not allowed to be used for any other purpose. Constant inspection to ensure their proper use was carried out by the *su yoldjularī*, who even had the authority to enter houses for investigation. When a new charitable institution, a mosque, bath or fountain was to be built, its founder was first required to find a water source outside the city. This water was brought to the city by means of a device called *ḳatma*, that is, the adding of newly-discovered water to the main water conduits of the *mīrī waḳf*. This *ḳatma* water could be taken from the main conduits only at certain specified points. Upon application, the sultan gave his formal permission for the use of *ḳatma* and recognised ownership rights over this water in a special *fermān*. The *sharʿī* principles required that such a procedure be followed. Many wells were dug in order to exploit underground water as a further addition to the city's water supply. Such waters became the property of the individuals who discovered them. Despite the close watch kept over the *mīrī waḳf* waters, there were many instances of diverting of water by individuals for private use. The government therefore closed a strip of land adjacent to the water line to new construction and assigned the populace of twelve villages as guardians and repairers of the water lines outside the city. To meet the water needs of the city population, water from the public fountains was distributed in waterbags by *saḳa*s or *saḳḳā*s. The *saḳḳā*s were organised in two corporations, the *arḳa saḳalarī* or human water-carriers, and the *at saḳalarī* or horse water-carriers, who were in competition with one another.

In repairing and enlarging the water system of Mecca dating from ʿAbbāsid times, the Ottomans made use of the organisation which they evolved in Istanbul. They sent a team of experts to carry out the construction, and using black slaves and others organised a maintenance crew along the lines of the *su yoldjularī* organisation of Istanbul.

9. Irrigation in pre-20th century Muslim India

Lakes, tanks, wells and artificial canals have supplemented rain water in the subcontinent since ancient times. With the establishment of the Dihlī Sultanate in the beginning of the 7th/13th century, traditional irrigation technology began to undergo a change, owing to the arrival of skilled architects from Central Asia; in particular, the construction of wells with Persian wheels and of large canals provides a clue to the introduction of certain mechanical devices and the progress of civil engineering in India during the 7th/13th and 8th/14th centuries. This section of the article is divided into three parts: the first on lakes and tanks, the second on wells, and the third on artificial canals.

The Turkish conquerors were the first dividers of the water from the land in the districts of innumerable rivers and boundless swamps in Bengal. They built dykes, roads and tanks and, consequent upon it, the reclamation of vast tracts of land was possible in Deltaic Bengal. According to Djūzdjānī, the dykes made the movement of people and cattle possible during the rainy season, while the water flowing through the channels could be diverted to the paddy fields, in case failure of the monsoon caused scarcity.

The first lake built by Sultan Shams al-Dīn Iltutmish (607-33/1211-36 [*q.v.*]) outside the capital city of Dihlī was called the *Ḥawḍ-i Sulṭānī* (also *Ḥawḍ-i Shamsī*). The mediaeval Indo-Persian writers mention it as a reservoir constructed for supplying drinking water to the city of Dihlī, but Ibn Baṭṭūṭa's reference to the cultivation of the seasonal fruits and vegetables at its sides during the summer shows that the water was used for irrigation also. Ibn Baṭṭūṭa also informs us that it was two miles long by half that breadth. ʿIṣāmī alludes to the *Cashmā-yi āftāb* ("sun spring", i.e. the famous Sūradj Kūnd near Dihlī) as its source of water. The details furnished by Sultan Fīrūz-Shāh and the compiler of the *Sīrat-i Fīrūz-Shāhī* about its repair contain reference to the original channels that were led off from the river Djamunā to the lake. These channels supplemented the rain water which sufficed for the whole year.

Like Iltutmish, his nobles also evinced keen interest in public utility works. Evidence from contemporary epigraphic sources shows that, during his and his successors' reigns, a number of lakes and tanks were constructed in the provinces. In Palwal (in Haryānā State) a tank was excavated in 608/1211. Another inscription found at Bārī Khātū (in the District of Nāgawr in Radjasthān) mentions the construction of a lake by the officer Masʿūd, son of Aḥmad Khaldjī, in 629/1232. It must have provided relief both to the cultivators and travellers in the torrid climate of the desert.

Little information is available about the excavation of lakes and tanks in Dihlī as well as in provinces during the Khaldjī and the Tughluḳid periods. Sultan ʿAlāʾ al-Dīn Khaldjī is credited with having taken an interest in developing irrigation in his empire for the progress of agriculture. By the time he occupied the throne of Dihlī (695/1296), the *Ḥawḍ-i Shamsī* had silted up and the city had expanded considerably. Therefore, he had the *Ḥawḍ*

cleared of silt and its embankments repaired. Moreover, he ordered the construction of a new lake, larger in area than the *Ḥawḍ-i Shamsī*, outside the wall of his new capital of Sīrī (near Dihlī), and this came to be known as the *Ḥawḍ-i khāṣṣ*. Baranī's reference to the *bālā-band-i Sīrī*, contained in his account of the construction of the beautiful buildings by Sultan Fīrūz-Shāh (752-90/1351-88) thereon, tends to suggest that the dam was built with lofty embankments for the storage of rain water in the nearby area. The construction of these royal lakes considerably raised the water level in the area, and thus reduced the depth of the irrigation wells in the area around.

The Tughlukid period is marked by much improvement in irrigation facilities in the empire. The number of lakes and tanks increased, not only in Dihlī but in the provincial towns also. The contemporary Persian epigraphs mention the construction of lakes in Bihār Sharīf (Bihār State), Gaṙh Mukhtaṣar (Distr. Ghāzīābād, U.P.) and Manglore (Distr. Sahāranpūr, U.P.). An inscription at Nāgawr informs us that the *muḳṭa'* (governor), Malik Fīrūz b. Muḥammad, constructed a large lake in Nāgawr and named it *Fīrūz Sāghar* (Hindi *sagar* "sea").

The lakes constructed in Dihlī are important as reflecting the progress being made in civil engineering on the one hand, and the concern of the succeeding sultans in causing to be constructed more beautiful lakes and tanks than those built earlier on the other hand. For instance, Sultan Ghiyāth al-Dīn Tughluḳ constructed aqueducts over the lake in Tughluḳābād, whose traces can still be seen. References are also found to the lakes built during the reigns of Sultan Muḥammad b. Tughluḳ and Sultan Fīrūz-Shāh. The anonymous author of the official history, *Sīrat-i Fīrūz-Shāhī*, and hagiographies, mention the famous lakes of Dihlī, such as the *Ḥawḍ-i Tughluḳ-Shāh, Ḥawḍ-i Ḳutlugh Khān, Ḥawḍ-i Shahzāda Fatḥ Khān* and *Ḥawḍ-i Shahzāda Mubārak Khān*. In the provinces, the lakes constructed in Dawlatābād and Ḥiṣār Fīrūzā are worth mentioning. Sultan Muḥammad b. Tughluḳ's *Ḥawḍ*, built on a considerable height in the fort of Dawlatābād, can be seen today. In Ḥiṣār Fīrūzā, Sultan Fīrūz-Shāh also had a cistern built in 754/1353 on a raised platform. It was originally constructed for supplying water to the ditch excavated around the fort, but after water from the newly-constructed canals became available, its water was used in the gardens and flower beds inside the fort.

In the 9th/15th century, cisterns appear to have been constructed by the rulers of the regional kingdoms that arose in the wake of Tīmūr's invasion of India (800/1398). The construction of fountains in Djawnpūr, Gudjarāt and other cities in the plains led to the construction of cisterns, as their water, flowing through narrow channels from a height, could make the fountains work. Bābur's description of lakes in the Pandjāb also testifies to the fact that old lakes were kept under repair, while new ones were excavated in the new towns. As the *iḳṭā'*s assigned by the king to nobles in lieu of cash salary and allowances were hereditary, at least in practice during the pre-Mughal times, the assignees constructed tanks in their lands for the extension of cultivation and horticulture. For instance, Yūsuf b. Mullā Djhakan, the *munṣif* or judge of the *parganā* of Čawnd, in 952/1545 constructed a beautifully-patterned tank in his administrative charge during the reign of Shīr Shāh Sūr.

Later on, the Mughal emperors, and the Dakanī sultans of Bīdar, Golkondā, Bidjāpūr and Aḥmadnagar, established reservoirs. Allusions to these reservoirs in contemporary inscriptions provide insights into the skill employed in their construction. The Muḥammad-Nād, a reservoir built at Bidjāpūr in 1165/1751-2 by Afḍal Khān, is a great feat of engineering. Similarly, the huge tank-like well with rooms was built with the money of Tādj Sulṭān, the wife of Sulṭān 'Ādil Shāh in Bidjāpūr. The Pānī-Maḥall (water-palace) at Nādrūg and the tank of Mā-Ṣāḥibā at Ḥaydarābād are notable exemples.

In the 12th/18th century, the *amīrs* of Sind and the two rulers Ḥaydar 'Alī and Tīpū Sulṭān [*q.vv.*] of Mysore maintained the traditions of the early rulers. Tīpū Sulṭān took special interest in irrigation questions, building new tanks and repairing old ones. The huge tank built by him in Doradji possesses a huge embankment about 2½ miles long, and at places is 45 feet high. He also rewarded other people who constructed tanks. The *'āmil*s (revenue collectors) were entrusted with the responsibility of maintaining the tanks in the kingdom. All these lakes and tanks from mediaeval times existed till the beginning of the 20th century, but with the modern expansion of the towns and cities many of them have been filled in and the land used for residential purposes. In South India, however, they still survive and are used as picnic spots.

As for the construction of wells, they are mentioned in our sources either as *čāh* or *ba'in* or *bā'olī*. The *ba'in* and *bā'olī* [*q.v.*] are step-wells, meant for the use of men and animals. Evidence available about the *čāh* is interesting in so far as it reflects on the use of the Persian wheel to lift water from the deep wells in areas around Dihlī during the early Sultanate period, indicating, from its comparative costliness, considerable local prosperity. Only fairly opulent farmers could afford the installation of this water-lifting machine.

Sources from the 8th/14th century refer to the *sāḳiya* and the *čarkh* set up on the wells that were owned both by the state and by the cultivators. Al-'Umarī in his *Maṣālik l-abṣār* was informed by an Indian traveller in Arabia, Shaykh Mubārak of Cambay (Gudjarāt), at some time in the beginning of Sultan Muḥammad b. Tughluḳ's reign (725-52/1325-51), that people in and around Dihlī set up Persian wheels on the wells to water their fields and gardens. The writer refers to the Persian wheels as *sawāḳī*, whereas the contemporary Indo-Persian writers use rather the term *čarkh*. An interesting anecdote related in the *Djawāmi' al-kalim* about Shaykh Niẓām al-Dīn Awliyā' suggests the presence of the Persian wheel in Dihlī in the preceding century. It tells us that Shaykh Niẓām al-Dīn once came across a *čarkh* set up on a well. The cultivator who was driving the bullocks for lifting water, exhorted the animals, saying *āge baṛh, āge baṛh* ("speed up, speed up") in a melodious tone. The sound produced by the motion of the wheels and the voice of the peasant had such an effect on the Shaykh that he immediately passed into a state of ecstasy.

The anonymous author of the *Sīrat-i Fīrūz-Shāhī* states that *čarkh*s were set on wells around the newly-constructed *Ḥawḍ-i Shahzāda-yi Mubārak-Shāh* outside the capital Fīrūzābād. The *Ḥawḍ* was filled with the water lifted from the wells in the summer when the rain water was exhausted. He further informs us that the income from the lake was endowed by Sultan Fīrūz-Shāh for the benefit of the poor. The work also contains references to the buckets (*dalw*s) made of metal (iron) instead of *kūza*

(pitchers or pottery vessels), hanging down the wheel by means of chain of ropes. The Persian term *dūlāb* also occurs in the same passage, signifying the surface wheel which was used to lift water from the *ḥawḍ*. The *dūlāb* was used to lift water from the open surface of tanks or rivers, the pitchers or buckets being fixed on the rim of the wheel, which was revolved by the hand.

Later sources reveal that the use of the Persian wheel was quite widespread in North India. Kabīr, who flourished during the 9th/15th and the first decades of the 10th/16th century, refers to it in his verses when he likens the rosary used by the externalists to the garland of vessels attached to a *rahaṭ* (Hindi equivalent of the Persian wheel). As Kabīr lived most of his life in Benares, we may assume that he found the Persian wheel being used in the region of modern eastern Uttar Pradesh.

Like Indo-Persian writers, S̲h̲ayk̲h̲ Zayn, the *ṣadr* or minister of Bābur, mentions, the *čark̲h̲*. In 925/1519 when Bābur crossed the D̲j̲helum river and occupied Bherā (Sargodhā District in Pakistan), he found Persian wheels as a common means of irrigation there. The orchards and the sugar-cane and paddy-fields were irrigated with the water of wells lifted thus. Later on, when he occupied the territories of Lāhawr, Dipālpūr and Sirhind (932/1525-6), he found everywhere the peasants irrigating their fields by means of the Persian wheel, and he describes its structure thus: "They make two circles of ropes long enough to suit the depth of the well, fix strips of wood between them, and on these fasten pitchers. The ropes with the wood and attached pitchers are put over the well-wheel. At one end of the wheel axle, a second wheel is fixed, and close to it another on an upright axle. This last wheel the bullock turns; its teeth catch in the teeth of the second, so that the wheel with the pitchers is turned. A trough is set up where the water empties from the pitchers, and from this the water is conveyed everywhere". S̲h̲ayk̲h̲ Zayn says however that in India, other methods of irrigation are used, including the leather bucket (*čaras*) lifted out of water by yoked oxen, whilst *dhekli*, based on the lever system, which is still in use, was most common.

Gradually, use of the Persian wheel seems to have spread everywhere during the Mug̲h̲al period, but they were especially numerous in the Pand̲j̲āb, the most prosperous region. Even an average cultivator there could afford to set up a Persian wheel on his well, which had been built of bricks and plastered with lime, despite the expenditure. Mug̲h̲al historians like Abu 'l-Faḍl, Ḥamīd al-Dīn Lāhōrī, Yūsuf Mīrak and Sud̲j̲an Rāʾī Bhandārī, mention it as one of the commonest means of irrigation in North India, but since the turn of the 19th century, it have been generally replaced by tube-wells.

As for the harnessing of rivers for irrigation purposes, the construction of large artificial canals began in the reign of Sultan ʿAlāʾ al-Dīn K̲h̲ald̲j̲ī (695-715/1296-1315) towards the close of the 8th/13th century. Amīr K̲h̲usraw refers to a deep and wide canal built by G̲h̲āzī Malik in the territory of Multān when he describes the revolt of the army and people of Multān against the governor Mug̲h̲altay. Besides this, G̲h̲āzī Malik seems to have constructed canals in Multān and Dipālpūr units. Baranī adds that in every territory where G̲h̲āzī Malik served as governor, he constructed canals for the progress of agriculture there. The *Ins̲h̲āʾ-i Māhrū* contains a *nis̲h̲ān* (official document) issued by the governor of Multān, Māhrū, in the reign of Fīrūz-S̲h̲āh, to an official, Kamāl Tād̲j̲, asking the latter to carry on the repair work of the old canals. Three canals, *D̲j̲ū-yi Nāṣirwāh*, *D̲j̲ū-yi Kuṭbwāh* and *D̲j̲ū-yi K̲h̲iḍrwāh*, are mentioned, and must have been constructed by G̲h̲āzī Malik before his accession to the throne in 720/1320.

The credit for constructing a number of canals in the region between the river Sutled̲j̲ and Dihlī goes to Fīrūz-S̲h̲āh. First, the vast arid tract of Haryānā, where only one crop was raised during the rainy season in a year, attracted the royal attention. In 755/1354, he laid down the foundations of the city of Ḥiṣār Fīrūzā (modern Ḥiṣār) and then constructed a double system of canals, the headwaters of which were drawn both from the Sutled̲j̲ and the D̲j̲amunā rivers. The Sutled̲j̲ canal, named Ūlūg̲h̲-K̲h̲ānī, flowing through Rupar and Sirhind town, met the D̲j̲amunā canal called Rād̲j̲īwāh near the new city of Ḥiṣār Fīrūzā. Both of them passed via Karnal. At Ḥiṣār Fīrūzā, they discharged their water through a single channel into the ditch around the city. Yaḥyā Sirhindī supplements S̲h̲ams-i Sirād̲j̲ ʿAfīf when he informs us that the construction of canals started in 756/1355. Besides the D̲j̲amunā and Sutled̲j̲ canals, he mentions another canal cut from the Sutled̲j̲, the waters of which were conducted up to D̲j̲had̲j̲har (a town in Rohtak Distr.), irrigating a vast arid tract of 96 sq. miles. In 757/1356, another canal was excavated from the Ghaggar river. This flowed past the fort of Sirsuli (town) and reached Harni K̲h̲erā. The most important canal was the D̲j̲amunā canal (later called western D̲j̲amunā canal) that was also cut from the D̲j̲amunā and conducted to the capital city of Fīrūzābād. Besides, the Salīmā canal (later *K̲h̲ānpūr ka nālā*) was dug in the Siwālik hills and the waters of Sirsūlī and Salīmā were diverted into it. It flowed past S̲h̲āhābād town (to the south of Ambālā). Like their master, some of Fīrūz S̲h̲āh's nobles also appear to have excavated irrigation channels in their *iḳṭāʿ*s, e.g. the *Sīrat-i Fīrūz-S̲h̲āhī* informs us that K̲h̲ān-i D̲j̲ahān Maḳbūl planted gardens and constructed canals, serais and bazars in his *iḳṭāʿ*.

All these canals were kept under repair by the later Sultans of Dihlī. Though Bābur complains that there were no artificial canals in India, although they could easily be constructed at a number of places even in the plains, S̲h̲ayk̲h̲ Zayn refers to the canal of Fīrūz-S̲h̲āh flowing via D̲j̲had̲j̲har, as well as the canal in the *iḳṭāʿ* held by Dilāwar K̲h̲ān Lōdī's maternal uncle in the foothills of the Pand̲j̲āb (D̲j̲ayswal *parganā*). Bābur's description of the territorial unit of Čandarī also contradicts him, for he found there much running water through channels. We find allusions in the *Afsānā-yi S̲h̲āhān* to the dams and canals in Orissa, and these appear to have existed there before the Afg̲h̲ān conquest of the region in 980/1572.

Likewise, the Mug̲h̲al historians furnish information about the repair of the old and the construction of new canals. According to Abu 'l-Faḍl, first S̲h̲ihāb al-Dīn Aḥmad K̲h̲ān repaired the Fīrūz-S̲h̲āh's D̲j̲amunā canal, as it had silted during the early years of Akbar's reign. Later, another officer of Akbar, Nūr al-Dīn Muḥammad Tark̲h̲ān, had the same canal repaired a second time. The reign of S̲h̲āh D̲j̲ahān witnessed the digging of new canals in different territories. S̲h̲āh D̲j̲ahān also increased the length of Fīrūz-S̲h̲āh's D̲j̲amunā canal by reopening it in the hills at K̲h̲iḍrābād, and brought its water up to S̲h̲āh-D̲j̲ahānābād (Dihlī). This came to be known both as *Nahr-i bihis̲h̲t* and the *Nahr-i fayḍ*.

Shāh Djahān's noble, Aṣālat Khān, built a dam on the Karnāl stream and made its water flow into a channel so that the land around might be irrigated.

During the same reign, a number of small canals were built in the upper Bārī Dōʾāb (Pandjāb), the best-known of which was the *Shāh-nāhr*. It was brought from the Ravi in the hills near Radjpur. It flowed as far as Lāhawr, covering 84 miles. Two other canals were led off from the same point, one to Paṭhānkot and the other to Batālā. ʿAlī Mardān Khān is also credited with the construction of a canal from the Tavī river for watering his gardens at Sodhrā near Wazīrābād in the upper Račna Dōʾāb which was 30 miles long. The canals were constructed in the regions of Multān and Sind also during the same reign.

In South India as well, the canals seem to have been a common means of irrigation since ancient times. Evidence available suggests that brick embankments were built to protect them from inundation. But the general practice in the South was that of water-storage. For instance, there were thousands of canals in Baglana cut from the river, and they supplied water to every village and town during the 11th/17th century. Tīpū Sulṭān, however, built a large canal in the tradition of the Muslim rulers of North India. In 1797 he constructed a dam across the Kavari, a few miles west of Sringapatam, with an embankment 70 feet high.

This irrigation system survived till the close of the 19th century, when the modern canal system began. The Persian wheel also became obsolete, owing to the introduction of tube-well technology, so that in the Pandjāb and western Uttar Pradesh they have almost disappeared.

10. Irrigation in Transoxiana. [see Supplement].

11. Economic aspects of modern irrigation

The use of water for irrigation in agricultural production is widely practised in the cultivated areas of the Muslim world where constraints of low and episodic natural precipitation limit yields on existing new crops or inhibit the introduction of a wider range of crops. Such areas include the desert lands of north Africa, the Arabian Peninsula, Iran, Central Asia and the Indian sub-continent, the semi-arid zones generally lying adjacent to the deserts, the Mediterranean zone and, in South Asia and Asia proper, the dry tropical climatic regions. The greater part of the Muslim world is encompassed by this definition. It should be added that there is scientific evidence that a process of desertification is affecting the semi-desert margins over wide areas. In consequence, it is possible that the surface area where irrigation is essential to agriculture is gradually extending, not least in the Sahel of Africa. In all except the dry tropical zones, the use of irrigation permits stabilisation of output of staple winter grain crops by off-setting fluctuations in annual rainfall and allows cultivations of summer vegetable and other cash cropping which would otherwise be difficult or impossible. In the dry tropics, where hot and wet summers alternate with hot but dry winters, irrigation mainly functions as an aid to cultivation in the winter months.

Irrigation has taken on a special significance in recent decades as population growth has tended to accelerate and as the need has increased for states to provide reliable and augmenting food supplies from domestic sources. While some success has been achieved in encouraging greater use of dryland areas under mechanised systems and with new improved seed varieties, most governments have attempted to reduce the growing and adverse imbalance between domestic supply and consumption of foodstuffs through expansion of the area under irrigated cultivation and better use of existing water supplies in traditional areas. Governments have played the major role in a drive common throughout the Muslim territories to increase the volume of irrigation water at the disposal of their agricultural sectors. Irrigation budgets have often dominated financial allocations to agricultural development, especially in countries such as ʿIrāḳ, Iran and Egypt. In the latter country, the continued engineering of the River Nile, culminating with the completion of the Aswan High Dam in 1970, was the main economic preoccupation of the state for much of the modern period. For ʿIrāḳ, too, hydraulic works on the Tigris and Euphrates for flood control, water storage and generation of hydro-electric power made a large and important claim on national resources, beginning with the first financial allocations of the Iraq Development Board in the 1951-2 fiscal year. The second Iranian development plan (1334/1955-6 to 1341/1962)

was above all concerned with the construction of storage dams on the main river systems of the country, including the Diz, Safīd Rūd and Karadj structures.

Rapid and expensive adoption of irrigation projects has not always been accomplished with regional co-operation or with a critical appreciation of the appropriateness of irrigation technology borrowed from the industrialised states of the world. Exploitation of the irrigation potential of the Euphrates in the period since the Second World War has brought conflicts between riparian states on the division of waters, as storage facilities in Turkey, Syria and ʿIrāḳ have been constructed without co-ordination. In 1974 and 1975 the flow of the Euphrates at Hīt in ʿIrāḳ fell to unprecedented levels (9.02 milliard cubic metres in 1974 and 9.42 milliard cubic metres in 1975) as a result of new water storage reservoirs built in the states upstream. In contrast, close liaison was maintained between Egypt and Sudan during the course of the creation of Lake Nasser behind the Aswan High Dam, both to ensure agreement on the division of waters and to provide for the settlement of communities displaced from the lands submerged beneath water level.

A slow response by traditional agricultural areas to the demands of a larger and often higher consuming population led to increasing state intervention in irrigation affairs with perceptible effect from 1952, though particularly from 1958 in Arab countries and from 1962 in Iran. With few exceptions, governments favoured centrally financed and controlled irrigation projects, which demanded imported technology and sophisticated management of land, water and farmers by the national bureaucracy. Irrigation developments in the Muslim world have witnessed damaging failures in selecting techniques of an appropriate type by scale and technology. In Iran, the Diz irrigation scheme foundered in part, since large farming units created to work the area proved unmanageable. The Libyan government-controlled Kufra irrigation scheme in the south of the country, a show-piece designed to demonstrate Libya's ability to utilise oil revenues to set up permanent non-oil assets, is one of the many high-technology irrigation projects established in the oil-exporting states of the Middle East and north Africa which have out-stripped indigenous economic and technical resources and have added little to the sum of domestic food production.

Sources of irrigation water have changed only insignificantly in recent years. Surface and ground water are the mainstays for irrigation water provision, though a number of richer states, notably Saʿūdī Arabia and Kuwayt, have made use of desalinised sea water on a very small scale at extremely high cost. Pumping of irrigation water from deep aquifers, of which the Kufra scheme is an example, has increased in importance, though in many cases water extraction is faster than replenishment rates or comes from fossil water reservoirs, with clear implications for the longevity of these sources. Considerable scope remains in the area for more efficient use of existing water resources, rather than the expensive creation of new ones.

The total area of irrigated land in the Muslim world has grown very slowly, despite large allocations of resources for the construction of reservoirs and irrigation schemes. In the Middle Eastern heartland of the Muslim world, the proportion of agricultural land under irrigation has remained more or less unchanged at a quarter of the total. Individual states have improved their positions somewhat, above all Egypt, where the Aswan dam has increased both the total area under irrigation and the area under perennial cropping. Estimates of relative reliance on irrigation for the main Muslim states are shown in Table 1, including both traditional and modern systems.

The strength of traditional systems has been much eroded in recent years. Underground water channels, *ḳanāt, falladj* or *kārīz*, have been generally neglected and many have fallen into disuse. The diesel pump has widely replaced other manual and animal-powered water lifting systems. Meanwhile, the addition of new irrigated areas served by modern systems of water storage has been offset by losses of irrigated land rendered infertile through growing alkalinity and salinity as a result of bad water management, inadequate provision of drainage facilities and inappropriate cropping patterns. Most countries of the arid and semi-arid zone are affected by this problem, though none worse than ʿIrāḳ, where it is estimated that more land is lost annually through the effects of soil salinity than is reclaimed by developments projects.

Despite the expenditure of considerable funds on, and the economic dedication of governments to the expansion of the irrigated area in the recent past, results expressed in real gains in land under cultivation and crop production have been disappointing in most areas of the Muslim world.

Table 1

Percentage of cultivated land under irrigation in the Middle East

Baḥrayn	8
Cyprus	16
Egypt	100
Iran	20
ʿIrāḳ	50
Jordan	7
Ḳaṭar (Qatar)	100
Kuwayt	100
Lebanon	20
Libya	8
Saudi Arabia	80
Syria	10
Turkey	7
United Arab Emirates	100
Yemen (North)	10
Yemen (South)	80

12. Ornamental uses of water in Muslim India

In a land so dependent generally on the summer monsoon, where there are few permanent sources of water away from the great rivers and their surrounding terrain where the water-table is high, human settlement depends on artificial means of conserving water from one rainy season to the next. These means, which apply to the domestic water supply as well as to agriculture, have been described in filāḥa, v; for canals see also Nahr. Many of these utilitarian works, however, are frequently ornamented and decorated beyond the call of functionalism, and are consequently described here.

Many water monuments were constructed before the coming of the Muslims, who continued not only their function and form (except for the elimination of figural ornament and the introduction of the arch) but also their maintenance through civil or *waḳf* funds. The simplest examples are large open reservoirs in and around towns (commonly called "tanks" in India; see Yule and Burnell, *Hobson-Jobson*, s.v., for etymologies; also *tāl*, *tālāʾō*, and in the case of Muslim constructions also *ḥawḍ*), of all shapes but commonly rectangular, sometimes with masonry surrounds and steps leading well below the average water-level; as the water was used or dried up more steps would be exposed, the shelves being convenient for personal ablutions or for washing clothes; pavilions (*kūshk*, *čhatrī*) may be added mainly for ornament [see further on these, above, 9]. Similar masonry surrounds (*ghāṭ*) may be provided on river banks or on artificial lakes caused by damming a valley (e.g. the Anāsāgar at Adjmēr, the Pičholā at Udaypur [*q.v.*]). Since open expanses of water cause a perceptible change in the microclimate, buildings might be sited to take advantage of the cooling effects of evaporation (e.g. Fīrūz Shāh's *madrasa* and other structures on two sides of the Ḥawẓ Khāṣṣ at Dihlī [*q.v.*], Maḥmūd Shāh's palace, the tombs and the mosque at Sarkēdj [see gudjarāt and hind, vii. Indo-Muslim architecture]; and many pleasances may be sited in the middle of an artificial tank (e.g. Djahāngīr's Hiran Mīnār complex at Shaykhupūra, the tombs of Shēr Shāh and Salīm Shāh at Sasarām [*q.v.*], Mughal kiosks at Nārnawl [*q.v.*], the Ẓafar Maḥall in the Ḥayāt Bakhsh garden in the Dihlī fort [see plan, Vol. ii, 266 above]; the tombs would have been used as pleasant retreats during the owners' lifetime.

Tanks and artificial lakes fed from constant sources naturally need provision to be made for the escape of surplus water; overflow tunnels and sluices may occasionally be sumptuously decorated, as at Sarkhēdj in Gudjarāt, but the simpler structures in the local quartzite at Dihlī have a monumental beauty of their own, e.g. that on a water-channel off the Nadjafgaṛh canal at Wazīrābād, with an included silt (and fish?) trap; those on the *band* connecting Tughluḳābād with ʿĀdilābād (see plan, Vol. ii, 257 above), whereby the low-lying fields to the south of Tughluḳābād could be flooded to a depth of some 2 m. to create an artificial lake for the defence of the citadel and leaving Ghiyāth al-Dīn's tomb as an isolated outpost; and, more complex, a two-storeyed sluiced dam, called Sāt pula, built into the south wall of Muḥammad b. Tughluḳ's Djahānpanāh to regulate the storage of water within the city; analyses, photographs and measured drawing of all these in Yamamoto *et alii*, *Delhi*, iii.

The simple well does not much lend itself to ornamentation, but may form part of a complex, such as Djahāngīr caused to be constructed at day's-march intervals along the road to Kashmīr, of *sarāʾī* + mosque + well, water from the latter being taken up by *čaras* [see filāḥa, v] to irrigate a small flower-garden. The step-well (*bāʾōlī* [*q.v.*]), however, is most frequently decorative as well as functional, providing chambers at various levels close to the water's edge to provide cool retreats in summer; e.g. in Dihlī the Gandhak kī bāʾōlī, *ca.* 630/1233; the circular *bāʾōlī* in Fīrūz Shāh's *kōṭlā*, *ca.* 753/1352; and the superb Rājōn kī bāʾīn, inscr. 912/1506; all analysed in Yamamoto *et alii*, *Delhi*, iii, with photographs and measured drawings. Analogous structures in Gudjarāt, called *vāv*, have the entire well covered at surface level; comprehensive study, including other water monuments, in Yasmin Amirali Shariff, *Water monuments of Gujarat* . . ., University of London M. A. Archaeology thesis 1981 (unpublished).

Water was a necessary adjunct to palaces and gardens, and might be provided, when either of these two was beside or close to a river or lake, by a Persian wheel (*rahaṭ*); a further Persian wheel, or series of wheels, housed in a tower, might be used to raise the water to a greater height when it was necessary to provide a sufficient head of water to operate fountains. The water was led through palace courtyards and gardens by stone channels, often with intermediate cisterns which could be highly ornamental, as that in the Laʿl bāgh at Bīdar (plan in Yazdani, *Bidar*, 53); in Bīdjāpur, where all the centre of the city was supplied by underground channels from the Čānd and Tādj *bāʾorīs*, a special water-pavilion, *djal-mandir*, in the elaborate later ʿĀdil Shāhī style, discharged water from jets into a large stone surrounding tank to make a visual focal point in the city scheme. Under the Mughals, however, the garden was developed more than ever before as a new art form [see bustān, ii]. The ideal garden shape was a fourfold plan, *čahār-bāgh* (the name *čār-bāgh* persists in many Indian towns as the name of a locality even where no traces of gardens remain), as in e.g. the garden surrounding Humāyūn's tomb in Dihlī (see plan, Vol. ii, 265, above), where the divisions are marked by water-channels with cisterns at or seats over the intersections; the pattern was followed and augmented in later tomb complexes: notably Akbar's tomb at Sikandra, the tomb of Iʿtimād al-Dawla and the Tādj Maḥall [*q.v.*] at Āgrā, the tomb of Awrangzīb's queen ("Bībī kā maḳbara") at Awrangābād, and that of Ṣafdar Djang at Dihlī, where the principal channels are often expanded into stone—often marble—basins 3 or 4 m. wide with a central rank of fountains, terminating on the cross axes in *bāradārīs*. Similar gardens exist apart from tombs and palaces, e.g. Rām bāgh, Zahrā bāgh, Wazīr Khān kā bāgh, Mihtar Khān kā bāgh, Ačānak bāgh, all at Āgra (*ASI*, iv [1871-2], 104 ff.); in his suggestive (but sometimes naïve) *Early garden-palaces of the great Mughals*, in *Oriental Art*, NS, iv/2 (1958), 3-10, R. A. Jairazbhoy proposes the latter as the site of Bābur's original *čahār-bāgh* in India.

Mughal gardens reached their peak of perfection in Kashmīr, where at Shrīnagar, Akbār's Nasīm Bāgh, Āṣaf Khān's Nishāṭ Bāgh and Djahāngīr's Shālīmār took advantage of the copious natural water supply; ʿAlī Mardān Khān's canal from the

Rāwī made possible Shāhdjahān's Shālimār at Lāhawr. These make use of *ābshār*, water-chute, an oblique bed of flat or scalloped marble, and *djharnā*, cascade, with water flowing in a sheet over a straight edge to fall over a vertical bank of small niches, each intended to hold a small lamp with a shade of coloured glass. Other Mughal gardens are mentioned above s.v. BŪSTĀN. A curious late Mughal water monument is the Pān čakkī, water-mill, in the shrine of Bābā Shāh Muẓaffar Čishtī, a spiritual preceptor of Awrangzīb, outside the city walls of Awrangābād: water brought from a distance falls through some 7 m. to operate a small mill, and the water then flows through two large tanks. Mughal water monuments and gardens were much imitated by Hindū rulers in Rādjāsthān. The Sahēliyon kā bāgh in Udaypur offers a number of fountains of different designs fed by water under high pressure from one of the city lakes, in a more extravagant taste than any Mughal conception. The small palace at Dīg, near Mathurā, is more refined in its elegant tanks and channels, and water is led in copper pipes over the openings of the buildings in order to flow over screens of *khas* grass, to cool and perfume the air passing through.

The devices of water decoration embodied in the gardens are found also in Mughal forts and palaces [see especially MUGHAL, v, a]. These sometimes involved bringing water from considerable distances (e.g. ʿAlī Mardān Khān's canal which supplied the Red Fort at Shāhdjahānābād, Dihlī, tapped the Djamunā over 100 km. away; see W. E. Baker, *Memoranda on the western Jumna canal* . . ., London 1849. Some of the aqueducts involved are themselves works of art). In the Red fort of Shāhdjahānābād, the water is further raised in the Shāh burdj, from an open pavilion in front of which, with *ābshār* and *djarnā*, water flows through a marble channel, the Nahr-i bihisht, which not only supplies the Ḥayāt Bakhsh and other gardens but also flows through all the palaces on the east wall [buildings marked c, e, f, g, h in the plan in Vol. II, 266 above] at a depth of some 15 cm., whose supreme achievement is a shallow basin 3 m. square in the Rang maḥall, carved into the shape of an open lotus flower; this was of one piece of the finest Makrāna marble and inlaid with semi-precious stones. When the water flows over it the petals of the flower appear to move and ripple (the channels are now normally dry, but the author of this article had the privilege of seeing them in operation at the end of 1942). The Ḥayāt Bakhsh garden has additionally two marble pavilions with *djarnās*, called Sāwan and Bhādon after the first two months of the rainy season in the Hindū calendar, with a fine central tank with scalloped red sandstone borders which again are intended to be barely covered with water to produce a ripple effect. Comparable works in the Āgra fort, of the time of Shāhdjahān's additions, include a very deep *ābshār* outside the Maḥall-i khāṣṣ and an elegant fountain in the Muthamman Burdj.

Bridges may be included in ornamental works. One near the tomb of Sikandar Lōdī in Dihlī, but of Mughal date, is rather a pleasant spot for strollers to catch the water-cooled breeze than a work of strict necessity for transport, although the Mughals brought an elegance to bridges of greater functional necessity. Outstanding is the bridge at Djawnpur [*q.v.*], whose two parts are provided with kiosks with carved marble screens to take advantage of the breezes along the river.

(J. BURTON-PAGE)

MĀʾ AL-ʿAYNAYN AL-ḲALḲAMĪ is the name consistently given in Mauritania and Morocco to the greatest scholar and religious and political leader of the Western Sahara during the latter half of the 19th century. Uncertainty remains as to the significance of his sobriquet Māʾ al-ʿAynayn, "water of both eyes", but it is not unlike *ḳurrat al-ʿayn*, "coolness of the eye". Māʾ al-ʿAynayn was born on the day of the death of his brother, Abu 'l-Fatḥ, and of his paternal grandmother Khadīdja. His father Muḥammad Fāḍil regarded his birth as a blessed consolation at a time of family distress. His mother, Manna bint al-Maʿlūm al-Idjaydjbiyya, cherished his name because the infant was her only son at that time; if she were to lose him it would be as grievous to her as the loss of her sight.

1. Life. Muḥammad al-Muṣṭafā was the twelfth son of Muḥammad Fāḍil b. Māmīn al-Ḳalḳamī, the founder of the Fāḍiliyya *ṭariḳa*. This was an offshoot of the Kunta Bakkāʾiyya branch of the Ḳādiriyya order [see KUNTA]. Muḥammad Fāḍil came from the family of the Ahl al-Ṭālib al-Mukhtār who were centred at Dār al-Salām north of Goumbou on the border between Mali and the Mauritanian Ḥawḍ. He was born about 1780, and his Fāḍiliyya order was pan-Ṣūfī in its aspirations. His ideal envisaged the unification of all other Ṣūfī orders by a recognition of equal worth and by acceptance of his independent counsel. His *wird* and *dhikr* encouraged a high-pitched, shrieked and ecstatic repetition of the *shahāda*, and his religious acts were accompanied by charms, spells, magic numbers and thaumaturgy. The family claimed Sharīfian descent from ʿAlī b. Abī Ṭālib through Yaḥyā b. Idrīs al-Ṣaghīr. It also claimed lineal relationship to the Lamtūna [*q.v.*] who were the aristocracy of the Almoravid Ṣanhādja.

Muḥammad al-Muṣṭafā Māʾ al-ʿAynayn was born on 27th Shaʿbān 1246/10th February 1831. He was taught by his father, and as a gifted pupil, he later became a devoted adherent of the doctrines of the Fāḍiliyya. He was to found his own order, the ʿAyniyya, but it differed little from the Fāḍiliyya on basic principles. His outlook was conservative and eclectic. His book, *Ifādat al-rāwī fī annī mukhāwī*, argues the case for a pan-Islamic rapprochement, theological and political, and within and beyond the Ṣūfī orders. He followed this path from his earliest years, and it became a political obsession towards the end of his life.

When still young he left home. When he was

16 years old he visited Marrākush in order to study, and for some time he lived with the Aghlāl on the border of the Ḥawḍ. In 1858 he performed his first pilgrimage to Mecca. On his way he paid his respects and requested support from the Moroccan sultan, Mawlay ʿAbd al-Raḥmān, and from the heir to the throne, Sīdī Muḥammad. He returned to Morocco in 1859, and on his route to the Ḥawḍ he stayed at the caravan town of Tindūf. It was then a centre for slave traffic, and was dominated by the Īdaw Bilāl and the Tādjakānt. Māʾ al-ʿAynayn acquired a reputation for miracles, and he enjoyed the favour of a noted scholar, Sīdī Muḥammad al-Mukhtār b. Aʿmash al-Djakānī. He had access to his library and taught and wrote, but he declined an offer to remain as a teacher in Tindūf. In 1861 he returned to the Ḥawḍ. In 1865 or 1867 he left the Ḥawḍ definitively on a journey to the Adrār town of Shinkīṭ and to Tīris.

In 1869 his father, Shaykh Muḥammad Fāḍil, died in the Ḥawḍ. His legacy was divided between his four principal sons. Māʾ al-ʿAynayn was held in the highest esteem and wielded most political power. After 1873 he chose the barren regions of the Rio de Oro and the Sāḳiya al-Ḥamrāʾ as a permanent headquarters for his growing company of novices (*talāmīdh*) whose life style owed much to the example of the Kunta *shaykhs* [*q.v.*], and their successors. These northern districts of the Western Sahara facilitated closer contact with the Morrocan sultans, who were regularly visited by Māʾ al-ʿAynayn and who supplied them with slaves. Meanwhile, he combatted European encroachment on the Atlantic coast of the Sahara. He married into the principal tribal groups of the region and enjoyed wide support from the Awlād Dulay, the ʿArūsiyyīn, Tādjakānt, Awlād Bū Sbāʿ and Ahl Bārikalla. He dominated the Western Sahara caravan routes, and his power grew so great that, according to his son, Shaykh Muḥammad al-Muṣṭafā Murabbīh Rabbuh, Mawlay al-Ḥasan (1873-94) entrusted Māʾ al-ʿAynayn with the guarding of the frontier between al-Dākhila (Villa Cisneros) and al-Ṭarfāya (Cape Juby), sc. almost the entire coast of the former Spanish Sahara. During this period, Māʾ al-ʿAynayn had neither village nor town. He lived in his tents in the Tīris, al-Karihi, Aswam, al-Djakūba and Tawrik, but, as the pull towards the north increased, he commenced the construction of a *zāwiya* at Dār Ḥamrāʾ in the Sāḳiya al-Ḥamrāʾ, a fortress, and a small settlement at Maltga in the same region.

After 1896, ties with the Sultanate were particularly close. The growing influence of France to the north and the south strengthened the unity and coordination of political and religious policies. In 1897 Māʾ al-ʿAynayn was received in triumph by the stripling sultan, Mawlay ʿAbd al-ʿAzīz, who had ascended the throne in 1894. The sultan received the *wird* of the ʿAyniyya and religious instruction from Māʾ al-ʿAynayn. *Zāwiyas* were founded in Marrākush, Fās and Salā, and lands and estates were bestowed on the Shaykh and his family. He became an *éminence grise* at court, and he was feared at court on account of his magic power and his fanatical followers. The *ʿulamāʾ* of Fās gave him the title of *ḳuṭb* [see ḲUṬB. 2. In mysticism]. With financial aid from the sultan, Māʾ al-ʿAynayn commenced his most ambitious project in 1898. This was the building of a *ḳaṣaba*, *zāwiya*, mosque, library, political and commercial headquarters at the reed beds of Ṣmāra on the banks of the Wayn Silwān in the Sāḳiya al-Ḥamrāʾ. The site was close to a route which linked the Wād Nūn to the Adrār and Tīris. It was not far from the port of al-Ṭarfāya, and the terrain was suitable for pasturage, some agriculture and the planting of date palms.

Ṣmāra was, and still is, a complex of low buildings designed in a style which blends the brown dry-stone walling of the Adrār and Tīshīt with the decadent urban Hispano-Moresque of Morocco. Building stone was locally quarried or brought by steamer from Mogador and the Canary Islands. Moroccan stone masons and architects were employed in the task of constructing a compound to which buildings were annexed. Some were private dwellings for the four wives and many concubines of Māʾ al-ʿAynayn. Others belonged to his sons or accommodated guests, artisans and *talāmīdh*. Work commenced on a large mosque and a *khalwa*. Space was allowed to house Māʾ al-ʿAynayn's library of 300 books and his collection of at least 500 manuscripts. Other buildings were store-houses, granaries and arsenals. The design was a compromise between the desert and the sown. Certain private quarters were hardly more than walled enclosures inside which tents were pitched and animals were penned.

The work was never completed. In 1903 the French declared the Trārza district of south-west Mauritania a French protectorate. In 1905 the *Commissaire général français*, Xavier Coppolani, was assassinated at Tidjikdja by anti-European Saharans who had the backing of Māʾ al-ʿAynayn. In 1906, France occupied the Tagant. As Ṣmāra was indefensible, Māʾ al-ʿAynayn withdrew to his *ḳaṣaba* at Tīznīt in the Sūs. In 1907 he made it the base for his *djihād* [*q.v.*], and he appealed to the sultan for maximum assistance. Events worked against his interests, however. The ineffective Mawlay ʿAbd al-ʿAzīz relinquished the throne to his brother, Mawlay al-Ḥafīẓ, to whom Māʿ al-ʿAynayn swore allegiance (*bayʿa*) in 1907. The latter sultan was anxious to achieve an accommodation with the French, so that Māʾ al-ʿAynayn quickly lost faith in him. In 1910 he arrived in Marrākush with an army of tribesmen of the Anti-Atlas and the Sūs. Accompanied by this show of strength, it was alleged that he announced his claim to the throne of Morocco as *Mahdī* [*q.v.*] of the hour, but some authorities doubt the historicity of this reported claim. The religious influence of Māʾ al-ʿAynayn in Morocco was formidable, but it should be remembered that he was 79 years old and was approaching senility. His son, Shaykh Muḥammad al-Imām, and a brother of Māʾ al-ʿAynayn, Shaykh Saʿd Abīhi (Saad Būh)—who cooperated with the French—both discount such reports as unfounded. Evidence suggests that Māʾ al-ʿAynayn's eldest son, his successor (*khalīfa*), Aḥmad al-Hība or Hayba [*q.v.* in Suppl.], directed the policy of his father. A major reverse took place at Ḳaṣbat Tadla on the 23rd June 1910. In September Māʾ al-ʿAynayn retired to Tīznīt, and he died there on 29 Shawwāl 1328/28 October 1910. His tomb in Tīznīt has remained a family shrine. Ṣmāra had been abandoned and was occupied by a French force under Colonel Mouret in 1913. The dome of its *ḳaṣaba*, the symbol of Māʾ al-ʿAynayn's authority, was severely damaged, and the library of several hundred books on mysticism, astronomy and theology was burnt.

According to Muḥammad al-Mukhtār al-Sūsī, Māʾ al-ʿAynayn married 116 wives. He fathered at least 21 sons and 30 daughters, and some sources give the total number of his offspring as 68. His most noted descendants, among them his *khulafāʾ*, were seven sons by his wife, Maymūna bint Aḥmad ʿAliyyūn, who was born into a lettered household

among the Barābīsh of the Ḥawḍ. She was the mother of Aḥmad al-Hība (d. 1919), Muḥammad al-Muṣṭafā Murabbīh Rabbuh (d. 1924), al-Ṭālib Khiyār, Muḥammad al-Imām and Muḥammad al-Aghdaf (d. 1972-3). These noted sons, together with brothers from other marriages, continued the family tradition of scholarship and sanctity in the Maghrib and the Sahara. Several of them were poets and authors of weighty works on theological and legal subjects and on the ideas of their father. Some of them co-operated with the Spaniards in the then Spanish Sahara; others became exiles in Morocco and Mauritania or lived a pastoral life in the Ḥawḍ. They strove to maintain the influence and status of the family and to combat European domination of the Western Sahara. In the main, they showed solidarity with the Moroccan royal house and followed the example set by Māʾ al-ʿAynayn himself. The extended family represented, and represents, a conservative force in the radically-changing Western Sahara.

2. Character and achievements. The closing years of the life of Māʾ al-ʿAynayn, his activities in Morocco and the building of Ṣmāra have disproportionately overshadowed the life he led between 1870 and 1890 when he ruled from his palatial tent in the Rio de Oro and the Sāḳiya al-Ḥamrāʾ and set down the bulk of his writings. In 1887 the captive explorer, Camille Douls, was brought to Māʾ al-ʿAynayn who subsequently released him. Douls was impressed by the physical stamina and awesome appearance of his captor. Due to his miracles, his many marriages and formidable learning he acquired a semi-divine power over the Saharans. He combined the roles of doctor, teacher, arbitrator and avenger with fire. In organising a desert community he put into effect his dream of unifying Islamic sects in pan-Islamic loyalities, as outlined in several of his books. These total some 300 titles. Shaykh Muḥammad al-Muṣṭafā Murabbīh Rabbuh in his own *Ḳurrat al-ʿaynayn* lists 140 titles. He adds, however, that his list is incomplete and that sundry opuscules were not included. Several of these were written as early as 1861 when his father was in Tinduf. Forty of his most important works were lithographed in Fās at his own expense. Here is the list of these as it was compiled by E. Lévi-Provençal in his *EI*[1] article: 1. *Adab al-mukhālaṭa maʿa 'l-yatīm*, on the margin of *Mufīd al-samiʿ*, no. 20, 1321; 2. *al-Aḳdas ʿala 'l-anfas*, commentary on the *Waraḳāt* of the Imām al-Ḥaramayn, 1320; 3. *Dalīl al-rifāḳ ʿalā shams al-ittifāḳ*, 1321, 3 vols; 4. *Dīwān* of mystical poetry, 1316; 5. *Djawāb al-muḥaḳḳiḳa fī akhbār al-khirḳa*, 1302; 6. *Kitāb Fātiḳ al-ratḳ ʿalā rātiḳ al-fatḳ*, 1296, 2nd ed. in 1939; 7. *Hidāyat al-mubtadiʾīn wa-nafʿat al-muntahīn*, *urdjūza* on *naḥw*, 1322; 8. *Ḥudjdjat al-murīd fī 'l-djahr bi 'l-dhikr ʿala 'l-marīd*, 1321; 9. *Ibrāz al-laʾālī 'l-maknūna fī 'l-asāmī 'l-ẓāhira wa 'l-muḍmara*, 1322; 10. *Iẓhār al-ṭarīḳ al-mushtahir ʿalā "ismaʿ wa-lā taghtarir"*, 1321; 11. *al-Khalāṣ fī ḥaḳīḳat al-ikhlāṣ*, 1320, 12. *al-Kibrīt al-aḥmar*, also printed at Fās in 1324; 13. *Ḳurrat al-ʿaynayn fī 'l-kalām ʿala 'l-ruʾya fī 'l-dārayn*, 1321, on the margin of no. 10; 14. *Mā yataʿallaḳ bi 'l-ḥasad*, on the margin of no. 36, 1320; 15. *Madjmaʿ al-durar fī 'l-tawaṣṣul bi 'l-asmāʾ wa 'l-āyāt wa 'l-suwar*, 1309; 16. *al-Maḳāṣid al-nūrāniyya*, 1306, on the margin of no. 29, 2nd ed. in 1320; 17. *Mubṣir al-mutashawwif ʿalā muntakhab al-taṣawwuf*, 1314, 2 vols; 18. *Mufīd al-ḥāḍira wa 'l-bādiya bi-sharḥ hādhih al-abyāt al-thamāniya*, 1316; 19. *Mufīd al-rāwī ʿalā annī mukhāwī*, 1309; 20. *Mufīd al-samiʿ wa 'l-mutakallim fī aḥkām al-twyammum wa 'l-mutayammim*, 1321; 21. *Mughrī 'l-nāẓir wa 'l-sāmiʿ ʿala taʿallum al-ʿilm al-nāfiʿ*, 1294; 22. *Munīl al-bashsh fī man yuẓilluhum Allāh bi-ẓill al-ʿarsh*, 1309; 23. *Munīl al-maʿārib ʿala 'l-ḥamdu li'llāh kifāʾ al-wādjib*, 1309; 24. *Muntakhab al-taṣawwuf*, printed 1325; 25. *Muẓhir al-dilālāt al-maḳṣūda fī alfāẓ al-taḥiyyāt*, 1321; 26. *Muzīlat al-nakad ʿamman lā yuḥibb al-ḥasad*, on margin of no. 11; 27 *Naṣīḥat al-nisāʾ*, 1321; 28. *Naʿt al-bidāyāt wa-tawṣīf al-nihāyāt*, 1311, also published in Cairo in 1324; 29. *Sahl al-murtaḳā fī 'l-ḥadīth ʿala 'l-tuḳā*, 1306; 30. *al-Sayf wa 'l-mūsā fī ḳaḍiyyat al-Khiḍr wa Mūsā*, 1320; 31. *Sayf al mudjādil li 'l ḳuṭb al-kāmil*, n.d.; 32. *Sayf al-sakt li 'l-mutaʿarriḍ lanā fī awwal al-waḳt*, n.d.; 33. *al-Ṣilāt fī faḍāʾil baʿd al-ṣalawāt*, 1321; 34. *Ṣilat al-mutaraḥḥim ʿalā ṣilat al-raḥim*, 1323; 35. *Tabyīn al-ghumūḍ ʿalā naʿt al-ʿarūḍ*, 1320; 36. *Taḳyīd yataʿallaḳ bi-ḥadīth "innamā 'l-aʿmāl bi 'l-niyyāt"*, 1320; 37. *Tanbīh maʿāshir al-murīdīn ʿalā kawnihim li-aṣnāf al-ṣaḥāba tābiʿīn*, 1321; 38. *Tanwīr al-saʿīd fī 'l-ʿāmm wa 'l-khaṣṣ*, 1320; 39. *Thimār al-muzhar*, collection of poems, printed 1324; 40. *Tibyān al-ḥaḳḳ alladhī bi 'l-bāṭil saḥḳ*, 1321.

According to the *Ḳurrat al-ʿaynayn* (fol. 72), Māʾ al-ʿAynayn mastered all the disciplines, language, grammar, syntax, elocution, logic, mathematics, the dating of seasons and feasts, the system of ʿAdjamī Saharan cryptology, jurisprudence, prosody and medicine (Arabian and Saharan Ḥassāniyya). Alongside these studies he gained experience in several branches of the occult.

Supernatural power was accepted as part of his personality. Its manifestation could not be separated from his involvement in mundane matters which concerned the day-to-day life of his *talāmīdh* or Saharawis. They sometimes found contradictions between their *ʿurf* and the *Sharīʿa*. Similar problems had been faced by earlier Kunta *shaykhs* and by Shaykh Muḥammad al-Māmī (d. 1865) of the Tīris Ahl Bārikalla. The Ahl Bārikalla of Imirikli were devoted followers of Māʾ al-ʿAynayn. They were familiar with attempts by Saharan teachers to resolve these question. Shaykh Muḥammad al-Māmī's book on tribal law and custom, *Kitāb al-Bādiya*, can be matched, though not surpassed, by opuscules of Māʾ al-ʿAynayn, and likewise his mathematical and astrological theories. Pamphlets by the latter on *tayammum*, prayer, fasting, hospitality, divorce and sexology were widely quoted, and several of these were appended to other works and lithographed. A major work, *Fātiḳ al-ratḳ ʿalā rātiḳ al-fatḳ*, forcefully argues the case for humane treatment of women, slaves, beggars and orphans, and for respect and deference towards kings and sultans.

Supernatural revelation accompanied the study of Arabic grammar, phonetics, and prosody. The *Ḳurrat al-ʿaynayn* (fol. 74) records that "when he composed a book about prosody one day he left with his mind preoccupied by certain obscurities. He sat facing a tree, and he began to beat the rhythm of the metres on the ground using a stick which he held in his hand. While thus engaged a burnt brick appeared before him. He raised it with his stick and discovered a treasure beneath it. He shunned it. He returned the brick to its former position and said, 'I do not want it.' Then he arose and sat opposite another tree, and God enlightened him in the matter he sought."

At least 30 of Māʾ al-ʿAynayn's major works are about Ṣūfism. *Naʿt al-bidāyāt wa-tawṣīf al-nihāyāt*, lithographed in Fās and twice published in Cairo, is still widely read in the Sahara and is possibly his

masterpiece. In its pages, Māʾ al-ʿAynayn argued that all Ṣūfī brotherhoods display only trivial divergencies. All brotherhoods were of equal merit and ought to combine. His arguments were carried a stage further in his book *Mubṣir al-mutashawwif ʿalā muntakhab al-taṣawwuf*, which is outspokenly pro-Ottoman in its sentiments. To the author, the Ottoman state exhibited pan-Islamic eclecticism and was the last to precede the appearance of the *Mahdī* who would unite Jews, Christians and Muslims after cataclysmic events.

Mention has been made of the license allowed by the Fāḍiliyya and the ʿAyniyya for the use of spells and secret scripts for religious purposes. Māʾ al-ʿAynayn, an avowed thaumaturge, displayed an interest in the occult and paranormal. Those unsympathetic to Māʾ al-ʿAynayn have dismissed him as a sorcerer posing as a scholar and have argued that his mysticism was an example of Ṣūfism in decadence. It is clear from the works which he wrote, for example *Madhhab al-makhūf ʿalā daʿwat al-ḥurūf*, where prayers are computed by letters of the alphabet, magic squares and numbers worn as amulets, that the system he used was highly complex and derived from mediaeval systems invented in the Maghrib. The Ḥawḍ is adjacent to Black Africa and has its own tradition of secret scripts. Eleven secret alphabets have been recorded in the Ḥawḍ. Some characters in these scripts represent the numerological value, or a graphic deformation of corresponding Arabic letters, or are based on the skeletal forms of complete Arabic words. Other characters are non-Arabic, possibly Lybico-Berber, and are lunette in shape. One Ḥawḍ script which is particularly rich in Non-Arabic characters is the al-Yāsīnī alphabet, which relates either to Yāsīn, its inventor (ʿAbd Allāh b. Yāsīn the Almoravid?), or to the letters Yāsīn which open Sūra XXXVI in the Ḳurʾān. Characters from these Ḥawḍ scripts appear in several lithographical works of Māʾ al-ʿAynayn, especially lunette letters. In the Rio de Oro, two of these scripts, the *suryāniyya* and the *ʿibrāniyya*, are known among the Ahl Bārikalla. Like Shaykh Muḥammad al-Māmī, Māʾ al-ʿAynayn found it natural to employ such scripts and alphabets for religious purposes.

Over one hundred miracles are attributed to Māʾ al-ʿAynayn in the *Ḳurrat al-ʿaynayn*. They range from the rescue of his books and novices from the flooding of the Sāḳiya al-Ḥamrāʾ in 1890 to the exorcism of one of his wives; punishment of robbers by fire; and the illumination of a room by his clothing. Certain of these happenings are patterned on miracles attributed to the Prophet. Nonetheless, they are far too varied to be unconnected with the psychic powers of Māʾ al-ʿAynayn, which were acknowledged even by his most bitter opponents. His powers of psychological persuasion were employed to dominate the minds of the Saharawis and to instil a fanatical zeal in the ʿAyniyya and its allies.

3. Al-Shinḳīṭī's portrayal. One of the most objective portraits of Māʾ al-ʿAynayn towards the end of his life is offered by Aḥmad b. ʿAmīn al-Shinḳīṭī, the author of the *Kitāb al-Wasīṭ* who passed through Ṣmāra on his way to Mecca and wrote his description, first published in 1911, a year after the death of Māʾ al-ʿAynayn. This author confirms that the Sāḳiya al-Ḥamrāʾ owed its habitations and date groves to Māʾ al-ʿAynayn. He remarks (pp. 365-6 of the 1958 edition) that the latter was learned in the *Sharīʿa*, *ḥadīth*, *tafsīr* and *fiḳh*, and that he was the only worthy successor to Shaykh Sīdiyya al-Kabīr (1780-1869). He thought highly of the moral qualities and character of Māʾ al-ʿAynayn, and speaks glowingly of him.

Bibliography: 1. Arabic sources. There is as yet no comprehensive biography of Shaykh Māʾ al-ʿAynayn in Arabic, but aspects of his life and career are dealt with in the following works: Aḥmad b. al-Amīn al-Shinḳīṭī, *al-Wasīṭ fī tarādjim udabāʾ Shinḳīṭ*, Cairo 1378/1958; Muḥammad al-ʿĀḳib b. al-Shaykh Sayyid ʿAlī ibn Māyābī, *Madjmaʿ al-baḥrayn ʿalā karāmāt shaykhinā al-shaykh Māʾ al-ʿAynayn*, n.d.; Muḥammad al-Imām b. al-Shaykh Māʾ al-ʿAynayn, *al-Djaʾsh al-rabīṭ fī maghribiyyat Shinḳīṭ wa-ʿarabiyyat man bihā min murakkab wa-basīṭ*, 1958; Muḥammad al-Mukhtār al-Sūsī, *al-Maʿsūl*, iv, Fedala, Morocco 1960, 83-101; Muḥammad al-Muṣṭafā Māʾ al-ʿAynayn, ms. Microfilm no. 171, National Library, Rabat; Muḥammad Taḳī Allāh, *Mudhakkir al-mawārid bi-sīrat Māʾ al-ʿAynayn dhi 'l-fawāʾid*, Fās 1316. — 2. European sources. A most useful source for the life of Shaykh Māʾ al-ʿAynayn is to be found in B. G. Martin, *Muslim brotherhoods in 19th century Africa*, Cambridge 1976, 125-51. Other sources which discuss aspects of his life and thought are: J. Caro Baroja, *Estudios Saharianos*, Madrid 1955, 285-335, *Un santón Sahariano y su familia*; G. Desiré-Vuillemin, *Contribution à l'histoire de la Mauritanie*, Dakar 1962, 91-102; C. Douls, *Cinq mois chez les Maures nomades du Sahara occidental*, in *Le Tour du Monde*, Paris 1888, 177-224; O. du Puigaudeau, *Une nouvelle généalogie du Cheikh Maʾ-el-Ainin u Mamim*, in *Hespéris-Tamuda*, xiv (1973), 157-63; D. Lafuente, *Ma el Ainin, Señor de Smara*, in *Africa* (1946, 1947); idem, *Mâ el Ainin frente a Gourand*, in *Africa* (1948); P. Marty, *Les Fadelïa*, in *RMM*, xxxi (1915-16), 139-41, 157; J. Mercer, *Spanish Sahara*, London 1976, 103-22, 153-6, 248-9; Al-Moutabassir, *Ma el Aïnin ech Changuîty*, in *RMM*, i (1907), 343-51; H. T. Norris, *Shaykh Maʾ al-ʿAynayn al-Qalqamī in the folk literature of the Spanish Sahara*, in *BSOAS*, xxxi (1968), 113-36, 347-76; C. C. Stewart, *Islam and social order in Mauritania, a case study from the nineteenth century*, Oxford 1973; M. Vieuchange, *Smara, the Forbidden City*, London 1933.

(H. T. Norris)

MAʿĀD (A.), place of return, a technical term in religious and philosophical vocabulary.

The verb *ʿadā*, *ʿawdᵃⁿ* signifies "to return to a place". Al-Djawharī treats it as a synonym of *radjaʿa*. The action of *ʿawd* is the movement whereby one returns to the point of departure: *radjaʿa ʿalā badʾihi*, or *ilā ḥāfiratihi*, either through a continuous progress, in describing a circle for example, or stopping at a certain point and retracing one's steps (cf. Sībawayh, cited by *LA*), whence the idea of a return to the origin, to the source. The verb *radjaʿa* is used in many Ḳurʾānic verses to indicate return to God: "Then He will make you die; then He will make you live; then you will be brought back to Him" (*ilayhi turdjaʿūn*, II, 28). This return takes places after the Resurrection. In the 4th verbal form, *aʿāda* denotes "to recommence, reiterate". This is the sense which it has in the verses where this root is associated with that of *radjaʿa*, for example (XXX, 11): "God begins (*yabdaʾu*) creation; then He repeats it (*yuʿīduhu*); then you will be brought back to Him". Subsequently, God is qualified by the titles *al-Mubdiʾ* and *al-Muʿīd*. These terms are not reserved for God. The Prophet said: "God loves

the *nakal* mounted on a *nakal*". He was asked the meaning of *nakal*. He replies "It is a strong and skilled man who is *mubdiʾ* and *muʿīd*, mounted on a strong and reliable horse which is *mubdiʾ* and *muʿīd*". Abū ʿUbayda explains that the reference is to a man who volunteers for successive military expeditions and returns ceaselessly to the attack. The well-trained and obedient horse earns the same distinctions. It is the notion of this 4th form which is dominant in the Ḳurʾān: resurrection is a recommencement. Theologians in fact mainly speak of *iʿāda* in the sense of a second creation. The idea of return is only implied, to the extent that there must be a return to the point of departure before there can be a recommencement. Thus al-D̲j̲uwaynī (*Irs̲h̲ād*, Arabic text, 317, ed. J. D. Luciani, Paris 1938) quotes Ḳurʾān, XXXVI, 78-81, from which he concludes: "That which has been brought back into existence (*al-muʿād*), is the same as that which has been created for the first time". We leave aside the question as to whether substances only, or both substances and accidents are the objects of *iʿāda*. In the *Kitāb Uṣūl al-dīn*, ed. Istanbul 1928, 232-3, ʿAbd al-Ḳāhir al-Bag̲h̲dādī shows that the return to existence of something which has been annihilated is possible, and he expresses himself in the same terms as those used by al-D̲j̲uwaynī. Consequently, if *iʿāda* is a second creation following death and annihilation, *maʿād* is the place reached by resurrected persons.

But the word *maʿād* is used only once in the Ḳurʾān (*XXVIIII*, 85): "Yes, He who endows you with the gift of Prophecy, it is He who brings you back to a place of return". The term is variously interpreted: some treat it as a synonym of *maṣīr* (place at which one arrives), as in III, 28: "And towards God is the place of arrival"; for others, it is the equivalent of *mard̲j̲iʿ* (place to which one returns), as in V, 18: "Towards God is your place of return for all"; or it is identified purely and simply as the Next Life (*al-āk̲h̲ira*). It should however be noted that the term has been understood in a much more concrete sense: it could denote, according to some, Mecca, whither the Prophet was to return, having conquered the town according to God's promise; in a more general sense, it could be the country where he was born (al-Farrāʾ) or his homeland (T̲h̲aʿlab). Finally, the word *muʿād* has been interpreted in terms of the verse II, 125: "And when We made the House (sc. the Kaʿba) a place where one returns (*mat̲h̲āba*)"; consequently, *mat̲h̲āba* = *maʿād* = place of Pilgrimage = *ḥad̲j̲d̲j̲*. In fact, al-Ḳurṭubī explains, a large number of pilgrims and visitors make their way each year to the holy places, and moreover, each one, having left them, desires to return there. Ibn Sīdah retains the two meanings of Pilgrimage and the Last Life. It may be noted that they conform perfectly, since *ḥad̲j̲d̲j̲* is a departure from the home, involving the leaving of country, goods, family, in order to go to the House of God, which, as al-G̲h̲azālī explains it, prefigures the departure from this earth in order to go to Paradise to see God Himself: seeing the House of God inspires the wish to see the Master of the House. Thus, *maʿād*, etymologically linked to *iʿāda*, taken in the symbolic connection *ḥad̲j̲d̲j̲-āk̲h̲ira*, came to refer primarily to the place of return of resurrected persons in the presence of God. It is in this sense that al-Tahānawī associates it with *ḥas̲h̲r* and *baʿt̲h̲*, the Assembly for the Last Judgment and the Resurrection. He distinguishes between a physical *maʿād* (*d̲j̲ismānī*), which is the return to life of bodies leaving their tombs, and a spiritual *maʿād* (*rūḥānī*), which consists of the return of spirits restored to their bodies (*iʿādat al-arwāḥ ilā abdānihā*). There can be as many as five doctrines on this subject. The first affirms only the reality of the physical *maʿād*; this, says al-Tahānawī is the approach of the theologians who deny the existence of a rational soul. He is no doubt referring to certain Ḥanbalīs, of whom Ibn Baṭṭa is an example, for whom the words *nafs* and *rūḥ* retained their ancient Semitic sense of vital principle, breath, even blood. Ibn Baṭṭa writes "We must believe in the call which Isrāfīl will utter to make the dead rise from their tombs". H. Laoust mentions in a note a passage of Ibn Taymiyya: "Men will rise from their tombs and appear before their Master, without shoes, all naked and uncircumcised. The sun will approach them and they will bathe in their sweat". (*La profession de foi d'Ibn Baṭṭa*, 94). In regard to the angel of death, Laoust quotes a passage from the *ʿAḳīda*, vi, attributed to Ibn Ḥanbal, where it is said "He catches the souls (*arwāḥ*), which are then restored to the bodies in their tombs". This point of view may be related to that of al-Naẓẓām, as revealed by ʿAbd al-Ḳāhir al-Bag̲h̲dādī in the *Farḳ bayn al-Firaḳ*, 145: "The twentieth of these disgraceful doctrines is that which concerns *maʿād*, whereby scorpions, snakes, beetles, flies, ravens, dung-beetles, dogs, pigs, wild beasts, insects will be gathered (*tuḥs̲h̲aru*) on the way to Paradise". In fact, these animals do not have a rational soul, but this does not prevent al-Naẓẓam believing in their *maʿād*.

The second doctrine listed by al-Tahānawī is that which asserts exclusively the spiritual *maʿād*; it is that of the philosophers. It is known that al-G̲h̲azālī was opposed to the idea of survival of the rational soul only. Nevertheless, Ibn Sīnā did attempt to understand in what sense the presence of a sensible human reality in the other life could be philosophically admitted. On this subject, we refer to the thesis of Jean Michot, presented at Louvain-la-Neuve in 1981 (still in manuscript) on *maʿād* in Avicennan thought, where there are to be found minute analyses of the metaphysics and psychology of Ibn Sīnā, based on numerous texts. But it was not only the philosophers who maintained that man is a spirit of which the body is only a "mould" (*ḳālab*). The Muʿtazilī al-Muʿammar, although he is counted al-Tahānawī among the adherents of the third doctrine, thought, according to al-Bag̲h̲dādī, *Farḳ*, 154, that "man is something other than this sensible body, something living, something knowing, something powerful, which is neither at rest, nor in motion, which is not localised anywhere ..." When asked if he meant that man is in this body, or in Paradise, or in Hell, he replied "I say that he is in the body insofar as he controls it; in Paradise insofar as he enjoys heavenly gifts; in Hell, insofar as he is punished". Al-Naẓẓam also reckoned that man is spirit (*rūḥ*), but by spirit he meant "a rarified body which penetrates (*mutadāk̲h̲il*) this compact body, the life (*ḥayāt*) entangled in this body" (*Farḳ*, 135). He is therefore closer to the preceding doctrine.

The third doctrine is that which affirms both the resurrection of the body and of the soul when man is restored to life. It is that which is taught by the As̲h̲ʿarīs as well as al-G̲h̲azālī, numerous Ṣūfīs and certain Imāmīs for whom man is "two things", the body which is inanimate (*mawāt*) and the spirit which is active, endowed with sensibility and with perception; this is the thesis of His̲h̲ām b. al-Ḥakam (*Maḳālāt al-Islāmiyyīn*, i, 125; *Farḳ*, 68). Al-Tahānawī places among the adherents of this doctrine

those who consider that man is "in reality" (*bi 'l-ḥaḳīḳa*) the rational soul, for it is the latter which bears the responsibility of prescribed acts, which obeys or disobeys, which is rewarded or punished. But this soul is linked to a body; also, "when God wills the gathering together of His creatures, He creates for each of the spirits a body (*badan*) to which it is linked and in which it acts freely, as was the case here below. But this is not a question of metempsychosis (*tanāsukh*), since it is a case of return (*ʿawd*) to the fundamental parts of the body (*ilā adjzāʾ aṣliyya li 'l-badan*), although this is not in itself the first body, as is made clear in the Word of God (IV, 56): "As often as their skins are burned, We shall give them other skins in exchange".

The last two doctrines are that which denies *maʿād* and that which remains in doubt on the subject. Those who deny it are the "physical philosophers" (*al-falāsifa al-ṭabʿiyyūn*). Galen is mentioned as a representative of the last doctrine. It is clear that the question of *maʿād* is linked to the problem of the nature of man and of the relationship between the soul and the body.

Among the mystics, the idea of *maʿād* is connected to that of ascension and return towards God rather than to that of resurrection and re-creation. Al-Tahānawī quotes the *Kashf al-lugha*: "For the Ṣūfīs, the *maʿād*, they say, are the universal divine names (*asmāʾ-i kullī-yi ilāhī*), like the beginning (*mabdaʾ*), they are the universal names relating to beings in development (*asmāʾ-i kullī-yi kawnī*)".

The arrival in this world of *homo viator* (*sālik*) is accomplished by the route of these second names; his return (*rudjūʿ*) by the route of the first. This definition relates to the concepts of Ibn ʿArabī, for whom the names have two faces, one turned towards God (*ism al-tanzīh*), the other towards the creatures of which they are the "patrons" (*ism al-tashbīh*). Similarly, the arrival and the return evoke the journey from God (*safar ʿan Allāh*) and the journey towards God (*ilā 'llāh*) which concludes, in the view of Ibn ʿArabī, with the journey into God (*fi 'llāh*). Here we have the most profound conception of *maʿād*.

Ismāʿīlī thought also considered *maʿād* an ascension and an elevation (*ṣuʿūd, irtiḳāʾ*). A detailed treatment of this subject is to be found in the book by Ibrāhīm b. al-Ḥusayn al-Ḥāmidī, entitled *Kanz al-walad* (ed. Muṣṭafā Ghālib, Wiesbaden 1971, ch. 10, 163-205). The concept of *maʿād* is here linked to that of the hierarchies which characterise this type of thought. It involves an ascent towards the spheres of the religious path, (*al-aflāk al-dīniyya*), sphere after sphere and from hierarchical degree to hierarchical degree (*ḥadd*) as far as the final stage, where the government of the world resides. The conditions for salvation are, along with the affirmation of the divine unity, the recognition of the *ḥudūd* and of the service (*khidma*) which is owed to them, obedience to the *Imām*. Al-Ḥāmidī quotes al-Muʾayyad al-Shīrāzī: "Every *ḥadd* is a paradise for the man whose *ḥadd* it is (*li-maḥdūdihi*), if the latter obeys it; it is his punishment, if he disobeys it". *Maʿād* is primarily a cosmic process in which the individual *maʿād* of the Believers is included. "Thus proceeds the progression (*tadarrudj*) in the *maʿād* until the end of time and of moons" (172). (For more details, see ISMĀʿĪLIYYA, iv, 203 b, 204 b.) We limit ourselves to pointing out a curious passage (174), where the different degrees of ascension are compared with the successive stages of gestation, as enumerated in the Ḳurʾān (XXII, 5; XXIII, 14).

The notion of *maʿād* is very important in the view of Ibn Sīnā, not only in terms of the destiny of man after death, but also in terms of his life on earth. In fact, God teaches that He "has prepared for those who obey Him a place of return which gives them good fortune (*al-maʿād al-musʿid*, *Shifāʾ*, *Ilāhiyyāt*, Cairo 1960, ii, 442), which poses the problem of eternal beatitude (*ibid.*, 445). But in this world men are in need of regulation: "It is therefore inevitable that the Prophet took important measures which have remained in the form of usages and laws which he established concerning good things useful to them. On this point there is no doubt, the foundation on which everything rests is that men persist in the knowledge of the Creator and of the *maʿād*; the suppression of this knowledge was the cause which led to forgetfulness of these matters at the expiration of the century following the [life of the] Prophet". For this reason, it is necessary that the acts prescribed by the Law are repeated and follow one another in time and that "they be, when recourse is made to them, linked with certainty to God and the *maʿād*".

It may be recalled finally that the root *ʿāda* is only used, in religious language, to express a return to a place from which one does not come again. This is how it differs from the root *radjaʿa*. In a mystical perspective, Ibn ʿArabī writes most elegantly: "Such is the attainment of lasting beatitude ... And he who has attained it does not come back (*lam yardjiʿ*), for a return (*rudjuʿ*) to the place of the beginning of the voyage would be impossible once the sails have been unfurled" (*Futūḥāt*, iii, 556). This is the doctrine of all Sunnīs, in contrast to that of the Rāfiḍī extremists, such as the disciples of Abū Kāmil or Djābir b. Yazīd al-Djuʿfī, who held belief in the return (*radjʿa*) of the dead to this world before the Resurrection (*Farḳ*, 54, 59). To conclude, it may be noted that the idea of cyclical return, as is found expressed by, for example, al-Bīrūnī in the *Āthār* (ed. Sachau, Leipzig 1923, 177) in connection with the cycle of the Jubilee (*dawr Yūbīl*) which recommences every fifty years following seven sabbatical years, is rendered by the word *radjʿa*. To summarise, the term *maʿād* brings together the two senses of return and recommencement: return to the source of being which is God, and a second creation which is the Resurrection.

(R. ARNALDEZ)

MAʿADD is a collective name for the northern Arab tribes (see Djazīrat al-ʿARAB (vi) = i, 544b). According to the standard genealogy, Maʿadd was a son of ʿAdnān [*q.v.*]. His son Nizār [*q.v.*] had three sons, Muḍar, Iyād and Rabīʿa, from the first and third of whom most of the northern Arabs claimed descent.

Maʿadd and his descendants are said to have lived for a time in the neighbourhood of Mecca and to have intermarried with Djurhum [*q.v.*]. The name Maʿadd is found in pre-Islamic poets, e.g. in verses of Imruʾ al-Ḳays (ed. Ahlwardt, no. 41, l. 5) and al-Nābigha (ed. Ahlwardt, no. 18, l. 1, 2); but according to Goldziher (*Muh. Stud.*, i, 90 n., Eng. tr. i, 89 n.), in such verses this may not always be the original reading. The name is also used of some of the tribesmen who had come to settle in Medina towards the end of Muḥammad's life (who are also referred to as Nizār and Muḍar); and in several verses of Ḥassān b. Thābit, Maʿadd is contrasted with the Anṣār (e.g. in Ibn Hishām, 829, 17; further references in Goldziher, *op. cit.*, i, 94 n. Eng. tr. i, 92 n.). Variant

genealogies of ancestors of Maʿadd are given in Ibn Ḳutayba, *Maʿārif* (18/34; 30 f./63 f.), Ibn Hishām, *Sira* (5-7), and al-Masʿūdī (*Murūdj*, iv, 115-18). Muḥammad is said to have forbidden the tracing of genealogies beyond Maʿadd (*ibid.*, iv, 112, 118 f.). In a *ḥadīth* Muḥammad commended *al-Maʿaddiyya*, which is said to be the rough clothing (or the way of life) of Maʿadd (Ibn Ḥanbal, *Musnad*, i, 43; Lane, *Lexicon*, s.v. *ʿ-d-d, al-libsa al-Maʿaddiyya*).

Bibliography: given in the article, but see also Ṭabarī, i, 671 ff.; Ibn al-Kalbī, *Djamharat al-nasab*, ed. Caskel; Masʿūdī, *Tanbīh*, index (evidence of genealogical disputes).

(W. MONTGOMERY WATT)

MAʿĀFIR (or AL-MAʿĀFIR), the name of a South Arabian tribe, the genealogy of which is given as Yaʿfur b. Mālik b. al-Ḥārith b. Murra b. Udad b. Humaysaʿ b. ʿAmr b. Yashdjib b. ʿArīb b. Zayd b. Kahlān b. Sabaʾ; they are included among the Ḥimyar.

The name was also given to the territory which the tribe inhabited and this corresponded roughly with the Turkish *ḳaḍāʾ* of Taʿizziyya and the present Yemen Arab Republic province (*ḳaḍāʾ*) of al-Ḥudjariyya (pronounced locally al-Ḥugariyya), itself part of the administrative area (*liwāʾ*) of Taʿizz. In early and mediaeval times it is described as a *mikhlāf*. The Yemeni geographer al-Hamdānī has a great deal of information on the area of al-Maʿāfir and lists the following places in it:

(1) al-Djuwwa (the modern Sūḳ al-Djuʾa between Djabal Ṣalw and Djabal Badw) which was ruled by the family of Dhu 'l-Mughallis belonging to the tribe of Hamdān, who had control of the citadel of the town which had to be ascended by a ladder. At a later date it was under the Marrānids, descendants of ʿUmayr Dhū Marrān, a *ḳayl* of Hamdān, with whom the Prophet was in communication by letter; (2) Djabaʾ in the plain of the same name between Djabal Ṣabir and Djabal Dhakhir. In ancient times, Djabaʾ was the capital of the Maʿāfir territory and the residence of the reigning dynasty of the Āl al-Karandā; (3) Ḥarāza; (4) Ṣuḥāra. Here according to Maslama b. Yūsuf al-Khaywānī were the palaces of the Maʿāfir, the ruins of which are mentioned by al-Hamdānī in Book 8 of the *Iklīl*; (5) ʿAzāza; (6) al-Dumama; (7) Birdād, which belongs to Bilād Ṣabir and lies between Djabal Ṣabir and Djabal Ḥabash, which corresponds to Djabal Dhakhir in al-Hamdānī; (8) Djizla; (9) al-ʿAnsiyayn; (10) Djabal Ṣabir; and (11) Djabal Dhakhir (the modern Ḥabash).

The lands of the Maʿāfir therefore lay between the Wādī Nakhla and the Wādī Ḥarāza and included a considerable part of the Taʿizziyya. The Maʿāfir, however, did not form a compact body, but, especially in the Djabal Ṣabir and Dhakhir, were much mixed with members of other tribes. From the earliest times the Maʿāfir enjoyed a certain reputation as weavers. The Tubbaʿ Asʿad Kāmil, who according to legend was the first to cover the Kaʿba, is said to have hung it with Maʿāfirī cloth. Muḥammad's body is also said to have been wrapped in Maʿāfirī cloth. The tribe has a reputation too for saddle-making.

The history of al-Maʿāfir can be traced far back into the pre-Islamic period. A Sabaean inscription from Ṣirwāḥ dated about 500 B.C., which records the founding of the great Sabaean kingdom, mentions the tribe of Maʿāfir. We know too that an embassy was sent from the town of Sawwā to the Sabaean king at a later date to make submission to him and to beg for peace. Sawwā must at this time have been on the side of Maʿāfir and its prince Shamir Dhū Daydān on the side of the Ḥabashāt, the enemies of Sabaʾ. In 96/630 the Maʿāfir with Dhū Ruʿayn and Hamdān adopted Islam and received a letter from the Prophet Muḥammad with detailed instructions regarding their obligations. At quite an early date in their Islamic history, many of the Maʿāfir migrated to Egypt, where with other South Arabians they played an important part in the building-up of the country. A Maʿāfirī was, for example, put in charge of the planning of al-Fusṭāṭ by ʿAmr b. al-ʿĀṣ. This migration probably explains the infrequent mention of both the tribe and the area in mediaeval Yemeni historiography. Certainly, the area was controlled by the Ziyādids, the dynasty of Muḥammad b. Ziyād centred on Zabīd, in the 3rd/9th century. The Zurayʿids too in the 6th/12th century reckoned al-Maʿāfir as part of their territory, but it was wrested from them by the Mahdids. It must have fallen to the Ayyūbid conqueror of the Yemen, Tūrān-Shāh, the brother of Saladin, who won over Tihāma and the south of the country in the years 569-71/1173-6. The Ayyūbids' successors, the Rasūlids, built military establishments in al-Maʿāfir in the 7th/13th and 8th/14th centuries, and we hear of a rebellion led by the Maʿāfirī tribal leader against the Turkish occupation forces of the Yemen in 1028/1618.

(A. GROHMANN - [G. R. SMITH])

AL-MAʿĀFIRĪ, ABU 'L-ḤASAN ʿALĪ B. MUḤAMMAD B. ʿALĪ B. DJAMĪL B. SAʿD AL-DĪN, an Andalusian Mālikī scholar who settled in Jerusalem and died there in 605/1208. Born and educated in Mālaḳa, al-Maʿāfirī left his native town early in his life and, like many of his compatriots at the time, travelled east for the dual purpose of performing the pilgrimage and acquiring knowledge. Though the sources mention that al-Maʿāfirī did some writing, they do not name any of his works. We know of only one extant work, a unique untitled manuscript in his own handwriting, found at present in the Chester Beatty Library, Dublin, and listed in the catalogue (ms. 3016) under the title *Biographies of famous women*. The manuscript has eleven chapters, of which the first two and the last two deal with biblical figures· The rest of the chapters (now publshed in Libya-Tunis 1978, ed. ʿĀʾida al-Ṭībī, under the title *al-Ḥadāʾiḳ al-ghannāʾ fī akhbār al-nisāʾ*), which form the main body of the manuscript, deal with post-Islamic women, mainly from the Umayyad period.

Bearing in mind the general paucity of biographical material about women in mediaeval Arabic literature and, in particular, the limited number of works devoted exclusively to them, this manuscript, with its diverse information, colourful anecdotes and copious verse quotations is, without doubt, especially significant. The overall picture it presents

of the character and status of women in early Islam is unexpectedly refreshing: it is an image of a proud, courageous woman with a keen sense of moral values and a high evaluation of her own worth, a woman who had not as yet succumbed to the disastrous consequences of being segregated from the world of men.

In his manuscript, al-Maʿāfirī mentions that he spent the year 581/1185-6 in Damascus collecting material for this work, his main source being Abū Muḥammad al-Ḳāsim (d. 600/1203), son of the illustrious Damascene historian Ibn ʿAsākir. In 583/1187, when Jerusalem was regained from the Crusaders, al-Maʿāfirī must have been among the numerous Muslims who then flocked to the city, for we are told that he was appointed resident preacher of the Aḳṣā Mosque by Sultan Ṣalāḥ al-Dīn. Mudjīr al-Dīn al-ʿUlaymī (*al-Uns al-djalīl bi-ta'rīkh al-Ḳuds wa 'l-Khalīl*, Nadjaf 1968, ii, 135) puts him second on the list of those who preached in the Aḳṣā Mosque after the *fatḥ*. Al-Maʿāfirī spent the rest of his life in Jerusalem, where he became known as al-Ḥādjdj al-Mālaḳī. There he achieved fame as a scholar and lecturer, and attained a position of wealth and power, but remained none the less devout and given to charitable works. He certainly made a strong impression on the inhabitants of his adopted city, for when he died large numbers followed his cortège. Ibn ʿAbd al-Malik al-Marrākushī (*al-Dhayl wa 'l-takmila*, Beirut 1965, v/1, 316) relates that "no worthy person was absent from his funeral and even the Christians who were in the church there joined the procession: they threw some of their garments on his coffin and then began to pass them to each other and to hold them to their faces in the hope of being blessed."

Bibliography: Ibn al-Abbār, *al-Takmila*, Madrid 1886, ii, 675; Ibn al-Zubayr, *Ṣilat al-ṣila*, Rabat 1937, 104; al-Dhahabī, *al-ʿIbar fī khabar man ghabar*, Kuwait 1960-6, v, 13; Ibn Taghrībirdī, *al-Nudjūm al-zāhira*, Cairo 1929-72, vi, 197; Ibn al-ʿImād, *Shadharāt al-dhahab*, Cairo 1350-1, v, 17.

(AIDA TIBI)

MAʿALTHĀYĀ, MAʿALTHĀ (Syriac "gate, entrance", Payne Smith, *Thesaurus syriacus*, col. 2881), modern Malthai, the name given to two villages in the former *ḳaḍā'* of Dehōk (Duhūk) in the *wilāyet* of Mawṣil in Ottoman times, now in the Autonomous Region of Dehōk in Republican ʿIrāḳ. The second of these two villages was formerly distinguished as Maʿalthā al-Naṣārā "M. of the Christians", but has recently become largely Kurdish and Muslim, like its fellow-village. Maʿalthāyā lies on a small affluent of the Tigris, the Nahr Dehōk, 60 km. northwards along the road from Mawṣil to Zākhō and at the southern end of the Djabal Abyaḍ. It owes its historic fame to its strategic position as the "entrance" from the plains of northern ʿIrāḳ into the mountains of Kurdistan and the lands south of Lake Van, the modern Turkish *vilayet* of Hakkâri.

Its importance in ancient times is signalled by ts famous rock-reliefs, carved at 300 m. above the valley a short distance from Maʿalthāyā. These comprise four similar panels, each showing twice an Assyrian emperor, in an attitude of worship and on either side of a procession of gods mounted on beasts. There are no inscriptions, but the reliefs are evidently connected with similar reliefs at Bāwiyān some 45 km. to the north-east of Mawṣil and to the east of Maʿalthāyā, and it is now generally accepted that the ruler responsible was the Sargonid Sennacherib (704-681 B.C.), the reliefs probably dating from the early 680s; the basic publications on them are F. Thureau-Dangin, *Les sculptures rupestres de Maltaï*, in *Revue d'Assyriologie*, xxi (1924), 185-97, and W. Bachmann, *Felsenreliefs in Assyrien (Bawian, Malthai und Gundük)*, Wiss. Veröff. der Deutschen Orient-Gesellschaft, lii, Berlin 1927, repr. 1969, 23-7, Pls. 25-31. It has recently been suggested by J. Reade (following a previous suggestion by R. M. Boehmer), *Studies in Assyrian Geography. Part I: Sennacherib and the waters of Nineveh*, in *Rev. d'Assyriologie*, lxxii (1978), 165-6, that the Maʿalthāyā carvings, with their depicted deities, obviously relate to some important event or project, and are possibly to be connected with the construction of watercourses and canals conveying perennial water to the plain of Nineveh.

Maʿalthāyā early became an important centre of Eastern Christianity, and the birthplace of Narses or Narsai (399-?502), founder of the Nestorian school of Nisibis, was in the village of ʿAyn Dulbē near Maʿalthāyā (E. Tisserant, art. *Narsai*, in *Dictionnaire de théologie catholique*, xi, cols. 26-30). It was the seat of an episcopal diocese known as either Maʿalthāyā or as Bēth/Bā-Nūhadrā. The line of Nestorian bishops begins in 410 with Isaac and continues till 1265 with Malkīshoʿ, apparently the last, whilst the Jacobite line begins with Zakai at the end of the 6th century and continues until Yūḥanna Yob in 1284 (J. B. Chabot, ed. and tr., *Synodicon orientale*, in *Notices et extraits*, xxxvii, Paris 1902, index s.v.; J. M. Fiey, *Assyrie chrétienne*, Beirut 1965-8, ii, 342-53). The Assyrian Christian community and its church in Maʿalthāyā of Mār Zīʿā must have suffered during the massacres by the Kurds of Christians and Yezīdīs [*q.v.*] towards the end of the 19th century, and the village seems to have been abandoned by its Christian community *ca.* 1906-7, and the service books and manuscripts of the church transferred to Dehōk (Fiey, *op. cit.*, ii, 675-81).

It had nevertheless been a flourishing place in early Islamic and pre-Mongol times. Al-Balādhurī, 331, records that al-Mʿla (? Maʿalla) was one of the places, together with Bā Hadhrā, etc., overrun by ʿUmar's general ʿUtba b. Farḳad al-Sulamī in 20/641. The Arabic geographers expatiate on the fertility and agricultural richness of the district of Maʿalthāyā and Fayshābūr (= originally, Fīrūzshābūr of Bā Nūhadrā, see Fiey, *op. cit.*, ii, 696 ff.). According to al-Muḳaddasī, it was small but rich in gardens, and it had a Friday mosque (hence already a Muslim community) on a tell; its specialities included dairy products, coal, grapes and fruit, hemp seed and flax, and dried, salted meat (al-Muḳaddasī, 139, 145; Ibn Ḥawḳal², 217-18, tr. Kramers and Wiet, 211-12; cf. Le Strange, *Lands*, 93, 124). For Yāḳūt, iv, 578, Maʿalthāyā was a "little town" (*bulayd*), but it is possible that this information was already anachronistic by the 7th/13th century.

Maʿalthāyā's position on the route into Kurdistan gave it a certain rôle in mediaeval Islamic history, and it is mentioned several times by e.g. Ibn al-Athīr. It was a centre for local chiefs and for the Khāridjī leader Hārūn in 266-7/879-81 in their squabbles with the Turkish caliphal governors of Mawṣil (ed. Beirut 1385-7/1965-7, vii, 353, 359). In 369/979-80 the Būyid ʿAḍud al-Dawla [*q.v.*] launched an expedition via this route against the Hakkārī Kurds, and crucified their chiefs along the road from Mawṣil to Maʿalthāyā (viii, 709). In 441/1049-50, during the warfare between the ʿUḳaylid ruler of Mawṣil Muʿtamid al-Dawla Ḳirwāsh b. al-Muḳallid and his brother Zaʿīm al-Dawla Abū Kāmil Baraka, the former's Kurdish allies marched on Maʿalthāyā and sacked it (ix, 553).

Thereafter, Maʿal͟thāyā sinks into obscurity on the wider stage of history, until it was visited in the 19th century by G. P. Badger (1842-4), the French Consul in Mawṣil G. Rouet (1845) and A. H. Layard (1846); Badger found there only 20 Assyrian Christian families.

(C. E. Bosworth)

MAʿĀN, Muʿān, a town of the south of Jordan, lying in lat. 30° 12' N. and long. 35° 44' E. at an altitude of 3,523 ft./1,074 m., and the chef-lieu of the governorate which is to the south of the Karak [*q.v.*] one and to the east of the Wādī ʿAraba. The name is said to come from Maʿān, son of Lot.

The town is surrounded by gardens which form an oasis of the western fringe of the desert plain; to its east are the slopes of the al-S͟harāt mountain chain of granite and porphyry, which rise to 5,665 ft./1,727 m. In Maʿan itself and the neighbourhood are many springs, the nearest of these being ʿAyn al-Dawāwī, whose water reaches Maʿān through an underground conduit, whilst a second conduit carries water from ʿAyn al-Dj̲iṭṭa as far al-Ḥammām to the north of Maʿān.

In the prehistoric period there were people in the region, as Palaeolithic remains attest. When nomadism and international trade developed, Maʿān became an important meeting-place for communications, through which the leading natural route from southwestern Arabia to Damascus and the ports of Phoenicia passed, i.e. the route for Sabaean trade. A track connected the Gulf of ʿAḳaba with Maʿān, whence routes went northwards to Moab. The caravan route of al-Nawala went to the west in the direction of G͟hazza and northern Egypt, and another track went southeastwards via the Dūmat al-Djandal oasis to Babylonia and the Persian Gulf.

The Syrian route of the Islamic Pilgrimage followed towards Mecca the old Tabūkiyya track, hence twice a year, on the outward and the return journeys, Maʿān was a privileged halt for pilgrims, who could stock up there with provisions. In the 19th century, it became a station on the Ḥid̲j̲āz railway. Its place as a crossroads and its abundant water supply have meant that Maʿān has always remained a vigorous centre of human settlement despite innumerable attacks from nomads. It was, as Jaussen noted "le rendez-vous des caravanes sortant de l'Arabie". During the 1st millennium B.C., the oasis apparently, according to Musil, 244, was controlled by the powers dominating the great trade routes, and had a South Arabian colony, Sabaean or Minaean, with a South Arabian governor who watched lest the local chiefs adopt measures hostile to the Sabaean or Minaean ruler; Musil further notes that in the second half of the 8th century B.C., an Assyrian army penetrated beyond the Maʿān oasis.

Classical sources hardly mention Maʿān, probably because the great international trade was concentrated on the emporium of Petra. In the Byzantine period, Maʿān formed part of the territory of the South Arabian tribe of Dj̲ud̲h̲ām [*q.v.*]. Al-Bakrī, cited by Musil, 247, narrates that Farwa b. ʿAmr of Dj̲udhām governed Maʿān on behalf of the Byzantine Emperor, but became a Muslim, rallying to the Prophet and presenting him with a white mule; in retaliation, the Byzantines threw him into prison and then killed him by crucifixion.

At the time of the expansion of Islam, Maʿān acquired a certain importance as a strong point of the al-S͟harāt district in the *dj̲und* of al-Urdunn, at the eastern end of the road which linked it to the sea via Petra, the massifs of al-S͟harāt, Ṣug͟hār, Arīḥā, al-Ḳuds and Ramla in a six days' journey. At this time it was inhabited by the Banū Umayya and their freedmen, from whom travellers could obtain provisions. In Mamlūk times, it became the chef-lieu of a *niyāba* and was a lively market for slaves; according to various authors, it formed a *manzil* (Ibn K͟hurradād͟hbih), a *manhal* (al-Muḳaddasī) or a *markaz* along the Pilgrimage route. In the 18th century, at the time of the return of the Pilgrimage, the *kātib al-ḥad̲j̲d̲j̲* was sent from Maʿān to Damascus to reassure the inhabitants about the safety of the pilgrims.

The modern town of Maʿān is still made up of two distinct, adjacent entities. To the north, Maʿān al-Ṣag͟hīra or al-S͟hāmiyya, sometimes called al-Mag͟hāra, had in 1910 110 families. To the south, Maʿān al-Kabīra or al-Miṣriyya, also called al-Ḥid̲j̲āziyya, had, according to Musil, 180 families. It was also called Maʿān al-Mudīriyya when it became the seat of a governor, who resided in a palace allegedly built by Sultan Sulaymān; there is there a residence for the *ḳaymaḳām*, who in Ottoman times depended on the governor of Bilād al-S͟hām.

A certain amount of agricultural production has long been a feature of Maʿān, thanks to the oasis's permanent irrigation system; grown there are vegetables and fruit, amongst which are most prized apricots, pomegranates and peaches; date palms and poplars also grow there. To the southeast of Maʿān, in the sparse wadis of the uncultivated steppe lands, strewn with blocks of lava and basalt, a few acacias (*ṭalḥ*) grow, these being known as *umm ʿayyās͟h*, with their wood used for making various household utensils. This species of tree is not found north of Maʿān.

At present, the town forms the chef-lieu of the governorate of Maʿān, 688 km.^{2} in extent, whose population in 1961 was 47,000, in 1967 58,000, and in 1973 62,000. The town itself with its fired and mud-brick houses, its narrow streets with infrequent and low doorways, its decayed railway station and its airport meant for tourists travelling to Petra, is of no archaeological interest. Its population was estimated in 1912 at 3,000 (Baedeker); in 1932 at 3,000 still (*Guide Bleu*). It was 4,500 in 1956, and in 1973 reached 9,500.

(N. Elisséeff)

AL-MAʿĀNĪ WA 'L-BAYĀN, two of the three categories into which, since the time of al-Sakkākī (d. 626/1229), the study of rhetoric has often been divided.

1. In Arabic. The *Miftāḥ al-ʿulūm* by al-Sakkākī [*q.v.*], where the two terms appear for the first time, was too confusing in its arrangement, and too obscure and at times self-contradictory to be of practical use to most students of rhetoric. It consisted of a section on grammar, a section on syntax, a section on the *ʿilm al-maʿānī* and the *ʿilm al-bayān*, and two supplements to its *maʿānī* section, one on demonstration (*istidlāl*), and one on the definition of the formal aspects of poetry and on metre and rhyme. The section on grammar included a chapter on phonetics and the supplement on the *istidlāl* ended with a discussion of the inimitability of the Ḳurʾān. Probably for this reason, the digest of the third section of the *Miftāḥ* by al-Ḳazwīnī (also known as the Khaṭīb Dimashḳ, d. 739/1338), entitled *Talkhīṣ al-miftāḥ* and, to a lesser extent, its companion volume, the *Īḍāḥ fī ʿulūm al-balāgha* by the same scholar, became the standard works on the subject. These two books, both compendia on rhetoric only, received wide circulation and it is through them that the study of the *maʿānī* and the *bayān* can be most profitably approached. The main differences between al-Ḳazwīnī and al-Sakkākī have been explained in the article AL-ḲAZWĪNĪ; here it should be pointed out that the addition of a section on the *badīʿ* to replace al-Sakkākī's remarks on the "special methods frequently used for the purpose of embellishing a literary composition" does not go back to al-Ḳazwīnī, but to Badr al-Dīn Ibn Mālik (d. 686/1287) (see Maṭlūb, al-*Ḳazwīnī*, 205), whose books were earlier, apparently less successful attempts to present al-Sakkākī's theories in a more readable form (see below). Whereas these "embellishments" received no more than a brief and superficial treatment in al-Sakkākī, they soon became in the hands of his followers a separate branch of rhetoric which was raised to the same level as the *maʿānī* and the *bayān*.

The present article aims at providing a few practical hints by way of introduction to the vast and little-known literature on the *maʿānī* and the *bayān* which is represented chiefly by commentaries and supra-commentaries on al-Ḳazwīnī's *Talkhīṣ*. The *badīʿ* section cannot be discussed here. This section continues the older tradition of rhetorical studies initiated by Ibn al-Muʿtazz and Ḳudāma [*q.vv.*], but does not include those figures of speech, tropes, and stylistic devices which al-Sakkākī and al-Ḳazwīnī had already discussed under *maʿānī* or *bayān*, e.g. simile, metaphor, analogy, metonymy, epiphrasis (*īghāl*) and apostrophe (*iltifāt*) (the last of which is listed by al-Sakkākī both as an "embellishment" and as one of the subjects that come under the *maʿānī*, see *Miftāḥ*, 95, 202; see also Maṭlūb, *al-Sakkākī*, 242-7, 259, 263, for the possible relation between this "embellishment" section and the *Kitāb Ḥadāʾiḳ al-siḥr fī daḳāʾiḳ al-shiʿr* by the Persian scholar, Rashīd al-Dīn Waṭwāṭ, d. 578/1182-3). Nor does it include the *ibtidāʾ* [*q.v.*], the *takhalluṣ* [*q.v.*], the *intihāʾ* [*q.v.*], and the *sariḳāt* [*q.v.*] which al-Ḳazwīnī discusses in two supplements (see Mehren, 142-54), though many authors belonging to the older school would have classified them as *badīʿ*. It should be noted, however, that the practice of separating some of these figures from the corpus of the *badīʿ* dates back at least till the 5th/11th century (see S. A. Bonebakker, *A Fatimid manual for secretaries*, in *AIUON*, xxxvii [1977], 310-12) and may have been initiated by al-Rummānī (d. 384/994), though the latter when he speaks of metaphor and simile as part of the *balāgha* [*q.v.*] does not state explicitly that these are not to be considered *badīʿ* figures (see al-Rummānī, *al-Nukat fī iʿdjāz al-Ḳurʾān*, in *Thalāth rasāʾil*, ed. M. Khalaf Allāh and M. Z. Salām, Cairo n.d., 70, ll. 3-4, and the quotation in Ibn Rashīḳ, *al-ʿUmda*, ed. M. M. ʿAbd al-Ḥamīd, Cairo 1353/1934, i, 214). It should also be noted that it is not correct to think of the history of rhetorical studies since the time of al-Ḳazwīnī as being completely dominated by the system he had introduced; works continuing the older tradition which brought all figures of speech under the heading of *badīʿ* and devoted a separate chapter to each figure [see BADĪʿ] continued to be written (they were especially popular in North Africa and Spain, see Ibn Khaldūn, *Muḳaddima*, iii, 292-3 = Ibn Khaldūn-Rosenthal, 2nd ed. 1967, iii, 336-8), even though their authors were aware of, and probably influenced by, the new trend represented by the *Talkhīṣ* (Ibn Khaldūn suggests that the *Miftāḥ* was the basic text). In many respects, the later history of Arabic rhetoric presents essential, but still unanswered, questions.

Finding adequate translations of the terms *maʿānī* and *bayān* is made complicated by the fact that the relation between grammar, logic, and rhetoric, and between literary theory and literary criticism, is not apparent at first sight. Moreover, the borderline separating the disciplines dealing with these two categories, the *ʿilm al-maʿānī* and the *ʿilm al-bayān*, is not always clear. In the *Miftāḥ*, the definitions overlap, and al-Sakkakī himself seems to regard the *ʿilm al-bayān* as a branch of the *ʿilm al-maʿānī* (see *Miftāḥ*, 77, 156-7, and cf. 77, lines 4-3 from bottom; see also Bahāʾ al-Dīn al-Subkī in *Shurūḥ*, iii, 261-2 and Maṭlūb, al-*Sakkākī*, 131-5). It is not surprising that al-Ḳazwīnī felt the need to criticise and reword these definitions and rearrange some of the material. Considering the etymology of the term *bayān* and the definition which al-Ḳazwīnī gives of the *ʿilm al-bayān* as "the science through which one knows how to express one and the same concept in ways which differ as to the degree of clarity achieved in indicating this concept" ([*huwa*] *ʿilm*[un] *yuʿrafu bihi īrādu 'l-maʿnā 'l-wāḥidi bi-ṭuruḳ*[in] *mukhtalifat*[in] *fī wuḍūḥi 'l-dalālati ʿalayhi*, *Talkhīṣ*, 66 = *Shurūḥ*, iii, 257 ff.; see Mehren, 18-20, 53-4 and BAYĀN, i, 1116a bottom) and its association with the *faṣāḥa* [*q.v.*] which involves, among other things, avoiding obscurity (*taʿḳīd*) in sentence structure (*naẓm*) and in the relation between statement and theme (*intiḳāl*, *Talkhīṣ*, 5, 7 = *Shurūḥ*, i, 103 ff., 150; see Mehren, 15-18), the translation "Science of exposition" (Mehren, 20: "Darstellungslehre") seems justified; but if one keeps in mind that the *ʿilm al-bayān* deals only with the simile (*tashbīh*) (as an introduction to the discussion of the metaphor), the metaphor (*istiʿāra*) [*q.v.*], the analogy (*tamthīl*), the metonymy (*kināya*) [*q.v.*] and the allusion, statement by implication (*taʿrīḍ*), the translation "Science of figurative expression" seems more appropriate.

Even more confusing is the term *maʿānī*, since what is meant is not the study of subjects and themes in poetry (as found in such works as the *Kitāb al-*

Maʿānī al-kabīr of Ibn Ḳutayba [*q.v.*] or the *Dīwān al-Maʿānī* of Abū Hilāl al-ʿAskarī [d. *ca.* 400/1009]), nor a study of lexicography, but essentially a study of those rules of syntax which have a bearing on the theory of functional, appropriate style, or as al-Ḳazwīnī puts it, "finding the proper expression to meet what is required in a given situation" (the full definition of the *ʿilm al maʿānī* is "the science through which one knows the various existing patterns of Arabic speech by means of which it meets the requirements of each situation", [*huwa*] *ʿilmᵘⁿ yuʿrafu bihi aḥwālu 'l-lafẓi 'l-ʿarabiyyi 'llatī bihā yuṭābiḳu muḳtaḍā 'l-ḥāli*); the translation "Semantics of syntax" suggests itself (cf. BAYĀN, i, 1116a: "the different kinds of sentence and their use").

The awkwardness of the terms *maʿānī* and *bayān* and the difficulty of finding proper definitions for the two disciplines, *ʿilm al-maʿānī* and *ʿilm al-bayān*, particularly in their relationship to lexicography and grammar, has not escaped the mediaeval critics (see the interesting observations in Yaḥyā b. Ḥamza's *Ṭirāz*, i, 8-18), and one wonders what determined the choice of these terms. The *maʿānī* and *bayān* sections in the *Miftāḥ* were based respectively on the *Dalāʾil al-iʿdjāz* and the *Asrār al-balāgha* by ʿAbd al-Ḳāhir al-Djurdjānī [see AL-DJURDJĀNĪ in Suppl.], and it is in these two works that one would first try to find an answer to this question. On p. 64 of the *Dalāʾil*, al-Djurdjānī makes clear that composition (*naẓm*) depends on obeying the rules of syntax (which he briefly enumerates), and on p. 65 he declares that determining a correct or faulty *naẓm* always involves a principle of syntax (*maʿnan min maʿānī 'l-naḥw*). On p. 222, ll. 4-5 of the *Asrār* (Ritter's tr., 261 bottom) he qualifies the simile as *maʿnan min al-maʿānī*, apparently meaning a way of formulating a common syntactic construction. It is possible that al-Sakkākī derived the term from al-Djurdjānī's definition of the *naẓm* as essentially a matter of correct syntax, the more so since the chapter on the *maʿānī* in the *Miftāḥ* immediately follows the section on syntax, so that the *ʿilm al-maʿānī* could be seen as an extension of syntax into the realm of rhetoric. It is also possible that he based himself on an earlier model: The term *maʿānī al-naḥw* appears in the famous discussion between Abū Saʿīd al-Sīrāfī and Abū Bishr Mattā b. Yūnus al-Ḳunnāʾī which took place in 320/932 (see Abū Ḥayyān al-Tawḥīdī, *al-Muḳābasāt*, ed. Ḥ. al-Sandūbī, Cairo 1347/1929, 80; idem, *al-Imtāʿ wa 'l-muʾānasa*, ed. A. Amīn and A. al-Zayn, Cairo 1373/1953, i, 121; Yāḳūt, *Irshād*, iii, 117; D. S. Margoliouth in *JRAS* [1905], 122), but seems to be used there for grammar in its widest sense. Ibn Fāris (d. 395/1004) in his *al-Ṣāḥibī* (ed. M. el-Chouémi, Beirut 1383/1964, 179) uses the term *maʿānī al-kalām* for the following categories: *khabar*, *istikhbār*, *amr*, *nahy*, *duʿāʾ*, *ṭalab*, *ʿarḍ*, *taḥḍīḍ*, *tamannī*, and *taʿadjdjub*, nearly all of which appear also in the *maʿānī* chapters of al-Sakkākī and al-Ḳazwīnī. The term *naẓm* may have been abandoned because it was too general and had to be associated, as al-Djurdjānī states clearly on pp. 300-1 of the *Dalāʾil*, with the use of the *istiʿāra*, the *kināya*, and the *tamthīl* as well as other tropes (*sāʾir ḍurūb al-madjāz*). It should be noted, however, that al-Ḳazwīnī (*Īḍāḥ*, i, 57-8) and al-Taftāzānī (*al-Sharḥ al-muṭawwal*, 27) quote a definition which gives the term a narrow sense and which was based on al-Djurdjānī (cf. *Dalāʾil*, 67-9). However that may be, one cannot deny that there is a certain logic in the new arrangement introduced by al-Sakkākī and al-Ḳazwīnī as long as one sees the *ʿilm al-maʿānī* as a set of rather strict rules governing the art of correct sentence structure, the purpose of which was to demonstrate that changes in word order almost invariably lead to changes in meaning; the *ʿilm al-bayān* as an analysis of figurative expressions which, one might argue, the writer is free to use but which, since they are the product of his creativity and often lend clarity and distinction to his style, are by necessity part of any theory of style; and the *ʿilm al-badīʿ* as a list of "embellishments" which are not essential criteria of a good style, but which are nevertheless applied quite frequently. It is conceivable that al-Sakkākī and al-Ḳazwīnī tried to programme the study of rhetoric in such a way that the reader would become familiar first with the elementary skills of composition, then with the characteristics of literature as a form of art, and finally with some stylistic devices used by accomplished poets and writers. It is true that much of what comes under the heading of *ʿilm al-maʿānī* is syntax or formal logic; but very often one finds that these statements of rules and principles explain how the speaker ought to convey a certain mood which requires him to emphasise, exaggerate, play on the hearer's imagination, or conform to a given situation by making tacit assumptions about what is known or acceptable to his audience, etc. This unquestionably draws the *ʿilm al-maʿānī* into the sphere of rhetoric and oratory. The use of the term *bayān* may reflect the view that metaphors should be used since they are sometimes more effective than terms used in their proper sense. Or the term may have been chosen simply because it was often associated with this aspect of *balāgha* (see BAYĀN, i, 1114a; see also al-Rummānī, *al-Nukat*, 79, l. 12 and cf. *A Fatimid manual*, 313-19: al-Rummānī speaks of the metaphor as leading to a *balāghat bayān* not possible if the proper term were used). One could suggest that al-Sakkākī had in mind the formulation of a concept in an unconventional, artful manner (and as such different from the common methods described in the *maʿānī* chapter) (cf. BAYĀN, i, 1116a bottom; cf. also *al-Nukat*, 98, ll. 2-15, and *A Fatimid manual*, 317, l. 12—318, l. 11), but no other examples of *bayān* being used specifically as a term for figurative expressions are known to exist: The terms *maʿānī* and *bayān* appear in al-Zamakhsharī's (d. 538/1144 [*q.v.*]) *al-Kashshāf* and in Fakhr al-Dīn al-Rāzī's (d. 606/1209 [*q.v.*]) *Nihāyat al-īdjāz fī dirāyat al-iʿdjāz*. Al-Zamakhsharī made frequent use of al-Djurdjānī, and al-Rāzī's *Nihāya* is actually a digest of al-Djurdjānī. But both authors use the terms in too vague a way to justify any conclusions, and, consequently, al-Sakkākī, who knew both the *Kashshāf* and the *Nihāya*, cannot have derived his definitions from these two books. He speaks however of "scholars" or "leaders" in the *ʿilm al-maʿānī* without specifying who they are (*Miftāḥ*, 95, 119, 121; see Maṭlūb, *al-Sakkākī*, 119-20), and this could of course be taken as an indication that he was not the first to introduce *maʿānī* as a term for a more or less clearly defined category of rhetorical studies.

How difficult it is to keep the *ʿilm al-maʿānī* and the *ʿilm al-bayān* completely separated appears from the treatment of the *madjāz* as part of the chapter on attribution (*isnād*) in the *maʿānī* section of the *Talkhīṣ* (10-13 = *Shurūḥ*, i, 224-72; cf. al-Djurdjānī, *Asrār*, 342-5 = 399-402 of the translation): al-Ḳazwīnī discusses sentences such as "The springtime made the herbage come forth" for "God made the herbage come forth" where there is a "trope of the intellect"

(*madjāz aklī*), i.e. the hearer's realisation that it is the Creator who makes the herbage come forth, while the terms "springtime" and "made [the herbage] come forth" are used in their original sense; and "The springtime made the earth come to life" where there is not only a trope of the intellect in the relation between subject and predicate, but also a tropical use of "made [the earth] come to life" for "covered [the earth] with herbage". Al-Ḳazwīnī points out that the hearer cannot do without a "frame of reference" (*ḳarīna*) supplied by an element in the context or the result of logical reflection which enables him to understand that the sentences are not to be taken in their literal meaning (see Maṭlūb, *al-Ḳazwīnī*, 355-71, for views on this point by al-Ḳazwīnī's predecessors and followers; see also Mehren, 30-1, 75-6). However, al-Ḳazwīnī gives no further attention in this section to the association that makes it possible to use "come to life" in the sense of "come forth", since this is a question that belongs to the *ʿilm al-bayān*. It would be wrong, however, to see the *ʿilm al-bayān* as a science that is exclusively concerned with individual words used metaphorically in a certain context (involving, of course, once more a discussion of the *ḳarīna*) and of the associations which make such metaphors acceptable (cf. *Miftāḥ*, 157, ll. 3-5): in phrases such as "I see you advancing one foot while at the same time moving backwards with the other", which are intended as analogies (*tamthīl*), the words are used in their original, proper meaning, though the sentence as a whole is used metaphorically to describe somebody who is reluctant to commit himself (*Talkhīṣ*, 86 = *Shurūḥ*, iv, 143 ff.; see Mehren, 38-9); and in the metonymy "He has many ashes [around his hearth]" there is no need to attribute a tropical sense to any term in the sentence in order to conclude that what the speaker wants to say is that the man often prepares meals and therefore must be a generous person who entertains many guests (*Talkhīṣ*, 92 = *Shurūḥ*, iv, 256 ff.; see Mehren, 41-2). Moreover, al-Ḳazwīnī considers the *istiʿāra* as essentially a form of simile (*tashbīh*) (67 = *Shurūḥ*, iii, 287 ff.; see Mehren, 53-4; this theory may go back to al-Rummānī, *al-Nukat*, 79, ll. 5-10, see Heinrichs, *The hand*, 14, 41, and Bonebakker, *A Fatimid manual*, 313-14, and was adopted by al-Sakkākī's contemporary, al-Muṭarrizī [d. 610/1213], see Yaḥyā b. Ḥamza, *Ṭirāz*, i, 260-1 and Maṭlūb, *al-Sakkākī*, 175, as well as by al-Sakkākī himself, *Miftāḥ*, 157, ll. 22 ff.), and therefore introduces a detailed chapter on the *tashbīh* in the *bayān* section before dealing with the *istiʿāra*. The *maʿānī* chapter, however, also deals briefly with the simile when it analyses the inversion (*ḳalb*) which, if applied to the simile, results in a hyperbole (*Talkhīṣ*, 27 = *Shurūḥ*, i, 488-9, and the *tashbīh maḳlūb* chapter in *Talkhīṣ*, 74 = *Shurūḥ*, iii, 407 ff.; see Mehren, 24-5, 68-9). Finally, as mentioned earlier, the *maʿānī* chapter includes figures (e.g. *iltifāt*, *tawshīʿ*, *ighāl*, *tadhyīl*, *takmīl* or *iḥtirās*, *tatmīm* and *iʿtirāḍ*) which scholars following the older schools would have identified as *badīʿ*. In making these figures part of the *maʿānī* chapter, al-Ḳazwīnī may have been the first to separate them from the corpus of the *badīʿ* (see Maṭlūb, *al-Sakkākī*, 138; idem, *al-Ḳazwīnī*, 316).

The works by al-Sakkākī and al-Ḳazwīnī and their school cannot stand comparison with the two books by ʿAbd al-Ḳāhir al-Djurdjānī on which they were based. On the surface, the chapters on the *ʿilm al-maʿānī* and the *ʿilm al-bayān* appear as nothing more than digests of al-Djurdjānī, the *maʿānī* sections, generally speaking, corresponding to the *Dalāʾil* and the *bayān* sections to the *Asrār*. Whereas in al-Djurdjānī the relation of his theories to the practice of literary criticism is always clear, his followers seem to be interested only in presenting a skeleton of these theories and in finding convenient means of recognising and classifying patterns of syntax and figurative expressions, and in offering concise definitions. It is easy to see that al-Djurdjānī's attention to detail, and his method of discussing the same problem in different contexts and handling it from different angles, should have invited attempts to offer his arguments and conclusions in a more convenient form. Still, the foundations laid by al-Djurdjānī and his psychological and logical analysis of literature as a work of art were not entirely obscured, and this is no doubt the reason why al-Sakkākī's unsuccessful attempt to subject the two works to a rigid system of classification and al-Ḳazwīnī's subsequent effort to make an intelligible, though extremely concise, revision and digest of al-Sakkākī gave rise to an extensive literature of commentaries and supra-commentaries (al-Ḳazwīnī's *Īḍāḥ* did not go far enough to clarify his *Talkhīṣ*). One admires the critical acumen and profound learning that characterise this literature and its concern to do full justice to every point of view, in spite of much casuistry in the classification of categories and the choice of technical terms. Outstanding examples are the two commentaries on the *Talkhīṣ* by Saʿd al-Dīn al-Taftāzānī (d. 792/1390), the *Sharḥ muṭawwal* and the *Sharḥ mukhtaṣar* (see *EI*[1], art. AL-TAFTĀZĀNĪ for other titles used for the same works).

In the prefaces to the *Talkhīṣ* and the *Īḍāḥ*, al-Ḳazwīnī informs us that he has changed the arrangement of al-Sakkākī's *Miftāḥ*, had recourse to al-Djurdjānī's *Dalāʾil* and to his *Asrār* (both quoted in the *Talkhīṣ* and the *Īḍāḥ*), as well as to other texts which he does not specify, and included some of his own ideas. According to Maṭlūb (*al-Ḳazwīnī*, 191-228), he used Abu 'l-Ḥasan ʿAlī b. ʿAbd al-ʿAzīz al-Djurdjānī (d. 392/1001), Abū Hilāl al-ʿAskarī, Abū Muḥammad ʿAbd Allāh b. Muḥammad al-Khafādjī (d. 466/1073) (on al-Khafādjī's *Sirr al-faṣāḥa*, see FAṢĀḤA, ii, 824b-825b), al-Zamakhsharī, Ḍiyāʾ al-Dīn Ibn al-Athīr (d. 637/1239) [*q.v.*], Ibn Abi 'l-Iṣbaʿ (d. 654/1256), Badr al-Dīn Ibn Mālik, and he may have used al-Rummānī. Other digests of the *Miftāḥ* which, if we may believe Ibn Khaldūn (see the passage quoted above), included a digest of the rhetorical section of the *Miftāḥ* by al-Sakkākī himself, apparently did not meet with the same measure of success. The same al-Taftāzānī who composed the *Sharḥ muṭawwal* and the *Sharḥ mukhtaṣar* wrote his own commentary on the *Miftāḥ* which survives in manuscript (Sellheim, 307). Badr al-Dīn Ibn Mālik wrote a *Miṣbāḥ fi 'khtiṣār al-miftāḥ* which should not be confused with his *Miṣbāḥ fi 'l-maʿānī wa 'l-bayān* (Sellheim, 315, 333, correcting Brockelmann). The latter work has been recognised by Ahlwardt (no. 7249, pp. 394b-396a) and Sellheim (316) as an independent system of rhetoric, though it may have been influenced by the "standardisation" established by al-Sakkākī. Maṭlūb (*al-Sakkākī*, 382) goes farther and finds that the *Miṣbāḥ* is no more than a "reduced size copy" of the *Miftāḥ*, though in his book on al-Ḳazwīnī (90-1, cf. also 160, 229) he points out some important differences between the two texts. In addition, Badr al-Dīn Ibn Mālik wrote a book with the title *Rawḍ al-adhhān fī ʿilm al-maʿānī wa 'l-bayān* which was used by Bahāʾ al-Dīn al-Subkī (d. 773/1372) [*q.v.*] in his *ʿArūs al-afrāḥ fī*

sharḥ talkhīṣ al-miftāḥ (see *Shurūḥ*, i, 30, 159, 376 and elsewhere) and is preserved in a manuscript in Leiden (see Maṭlūb, *al-Ḳazwīnī*, 92, 684). According to Maṭlūb, it was written before the (second) *Miṣbāḥ* and was like its companion volume essentially a digest of the *Miftāḥ*, the first such text to reach Egypt. The substantial agreement between the *Miṣbāḥ* and the *Miftāḥ* appears clearly from a comparison of the definitions of the *maʿānī* and the *bayān* and, to a lesser extent, from a comparison of the tables of contents. Where the two books show an important difference is in the use of the term *badīʿ* (see above) and in the detailed treatment which the *badīʿ* receives in the *Miṣbāḥ* (which falls outside the scope of this article).

Much more interesting as an independent study of the *ʿilm al-maʿānī* and the *ʿilm al-bayān* than Badr al-Dīn Ibn Mālik's *Miṣbāḥ* is another little-known work, the *Ṭirāz al-mutaḍammin li-asrār al-balāgha wa-ʿulūm ḥaḳāʾiḳ al-iʿdjāz* of al-Muʾayyad bi'llāh Yaḥyā b. Ḥamza al-ʿAlawī (d. 747/1346; see Brockelmann II, 186, S II, 242). A curious aspect of this book is that the author apparently knew neither the two books by al-Djurdjānī nor al-Sakkākī's *Miftāḥ* and that it cannot be precisely determined where he found the quotations from the *Miftāḥ* which so much influenced his thinking (see Maṭlūb, *al-Sakkākī*, 359-60). In the preface (i, 3-4), he acknowledges that he used the *Mathal al-sāʾir* by [Ḍiyāʾ al-Dīn] Ibn al-Athīr, "the *Tibyān* by the *shaykh* ʿAbd al Karīm", the *Nihāyat [al-īdjāz fī dirāyat al-iʿdjāz]* by Fakhr al-Dīn al-Rāzī (which, as mentioned earlier, was a compendium of the *Dalāʾil* and the *Asrār*), and the *Miṣbāḥ* of Ibn Sirādj (*sic*) al-Mālikī. Maṭlūb (*al-Sakkākī*, 358-9) does not seem to be in any doubt that this last work is identical with the *Miṣbāḥ fī 'khtiṣār al-miftāḥ* of Badr al-Dīn Ibn Mālik, and believes that it was from this abridged version of the *Miftāḥ* that Yaḥyā b. Ḥamza derived his knowledge of al-Sakkākī. He apparently also feels certain that the work by ʿAbd al-Karīm is the *Tibyān* of ʿAbd al-Wāḥid b. ʿAbd al-Karīm b. al-Zamlakānī (d. 651/1253; see also Maṭlūb's ed. of this work [Baghdād 1383/1964], 17). Yaḥyā b. Ḥamza quotes several other important authors, such as Abu 'l-Ḥasan (Abu 'l-Ḳāsim?) al-Āmidī (d. 370/980-1), al-Rummānī, Abū Hilāl al-ʿAskarī, al-Muṭarrizī, and al-Khafādjī, of whose works, however, he may not have had direct knowledge. He must also have been thoroughly familiar with al-Zamakhsharī's *Kashshāf* (a work that gives much attention to the stylistic excellence of the Ḳurʾān and made use of al-Djurdjānī), since the *Ṭirāz* was intended as an introduction to the author's lectures on the *Kashshāf* (i, 5). The work has a much wider scope than the works by al-Sakkākī, Badr al-Dīn Ibn Mālik, and al-Ḳazwīnī: Yaḥyā b. Ḥamza explains his views in great detail and offers copious examples. That the *Ṭirāz* was not an imitation of any of these earlier texts is clear also from its arrangement: Yaḥyā b. Ḥamza divides his work into three lengthy "subjects" or chapters (*funūn*), a series of introductory remarks (i, 8), a chapter dealing with the *bayān*, the *maʿānī*, and the *badīʿ* (i, 183), and a third chapter dealing with the inimitability of the Ḳurʾān (iii, 213). The second chapter, which interests us here, deals first with the *istiʿāra*, the *tashbīh* (which Yaḥyā b. Ḥamza considers a subject far more complicated than the *istiʿāra*), the *kināya*, the *taʿrīḍ*, and the *tamthīl*. Next come two sections qualified as belonging to the *ʿilm al-maʿānī* (cf. i, 196), the first of which deals with the semantics (*dalālāt*) of individual words and sentences (ii, 9), and the second with matters of style (ii, 221) as far as these two can be kept apart (cf. ii, 221-2). The chapter ends with a discussion of the *badīʿ* (ii, 353).

As noted earlier, there are numerous commentaries on the *Talkhīṣ*, as well as supra-commentaries and glosses. An authoritative and informative list of many of these, with valuable information on manuscripts, appears in Sellheim, 310-15. A collection of commentaries which comprises not only al-Ḳazwīnī's *Īḍāḥ* and al-Taftāzānī's *Sharḥ mukhtaṣar*, but also the *Mawāhib al-fattāḥ* of Ibn Yaʿḳūb al-Maghribī (wrote 1108/1696; see Brockelmann, S I, 518, m), the *ʿArūs al-afrāḥ* of Bahāʾ al-Dīn al-Subkī (see above), and the *Ḥāshiya* of the *Sharḥ mukhtaṣar* by Muḥammad b. Muḥammad ʿArafa al-Dasūḳī (d. 1230/1815; see Brockelmann, II, 84, S II, 98 and Maṭlūb, *al-Ḳazwīnī*, 592-7) was published in Cairo in 1937 (and earlier in Būlāḳ in 1318/1900-1, according to Brockelmann, S I, 516, 3a) in four volumes. Mention should also be made of the *Sharḥ ʿuḳūd al-djumān fī ʿilm al-maʿānī wa 'l-bayān* by al-Suyūṭī (d. 911/1505) [*q.v.*], a versification of the *Talkhīṣ* to which the author himself wrote a commentary, and the well-known commentary on the verses quoted in the *Talkhīṣ* known as the *Maʿāhid al-tanṣīṣ ʿalā* (or: *fī sharḥ*) *shawāhid al-talkhīṣ* by ʿAbd al-Raḥīm (or ʿAbd al-Raḥmān) al-ʿAbbāsī (d. 963/1556), both of which were printed in several editions (see Brockelmann, I, 296, S I, 519).

The popularity which the system of al-Sakkākī and al-Ḳazwīnī has enjoyed to this day is shown by such works as the edition by M. ʿA. Khafādjī of al-Ḳazwīnī's *Īḍāḥ*, Cairo 1368-70/1949-51, which contains extensive notes on the interpretation of the text and the history of the genre, and by modern works on the *maʿānī* and the *bayān* such as the *Bughyat al-īḍāḥ li-talkhīṣ al-miftāḥ* of ʿA. al-Ṣaʿīdī, Cairo 1380/1960?, in four volumes and the *Djawāhir al-balāgha fī 'l-maʿānī wa'l-bayān wa 'l-badīʿ* by A. al-Hāshimī, Cairo 1379/1960, a work intended for school use. Other works are listed by Maṭlūb in his book on al-Ḳazwīnī (613-17). A complete survey of literature based directly or indirectly on al-Sakkākī and al-Ḳazwīnī remains to be written; it should include such interesting works as the unpublished *Badīʿiyyat al-ʿumyān* by Ibn Djābir (d. 780/1378), a didactic poem based on the *badīʿ* section of the *Īḍāḥ* with a commentary by Ibn Djābir's friend, al-Ruʿaynī (d. 779/1377; see Brockelmann, II, 13, 111, S II, 6, 138), the *Badīʿiyya* of Ṣafī al-Dīn al-Ḥillī (d. around 750/1349; see Brockelmann, II, 159, S II, 199) which lists, among the works consulted by the author, the *Miftāḥ* and works based on the *Miftāḥ*, and *badīʿiyyas* by other authors that might contain elements of the same tradition.

An excellent summary of the *ʿilm al-bayān* and the *ʿilm al-badīʿ* is found in Mehren's *Rhetorik*. Mehren based himself on the *Talkhīṣ*, the two commentaries by al-Taftāzānī, and the *ʿUḳūd* by al-Suyūṭī. Other texts were known to the author and occasionally used by him (see pp. iv-v and 3-13). Mehren also dealt briefly with the *ʿilm al-maʿānī* (18-19), but apparently gave up his plans to deal with this discipline in a separate publication (p. v). However, the technical terms in the *maʿānī* chapters, as far as they pertain to rhetoric, are sometimes the same as those of the *bayān* which are adequately explained in Mehren; or they are common *badīʿ* terms which can be identified in handbooks composed by authors who followed the "older" school, such as the *Taḥrīr al-taḥbīr* of Ibn Abi 'l-Iṣbaʿ, ed. Ḥ. M. Sharaf, Cairo 1383/1963.

Another useful introduction is the article by M. Weisweiler, *ʿAbdalqāhir al-Curcānī's Werk über die Unnachahmlichkeit des Korans und seine syntaktisch-stilistischen Lehren*, in *Oriens*, xi/1-2 (1958), 77-121, which, though intended as a summary of the *Dalāʾil*, can be used as a study of the *ʿilm al-maʿānī* and thus makes up in a large measure for the omission of this section from Mehren's book.

Bibliography (for more detailed information on existing editions of Arabic texts listed in the article or in this bibliography, see Brockelmann and the relevant articles in *EI*[1] and *EI*[2]): ʿAbd al-Ḳāhir al-Djurdjānī, *Dalāʾil al-iʿdjāz*, Cairo 1367/1947-8; idem, *Asrār al-balāgha*, ed. Sellheim, *Materialen zur arabischen Literaturgeschichte*, Teil I (= *Verzeichniss der orientalischen Handschriften in Deutschland*, Bd. xvii, Reihe A: *Arabische Handschriften*), Wiesbaden 1976; W. Heinrichs, *The hand of the Northwind: opinions on metaphor and the early meaning of Istiʿāra in Arabic poetics*, in *Abh. K.M.*, Bd. xliv/2, Wiesbaden 1977 (the term *istiʿāra* with observations on al-Sakkākī's use of this term). (S. A. BONEBAKKER)

2. In Persian. The rhetorical system innovated by al-Sakkākī and his school did not meet with particular attention in the field of Persian rhetoric. One of the few books written in Persian and following his system of devices is contained in the ms. Madjlis 4866 (cf. Munzawī, *Fihrist-i Kitābkhāna-yi Shūrā-yi millī*, xiii, Tehran 1968, 303-4). It seems, however, that no attempt has been undertaken, so far, to look for a creative adaptation of the above-mentioned system to the exigencies of Persian language and literature. Even one of the latest treatments of this scheme of ideas, the *Maʿālim al-balāgha dar ʿilm-i maʿānī wa-bayān wa-badīʿ*, by M. Kh. Radjāʾī, Shīrāz 1962 and [2]1975, contents itself with illustrating the two rhetorical categories by means of the well-known Arabic quotations, just complementing them by some Persian examples for clearer reference.

Persian scholars of rhetoric, at all times, were mainly interested in rhetorical figures and the rhetorical art (*ṣanāʾiʿ*). These are assigned by al-Sakkākī to the third rhetorical category (*badīʿ*), as far as they are not simile, metaphor, metonymy, analogy, etc. The basic work dealing with this subject is, however, not the *Miftāḥ* written by him, but the *Ḥadāʾiḳ al-siḥr* by Rashīd al-Dīn Waṭwāṭ (see also the foreword by A. Iḳbāl to his edition of this work, Tehran 1308 h sh.).

To understand this phenomenon, we have to bear in mind that al-Sakkākī based himself on the study of Ḳurʾānic modes of expression, whereas in Persian literature such a sacrosanct linguistic monument was non-existent, and with it the motive for analogous considerations. Al-Sakkākī himself was a Persian, as was his famous predecessor al-Djurdjānī and as were some of his commentators, for instance al-Taftāzānī. They all wrote in Arabic about an essentially Arabic subject, so that whoever wanted to deal with the material, had to have a good knowledge of Arabic. Persian elaborations of the above theory, therefore became quite superfluous. Not surprisingly, a number of manuscripts of the Arabic commentaries and supra-commentaries are at present to be found in Persian libraries. (B. REINERT)

MAʿĀRIF (A.), education, public instruction. The word is the pl. of *maʿrifa* "knowledge". The term was already used in mediaeval times to denote the secular subjects of knowledge or culture in general (e.g. in the title of Ibn Ḳutayba's *Kitāb al-Maʿārif*), in opposition to the religious sciences (*ʿulūm*, pl. of *ʿilm*).

1. IN THE OTTOMAN EMPIRE AND THE CENTRAL AND EASTERN ARAB LANDS

It seems that the official use of the term appears for the first time in the Ottoman Empire in 1838, when a school for educating government officials was established in Istanbul and was named *Mekteb-i Maʿārif-i ʿAdliyye*. After that, the term was frequently used in Turkish to indicate education. Thus the first governmental body charged with the administration and supervision of the budding system of state schools which was created in 1845 was called *Muwaḳḳatī Maʿārif Medjlisi*, Provisional Council of Education. This was the forerunner of the Ministry of Public Instruction, *Maʿārif-i ʿUmūmiyye-i Neẓāreti*, established in 1857. It is noteworthy that the first directorate of the new state schools, which had been created in 1839, was called *Mekātib-i Rüshdiyye Neẓāreti* and did not include the new term *maʿārif*, perhaps because it was a department within the Ministry of Pious Foundations under the *Shaykh al-Islām*. The Ministry of Education was renamed in 1920 by the Kemalists *Maʿārif Vekāleti*. In 1933, with the language reform in Turkey, the former Arabic-Ottoman Turkish-sounding term was replaced by a purely Turkish one, and the Ministry was renamed *Millî Eğitim Bakanlığı*, Ministry of National Education, which has remained the official term, although *maarif* is still a common word in Turkish for education, along with the neologism *eğitim*.

The use of the word *maʿārif* for public education became current in Egypt and Iran in the 19th century, almost certainly under the influence of the Ottoman term. Both in Egypt and in Iran the official use of the term to designate the system of education was avoided for about half a century. When the first Ministry of Education was formed in Egypt in 1837, it was simply called *Dīwān al-Madāris* (*Medāris Dīwānī* in Turkish), the Department of Schools. Only since the Khedive Ismāʿīl's rule (1863-79) was the Ministry of Public Instruction

called *naẓārat* (later, in 1915, *wizārat*) *al-maʿārif al-ʿumūmiyya*. The term *maʿārif* was universally used for "education" in the Ministries of Education of the Arab successor-states of the Ottoman Empire, and until the mid-1930s, also in Iran. Only after the Egyptian Revolution, at the beginning of the school year 1954-5, was the Ministry of Public Instruction renamed *Wizārat al-tarbiya wa 'l-taʿlīm*, literally "Ministry of Education and Instruction". The Minister of Education explained that the change aimed to emphasise the shift from the static and passive "knowledge" to the dynamic process of education and the teaching of various skills. It may be suggested that additional reasons were behind the decision to do away with the term *maʿārif*. Although the word is of an Arabic origin, Arabic was less comfortable with it in the sense of education than Ottoman, and even modern Turkish. The expression *dāʾirat al-maʿārif*, for example, has the double meaning of "Department of Education" and "encyclopaedia". The dropping of the old and, from the Arabic point of view, the somewhat clumsy term *maʿārif* should be also viewed against the background of the Arabisation after the Egyptian revolution of 1952 of the official nomenclature, which had still retained many Turkish terms in the civil administration and in the Army. Following the Egyptian example, the other Arab countries replaced in the fifties the term *maʿārif* with *tarbiya* or *tarbiya wa-taʿlīm* for their Ministries of Education. It further seems that the word *maʿārif* in the sense of education is dying out in Arabic in the non-official usage also.

i. The Ottoman Empire and Turkey

The beginning of modern education in the Ottoman Empire. — Islamic society had traditionally the highest regard for the pursuit of knowledge, *ʿilm*, but education was considered as a religious or communal matter of no concern to the state. Muslim children were taught the Ḳurʾān and the basics of religion in the Ḳurʾān schools, the *mekteb* (Arabic *maktab* or *kuttāb* [*q.v.*]). Higher religious studies were given in the *madrasa* [*q.v.*] (Turkish pronunciation, *medrese*). The traditional educational institutions were financed by private donations, but mainly by the *waḳfs*, pious foundations. The religious educational system was entirely within the jurisdiction of the *ʿulamāʾ*. The traditional religious education had not changed substantially for centuries and was quite uniform, some local variations notwithstanding. The modernised, state-directed, and at least partially secularised education which was called *maʿārif* emerged only in the 19th century, although there were some hesitant beginnings in the 18th century. These had been prompted by the Ottoman defeats at the hands of the European powers. The Ottoman government realised that it had to improve the training of its officers and that this could be accomplished only by borrowing European training methods and techniques.

As early as 1734 a school of engineering, *Hendese-k͟hāne*, was established in Üsküdar. This first institution was to be shortlived, but in the last quarter of the 18th century more successful efforts to found military schools were made. After the Ottoman navy was burned by the Russians, the Ottomans established in 1776 a new Imperial Naval Engineerng School, *Mühendis-k͟hāne-yi Baḥrī-yi Hümayūn*. In order to train army artillery officers, an Imperial Land Engineering School, *Mühendis-k͟hāne-yi Berrī-yi Hümayūn* was founded in 1794 (or in 1796). These military schools were staffed largely by French officers, and European textbooks, especially translated for the cadets, were used there.

Maḥmūd II. — Yet the first real educational beginning in the Ottoman Empire belongs to the reign of Maḥmūd II (1801-39), who was following the example of Muḥammad ʿAlī, Egypt's modernising Pas͟ha. Maḥmūd's first significant step in the field of education was issuing an edict which stated that "the majority of people lately avoid sending their children to school and prefer to give them to a trade as novices to artisans when they reach the age of five or six because of their ambition to earn money immediately. This condition is the cause not only of widespread illiteracy but also of ignorance of religion ... No man henceforth shall prevent his children from attending school until they have reached the age of adulthood ...". This edict cannot be considered as a compulsory education law, and it contained nothing to change the traditional aims and structure of elementary education, but it did mark a departure from the past by declaring the direct involvement of the state as such in the education of children. Maḥmūd realised that in order to reform the army, the reactionary forces should be eliminated. Therefore he destroyed the Janissaries in 1826, as Muḥammad ʿAlī had massacred the *mamlūk*s in 1811. It is no coincidence that the greater part of Maḥmūd's educational activity took place after that date. It was to be typical of educational development in the Middle East that reform in the school system started from the top, by establishing modern specialised schools to train officers, doctors, engineers and administrators for the army and the civil bureaucracy. The higher, specialised schools were unrelated to the traditional educational system; the elementary schools especially saw very little change until the 1908 revolution. Because of this, students of engineering and medicine in the first higher schools had to study such elementary subjects as arithmetic, Turkish grammar and French. Eventually, the higher institutions of learning had to form their own preparatory sections, until the state gradually developed the higher-elementary and secondary stages of the educational system. An impressive number of higher schools were founded during the reign of Maḥmūd II. In 1827 Maḥmūd opened a medical school in Istanbul to train doctors for the army, less than a month after the opening of Muḥammad ʿAlī's medical school in Cairo. The Imperial Music School was inaugurated in 1831. In 1832 the *D̲j̲errāḥ-k͟hāne*, another medical school for the training of surgeons, was founded. In 1834 the *Ḥarbiyye*, the Military Academy was opened. It was modelled on St. Cyr, and indeed the French influence was dominant at this school. In 1838 a Law School was opened. Among the educational achievements of Maḥmūd's reign should be mentioned the first students' mission to European capitals, which started in 1834 (according to one source, in 1827), also by following Muḥammad ʿAlī of Egypt, who was the first Middle Eastern ruler to adopt his method of training specialists for his army and administration. Another method to raise the educational standards of his army was to establish training units within the military corps (1832).

Toward the end of the reign of Maḥmūd II, two schools of a new kind were created, the *Mekteb-i Maʿārif-i ʿAdliyye*, the so-called *ʿAdlī* (after a title of Maḥmūd II) School of Science, a school designed specifically to train employees for government offices (1838), and the *Mekteb-i ʿUlūm-i Edebiyye*,

School of Literary Sciences, to train translators and interpreters (1839). These schools taught, among other things, modern subjects such as French, geography and mathematics. Maḥmūd's educational system created a new type of school, the *rüs̲h̲diyye*, higher elementary school (from *rüs̲h̲d*, meaning "adolescence"), which was to serve throughout the 19th century as an important link between the elementary schools and the higher stages, which were somewhat modernised and secularised, although lip-service to religion was always paid. As has already been mentioned, Maḥmūd's reign also initiated the first government offices which were charged with administering and supervising the new schools, the forerunners of the Ministry of Education. One of them was the *Med̲j̲lis-i Umūr-i Nāfiʿa*, the Board of Useful Affairs, established in 1838, which among other things constructed schools. Another body was the Department of the *rüs̲h̲diyye*s, *Mekātib-i Rüs̲h̲diyye Neẓāreti* (1839). Despite the impressive record of Maḥmūd's period, one must remember that the number of students exposed to the new education was severely hampered by lack of teachers and by difficulties of language and terminology.

The Tanẓīmāt. — The period of the Ottoman Reforms, the *Tanẓīmāt* [*q.v.*] (1839-76), brought about a real breakthrough in all the spheres of education: organisation, legislation and development. In 1845 the *Muwaḳḳat-i Maʿārif Med̲j̲lisi*, Provisional Board of Education was formed, in the next year it became *Mekātib-i ʿUmūmiyye Neẓāreti*, Ministry of Public Schools, and was replaced in 1857 by the Ministry of Public Instruction. In 1851 the Society of the Learned, *End̲j̲ümen-i Dānis̲h̲*, was formed with the purpose of sponsoring Ottoman culture and contributing to education. It was active only for a few years and did not accomplish much. In 1868 a Council of State was set up. The Council had five sections, after the French model, one of which was in charge of agriculture and public instruction. A Higher Council for general education was formed in 1869 within the Ministry of Education, on which representatives of the non-Muslim communities (*millets* [*q.v.*]) also served. Subordinate to this central council, provincial councils were established in each province as part of the local government. During the *Tanẓīmāt* era, important innovations were introduced. For the first time programmes and regulations were issued to all the elementary schools of the empire (1847). In 1870 a similar set of regulations concerning the *rüs̲h̲diyye* schools was circulated. In 1846 ʿAlī and Fuʾād, two of the chief reformers, prepared an ambitious but unrealistic scheme to reorganise the entire educational ladder from the *ṣibyān* elementary schools up to the university. With the foundation of the Ministry of Education in 1857, another scheme for the organisation of the school system was prepared, which provided for an elementary school (*mekteb-i ṣibyān*) of 4 grades (ages 7-10), secondary school (*rüs̲h̲diyye*) of 6 grades (ages 11-16), from which the graduate could continue in various higher institutions of learning, including the *Mülkiyye*, a school which was actually founded only in 1859 to prepare civil servants.

In 1286/1869 a comprehensive law or reorganisation of the state school system was issued. This time the scheme was more thorough than previous attempts aiming at the rationalisation of the school system and integrating all that which had been achieved till that date. The Ottoman Education Law was inspired by the European legislation of the day, and perhaps also followed the Egyptian Education Law of 1867. The Ottoman law classified schools in the empire into public (*ʿumūmiyye*) and private (*k̲h̲uṣūṣiyye*). The former were graded as elementary (*ṣibyāniyye*) higher elementary (*rüs̲h̲diyye*), lower secondary (*iʿdādiyye*) and higher secondary (*sulṭāniyye*). At the top there were higher institutions of learning, technical, agricultural, and teacher training, and the state university (*Dār al-Fünūn*). Already in 1868 a compulsory education law had been issued, according to which all boys aged 7-11 and all girls aged 6-10 had to go to school. The 1869 law provided for a *ṣibyān* school in every village or town quarter, a *rüs̲h̲diyye* in towns with 500 or more families, and an *iʿdādiyye* in communities with 1,000 families or more. A *sulṭāniyye* secondary school was to be established in every provincial capital. The actual development of Ottoman education, however, lagged behind this scheme, for lack of funds, teachers and facilities. By 1876 there were only 362 *rüs̲h̲diyye*s, and only one *sulṭāniyye* school was opened for a long time to come. As for the University, the first public lectures were held in 1863, but it was soon closed down. In 1870 another attempt to open the *Dār al-Fünūn* was short-lived. Only in 1900 was the university finally organised.

The *Tanẓīmāt* period began with the promulgation of the famous *K̲h̲aṭṭ-i S̲h̲erīf* ("Noble Rescript") of 1839 which proclaimed, at least implicitly, the principles of the equally of all Ottoman subjects, regardless of creed, and which opened the new state schools to non-Muslim children. The *K̲h̲aṭṭ-i Hümayūn* of 1856 made these promises explicit. Generally, the *Tanẓīmāt* period witnessed some genuine attempts to integrate the non-Muslim elements in Ottoman society, and it was realised that this could best be achieved through education. Midḥat Pas̲h̲a [*q.v.*], the famous reformer and administrator, established integrated schools while he was the governor of the *wilāyet* of the Danube. The first major breach in religious barriers against mixed education occurred in September 1868 with the establishment of the *Lycée* of G̲h̲alaṭa-sarāy, which was to be a conscious copy of the French *lycée*. The school offered a European-style curriculum in a five-year course and religious education for students of the main Ottoman millets; the Muslim children constituted about one-half of the student body. In its first years, the administration and the staff were mainly French. But in the seventies the French influence decreased and the school became increasingly Turkish in character. Robert College, the Protestant counterpart of G̲h̲alaṭā-sarāy, had already been in existence since 1863.

The *Tanẓīmāt* period is also to be c edited with the first institutes of teachers' training. The idea of state supervision of the teachers belongs to the time of Maḥmūd II, but nothing had been done before the *Tanẓīmāt* to train teachers formally; *medrese* graduates were considered as qualified teachers. The first college of teacher training (*dār al-muʿallimīn*) for the *rüs̲h̲diyye*s was opened in 1848 in Istanbul. The first normal school for girls (*dār al-muʿallimāt*) was founded in 1870, and by 1908 there were 33 teachers' training institutes throughout the empire.

The *Tanẓīmāt* period saw a determined effort to spread education to the provinces. The *wilāyet* Law of 1871 made provisions for provincial educational administration. In 1872 a decree for reform in the elementary schools in the provinces was issued.

Perhaps most important, the organised under-

taking of female education was original to the *Tanẓīmāt*. Coeducation was practised in the elementary *mekteb*, but was impossible in the *rüshdiyye*. Around 1862, separate schools for girls were established. The educational scheme of 1869 provided for the first time for education for girls, where such subjects as sewing and cooking were taught, and the first female teachers for girls' trade schools were appointed in 1873.

To sum up, the educational efforts of the *Tanẓīmāt* meant that new forms emerged; a network of military and civilian schools developed; pioneer work in the fields of education of girls and teacher training was started; contacts with Europe continued, including consultations with European education experts; student missions were sent; and the Ottoman School in Paris (1857-74) became a centre for the Ottoman students in that city. During the *Tanẓīmāt*, the gap between the secular and the religious in Ottoman society widened considerably.

The Constitutional, Ḥamidian and Young Turk periods. — The Constitution of 1876 reiterated the principles of compulsory and free primary education and the concept of a centralised and somewhat secularised school system. The state did not interfere with religious education in the elementary schools and in the *medreses*, which remained the province of the *ʿulamāʾ*.

Although the long reign of sultan ʿAbd ül-Ḥamīd II (1876-1909) was a time of despotism and political reaction, the sultan carried on his predecessors' educational activities. He imposed strict censorship on curricula and textbooks and his spies bedevilled the lives of teachers, students and intellectuals. Yet during his rule the literacy rate tripled, many schools were opened, new types of higher institutions of learning were established and the first modern university in the Muslim world was finally founded (1900). During the period 1879-99 the number of the *rüshdiyyes* rose from 253 to 389. The network of military schools was developed; there were 29 military *rüshdiyyes* in 1897. In accordance with his overall Islamic and Arab policy, ʿAbd ül-Ḥamīd II paid more attention to education in the Arab and other Muslim non-Turkish provinces than had been done previously. A typical example of this policy was the *ʿAshīret Mektebi*, School of the Tribes, which was opened in Beshiktāsh in 1894 and lasted until 1907. This school trained teachers, officers and administrators from the Arab, Kurdish and Albanian provinces. In 1883 the sultan decreed that every provincial capital should have its own teacher training college. In the same year he imposed an "assistance tax", a share of which was set apart for education. A medical school was opened in Damascus in 1903; it was then transferred to Beirut in 1916, and finally closed down in 1918. The network of military schools was extended, and in 1904 military schools were opened in Damascus, Baghdād, Erzincan, Edirne, and Monastir. Law schools were established in 1907 in Konya, Salonika and Baghdād.

ʿAbd ül-Ḥamīd sponsored the opening of schools of finance (1878), fine arts (1879), commerce (1882), engineering (1884), a school for the blind and deaf (1889), veterinary services (1889), police (1891) and customs (1892). Generally, vocational and technical education was emphasised, and courses to train telegraphic operators and steamboat mechanics were given. The institutions of higher learning developed vigorously under ʿAbd ül-Ḥamīd's rule, although the sultan realised that these could endanger his régime. Indeed, the first revolutionary group was organised in the military medical school in 1889. Similar circles were eventually successful in bringing about the 1908 revolution, which ushered in the period of the Young Turks, or the "Second Constitution", which lasted until the collapse of the Ottoman Empire.

The turbulent last ten years of the empire witnessed some basic changes in the approach to education. It can be stated that in this short period the educational system was transformed through modernisation and secularisation, preparing the road for the future Kemalist reforms. Besides the institutional and legal reforms in Turkish education, which will be presently discussed, new concepts about education came to the fore. As N. Berkes has aptly put it: "If the word *maarif* symbolises the era opened by Mahmud II, the term *terbiye* well represents the Meşrutiyet era, and signifies an important improvement over the first." Thus, to the concept of knowledge, the idea of education was now added. This era saw the emergence of the first professional Ottoman pedagogues, such as Sāṭiʿ al-Ḥuṣrī (who would be later better known as an Arab educator and nationalist), Riḍā Tewfīḳ, Selīm Sirrī and Ismāʿīl Ḥaḳḳī, who promoted the publication of psychological and pedagogical literature. While the educational model during the *Tanẓīmāt* was the French system, the educators of the *Meshrūṭiyyet* turned to the Anglo-Saxon education system for inspiration.

There were significant beginnings of secularisation. The first teachers' organisations appeared. The struggle between the *khōdja* (clerical teacher) and the *muʿallim* (secular teacher) became more pronounced in the Young Turk period. The ideologues of the ruling Union and Progress Committee (*Ittiḥād ve Terakki Djemʿiyyeti* [*q.v.*], headed by Diyāʾ (Ziya) Gökalp, demanded that the state, not the *ʿulamāʾ*, should control and supervise public instruction. As a result of a resolution adopted at its 1916 convention, the Union and Progress Committee transferred the elementary schools, which had been previously under the Ministry of *Ewḳāf*, to the Ministry of Education. The *medreses* were merely transferred from the Ministry of *Ewḳāf* to another religious authority, the *Bāb-i Meshīkhat*, the Department of the *Shaykh al-Islām*.

In the legislative field, the 1329/1913 Provisional Law of Elementary Education, the most important law since the Ottoman Education Law of 1286/1869, was promulgated. The law created education committees at the level of districts and sub-districts, thus delegating administrative, financial and pedagogical responsibility to local authorities. The law placed all the financial burden of maintaining the schools, namely establishing a school, acquiring the land, constructing the building, paying the teachers' salaries and all current expenses, on the people of the countries and districts. This meant in practice that universal elementary education could not be achieved for a long time to come.

In the "Second Constitutional" period, progress was achieved in the sphere of women's education. Educational opportunities for women were extended to the secondary school. In 1911 the first *iʿdādiyye* and in 1913 the first *lycée* for girls were opened in Istanbul. Trade schools for girls were established, not only for cooking and sewing, but to train nurses and secretaries. In 1915, women were admitted to the University, although in separate classes, to be trained as secondary school teachers. After 1918, women were allowed to work as elementary school teachers.

After the 1908 Revolution, the University was reorganised and the curriculum now included history, philosophy and sociology, which had been banned under ʿAbd ül-Ḥamīd.

Education in the Turkish Republic. — The educational developments in the Turkish Republic in the twenties and thirties are closely linked with the reforms of Muṣṭafā Kemāl, the future Kemal Atatürk [*q.v.*], the first president of the Republic. The Kemalists, committed as they were to drastic cultural change, rightly understood the utmost importance of education for their objects. The revolutionary government in Ankara established its own Ministry of Education in May 1920, while still fighting against the Allied-supported Ottoman government in Istanbul.

The Law of Unification of Instruction (*Tawḥid-Tedrīsāt*) of 1924 ended the century-long dichotomy between secular and religious education in Turkey and created a fully secular and integrated school system. All educational institutions were placed under the control of the Ministry of Education. The *medreses*, 479 in all, with a total enrollment of 18,000 (only a third of whom were genuine students) were closed down. To provide alternative higher Islamic education, the Faculty of Theology was opened at the University of Istanbul and 26 secondary schools for training *imāms* and *khaṭībs* were established. The anti-clerical atmosphere of the period did not encourage the development of these institutions. The Theological Faculty was closed in 1934 and the last *imam-hatip mektepleri* were closed down in 1932-3, after their enrolment had been continuously dwindling. As for the religious education in regular schools, this too was adversely affected by the secularising ethos of the Atatürk era. In 1928 Islam ceased to be the state religion, and the principle of laicism was accepted. In the same year, the Latin script was adopted for the Turkish language. Atatürk himself went out to the people to teach the new script. In the next year, Arabic and Persian were eliminated from the curriculum. In 1932 religious instruction in the secondary schools was finally stopped. There is no agreement as to when religious instruction in the elementary schools was discontinued; some sources date it as early as 1924, others mention 1928, a date which seems more accurate. It seems that religious instruction was simply phased out, although it continued in many village schools. Toward the end of the forties, the public mood became definitely favourable to the reintroduction of religious instruction in schools. The issue came up in the National Assembly at the end of 1947. In January 1949 the Ministry of Education issued a circular, according to which two hours of religious instruction would be given in the fourth and fifth grades of elementary schools to pupils whose parents might ask for it. The coming to power of the Democratic Party in 1950 was a turning-point in the attitude of the government toward religion generally and religious instruction in particular. After 1950, religious education became compulsory for all; parents were required to opt out instead of in as before. At the beginning of the school year of 1956-7, religious instruction was introduced to the middle schools, or junior high schools (*orta okullar*), as well. In 1951 new *imam-hatip okullari* were established. In contradistinction from the early version, these institutions have been successful. Higher religious instruction have been offered in institutes in Istanbul and Konya, but the most important faculty which teaches Islam at the university level is the Faculty of Theology (*Ilâhiyat Fakültesi*) at Ankara University which was founded in 1949-50.

It is not surprising that, due to the administrative traditions of the Ottoman Empire, which had been influenced by the French model, the Ministry of Education of the Turkish Republic was centralistic from the start. This was also justified in part by the determination of the government to create a unified, modernised and secularised education in a country which was fragmented into numerous regions and tribes and which was far from enjoying linguistic and cultural homogeneity. Centralistic educational administration was also needed to overcome the indifference or even hostility of the conservative elements, particularly in the countryside, towards the Kemalist Revolution and its educational goals. In 1926 the Ministry of Education was reorganised. The country was divided into twelve regional directorates of education, each being headed by a superintendent of education (*maʿārif emīni*), directly responsible to the Ministry in Ankara. Since 1949, the organisation of the educational system has been somewhat more flexible, each governor being responsible for the education in his district. He is assisted by an educational council and a director of education, who is more responsive to local needs. In spite of these reforms, the educational system of Turkey, like most countries in the Middle East, is quite centralised, and the state controls the whole educational system pedagogically, administratively and financially. The Ministry of Education is helped by a National Educational Council (*Milli Eğitim Şurası*) which consists of educators and administrators and has wide powers in drawing up educational policies concerning curricula, textbooks and school regulations. The Council meets once every few years. The Tenth Educational Council convened in 1981. The Ministry of Education has a virtual monopoly of textbooks. The government controls higher education as well, and inspects private and minority schools closely. Private institutions have been declining in comparison with state schools. Scores of higher institutes which train students in such fields as economy, commerce, engineering and architecture were nationalised at the beginning of the school year 1971-2 after the important education law no. 1472 had been promulgated. Education in all state schools at all levels is free of charge.

The most difficult task which the education authorities had to face was to raise educational standards and to combat illiteracy in the nation generally and in the countryside in particular. The formal school system was complemented by the Turkish Hearths (*Türk Odjaghī*), a network of a kind of clubs founded in 1912 to promote Turkish culture and economic welfare through lectures, publishing books and opening schools. The Turkish Hearths were closed down in 1931 and replaced by a network of People's Houses and People's Rooms (*Halkevi* and *Halkodası* [see KHALKEVI]), community centres established to diffuse Turkish culture and closely associated with the ruling Republican People's Party. Teachers were encouraged by their Ministry to participate in the activities of these centres.

The Ministry of Education devised several programmes to train teachers for the village schools. One of them was to send soldiers of rural origin and having some education on short pedagogical courses. Since 1936, young villagers who had finished primary school were sent on courses of six months to prepare them to teach in their villages. According to the Village Educators' Law of 1937, special centres to

train teachers were initiated. In 1940 the law of 1937 was supplemented by the Village Institute Law. Subsequently, the two programmes were united. In addition to his regular teaching assignments, the village educator was expected to teach adults and to help in the social and economic development of the village. The Village Institutes were merged with the regular teacher training colleges in 1954.

All these efforts have produced positive results, and the gap between school attendance rates in villages and in the cities is not nearly as wide as is the case in most Middle Eastern countries. This applies even to education of girls. In the school year 1973-4, for instance, the proportion of girls in state elementary schools in the cities was 46%, while in the villages the percentage was only 3.7% lower. National schooling rates for children between the ages of seven and twelve, who are obliged to go to school according to the compulsory education law, were 90% already in 1672-3, again a much higher rate than in most countries of the region. The school attendance rates have been on the rise in all educational levels. Consequently, literacy rates rose from 19.2% in 1935 (29.3% for men and 9.8% for women) up to 54.67% in 1970 (69% for men and 40% for women). The progress in the education of women is especially impressive. Coeducation has been a principle in Turkish education since 1927; only when there are special circumstances or professional needs are separate schools for girls established.

The basic structure of the Turkish educational ladder is 5-3-3, i.e. primary school (*ilkokul*) of five grades (ages 7-11) followed by a junior high school or "middle school" (*ortaokul*) of three grades (ages 12-14) and leading to the secondary or high school, *lycée* (*lise*) of three grades (ages 15-17) or a vocational or a trade school. The *ilkokul* and the *ortaokul* comprise the two stages of the "basic education" (*temel eğitim*). At the *orta* level, the student may already start at a teacher training school, which continues four more years at the secondary level. Other courses which last four years after the *ortaokul*, that is up to the twelfth grade, are the *imam-hatip okulları* and technicians' schools. In addition to regular schools, there are evening schools for working youth. Special mention should be made of the state schools which teach in foreign languages. These institutions teach the "national" subjects in Turkish, but the language of instruction of all other subjects is English, French or German, according to the particular school.

Despite the impressive achievements, education in Turkey has yet to overcome many serious difficulties. Teachers' status and salaries are quite low. There is considerable shortage of teachers, since the teacher training schools at the secondary and university level do not keep up with the rapid growth of the student population. In 1972-3 the teacher: student ratio was 1:33 in the state primary schools, in the state *ortaokul* 1:43 and in the *lise* 1:39.7. Another structural weakness of the educational system is the small proportion of students in vocational and trade schools at the secondary level, which is well beneath 20% of the secondary school student population. One result of this is that each year, increasing numbers of the *lise* graduates cannot be admitted to the universities and other higher institutes of learning for lack of space, although the higher educational system is also expanding very quickly.

ii. Egypt

Educational development under Muḥammad ʿAlī. — The foundations of modern education in Egypt were laid by Muḥammad ʿAlī Pas͟ha, the virtually independent viceroy of Egypt from 1805 until 1848. His ambitions were personal and dynastic, yet he was aware that if he was to establish a powerful state, he had to build a modern, European-style army and an efficient administration and economy. This he could accomplish only with Western methods and advice, since education and learning in Egypt, even more than in the centre of the Ottoman Empire, were wholly traditional and were confined to religious instruction at the *kuttāb*s and the *madrasas*, the most important one being al-Azhar [*q.v.*]. So it happened that although Muḥammad ʿAlī had little interest in raising the educational standards of the Egyptian people, his dynamic reign made Egypt the forerunner of modern education in the Arab-speaking world, and a model for the Ottoman Empire, of which Egypt was nominally only an outlying province.

After having destroyed the Mamlūks [*q.v.*] in 1811, Muḥammad ʿAlī set out to establish the *Niẓām d͟jadīd*, his new army. For this purpose he started to send student missions to Europe to study various technical subjects, and on the other hand began to found new state schools, bypassing the traditional system of education. France and Frenchmen enjoyed a predominant influence in the modernisation of Egyptian education, at least until the British occupation in 1882. Therefore it is of interest to note that the first student missions, in 1809 and 1819, were sent to Italy (to Leghorn, Milan, Florence and Rome) in order to study military science, shipbuilding, printing and engineering. The foreign language which was taught in the first state school established by Muḥammad ʿAlī was Italian. Since about 1820, however, Italian influence was replaced by the French, and a group of French experts and educators gained central positions in Muḥammad ʿAlī's bureaucracy. The best-known of these was Colonel Sève, who as a convert to Islam became known as Sulaymān Pas͟ha. Sève organised the new army and the military schools. Indeed, the next missions were sent, mainly though not exclusively, to France. Thus the first large mission went to Paris in 1826, with the famous educator and writer *S͟hayk͟h* Rifāʿa Rāfiʿ al-Ṭahṭāwī [*q.v.*] as its *imām* and preacher. This mission included other members who later rose to prominence in the educational and administrative service of the Pas͟ha. By the mid-1830s the first Egyptian graduates of the student missions were teaching in Egypt at the professional school and replacing the European teachers and instructors.

In 1816 Muḥammad ʿAlī opened a school in the Citadel of Cairo where some 80 students began to study military subjects, arithmetic and Italian. Four years later the school was moved to Aswān. It is significant that the students were sons of *Mamlūk*s and other boys of Circassian, Turkish, Albanian and Armenian origin, who were believed to be superior in martial qualities to the native, Arabic-speaking Egyptians. Turkish was the language of instruction.

The beginning of secondary education was also connected with the army. Since the *kuttāb* schools could not prepare students for the higher schools, a preparatory (*tad͟jhīzī*) school was established in 1825 at Ḳaṣr al-ʿAynī with 500 students between 6 and 12 years of age. By 1833 the school had 1,200 students. The discipline and organisation at the prepar-

atory school, as indeed in the whole of Muḥammad ʿAlī's educational system, were military. The students were trained to join the naval, infantry, cavalry and engineering schools which were opened in the 1820s and the 1830s.

The first important institute of higher learning in Egypt was the Medical School, opened in 1827 at the hospital of Abū Zaʿbal, its director for the next 22 years was Clot Bey, another Frenchman, who was in charge of public health and medicine in Egypt. It was again typical that although the Medical School was mainly intended to serve the army, its students were native Egyptians, who had studied at al-Azhar, unlike the students of the military schools properly speaking. Other schools of civilian character were opened in 1829—the School of Agriculture, the School of Pharmaceutics and the Veterinary School. All these schools fell within the jurisdiction of the Department of the Army, *dīwān al-djihādiyya*, but already in 1826 a *Commission d'Instruction*, a consultative body for the new schools was set up within the *dīwān al-djihādiyya*.

The 1830s were the zenith of Muḥammad ʿAlī's career. His army became a huge fighting force which won victories and successfully challenged and threatened the Ottoman Empire itself. The growth and development of the army further stimulated the development of the school system. In that decade, the most important schools were founded and patterns for educational organisation and supervision were laid down. An impressive number of specialised, technical and industrial schools were founded. Among them were the short-lived School of Government Administration (1834), the Staff College (1836), the School of Chemistry (1831), School of Minerals (1834) and an industrial workshop (1839). The most important ones were undoubtedly the School of Engineering, *Muhandis-khāne* (1834), and the School of Languages and Translation, *Madrasat al-alsun wa 'l-tardjama* (1835). After a modest and apparently unsuccessful attempt to open a school of engineering in 1820, the *Muhandis-khāne* at Būlāḳ was opened. The engineering school, modelled after the École Polytechnique of Paris, trained engineers and supplied mathematics and science teachers to the secondary and higher schools. The School of Languages was founded by al-Ṭahṭāwī and directed by him for many years. The students spent there five or six years studying French, Islamic jurisprudence and mathematics, among other subjects. This institute became an important translation centre, where many textbooks were prepared or translated from European languages.

The 1830s were also the period of laying the foundations for the modernised primary education. Muḥammad ʿAlī ignored the *kuttāb* schools; he actually weakened the traditional system by confiscating the *waḳf* foundations which financed it. From 1833 state primary schools (*mubtadiyān*) were opened in the capital and the provinces, and within three years were over 50 of them. The pupils, who were from 7 to 12 years of age, learned besides the usual religious instruction secular subjects also such as geography and arithmetic. The people were reluctant to send their sons into these schools, which they rightly regarded as an integral part of Muḥammad ʿAlī's system of recruitment into the army.

The administration of the schools was separated from the army, but it took some time to reach that decision. Colonel Sève was appointed in 1834 as an inspector general of the schools within the *dīwān al-djihādiyya*, but later he had to devote all his time to his military duties. In 1830 the *Conseil supérieur de l'instruction publique*, which in Arabic was inaccurately known as *madjlis shūrā 'l-makātib*, was established. It was a pedagogical body which was expected to coordinate the schools and the *dīwān al-djihādiyya*. A committee was formed, and it prepared a comprehensive scheme for education in Egypt, providing for primary schools, two preparatory schools (one in Cairo and the other in Alexandria) and special schools. Finally, in February 1837, a separate department, independent of the *dīwān al-djihādiyya*, and in charge of the schools, was founded. It was called the *dīwān al-madāris*, the Council of Schools, a term which was more correct than the bombastic French term by which the department became known, *Ministère de l'instruction publique*. It is true, however, that the *dīwān al-madāris* was the core of the future Ministry of Education. At first, the *dīwān al-madāris* suffered from mismanagement, inefficiency and intrigues. In addition to its pedagogical functions, it was charged with construction (for a time it was called the Council of Schools and Construction) and with the publication of the Official Gazette (*al-Waḳāʾiʿ al-Miṣriyya*). Initially, the *dīwān al-madāris* was divided into three sections: Arabic, Turkish and engineering. The Delta Barrage and the engineering services were also attached to the *dīwān* on account of their dependence on the *Muhandis-khāne*.

The setback to Muḥammad ʿAlī's imperialistic ambitions by the Treaty of London in 1840 drastically curtailed the extent of the Egyptian army and caused the breakdown of the school system in the 1840s. In 1841, only 5 state primary schools remained. The special schools were affected too. The student missions abroad continued, however, and in 1844 a large mission which included several princes (and was called thereafter *baʿthat al-andjāl*) was sent to France. In 1847, toward the end of Muḥammad ʿAlī's reign, a programme to establish popular elementary schools, or reformed *kuttābs*, called *makātib al-milla* (in contradiction from the government primary schools, the *mubtadiyān*), was brought forward. It is probable that Ibrāhīm Pasha, Muḥammad ʿAlī's son and successor, took an interest in the project, but his reign was too short to accomplish much and the reforms in the elementary education had to wait until the accession of Ismāʿīl.

Education under ʿAbbās I (1849-54) and Saʿīd (1854-63) — Educational development suffered a serious slowdown during the reigns of ʿAbbās I and Saʿīd. Although ʿAbbās was no more interested than Muḥammad ʿAlī in educating the Egyptian people, the training of army officers and bureaucrats continued on a modest scale. ʿAbbās sent some 40 students abroad, this time mainly to central Europe. ʿAbbās exiled al-Ṭahṭāwī to Kharṭūm to organise an Egyptian school there. On the other hand, he favoured and promoted ʿAlī Mubārak [*q.v.*], an able administrator, reformer, and writer, who was to become a key figure in the development of education in the next three decades. ʿAbbās weakened the Council of Schools and the educational system in general, but he was interested in the army and founded in 1849 the élite military school, *al-Madrasa al-ḥarbiyya al-mafrūza*. Of the special schools, only the medical school and the school of engineering remained.

It is generally agreed that Saʿīd's educational policy was erratic, and that he aimed at reversing his predecessor's decisions. Upon his ascession to the vice-regal throne, he abolished the *dīwān al-*

madāris and closed down all the schools within its jurisdiction. Shaykh al-Ṭahṭāwī was recalled from the Sudan, whereas ʿAlī Mubārak was sent by the ruler to the Crimean War. Egyptian students were sent to France again. Saʿīd's short reign was favourable to the development of foreign and missionary schools; by the end of his reign their number reached approximately 60.

The period of Ismāʿīl (1863-79) — During Ismāʿīl's reign, educational activity was vigorously renewed under the able direction of the European-educated administrators Ibrāhīm Adham and ʿAlī Pasha Mubārak. For the first time, education in Egypt was becoming "public" in the true sense of the word, not limited to the task of training experts and technicians for the army and the state machinery. Unlike Muḥammad ʿAlī, Ismāʿīl made the *kuttāb*s the basis of the elementary education, and the *wakf* funds were used to finance them. Immediately after assumming power in 1863, Ismāʿīl reactivated the Council of Schools (*dīwān al-madāris*) which became in 1875 the Ministry of Public Instruction (*Naẓārat al-maʿārif al-ʿumūmiyya*), with ʿAlī Mubārak as Minister. Ismāʿīl gave full support throughout his reign to the initiative of Mubārak and other progressive educators. In November 1867 ʿAlī Mubārak presented a document which he had prepared with a committee of administrators and notables. This was the Radjab Regulation of 1284, *lāʾiḥat Radjab*, which aimed at promoting elementary education by establishing provincial primary schools, which would be under government inspection and would be financed by *wakf* and private contributions. The new regulations provided for the first time for a sort of pedagogical supervision of teachers. The curriculum of the elementary schools was to be somewhat modernised. Of course, many reforms remained on paper only for a long time to come, but scores of elementary schools were nevertheless opened and the principle of state control over all elementary schools was established. Mubārak also put an end to the confusion between civil and military schools and confined the authority of the *dīwān al-madāris* to civilian schools, freeing them from their military character. The provisions of the *lāʾiḥat Radjab* were complemented by the regulations set down in 1880 by a committee, known as the *kōmisyōn*, which provided for three types of schools depending on the size of the community: villages, provincial towns and cities. Provincial authorities were empowered to collect contributions and fees from well-to-do parents and to use *wakf*s to finance schools.

Ismāʿīl's reign should be credited with introducing education of girls and teacher training. The only kind of female education before Ismāʿīl was the School of Midwifery which was founded in 1832. This school recruited its first students from among Sudanese and Ethiopian Negro girls, Egyptian girls being considered too delicate for that kind of work. The first school for girls, *al-Madrasa al-Suyūfiyya*, was opened in 1873. In the following year it had 400 students, who studied general subjects as well as sewing and weaving.

The first teacher training school, called *Dār al-ʿUlūm*, the House of Sciences, was founded in 1872. It had already started in 1871 as a programme of public lectures for students recruited from al-Azhar to prepare them to become teachers. In the next year, it was organised as a regular teacher training college, where students studied religious and secular subjects.

The period witnessed the reopening of several higher institutions of learning which had been closed down by ʿAbbās or Saʿīd and the foundation of new ones. Thus the School of Languages founded in 1835 but closed down in 1850 was reopened in 1868 under the name the School of Administration and Languages and later became the first secular law school in Egypt.

In the 1860s, a number of trade and vocational schools were opened. Schools of land surveying, accounting, archaeology and hieroglyphics were opened in the 1870s, together with preparatory schools. In 1872 the first reforms were introduced at al-Azhar. The missions continued and 175 students were sent, mainly to France. In Ismāʿīl's time there was a tenfold increase in budget expenditure for schools. Owing to Ismāʿīl's "open door" policy toward Europeans, his period was also one of unprecedented boom for the schools of foreigners, missionaries and local religious minorities. About 130 new schools were opened with 9,000 students.

Beside the activities of the government, there were private societies and groups which worked for the promotion of education, such as the Society of Knowledge (*djamʿiyyat al-maʿārif*) formed in 1868, and the Islamic Philanthropic Society (*al-djamʿiyya al-khayriyya al-islāmiyya*) which was founded in 1878 by the journalist-orator ʿAbd Allāh al-Nadīm for opening community schools, in order to counterbalance the influence of the missionary schools. Al-Nadīm accomplished little, however, because of his involvement in the ʿUrābī revolt.

Education under the British occupation — After the military occupation of Egypt in 1882, the British controlled the entire state machinery, including the Ministry of Education. Educational policy was perhaps the most criticised aspect of the British rule, since it was highly restrictive and conservative, due to financial and political considerations. Lord Cromer, who ruled Egypt from 1883 to 1907, considered the financial recovery of the country as his most urgent goal and spent less than 1% of the budget on education. Previously, almost all the schools were free; now students had to pay tuition fees. This made even the primary education, and certainly the secondary and higher education, élitist in nature. The British made some efforts to improve the *kuttāb*s, turning them in 1916 into elementary (*awwaliyya*) schools, where nothing but religion and the three Rs were taught. The British intentionally hampered the development of secondary and higher education. They regarded the educational system as a means of training a limited number of Egyptian clerks who were to serve in the lower and middle levels of the bureaucracy, and were expected to carry out the instructions of the British policy-makers. Cromer conceived higher education as undesirable, since it might lead to political agitation. Therefore the University was opened only in 1908 as a private institution and did not become a state university until 1925, three years after Egypt's formal independence.

Douglas Dunlop, a Scotsman who administered Egyptian education under Cromer, did it in a rigid, centralistic and unimaginative manner. Strict discipline was imposed both on teachers and pupils. All studies continued to be geared to passing examinations. English was made the language of instruction in history, geography and the natural sciences. Learning by rote continued to be the main method of study. During the British occupation, Egyptian students were sent to study in England only. Whereas before the occupation students travelled to Europe to study mainly technical and industrial subjects, they

now studied humanities and the law. This was in accord with the British policy to keep Egypt an agricultural, not an industrial country.

Many of the higher institutes of learning were closed down, but a few new ones were opened, such as the School of Police and Administration in 1896, a Veterinary School in 1901, a teacher training college for women in 1900, another one for men in 1904 and a College of Commerce in 1911.

As a gesture to ease nationalist resentments, Saʿd Zaghlūl [*q.v.*], the future nationalist leader and founder of the Wafd party, was appointed Minister of Education in 1906. He enhanced the status of the Arabic language in the school system and exempted many poor children from paying tuition fees.

It is not surprising that the balance-sheet of British educational policy was poor. The illiteracy rate barely changed from 1882 (91.7 per cent) to 1917 (91.3 per cent). In 1914, 230,000 students were enrolled in the *kuttāb*s and only 14,000 in the primary schools. High schools of various kinds enrolled some 10,000 students. The number of students in foreign and private schools exceeded by far those enrolled in government schools. There was progress in the education of girls, but the majority of them were in private schools.

Education under the Monarchy 1922-52 — Although Egypt did not gain full sovereignty in 1922, control of internal affairs, including education, passed into Egyptian hands. During the next three decades, the educational system improved but did not free itself as yet from negative aspects of the pre-British and British inheritance, and further suffered from newly-acquired weakness. The Egyptian school system under the monarchy did not reduce illiteracy substantially, and in 1952 it stood at about 80 per cent, and was particularly high in rural areas and among women.

Article 19 of the 1923 constitution guaranteed compulsory and free elementary education; the compulsory education law, passed in 1925, provided for elementary schools of six years, later reduced to five. In 1925 the Ministry of Education planned to universalise elementary education within 23 years. Although quantitative progress was achieved, with student enrolment rising from 809,000 in 1930 to 1,310,000 in 1950, the goal of bringing all children aged six to twelve to school has not yet been reached even by 1981, when only about three-quarters of the children of compulsory education age were in school.

The Egyptian elementary school system was fragmented into several types of schools, a fact which was detrimental to the function of nation-building, and it did not provide equality of opportunity. In the school year 1925-6, elementary schools (*madāris awwaliyya*) were opened to offer free education according to the 1925 law. These schools gave a six-year course (shortened to five years in 1930) and worked usually on a half-day, two-shift basis. The primary schools (*madāris ibtidāʾiyya*) charged fees. They had better physical facilities than the elementary schools and their teachers were better trained. Perhaps the most important difference between the two types of schools was that the curriculum of the primary schools alone included a foreign language (usually English), thus making it possible for the pupils to continue their studies to secondary and higher education, while the elementary schools were terminal. In 1943 another kind of school was added—the rural elementary school (*madrasa awwaliyya rīfiyya*), and special teacher training colleges were opened for them. Beside the public schools, al-Azhar provided religious education at the elementary, secondary and higher level. Finally, there were the private and foreign schools, both religious and lay. In 1942-3 more than 25% of the elementary school pupils and more than 50% of secondary school pupils were in private and foreign schools. Their role was particularly important in the education of girls. The foreign schools were accused of educating their students in languages and cultures alien to Egypt. Private schools were sometimes accused of being more interested in financial profits than in the education of their students. In 1933 and in 1940 laws were passed which imposed stricter supervision of the state over the foreign schools. These schools were instructed to teach Arabic language and the religion of Islam to their Muslim pupils. After the 1956 Suez crisis, all foreign schools were either closed down or nationalised. The relative importance of the private schools had been declining since tuition fees were abolished in the primary schools in 1943 and in the secondary schools in 1951.

It should be noted that the fragmented and deficient nature of the Egyptian school system was criticised by leading educators and administrators such as Ṭāhā Ḥusayn and Ismāʿīl al-Ḳabbānī in Egypt and Sāṭiʿ al-Ḥuṣrī in ʿIrāḳ, and some steps were taken to make the system more just and less divisive and to make educational opportunities more accessible to all social classes. The abolition of tuition fees has been mentioned. In 1938 the teaching of English was postponed from the first to the second grade in primary schools to enable more children to transfer from elementary to primary schools. Again in 1944, English lessons began only in the third grade. In 1951 a law was passed which aimed at creating a unified elementary school system of six grades. This was given effect, however, only after the 1952 revolution.

The secondary and higher levels of education developed more quickly than the elementary schools. The number of students in the secondary schools increased from 2,500 in 1913 to 15,000 in 1933 to 122,000 in 1951. This growth created pressures on the university and also created the problem of many unemployed graduates. The familiar weaknesses of the secondary education, such as rote learning and overemphasis on examinations, were not cured. Secondary and higher education were regarded mainly as a means to enter government service. It is not therefore surprising that vocational and technical education were neglected and that their prestige was low.

Higher education also developed and was modernised to some extent. In 1942 the Fārūḳ I University (renamed in 1952 the University of Alexandria) was constituted. The *Dār al-ʿUlūm*, the old institute which trained Arabic language teachers, became in 1945-6 a part of the Fuʾād I University (since 1952 Cairo University). After earlier efforts to reform al-Azhar (1911), further steps were taken in 1936 in the same direction.

Educational administration in Egypt, as indeed in all the Middle Eastern states, was highly centralised, despite some efforts at decentralisation, especially after 1938, when the country was divided into educational zones. The Ministry of the Interior conducted the elementary schools of the provinces. As in Turkey, a Supreme Education Council meets periodically to discuss broad educational policy.

Developments since the 1952 Revolution — Even the most critical review of the educational policies of the post-1952 régime would admit that the main

weaknesses of the school system have been approached correctly and positively, although the good intentions have not always been realised in the desired time and manner.

The new régime succeeded in establishing a national, united and integrative school system. The basic laws concerning school reform were promulgated in the 1950s. Law no. 210 of 1953 provided for a unified elementary school of six years and a preparatory school of four years, later reduced to three years. Law no. 213 of 1956 established free tuition in all public education below the university level (tuition fees in the universities were abolished in 1963), and also abolished the examinations as a means for proceeding from one grade to another. Law no. 55 of 1957 established the preparatory school as an independent element of the cycle. Law no. 160 of 1958 abolished all foreign schools as such and turned them into private Egyptian schools.

After some experimenting and changes in the 1950s, an educational ladder of 6-3-3 emerged: An elementary school (*madrasa ibtidāʾiyya*) of six years, for the ages six to twelve, followed by a preparatory school (*madrasa iʿdādiyya*) of three years, and a secondary school (*madrasa t̲h̲ānawiyya*) of three years. According to the new curriculum, the teaching of a foreign language was postponed to the preparatory school.

The quantitative development has been fairly rapid. In the school year 1973-4 there were about 4 million pupils in the elementary schools, 2.6 times more than in 1952. The preparatory schools had a million students, three times more than in 1952; the secondary schools had 670,000, an increase of three times; and 334,000 students were enrolled in higher education, an increase of six times for the same period. Owing to the improvement in the implementation of the compulsory education law, illiteracy rate in Egypt has been declining, though not dramatically, from 80% in 1952, to 70.5% in 1960 and 56.5% in 1976. A decision to extend compulsory education to the preparatory school age group has been reached, but has not yet been put into practice.

The most important change in Egypt's school system has been the structural transformation of secondary education from an overwhelming general or academic education towards technical and vocational training. While all the Middle Eastern states are aware of the need to slow down the growth of general secondary education and to train technically skilled manpower, only Egypt has been able actually to realise that ideal. In 1952 only 15% of the secondary school students were enrolled in technical and vocational training. By 1971 the rate reached 52% and has risen to 55% in the early 1980s. Still, technical and vocational education in Egypt has serious problems of quality and status. In the general secondary education, about two-thirds of the students are in the science stream and only one-third in the literary stream, reversing the situation in the pre-revolutionary period.

Egypt has a well-developed system of teacher training for all levels, and all schools will be supplied with qualified teachers in the forseeable future. In some subjects (such as the social sciences) there is already a surplus of teachers, while in others there is a deficit, mainly in modern languages and technical training. Nevertheless, tens of thousands of Egyptian teachers work temporarily or permanently in Arab and African countries.

Despite the fact that the majority of the secondary school students are channelled to the vocational streams for boys and girls, the pressures on the universities are growing rapidly. The universities are becoming increasingly overcrowded and understuffed, and suffer from insufficient space, libraries and teachers. In order to administer the admittance of secondary school graduates to higher education, all applications are processed centrally through a "coordination bureau", which distributes students into the various faculties according to their grades and their preferences. The figures of the academic year 1979-80 are typical: 227,500 students sat for the final secondary school examinations and 133,000 passed. From these, some 80,000 were admitted to the universities, and the other 53,000 proceeded their studies in the various institutes for higher learning.

During the 1970s, considerable efforts at the decentralisation of higher education were made. The universities were granted a measure of independence. Many regional universities were established, some of them new, others as branches of existing universities.

Between 1961 and 1976 Egypt had, in addition to the Ministry of Education, a Ministry of Higher Education in charge of the universities, higher institutes, student missions and the like. In 1976 it was announced that the Ministry of Higher Education would be abolished and its responsibilities would return to the Ministry of Education. It should be pointed out that the Higher Council for the Universities, a body which lays down the national policy concerning the universities, has wide powers, and many have rendered the Ministry of Higher Education redundant.

iii. The Arab States of the Middle East

There are marked similarities in the development and the problems of the educational systems of the successor states of the Ottoman Empire, despite local differences. The most important common features are the Ottoman heritage, the Arabic language and Islam, which is the religion of the overwhelming majority of the people in the region. The traditional Islamic education of the *kuttāb* was still widespread towards the end of the Ottoman period. The reforms of the 19th century and the beginning of the 20th century had their impact on the Arab provinces as well. A few modern government schools were opened there, and a small number of their graduates continued their studies in the civil and military institutes of learning in Istanbul. The government schools, however, did not offer education to the Arab population at large, but admitted mainly children of Turkish army officers and officials, as well as children of provincial notables. After the Young Turk Revolution, the pace of educational reform accelerated in the Arab provinces as well as in Turkey. Many new schools were opened in ʿIrāḳ, Syria, Palestine and Libya. The policy of the new Ottoman government of making Turkish the medium of instruction in the state schools in the Arab provinces clashed with the aspirations of the Arab nationalists, who insisted on the right to teach in Arabic. The Arab nationalists' struggle bore some fruit, especially in ʿIrāḳ and Palestine. The Ottoman authorities agreed, as a concession to Arab sentiment, to open some new schools (such as the Arab College in Jerusalem) where Arabic was to be the language of instruction and to allow the use of Arabic in the lower secondary schools, except in history and geography lessons. The higher secondary schools, the *sulṭāniyyes*, retained their Turkish character in most cases. Yet the period of reforming the schools in the

Arab provinces in agreement with the Ottoman government was short and was stopped by the First World War.

In the interwar period, most of the Arab successor states of the Ottoman Empire were subject to European domination in varying degrees.

Libya was occupied by Italy from 1911 until 1943. During that period, the educational system was controlled by the Italians, and Italian became the medium of instruction in state schools after the third grade. From 1943 until 1951, when Libya became independent, the British administered the educational system in the Libyan provinces of Tripolitania and Cyrenaica and the French controlled the province of Fezzan.

In Palestine, which became a British mandate, the Arab school system was controlled by the Department of Education whose director was always British. There were in the system some Arab inspectors and administrators, but they did not make the educational policy. The British influence on Arab education in Palestine was very strong; the standard of English required for the Palestine Matriculation examination was high, but as a result led to the emergence of an élite of Palestinians with a high level of education and culture.

Transjordan was also placed under a British mandate until 1946, when the state became independent. Unlike other Arab states, Transjordan did not experience political struggles, and the transition from British control to purely Arab administration was smooth. Thus the Jordanian educational system had all the benefits from British assistance and advice without the tensions of other Middle Eastern countries. This was possible because of the rudimentary and primitive conditions of the Transjordanian school system at that time.

ʿIrāḳ also was placed under British mandate until 1932, and the school system was administered by the British after 1925. However, the country enjoyed a large extent of independence and developed her education in a national spirit, although the school system was influenced by British teaching methods. In the days of the mandate, a British adviser was attached to the Ministry of Education but the office was abolished prior to the termination of the mandate. Leading ʿIrāḳī educators were influenced by British, American and French methods of education.

Under the French mandate following the First World War, education in Syria and especially in Lebanon underwent an extremely strong French influence, both in organisation and curriculum. The Ministry of Education in Lebanon was established in 1928 and replaced the High Commissioner's *Service de l'Instruction publique*, but the French advisers could still interfere in the policy of the Ministry of Education. Only after Syria and Lebanon attained their independence, and especially after the withdrawal of the French troops in 1946, were they able to assume full control over their educational systems. In Lebanon, the French character of the educational system was retained; the French educational ladder was not changed with the termination of the mandate, and the Lebanese system is still outstanding in the area in its close resemblance to the French model. Upon the attainment of independence, important decrees on education were issued, the foremost among them being that Arabic became a compulsory language; that the teaching of national subjects, such as the history of Lebanon and the geography of the Middle East, was made compulsory; and that schools could choose English as a first foreign language instead of French.

On the other hand, Syria changed the nature of her education as soon as the French left. Under the mandate, French advisers had been attached to the Ministry of Education, and in Syria too French influence was spread by the teaching of French in schools and through French private schools. Now all traces of French influence were removed from the educational system, and the teaching of a foreign language was postponed to the intermediary school.

Upon the establishment of the Arab states after the First World War, their governments showed that they were aware of the importance of education as a factor in nation-building and as a tool for progress. It was in the interwar period that illiteracy was first faced as a national problem. The first reliable educational statistics in the Arab world date from that period.

Whereas the traditional educational system was considered a religious and communal matter of no concern to the state, now, on the contrary, the new nationalist government education was regarded as another agency of the state rather than as an integral part of community life. This feeling was partly justified by the highly centralised nature of the Ministries of Education in all the Arab countries. The Ministry exercises almost unlimited powers over the school system. It determines curricula, acts as a publisher of textbooks, administers public examinations, constructs or supervises the construction of schools, trains, appoints, transfers, promotes and dismisses teachers, and finances all educational activities. According to Ottoman education laws, village communities were responsible for the construction of the school buildings. Nevertheless, the idea of municipal initiative, control, or financing of education has not yet taken root in the Arab world.

There is a marked uniformity in the structure and organisation of the Ministries of Education in the Arab states. The Minister of Education, who is a cabinet member, is assisted by a Director-General. The Ministry functions through departments for elementary education, secondary education, vocational and technical training, teacher training, curricula and textbooks, personnel, statistics, etc. The country is divided into education districts, which are identical with the administrative division of the state. In each district there is a bureau of education, which is a miniature copy of the central Ministry in the capital. Generally, the regional directors of education have little independence; they are charged with implementing the decrees issued by the Ministry and have to report local problems to the capital.

Most of the school systems in the area are administered by the government. After attaining independence, the Arab states started to impose much stricter control over the numerous private and foreign schools which had been established and flourished under the protection of the European powers. Now the Ministries of Education demanded that the national subjects be taught at the private schools in Arabic and by citizens of the host country. The closer inspection of the private schools and progress in the implementation of the free and compulsory education caused the proportion of pupils in private and foreign institutions to decline, especially in the primary stage. Even in Lebanon, the only country in the Middle East where private education is more important than state education, the weight of state education has been growing. Under the French mandate, a state elementary school system emerged;

it served mainly the Muslim population, which was less attracted to the private Christian institutions. A state system of public secondary schools started to develop after 1949. Total arabisation of the school system was emphasised as an expression of national sovereignty. Nevertheless, minorities were allowed to use their language in their schools, as demonstrated by the ʿIrāḳī Local Languages Law of 1931 which provided for the use of Kurdish and Turkish as the medium of instruction, with Arabic as a second language, in the regions where these minorities constitute a majority.

The need to train teachers was one of the most urgent tasks facing the Ministries of Education. The teachers in the state schools are government employees. Since they are chronically underpaid and their opportunities of promotion are limited, the teaching profession below the university level does not attract the best men and women, and the social status of the teachers is lower than it was in past generations. Until the 1950s there were multiple ways and levels in which teachers were trained in the Arab world, ranging from courses lower than the secondary school up to two years above the secondary school. In recent years, with the tendency to standardise the educational levels and methods in the Arab world, the most common teacher training college begins after graduation from the preparatory or intermediate school and lasts four or five years. In recent years, with the rapid growth of higher education, the training of teachers for secondary schools is entrusted to the university schools and faculties of education. In the interwar period, all the Arab countries suffered from shortage of trained teachers; only Egypt and ʿIrāḳ came near to self-sufficiency. Recently, this situation has improved considerably, but there is still a shortage of teachers for certain subjects (mostly foreign languages, the sciences and technical training). Generally, the teacher shortage worsens as one goes higher up the educational ladder.

The most formidable problem with which the education authorities have had to cope has been the widespread illiteracy, which reached 80-90% of the population in most countries of the region in the interwar period. Since adult literacy campaigns have not been efficient in the middle East, the main burden was placed on the elementary schools. Generally speaking, the principle of free elementary education was accepted throughout the Arab world at an early stage. Yet the idea of legislating for compulsory school attendance has been put forward only in the last three decades and has by no means been universally accepted. Lebanon, which is one of the most advanced countries in the region educationally, has no compulsory education law. In several educational laws, references to compulsory education are qualified. Compulsion has applied to those areas where facilities existed (for example, the Transjordanian education regulation of 1939 and the ʿIrāḳī Education Law of 1940).

In the mid-1940s, the proportion of children who were in school from the elementary school age group was still limited. Lebanon had the highest attendance rate of 72.7%, followed by Palestine (Arab education only) 51.6%, Egypt 47.4%, Syria 39.4%, Transjordan 28.0% and ʿIrāḳ 20.0%. Since that time, the primary school attendance rates have been improving constantly, in spite of the rapid population growth in the Middle East, which ranges between 2.5% to over 3% annually. According to a survey of all the Arab states (including North Africa) conducted in 1969-70, 60% of the children in primary school age (between six to twelve years of age in most countries) were in school. That rate increased to 69% in 1974-5. By 1981, 100% attendance rates at the elementary stage (or, in fact, more than 100% in some countries, due to numerous over-age students) have been reached in Jordan, Lebanon and some of the Gulf states, and the rates are rising everywhere.

Jordan and Kuwayt have already extended by legislation the compulsory education stage to apply also to the intermediate school. Other countries, including Egypt, are contemplating doing the same, but will probably do it officially only after reaching full or nearly full attendance rates at the elementary stage.

Again, the difficulties in bringing all children to school are similar in the Arab countries, although their severity varies from one country to another. It is difficult to provide education for bedouin tribes or for small and remote villages. The realisation of the importance of education was not universal a few decades ago. Parents have been reluctant to send their daughters to school, especially after puberty, as they regarded this as contrary to traditional morality. Until today, the illiteracy rate among women is higher than among men and the percentage of girls who attend school is lower than that among boys; this is particularly true in the countryside. Many parents refrain from letting their children go to school because they need their help in the field, the workshop or at home. This tendency has been strengthened by a widespread feeling that the curricula taught at school are unsatisfactory and irrelevant to the needs of the community. Besides, there are not enough qualified teachers. Another problem is a severe shortage of classrooms, and many classes are lodged in rented rooms. Schools often operate in two or even three daily shifts because of scarcity of space. Many children do not enter school at all, and many pupils fail to graduate. Children who leave school after a few years relapse into functional illiteracy. Of course, some of the shortcomings were in the past caused by lack of funds. This factor has been fundamentally changed in those countries of the region which have large incomes from oil, although it has made its notable impact on education only recently. Yet, generally, some of the above-mentioned difficulties have been alleviated recently, and education in the Arab world has been making a qualitative as well as a quantitative progress. The beginnings of systematic planning of national education by the Arab states, including five-year-plans, belong to the 1960s, and have helped to clarify the problems and to approach them more efficiently.

Although demand for secondary education has been growing rapidly, the elementary school is still terminal for some 70-75% of the pupils in the Arab world. The promotion from the elementary to the secondary (or intermediate) stage is determined by passing external examinations, except in the few countries which have made the intermediate stage compulsory. In the interwar period, access to secondary education was extremely limited. Usually, there were no secondary schools outside the towns, and although there were dormitories attached to a few schools in the cities, the vast majority of the population which was rural was deprived of post-primary education. Besides, tuition fees were a serious barrier for poor students, although there were some exemptions on the basis of good grades or financial need. By 1950, tuition fees in the state secondary schools had been abolished throughout the Middle East, and in the 1960s the universities, too, became free

of charge. The popularity of secondary education should be partly ascribed to the fact that it is considered a gateway to higher education and then to a government post. Another motivation for study in a secondary school was exemption from military service or the possibility of service under favourable conditions in some countries.

The weaknesses of the secondary education are well-known, and are in fact an inheritance from the pre-modern period: the overemphasis on rote learning, discipline, examinations, the heavy load of subjects to be taught and frontal lessons. Most of the secondary schools in the region are not equipped with sufficient libraries, laboratories and playgrounds. Secondary education has been overwhelmingly academic; vocational and technical education have been neglected or even looked upon with disdain. In the recent two decades, official attitudes toward vocational and technical education have been changing, but among the Arab states of the Middle East, only Egypt has accomplished a structural change in secondary education by channelling over half of the students into technical and vocational schools.

In the first decades of their independence, the educational ladders in the Middle East differed widely from one Arab state to another. The school system was influenced both by the elements inherited from the Ottoman Empire, which on their part had been shaped by the French model, and by the example of the European mandatory powers. Since the end of the Second World War, the Arab educational systems have been drawing closer to each other, and efforts have been made to coordinate the curricula, the organisation, and the terminology of the educational systems. Egypt has been the object of emulation and has set the example for many reforms, owing to her central position in the Arab world and culture. Thus today the educational ladder of 6-3-3 is the most common pattern in the Arab world, although there have been other variations, such as the Lebanese pattern, Kuwayt (4-4-4), and ʿIrāḳ (6-3-2). There are also differences in the curricula, mainly in the teaching of foreign languages and religious instruction. There is a tendency to postpone the teaching of the foreign language to the intermediate school. Yet in Lebanon, Jordan, ʿIrāḳ and South Yemen, it is taught in the primary school. Saʿūdī Arabia and Sudan devote more hours to the teaching of Islam than other Arab states.

Occasionally, conferences are held to discuss and coordinate educational and cultural policies of the Arab countries. Thus in 1947 a convention was held in Lebanon to coordinate methods of teaching Arabic. In 1957 the important Agreement of Arab Cultural Unity was signed by Egypt, Syria and Jordan, and was joined a year later by ʿIrāḳ. The agreement called for coordination of the school systems from all the cultural, pedagogical and organisational aspects. Over the years, various inter-Arab conferences and conventions have been held which have dealt with the teaching of civics, textbooks, examination, educational planning, the teaching of the sciences, illiteracy, etc.

Bibliography: The bibliography on the history of education in the Ottoman Empire and its successor states is vast and of greatly varying quality; it is accordingly impossible to try to give anything resembling an exhaustive list. The best sources for the current educational developments in the area are the official reports and publications of the Ministries of Education and reports and studies prepared by UNESCO and by other regional and international organisations.

2. In North Africa

A. Tunisia. Since 1840, with the foundation of the École Polytechnique of the Bardo, a trilingual instruction (in Arabic, French and Italian) was provided, shaping the scientific and technical education of the armies of the Bey, ruler of the Regency of Tunis. But it was above all after 1875 that a bilingual and bi-cultural instruction in Arabic and French was available through the founding of the Ṣādiḳī College [*q.v.*].

With the establishment of the French Protectorate (12 May 1881), public education took shape with the following features: (1) diversity (at primary level, French schools, Franco-Arab ones, modern Ḳurʾānic schools and traditional-type ones; at secondary level, purely French-type lycées and colleges, institutions or classes giving a bilingual "Ṣādiḳī" education, and traditional Zaytūna education); (2) French influence (Arabic was treated as a foreign language, except at the Ṣādiḳī and some other institutions, and all references to the Arab-Islamic national heritage excluded, or largely excluded, from courses given); and (3) a disequilibrium between the schooling of European and Tunisian children (in 1949, 94% of French children in primary education and 12% of Tunisian Muslim ones; admittance of Tunisians to primary education only (in 1953, secondary education comprised 5,661 French children out of a French resident population of 14,500 and 6,682 Tunisian Muslim ones out of a population of *ca.* 3 millions, the theoretical plan for education of Lucien Paye, the last Director of Public Education under the Protectorate, not having been put into practice).

After independence (20 March 1956) and the proclamation of the Republic of Tunisia (25 July 1957), from 1958 onwards President Habib Bourguiba has tried: (1) to replace the legal chaos and the instructional diversity with a unified system which has its own Tunisian character, Tunisia being a "Republic whose language is Arabic and whose faith is Islam"; and (2) to give public instruction (*al-taʿlīm al-ʿumūmī*) the character of a national education (*al-tarbiya al-ḳawmiyya*) adapted to the variety and the evolution of economic, social, technical and cultural needs of the nation, taking into account demographic increase, and aiming ultimately at education for all, opening out on to the external world, and responsive to scientific and technical changes and developments. This was the reform of 1958 ("A new conception of teaching in Tunisia"). After this first period of reform (1958-68), and after a series of interventions, primary teaching has been completely arabised—French being studied as a foreign language from the 4th year onwards—whilst in secondary teaching, the humanities, including philosophy, are taught in Arabic. At the level of higher education, a step towards the arabisation of the humanities has already been made, and there are even lectures at the Medical Faculty of Tunis in Arabic.

With a percentage devoted to it in 1968 of 9% of the GNP and in 1980 of at least 8%, and with a third of the state budget, expenditure on education in Tunisia surpasses all that recorded for other countries (1968-9, in the USA and Netherlands, 6.5% of the GNP, and in the Communist countries, between 4 and 6.5%). The goal of universal education is in view. In primary education, there were in 1955-6 209,438 pupils (out of a population of *ca.* 3.5 million); in 1965-6, 717,093; in 1975-6, 920,924; and in 1981-2, 1,071,000 out of a population of 6.5 million). If secondary education students (over 300,000) and those in higher education (more than 30,000) are added, a total of 1,400,000 is reached (about 1 Tunisian in 5 is at school).

However, the problem of quality remains outstanding in the framework of Arab-French bilingualism: in the first place, the process of apprenticeship of the French speaker gives him a privileged place at the outset in acquiring competence in communication through language expression (aptitude at varying the message according to psycho-social-cultural conditions) in connection with purely linguistic communication (skill in transmitting a message orally or by means of writing in accordance with the rules of the languages). Hence the option of keeping up Arab-French bilingualism, 25 years after independence, forms part of a project concerning with general culture: (1) primacy for Arabic ("the language which expresses the Tunisian cultural identity and authenticity"); and (2) the opening-up of the educational system on the problems of development defined by the Fifth Plan (1977-81), the aims of educational policy being to favour the development of education, alter the orientation of primary teaching, improve its quality and its impact by developing the child's personality, thereby ensuring for him at one and the same time an intellectual and a manual training (this latter orientated towards the industrial and agricultural techniques built into the teaching), reduce losses of pupils and the inequalities of fortune and fate, and thus facilitate the integration of young people into the economic life of their home districts and regions.

Yet this attachment to French language and culture has always provoked debate between the supporters and opponents of bilingualism since independence. The problem of arabisation (*taʿrīb*) has always stirred up controversy, sometimes violently, and has released religious, political and philosophical passions, as it endeavours to make some people realise their "linguistic, and even cultural, mutilated state". A process of acculturation is felt to be at work here: (1) the French language—considered as one which is widely-spread through the world and one which gives access to a culture with a universal, scientific and technological character—presents itself as a strong rival to Arabic, the bearer of deeply-rooted values, and seen as the language of communication and of liberation; and (2) the two cultures, Arabic and French, express a class antagonism between the comfortably-off classes and the rest and a confrontation between modernism and traditionalism.

Tunisia, an Arab and Muslim country, is nevertheless trying to realise its authentic genius in the midst of modernity by means of a system of unified and general education (a "national" system for the masses and not one of "public education" for

the élite, since "primary education is a right for everyone, secondary education is a necessity, and higher education meritorious"). Lengths of the stages of education: primary, 6 years; secondary, 7 years (3 years of a common core and then three branches leading to baccalaureates in letters, mathematics and sciences or mathematics and technology); and higher (decentralised: sectors for the basic sciences, the medical and biological sciences and the human and social sciences, totalling in 1981 53 units, sc. Faculties, Schools and Institutes).

B. **Algeria**. On the morn of independence (5 July 1962), the educational system inherited from the colonial period (sc. the French system as it existed before 1968) was kept in being, like all the other institutions which were not contrary to national sovereignty. Under the stimulus of a Ministry of National Education, this system slowly evolved and then changed radically after 1970. The slow period of evolution consisted mainly of an adaptation of the content of syllabuses (concentration of studies on Algeria), the gradual algerianisation of the teaching personnel (accompanied however by a massive appeal for co-operation from other Arab countries) and the arabisation of a certain number of sectors: the first two primary education years in 1966 and then the higher classes, with the preservation of the teaching of a foreign language from the third year onwards, immediate arabisation in secondary and higher education and the opening-up of official channels in the Arabic language.

In 1970 a fairly important change took place. The Ministry of National Education was split up into a Ministry of Primary and Secondary Education and one for Higher Education and Scientific Research. At the side of these two there was set up a Ministry of Basic Education which started to put into effect a parallel system of education, but one completely arabised.

In 1971-2 higher education was completely reorganised. The essential preoccupations of the Algerian government which lay behind this reform were the following: "to form the type of cadres *of which the country has need*, a cadre engaged in the work of socialist reconstruction and filled with the Algerian national personality and the socio-economic realities of the country. From this follows the new shaping of the subjects of teaching and educational qualifications and their integration within educational frameworks based on job needs defined by the sectors requiring these skills. A student must accordingly be directly operational". The organisation of these subjects of teaching was inspired by what existed in certain western countries and those of the East: the substitution in place of an annual curriculum structure of a system of semesters, units of teaching (modules) and the consequent institution of continuous control of courses. The application of these reforms got under way only with great difficulty. Moreover, it required the recruiting of a considerable number of assistants, often at the expense of quality. The establishment of courses of instruction in Arabic parallel to and not instead of those already being carried on in French developed extensively in this period. This distinct monolingualism has not been without serious consequences for the cultural unity of the country.

In regard to primary and secondary education, the system was extensively remodelled in 1977 (by the application of law no. 7635 of 16 April 1976). Henceforth it was to be made up of three levels: preparatory, basic and secondary. The basic school, a fairly original concept, had as its aim the providing of a basic education for all, compulsory and lasting nine years (up to the third grade class of the old system). In order to get the system into operation as quickly as possible, the ministry in charge of this sector of education was in 1981 divided up into a Ministry of Basic Education and Instruction and a Secretaryship of State for Secondary Education.

The lack of personnel at the teaching level has led to the extensive establishing of a grade of elementary (Brevet élémentaire) teachers (instructors) or of a grade a little below this (monitors). This last group made up 41% of teaching personnel in 1965. By 1976 it was only 14.8% and had disappeared totally in 1977. On the other hand, because of the drive towards homogeneity in education, non-state education (secular and confessional) was integrated with public education (Ḳurʾān schools, *madrasas* and *zāwiyas* in 1963, private education in 1977). In the same year, all the institutions within the

jurisdiction of the original educational system, which was dissolved, were integrated in the Ministry of Primary and Secondary Education.

Other forms of education have also been made possible b· other Ministries, who have started "institutes for technology" or institutes for higher studies in order to provide trained personnel for their own needs. A Ministry for Professional Education has been in being since 1981.

The growth of those undergoing education has been rapid and great since 1962, at all levels, as the following table shows:

	Oct. 1962	1971	1977	1981
Elementary	777,636	2,018,091	2,782,044	3,118,827
Middle and secondary (general and technical)	82,937	236,882	612,229	1,029,884
Higher	2,725	24,334	54,547	78,027

In 13 years (1963-76) the number of schools has almost tripled; in October 1962 there were 2,759 and in 1976 7,798 (classes in practice: 46,529 in 1976 with the introduction of the double vacation). Teachers in primary and secondary schools rose from 19,908 in October 1962 to 129,618 in 1981. The same picture obtains in higher education: from 282 teachers, of whom 82 were Algerians, in 1981 there were 9,778, of whom 7,018 were Algerians.

Like most the Third World countries who have recently achieved independence, Algeria had a fairly large number of illiterates (5,941,000 according to the 1966 census, i.e. about 80%). The number of Algerian children not at school was considerable, and the Algerian students registered at the University of Algiers was not more than 500.

After 20 years, Algeria has certainly accomplished a work which, though still unfinished and full of flaws, is nevertheless positive in its results. More than one-third of the state budget goes annually on education and training. All children are in the process of being placed in schools despite an unprecedented demographic rise (the population has doubled in 20 years). Twenty-one towns either have or are on the point of getting a university or university centre. Two thousand medical doctors are trained each year, together with a good number of engineers and higher technicians.

C. Morocco. In its modern form, public education in Morocco dates from the colonial period. During the 44 years of the Protectorate (1912-56), the French authorities progressively installed, at the side of the traditional network of Ḳurʾānic schools and *medersas*, an assemblage of educational institutions intended to further the "mission civilisatrice" of the metropolitan power whilst at the same time respecting the particular genius of Moroccan society, following Marshal Lyautey's intentions. But the concrete results of the colonial educational policy were far removed from this noble ideal. The system of modern education introduced by France into Morocco was essentially élitist and brought into the local context a completely alien culture. This explains why the right to education for all was one of the main demands of the nationalist movement.

The attainment of independence in 1956 was marked by a great popular movement in favour of education. Literacy campaigns sprang up spontaneously all over the country, and the new Minister of Education succeeded in getting into school in October 1956 five times as many children as the Protectorate authorities had accepted in the preceding year. This date accordingly marks the real birth of modern education in Morocco.

Efforts to develop the public education system found their justification in a double conception of education's rôle, seen from one aspect as a fundamental right enshrined in the constitution, and from another as a powerful factor making for economic and social progress. This is why education and the training of cadres always had priority in the development plans successively introduced after 1960.

These long-term development objectives were given effect through the choice of four principles for

TABLE OF CHILDREN IN EDUCATION

Year	Primary	Ratio of increase	Secondary	Ratio of increase	Higher	Ratio of increase
1956	318,995	100	10,490	100	3,792	100

action which guided the Moroccan government's educational policy after independence: making attendance at school available for all children of appropriate age; unifying the different types of schools left behind by the colonial power; the arabisation of curricula and the language of instruction; and the moroccanisation of the body of teachers.

The results obtained after a quarter of a century of massive investment in the educational sector are impressive, as the following table of the school enrolments shows:

These figures demonstrate the size of the financial resources devoted by the state to public education —almost 25% of the annual budget—which have enabled the transformation of the embryonic educational network inherited from the Protectorate into a vast and complex system.

The present educational system, whose structure is to a considerable extent modelled on the French one, comprises three levels. Primary school lasts for five years and accepts children from the age of seven. This first level is completed by a nationally-organised examination (the certificate of primary education) which gives access to the following level.

Secondary education is itself divided into two stages. The first four years, forming the first cycle, are common to all pupils. Then at the end of this, specialist educational advisers divide the children, according to their aptitudes and wishes, into differing channels of the second cycle. The fifth year of secondary education offers two options of general education (scientific and literary) and two technical ones (commercial and industrial studies). In the sixth and seventh years, the choice is even more varied, with a spread of six channels, each one leading to a distinct type of baccalaureate.

Higher education comprises two groups of institutions. In the universities, which are controlled by the Ministry of Education, students can follow the usual groups of studies, such as arts, law, economics, science and medicine. At the side of this channel of classic university education, which 90% of students of higher education follow, there exists a complete network of specialised schools and institutes of higher education functioning under the control of different technical government departments and aiming at training engineers and the middle management grades which will work in the public and semi-public sectors. Among the most important of these are the Mohammedia (Muḥammadiyya) School of Engineers, the National School of Public Administration, the National Agricultural and Veterinary Institute, the National Institute for Statistics and Applied Economics, the National Institute of Posts and Telecommunications, the Higher Institute of Commerce and Business Administration, etc. There further exists a certain number of pedagogical institutions (regional schools for primary teachers, regional pedagogical centres and teacher training colleges) intended to prepare Moroccan teachers in order to replace foreign instructors, especially in the scientific disciplines.

Considerable progress had been made towards arabisation. All literary topics are taught in the official language. The arabisation of scientific courses is on the way to completion at the primary level, and will be progressively extended to the secondary and higher levels.

From the legal aspect, it should be stressed that school attendance is compulsory till the age of 13 and that education is free at all levels. Moreover, over the last 12 years or so, the government has adopted a policy of granting very generous scholarships for the large majority of students of higher education.

Nevertheless, despite these very positive results, the Moroccan education system has for several years gone through a severe crisis of development whose main components can be set out in the form of three paradoxes with interconnected effects. In the first place, despite a great increase in public expenditure on education and in the number of children enrolled in the schools, making primary education general remains a distant ideal because of the population growth (3% per annum). In the second place, a significant share of the resources devoted to the educational system is wasted because of the high rate of those having to repeat courses or abandoning them altogether. Finally, educational planners find themselves faced by a lack of correspondence between the "products" of the educational system and the employment needs of the labour market, above all in the scientific and technological fields.

The sum total of these difficulties which the Moroccan educational system has come up against, like those of many other young countries of Africa and Asia, has led the authorities in the Ministry of Education to prepare at the present time a long-term reform programme which will allow the Moroccan educational institutions to be better adapted to the needs of a changing society and to enable them to play a more positive rôle in the country's development process.

Bibliography: A detailed description of the Protectorate's educational policy is given by the Directorate of Public Education in Morocco in its *Bilan 1945-50*, Rabat 1950. A more analytical treatment has been made by L. Paye, *Enseignement et société musulmane. Introduction et évolution de l'enseignement moderne au Maroc*, thèse d'état, Paris, Sorbonne 1957; see also the section on this topic in Ch. A. Julien's *Le Maroc face aux impérialismes*, Paris 1979.

The main research works on Moroccan public education since independence are those of A. Motassime, *Tendances actuelles de l'enseignement au Maroc et problèmes d'orientation scolaire. Contribution à l'étude des problèmes actuels de l'éducation au Maroc, pays du Tiers-Monde*, thèse de 3ᵉ cycle, Paris 1970; A. Mezouar, *Enseignement supérieur au Maroc et développement*, Mémoire de DES, Casablanca 1977; J. Salmi, *Educational crisis and social reproduction: the political economy of schooling in Morocco*, Ph.D. thesis, Univ. of Sussex 1981. Various more descriptive articles and studies should also be mentioned, including Moatassime, *La politique de l'enseignement au Maroc de 1957 à 1977*, in *Maghreb-Machrek*, no. 79 (Jan.-March 1978), 29-54; C. Tibi, *Politique éducative et financement de l'éducation au Maroc*, Institut International de Planification de l'Éducation, Unesco, Paris 1976; A. Baina, *Le système d'enseignement au Maroc*, Casablanca 1982; M. Merrouni and M. Souali, *Question de l'enseignement au Maroc*, in *Bull. Economique et Social du Maroc*, quadruple no. 143-6 (1982), which has a very complete bibliography. The most useful of the regular publications are *Le mouvement éducatif au Maroc* prepared each year by the Ministry of National Education; *Attadriss*, a twice-yearly educational review published by the École-Normale Supérieure, Rabat; and the cultural chronicle on Morocco which appears each year in the *Annuaire de l'Afrique du Nord*, Aix-en-Provence.

(J. Salmi)

3. In Iran.

Before the appearance of secular education in Iran, what primary education there was was essentially that of the *maktab*s or *kuttāb*s [*q.v.*], where children from the age of six or so learned the rudiments of reading and writing, Islamic religion and some arithmetic. These *maktab*s, as small-scale, informal, locally-organised institutions, continued to exist in the small towns and villages of Iran till after the Second World War, although after 1925 they had to use Ministry of Education textbooks.

Organised higher education may be said to go back to the pre-Islamic medical school and hospital at Djundīshāpūr in Ahwāz [see Gondeshāpūr], but under Islam, the *madrasa*s [*q.v.*] took over the function of higher religious education, tending, however, in the Ṣafawid period to become exclusively centres for the training of the Shīʿī clergy, so that by the end of the 19th century, there was virtually no awareness in Iran of the modern intellectual and scientific progress of the West, and little attention was paid also to the rich heritage of classical Islamic scientific and secular literary production.

The impetus for the acquisition of modern Western science and technology began to be felt by the leaders of Iran under the Russian threat to the northwestern provinces of Iran early in the 19th century. ʿAbbās Mīrzā [*q.v.*] the enlightened Ḳādjār crown prince directly concerned with Iran's defence against Russia, and his able minister Mīrzā Buzurg Ḳāʾim-i Maḳām [see Ḳāʾim-i Maḳām-i Farāhānī], tried to modernise the Iranian army; he told the British envoy James Morier in 1809 that "No pains have been spared to acquire a knowledge of military tactics and theory of fortification which they had gleaned from French and Russian books translated by ʿAbbās Mīrzā's order" (see A. K. S. Lambton, *Persian society under the Qājārs*, in *JRCAS*, xlviii [1961], 123-39).

Negotiations with the embassy sent by Napoleon under General Gardane in 1807-9 (see R. M. Savory, *British and French diplomacy in Persia, 1800-1810*, in *Iran, JBIPS*, x [1972], 31-44) for training the Iranian army included the project of sending 200 Iranian students to study in France, but this project never materialised. In 1811 and 1815, seven students sere sent to London for training, and this was the first attempt by the state to acquire an element of modern science and learning through sending students abroad.

Modern Western-type of education dates from the establishment of the *Dār al-Funūn*, the term being a rendering of "école polytechnique", in 1851 [see djāmiʿa]. In 1848, Nāṣir al-Dīn Shāh began his reign and immediately appointed Mīrzā Taḳī Khān, later called Amīr Kabīr [*q.v.* in Suppl.] as his minister. Amīr Kabīr ushered in many reforms, and prepared a project for the establishment of a modern-type university, mainly to train experts for the army and the higher echelons of the civil service. He started on the necessary building and engaged a number of professors from Austria for it. The university was inaugurated by the Shāh in 1851, only a few days after its initiator, Amīr Kabīr, had fallen from power. The *Dār al-Funūn* was a combination of a military college and a secular university. Branches of study comprised infantry, cavalry and artillery sciences; medicine, physical sciences, mathematics, pharmacology, cartography, history, geography, and the Persian, Arabic, French and Russian languages. In addition to the Austrian professors who were engaged for six years, a number of European experts already in the service of the Iranian government were assigned to teaching posts, as well as a number of native Iranian scholars.

For the first year, 150 students were enrolled. Studies were free, and students were given a free mid-day meal and two uniforms per year. It had a theatre and a model factory attached to it, and was well-equipped with laboratories. Although the Amīr Kabīr was executed soon after the opening of the *Dār al-Funūn*, it continued its work. Amīr Kabīr's reforms, and particularly his founding the *Dār al-Funūn*, were not applauded by the powerful Muslim clergy, but as he had linked it with the needs of national defence, it was difficult for them to oppose it (see F. Ādamiyyāt, *Amīr Kabīr wa Īrān*,[3] Tehran 1348/1969).

The Austrian professors wrote many textbooks in their respective fields, and these were translated into Persian; thus not only was modern science introduced into Iran, but also, the foundations for modern Persian scientific terminology were laid.

The *Dār al-Funūn* was a landmark in the history of Iranian education, both as the first organised attempt to introduce modern science and technology and also as the first attempt by the state to assume responsibility for public education. For over forty years its work was responsible for the education of an élite class of intellectuals who were in no small measure responsible for the establishment of constitutional monarchy in 1906 (see F. Ādamiyyāt, *Fikr-i āzādī*, Tehran 1340/1961).

Nāṣir al-Dīn Shāh became increasingly suspicious of the new learning, and education stagnated in the later part of his long reign. In 1855, the Ministry of Science (*Wizārat-i ʿUlūm*) was created. In 1858, 42 students were sent to France to study in various scientific fields. In 1871 a modern school with European teachers was established in Tabrīz.

In the last decade of the 19th century, two colleges of higher education were established which later became faculties of Tehran University. One was the College of Political Sciences, primarily intended for the education of future diplomats, and the other was the College of Agriculture, with training at secondary school and university level. With the creation of the Society for Promotion of National Education, many philanthropically-inclined citizens were encouraged to endow and start their own private schools on modern lines.

The reformist movement which had started early in the reign of Nāṣir al-Dīn Shāh was fully conscious of the inadequacy of the traditional *maktab-madrasa* type of education, and worked towards the adoption of a modern Western-type of education. Mīrzā Malkam Khān [*q.v.*] was the first to propose a national system of education, similar to the French one of primary, secondary and university stages (see Ādamiyyāt, *op. cit.*). Others, more nationalist and anti-clerical, like Mīrzā Fatḥ ʿAlī Ākhund-zāda [*q.v.*], Mīrzā Āḳā Khān Kirmānī [*q.v.*] and Ṭālibov, demanded a secular system of education.

The constitutional period, beginning in 1906, inaugurated a period of upheaval for Iran, with the re-imposition of despotic Ḳādjār rule, pressures from outside powers during the First World War years and finally the downfall of the Ḳādjārs [see mashrūṭiyya and ḳādjār], yet a great deal was done for education between 1908 and 1925.

In 1910 the *Madjlis* passed the administrative Law of Education which established the Ministry of Education (*Wizārat-i Maʿārif wa Awḳāf wa Ṣanāʾiʿ-i Mustaẓrafa*), whose responsibilities included also, as its name implied, pious endowments and the fine arts.

Responsibility for public education was assigned to this Ministry. In 1911 the Fundamental Law of Education made the Ministry responsible for the provision of basic education for all children aged from 7 to 13 years of age. This law also recognised three stages of education: primary, secondary and higher stages. Private schools were recognised, but they all had to carry out the curriculum ratified by the Ministry of Education. Corporal punishment was banned in all types of school (see further on the provisions of these laws, Issa Sadiq, *Modern Persia and her educational system*, New York 1931).

In 1918 the Central Teachers' College was established for training secondary school teachers. A number of French teachers were engaged to teach modern sciences, and eminent Iranian scholars came to be associated with this college, later called the Higher National Teachers' College. When the University of Tehran was established in 1935, this College was incorporated into the University to form its faculties of Arts and Sciences. In 1921 the School of Law was established and a number of European teachers engaged to teach modern jurisprudence. In 1922 a law was ratified by the *Madjlis* establishing the Supreme Council of Education, which was the legislative and supervisory body with regard to all matters pertaining to education. Thus with the education acts of 1910, 1911 and 1922, the foundations were laid for a national system of education.

With the advent of Riḍā Shāh Pahlavī [*q.v.*], Minister of War in 1921, prime minister in 1923 and voted as Shāh by the Constitutional Assembly which deposed the Ḳādjār dynasty in 1925, a new era began in the history of Iran, one marked by unification of the country under a strong central government, economic progress, the first steps towards emancipation of women, a resurgence of Iranian nationalism and further progress in education.

The need for trained people in higher education prompted the new Shāh to introduce a law into the *Madjlis* authorising the Ministry of Education to send at least 100 students abroad every year for higher education; the first group left for France in 1928. Scholars sent abroad under this law provided the future universities with the bulk of their teachers and also manned important posts of state. At the same time, the government engaged a number of foreign professors to teach at centres of higher education.

In 1934 an important step was taken to provide teachers for primary schools. A law was ratified by the *Madjlis* establishing teachers' colleges, and also making provisions for the employment, promotion and retirement of teachers and civil servants. By 1939 there were thirty such colleges in operation.

The University of Tehran was established by law in 1934 and inaugurated in 1935 [see DJĀMIʿA]. Almost all the faculties were already in existence; the new law brought them under a unified administration. The law also approved the budget for extensive new buildings.

In 1936, Riḍā Shāh decreed the emancipation of women, and a consequence of this was that, hitherto barred from higher education, they found access to educational facilities at all levels.

In 1939, secondary school organisation was changed. Until then, the secondary school was divided into two stages or "cycles" of three years each. The first cycle was general in nature, and the second one provided more education in the arts and sciences. As there was a terminal examination at the end of the first cycle (at the age of 16) and a certificate was issued at that point, more than 50% of students terminated their studies then or went into a trade or vocational school. With the new system, the secondary school was divided into a structure of 5 + 1 years, with specialisation at the sixth year. This had an adverse effect on the subsequent development of education, however, in that it turned students away from vocational schools towards a university education, and consequently produced a surfeit of applicants for university education.

Technical and vocational education had all along been the responsibility of various departments of state who trained the experts whom they needed. The Ministry of Education—called since the early 1930s the *Wizārat-i Farhang* (*farhang* = both education and culture)—did have its own vocational schools which students could enter at the age of 16 after the first cycle of secondary school, but the number of these schools was inadequate.

The whole system of education was highly centralised, with all important decisions taken in Tehran. However, when Riḍā Shāh abdicated in 1941, a national system of education had been firmly established. The most remarkable achievement was perhaps the fact that, under him, girls came to enjoy the same right to education as boys.

Under Muḥammad Riḍā Shāh Pahlavī [*q.v.*] there was an enormous growth in all fields of education. Whereas there were 285,000 students in primary schools in 1941, the figure rose to 4,708,000 in 1976. Secondary school enrolment rose from 25,000 to 2,357,000, and university enrolment from 3,367 to 154,000 in the same period. The increase in educational expenditure was from 154 million rials in 1941 to 260 billion rials in 1976. In addition, in 1976 there were some 50,000 Iranian students studying at foreign universities, mainly in the United States and in Western Europe.

In 1943 a law ratified by the *Madjlis* made the University of Tehran autonomous. Between 1949 and 1950, new universities were established in Tabrīz Shīrāz, Ahwāz, Iṣfahān and Mashhad. In 1956, Pahlavī University was established in Shīrāz, in 1957 the National University opened in Tehran, and in 1962 the Āryāmihr Technological University was inaugurated in Tehran. By 1964, eleven new institutions of higher education had been established.

In 1963, the law establishing the Literacy Corps or "Army of Knowledge" (*Sipāh-i Dānish*) was ratified. According to this law, young men of military age, with secondary school certificate, could choose to undergo four months of training as primary school teachers and afterwards teach for 20 months in remote rural areas, this being regarded as in lieu of military service. Between 1963 and 1969, some 1.3 million children and adults had been taught by the Literacy Corps in 22,000 villages.

In 1964 the whole system of primary and secondary schools was reorganised. The primary school was allotted 5 years, the "guidance" school 3 years after the primary school and the last four years of secondary school could be devoted to specialised studies relevant to the university course which the student planned to follow. Alternative vocational and technical schools were provided after the primary school and after the three years of "guidance" school, this system marking a considerable improvement over the previous one.

In 1968 a new Ministry of Science and Higher

Education was created to deal with ever expanding higher education. The new Ministry authorised the establishment of private colleges of higher education, but the experiment was not a successful one, and all the private colleges were nationalised in 1974. Also in 1974, education at all levels was declared free by the Shāh.

The abnormal growth of secondary education had created a large number of applicants for university places. Notwithstanding the fast expansion of higher educational facilities, only a fraction of the applicants could find places. The accumulating number of young people whose levels of aspiration had been thereby raised, but could not be satisfied, was another factor responsible for the discontent that led to the 1979 Revolution in Iran, but the consequent closure in effect of the universities as potential centres of resistance, and the relegation once again of woman to an inferior status under the Khumaynī régime have diminished rather than enhanced educational opportunities.

(MAHMUD SANA'I)

MAʿARRAT MAṢRĪN or **MIṢRĪN**, a small town in North Syria (lat. 36° 01′ N., long. 36° 40′ E.). It is 40 km. to the north of Maʿarrat al-Nuʿmān [*q.v.*], 50 km. south-west of Aleppo or Ḥalab [*q.v.*] and 12 km. north-west of Sarmīn. It owes its importance to its position between the districts of the Rūdj, the Djazr and the Djabal al-Summāḳ and formerly served as the market for this region which the road from Ḥalab to Armanāz traverses, a route used in the Middle Ages by the Turkomans. Its role has devolved today on Idlib. The land, although poorly watered, has never lacked agricultural resources; in the Middle Ages there were already fig, olive and pistachio trees as well as *summāḳ*, which was exported to the tanneries; lentils were also cultivated there. In former times, the town was protected by a wall which today has disappeared, and there were five mosques.

As the chef-lieu of a *nāḥiya* of the *muḥāfaẓa* of Ḥalab, situated in the district of the Djazr, Maʿarrat Maṣrīn had 3,000 inhabitants in 1930 and 5,000 in 1945, and came under the *ḳaḍāʾ* of Idlib.

The name of the town is often given in the form Maʿarrat Miṣrīn, but it is also called Maʿarrat Naṣrīn, which some authorities, such as al-Muḳaddasī and Abu 'l-Fidāʾ, connect with the name of Ḳinnaṣrīn [*q.v.*], the *djund* of which the town formed part, just as Maʿarrat al-Nuʿmān [*q.v.*] was sometimes designated Maʿarrat Ḥimṣ by an allusion to the *djund* to which it belonged. In the Syriac manuscripts of the 8th century, this town, situated in the *kūra* of Anṭākiya [*q.v.*], is called Maʿarrat Meṣrēn; the monastery of Bēth Mari Ḳānūn was there. In the chroniclers of the Crusades, one encounters the form Megaret Basrin or Meguaret Mesrin. In Isambert's *Guide* (714), one reads Maarrat Moucerim.

History. In the year 16/637, after having defeated a large Byzantine army drawn up between Ḥalab and Maʿarrat Maṣrīn, Abū ʿUbayda [*q.v.*] conquered this town, which surrended on the same conditions as Ḥalab [*q.v.*]. In the ʿAbbāsid period, under the caliphate of al-Mutawakkil (d. 247/861), ʿAmr b. Ḥawbar, originally from Maʿrāthā al-Buraydiyya, a locality near Maʿarrat al-Nuʿmān, held the office of governor of Maʿarrat Maṣrīn. A century later, in 357/968, profiting from the unstable situation in Ḥalab after the death of Sayf al-Dawla, Nicephorus Phocas conquered the town and had more than 1,000 inhabitants deported to the *bilād al-Rūm*. After the Arabo-Byzantine truce of Ṣafar 359/end of 969-beginning of 970, the town was part of the territory governed by Ḳarghuwayh. At the time of his expedition against Ḥalab, in 415/1024, Ṣāliḥ b. Mirdās, chief of the Banū Kilāb, sent one of his *amīrs*, Abū Manṣūr Sulaymān b. Ṭawḳ, to attack Maʿarrat Maṣrīn; the place was captured and its commander taken prisoner. In 454/1062, a short time before the death of Muʿizz al-Dawla Thimāl, the Byzantines succeeded in making themselves masters of the town by trickery. Asad al-Dawla ʿAṭiyya succeeded his brother in Ḥalab but, in 457/1065, his nephew Maḥmūd b. Naṣr, with the help of the Kilābīs, was successful in turning out his uncle and setting himself up in his place. However, some discontented Kilābīs helped ʿAṭiyya to attack Maʿarrat Maṣrīn in 458/1066 and recapture it from his nephew. In 490/end of 1097 the Franks besieged Antāḳiya, where the Saldjūḳid governor Yaghī-Siyān resisted them. During the siege, the Franks went in Ṣafar 491/January 1098 to pillage some of the towns of the Djazr and notably Maʿarrat Maṣrīn. In Djumādā II 491/June 1098, Anṭākiya was taken; Yaghī Siyān escaped, but he fell from his horse at Armanāz, not far from Maʿarrat Maṣrīn and, mortally wounded, he is said to have been killed by some Armenian woodcutters who carried his head to Bohemond.

After having taken Ḥārim [*q.v.*] in Shaʿbān 492/July 1098, Raimond Pilet, with a detachment of the army of the Comte de Saint-Gilles, crossed the Rūdj and captured the town, which was integrated into the Frankish defences to the east of the Orontes. When Baldwin of Edessa had been taken prisoner, the Frankish garrisons were attacked in 497/1104 in the district of al-Djazr by the inhabitants of al-Fuʿa, Sarmīn and Maʿarrat Maṣrīn, who inflicted heavy losses on them and drove them out of the region. Riḍwān of Ḥalab received a good reception and occupied the town, which came to play the role of frontier-post (*thaghr*) for the Muslims. In 505/1111-12 the population of Maʿarrat Maṣrīn came into conflict with the Shīʿī Ismāʿīlīs, who were numerous in the district; two years later, in Dhu 'l-Ḳaʿda 507/April 1114, a group of Ismāʿīlīs recruited in Maʿarrat Maṣrīn, Afāmiya [*q.v.*] and Maʿarrat al-Nuʿmān, tried to attack Shayzar during Easter, but were repulsed by the Banū Munḳidh.

In 514/1120 Ṭughtakīn and Ilghāzī, lords of Ḥalab, arrived to besiege the Franks who had withdrawn to Maʿarrat Maṣrīn; when Baldwin proceeded to the rescue of the Crusaders, the antagonists reached a peace agreement granting the Westerners a certain number of places, including Kafarṭāb, al-Bāra [*q.v.*] and Maʿarrat Maṣrīn, whence the Franks could keep a watch on the Turkomans. The Frankish fief of al-Athārib extended as far as Maʿarrat Maṣrīn at that time. In Radjab 520/August 1126, when Aḳ Sunḳur al-Bursuḳī [*q.v.*], governor of Mawṣil, invaded the territory of Sarmīn, he found the Franks camping in front of him near the cisterns (*ḥawḍ*) of Maʿarrat

Maṣrīn; they retreated several days later to their territory because of their lack of provisions.

For several years, the region of the Djazr was to witness the constant passage of Crusaders and Muslims. In 524/1130, ʿImād al-Dīn Zangī, having become *atabeg* of Mawṣil after the assassination of Aḳ Sunḳur, profited from the conflict which broke out between Alice of Antākiya, widow of Bohemond, and her own father Baldwin II, to attack the outlying parts of Athārib and Maʿarrat Maṣrīn, which he captured for a while from the Franks. In 527/1134, the *amīr* Sawār, lieutenant of Zangī in Ḥalab, undertook a plundering expedition against the Djazr and the citadel of Zardanā; he surprised the Franks near Ḥārim, invaded the territories of Maʿarrat Maṣrīn and Maʿarrat al-Nuʿmān, and returned to Ḥalab loaded with booty.

In 571/1175, Ṣalāḥ al-Dīn, in order to bring the Ismāʿīlī Hashīshiyyīn to reason, mounted a punitive expedition against their territories of Sarmīn, Maʿarrat Maṣrīn and the Djabal al-Summāḳ whose inhabitants he massacred; he then entrusted to Shihāb al-Dīn al-Ḥārimī, his maternal uncle, the district of Ḥamāt [*q.v.*], which was rich in fortresses.

In the Ayyūbid period, Maʿarrat Maṣrīn often changed masters; in Djumādā I 619/July 1222, al-Malik al-Ṣāliḥ, son of al-Malik al-Ẓāhir Ghāzī, acquired the territories of Shughr and Bakas, Rūdj and Maʿarrat Maṣrīn, which he was to exchange later, around 624/1227, for some places situated to the north-west of Ḥalab, such as ʿAyntāb [*q.v.*] and Rāwandān. In 637-8/1240, the region was devastated by the Khwārazmians (see KHWĀRAZM-SHĀHS).

In the modern period, the town seems only rarely to have been visited by travellers. The consul J.-B. Rousseau speaks of it in 1814 in his description of the *pashalïḳ* of Ḥalab. At the end of the 19th century, Jullien says of Maʿarrat Maṣrīn that it was a large village situated in the midst of fields of sesame and olive-trees in a rich plain, whose great fertility, before 1914, was praised by Garrett.

(N. ELISSÉEFF)

MAʿARRAT AL-NUʿMĀN, chef-lieu of a *ḳaḍāʾ* of North Syria comprising the southern half of the Djabal Zāwiya, which consists of the southern part of the Belus massif with numerous villages. Maʿarrat al-Nuʿmān, famous as the birthplace of the blind poet al-Maʿarrī [*q.v.*], is situated at about 500 m. altitude, in lat. 35° 38′ N. and long. 36° 40′ E. Falling within northern Phoenicia, two days' journey to the south of Ḥalab or Aleppo (70 km.), it is situated on the eastern fringe of a massif rich in archaeological remains. From west to east, we have Eocene limestones which provide cut stone, cretaceous marl, and, about 12 km. to the east, Pliocene basalts which, to the south, take the form of a flow which traverses the Djabal Zāwiya as far as the Orontes.

There is no running water in the vicinity, and the inhabitants have to collect rain water in cisterns. The contributions of rainfall and wells have allowed a rich agriculture without irrigation since antiquity. According to Ibn Djubayr, it used to take two days to cross the area covered by gardens which stretched all around the town. This land was, in the Ayyūbid period, one of the most fertile and rich in the world. To the west of Maʿarrat al-Nuʿmān, since classical times there has been cultivation of olive trees and vineyards; near the town, in the gardens, grow pistachio and almond trees, while to the east, stretch fields of cereals (corn and barley). The region produces three essential commodities: corn, olives and raisins for immediate export, which leads to "recurring concentrations in great masses of these specialised products" (Tchalenko, *Villages*, i, 98).

If one accepts the identification of Maʿarrat al-Nuʿmān with Ara, the existence of a human settlement on the site of the present town very near to Tell Mannas dates back to the first millenium B.C. In fact, Ara is mentioned in the Assyrian texts among the conquests of the empire in 738 B.C. There is no doubt that it is the same town which appears under the name Arra as one of the Graeco-Roman cities of the Antonine itinerary which is identifiable with the Megara of Strabo and which becomes Marra in the Latin chroniclers of the Middle Ages, while the Western historians of the Crusades call it La Marre or La Maire. According to the Arab authors, the form Maʿarrat al-Nuʿmān designated in the Umayyad period a town and a district situated in the fourth climate and belonging to the *djund* of Ḥimṣ; then, from the time of Hārūn al-Rashīd, it was incorporated in that of Ḳinnasrīn [*q.v.*]. This is why the geographer Ibn Khurradādhbih (d. before 272/885) considers this region as one of the *ʿAwāṣim* [*q.v.*]. According to al-Balādhurī (d. *ca.* 279/892) and al-Yaʿḳūbī (d. *ca.* 278/891) and repeated by Ibn Baṭṭūṭa (756/1355) and Khalīl al-Ẓāhirī (872/1468) (*Zubda*), the town was at one time called Dhāt al-Ḳuṣūr "the town of palaces", al-Dimashḳī speaks of Dhāt Ḳaṣrayn, "the one with two palaces".

The second part of the name of the town, according to al-Balādhurī, repeated by al-Harawī, is taken from a Companion of the Prophet, al-Nuʿmān b. Bashīr al-Anṣārī [*q.v.*], who, in the caliphate of Muʿāwiya, was governor of Kūfa and the region of Ḥimṣ and whose son died in Maʿarra; on the death of Yazīd, the governor of Maʿarra is said to have been Nuʿmān b. Bashīr, who himself died in 65/684. There is another tradition according to which this second name is taken from al-Nuʿmān b. ʿAdī al-Sāṭiʿ, of the Banū Tanūkh family who lived in the town and the region.

Maʿarrat al-Nuʿmān, since its establishment, has been an important crossroads and active economic centre. The town is situated on the north-south axis, which, from Ḳurus at the foot of the Taurus, goes as far as Palestine passing via Ḥalab, Ḥamāt, Ḥimṣ

and Dimashḳ. This route passes along the foot of the eastern slope of the Djabal Zāwiya and skirts the plain which stretches to the east. A road also passes it which links Ḥamāt with Anṭākiya, and halfway between the latter and Maʿarra is Rūdjiyya (Chastel Ruge) in the Rūdj district which screens Antioch to the south. An important road goes westwards from Maʿarra via al-Ḥass and al-Bāra, goes over the Djabal Zāwiya, then crosses the Orontes at Djisr al-Shughr before reaching Lādhikiyya [*q.v.*].

To the south, one goes by Maʿarrat al-Nuʿmān to Kafar Ṭāb, from where one can reach Afāmiya or Shayzar. It should be noted that the old Ḥalab-Ḥimṣ route that al-Yaʿḳūbī followed in the 3rd/9th century did not pass by Maʿarrat al-Nuʿmān but via Tell Mannas, several kilometres to the east of the present road, and yet the Antonine itinerary gives the Arra-Epiphania (Ḥamāt) route. A well-articulated road network linked the agricultural villages of the east with Maʿarrat al-Nuʿmān. This town was not only a resting stage, but also a centre of exchange between the mountain and the plain, and it served as a great collecting centre of agricultural products; in 340/951 it was already a prosperous town. As the key to Ḥamāt, Maʿarrat al-Nuʿmān was to be, under the Middle Ages, the first objective to be attained by any adversary, coming from the north-west, north or north-east, while to any master of Ḥamāt it constituted an advance defence. In the Ottoman period, the economic importance of the town was emphasised by the fact that the *sandjaḳ* of Maʿarrat al-Nuʿmān had its own fiscal regulation; taxes were paid on merchandise in transit, animals and produce transported from the villages to the town, the *bādj* fee [*q.v.*]. In 1913, there was a French school in this town. At the present time, Maʿarrat al-Nuʿmān preserves its role as a craft and commercial centre which is emphasised by the coming-and-going of trucks, agricultural machines, buses and taxis as well as the appearance of its main street, which is dominated by garages, workshops for mechanical repairs, cafés and restaurants.

Demographic growth in the 20th century has followed that of the country as a whole. From 5,250 inhabitants in 1932, the population rose to 9,140 in 1945, to reach 20,000 in 1970.

History. In 16/637, the army of Abū ʿUbayda [*q.v.*] occupied Maʿarra-Ḥimṣ; those of the inhabitants who were not converted were forced to pay the *djizya* and *kharādj* [*q.vv.*]. In Radjab 101/February 720, the pious caliph ʿUmar b. ʿAbd al-ʿAzīz was buried in Dayr Samʿān in al-Naḳīra to the south-west of Maʿarra. It is in this village that there lived the Ṣūfī Yaḥyā al-Maghribī whom Saladin visited. This was a place of pilgrimage frequented in the 7th/13th century.

In 207/822, ʿAbd Allāh b. Ṭāhir, nominated by the caliph al-Maʾmūn as governor of Syria where he succeeded his father, fought the rebel Naṣr b. Shabath and, on this occasion, destroyed the fortifications of Maʿarrat al-Nuʿmān and other fortresses such as those of al-Kafr and Ḥunāḳ.

In 290/903, the Ḳarāmiṭa [*q.v.*], under the command of the Ṣāḥib al-Khāl, devastated the region of Ḥimṣ, Ḥamāt, Salāmiyya and Maʿarrat al-Nuʿmān. They killed many people there and took captive women and children. In 325/936-7, some Banū Kilāb nomads penetrated into Syria from Nadjd; when they drew near to Maʿarrat al-Nuʿmān, Muʿādh b. Saʿīd, commander of this place, went to meet them, but was taken prisoner at al-Burāghithī (whose location is unknown) with a part of his army; he was only released later by Abu 'l-ʿAbbās Aḥmad b. Saʿīd, a Kilābī commander of Ḥalab.

In 332/943-4 al-Ḥusayn b. Saʿīd, uncle of Sayf al-Dawla, drove out of Ḥalab Abu 'l-ʿAbbās b. Saʿīd and the Kilābī Yānis al-Muʾnisī, and passed by Maʿarrat al-Nuʿmān on his way to Ḥimṣ, while Yānis fled to Egypt. In Shawwāl 333/May-June 945, the Ikhshīdid governor of Egypt left Damascus and marched against Sayf al-Dawla; he seized Maʿarrat al-Nuʿmān and appointed Muʿādh b. Saʿīd as governor for the second time, but he was killed shortly after by Sayf al-Dawla at the Battle of Ḳinnasrīn. In 348/959 the Ḳarāmiṭa were numerous in the region of Maʿarrat al-Nuʿmān, and the ʿUḳaylid governor Shabīb b. Djarīr headed a band of these insurgents and marched on Dimashḳ. At the end of 357/end of 968, Nicephorus Phocas conquered Maʿarrat al-Nuʿmān, destroyed the Great Mosque and damaged a large part of its ramparts. At the beginning of 358/969, a peace treaty was signed and the town was one of those which had to pay tribute to the Byzantines, but the latter did not have sufficient troops to enforce the agreement. Abu 'l-Maʿālī, son of Sayf al-Dawla, recaptured Maʿarra.

In 358/969, at the time when the Byzantines withdrew from the Ḥalab region, Abu 'l-Maʿālī came to Maʿarrat al-Nuʿmān, whose governor delivered the *khuṭba* in his name. In October of the same year, on the return of the Byzantines, Abu 'l-Maʿālī fell back on Maʿarrat al-Nuʿmān, where he received reinforcements, provisions and fodder. He appointed as his lieutenant there Zuhayr, a *ghulām* of his father, and went on to Ḥimṣ. On his return, Zuhayr refused to open the gates of the town to the Ḥamdānid prince, who decided to use force; finally, his lieutenant secured *amān*.

When in Dhu 'l-Ḥidjdja 358/October 969, Karghawayh seized power in Ḥalab, Zuhayr, the governor of Maʿarrat al-Nuʿmān, allied himself with the Ḥamdānid Sayf al-Dawla and took part in the campaign against Ḥalab. But as soon as the Byzantine Peter Stratopedarcus, whom Kamāl al-Dīn Ibn al-Athīr calls al-Turbāzī, came to help Karghawayh, Abu 'l-Maʿālī abandoned the siege of Ḥalab and withdrew with Zuhayr to al-Khunāṣira and Maʿarrat al-Nuʿmān. In 364/975 Saʿd al-Dawla Abu 'l-Maʿālī came, with the aid of the Banū Kilāb, to besiege Zuhayr in his town, and broke in by the Ḥunāḳ gate; driven back from the town, Abu 'l-Maʿālī burned the Ḥimṣ gate, and finally, Zuhayr gave himself up and was executed. In Shawwāl 366/May-June 977, the castle of Maʿarrat al-Nuʿmān was pillaged.

An expedition of the Fāṭimids against Ḥalab in 386/996 was held in check, but the Egyptians succeeded in extending their authority as far as Maʿarrat al-Nuʿmān. In fact, Rummāḥ, a *mamlūk* of Sayf al-Dawla who governed the place, had revolted against his master Abu 'l-Faḍāʾil Saʿīd al-Dawla, prince of Ḥalab, and had appealed to Mangūtakīn, a Turkish leader in the service of the Fāṭimids, to relieve him from the pressure exerted by the Aleppine forces. It seems that following an agreement with the Fāṭimids, Luʾluʾ, the *atabeg* of Ḥalab, had recovered Maʿarra. In 393/1003 the district of Maʿarrat al-Nuʿmān was attacked by Luʾluʾ, who had seized power in Ḥalab in the preceding year; he dismantled the fortresses situated in this territory and in that of Rūdj in order to prevent his adversaries from using them against him.

In the middle of the 5th/11th century, after the appearance of the Mirdāsids on the political scene with the capture of Ḥalab in 1024, Maʿarrat al-

Nuʿmān was to change hands several times. In 434/1042-3 the Ḥamdānid Nāṣir al-Dawla confronted the Mirdāsid Thimāl, master of Ḥalab, and took possession of Maʿarrat al-Nuʿmān. In 452/1060 Thimāl, in the course of an expedition against his nephew Maḥmūd, stayed in the town whose inhabitants had to suffer the enemy occupation. Five years later, after entering Ḥalab, Maḥmūd the Mirdāsid, sent Hārūn, a Turkish leader, to capture Maʿarra. On 17 Shawwāl 458/10 September 1066, Hārūn penetrated into the town with more than 1,000 men comprising Turks. Daylamī, Kurds and men from the al-Awdj tribe. They had established their camp outside the walls in front of the gate where public prayer was performed. These troops were disciplined, and respected the olive groves and vineyards, only taking water for their beasts without paying. They left the town to help Maḥmūd in his struggle against the Kilābīs.

Some Turks from the Byzantine territory advanced in 462/1070, under the command of Ṣundaḳ, against Ḥalab; they went as far as the Djazr and devastated the territories of Maʿarrat al-Nuʿmān, Kafar Ṭāb, Ḥamāt, Ḥimṣ and Rafaniyya. Shortly after, the Saldjūḳids made their appearance in North Syria. In 472/1079-80, Tutush, brother of the sultan Malik Shāh, made the inhabitants of Sarmīn and Maʿarrat al-Nuʿmān, whose eastern villages he plundered, pay large sums.

In 478/1085, Maʿarra belonged to the ʿUḳaylids; at the beginning of Rabīʿ II/August, Sulaymān b. Ḳutlumush who, the preceding year had seized Anṭākiya, took it from them. In 485/1092 Yaghī Siyān received from Tutush a certain number of places in *iḳṭāʿ*, including Maʿarrat al-Nuʿmān. Three years later, Riḍwān, the Saldjūḳid prince of Ḥalab, gave the town and its territory to Suḳmān b. Artuḳ; in the following year, Djarrāḥ al-Dawla, Riḍwān's *atabeg*, having quarrelled with the latter, seized Maʿarrat al-Nuʿmān.

The strategic position of this place was also to interest the Crusaders. In the vicinity of the town, to the west, troops could be concentrated, under the protection of the forts of Tell Mannas and Kafr Ruma to the east and Kafar Ṭāb which, on the south, also served to defend the approach from Afāmiya and to attack Shayzar on the Orontes. In 491/1098 Raymond of Saint Gilles decided to attack Maʿarrat al-Nuʿmān on leaving Anṭākiya, supported by the Christians of the region, but he was driven back. At the end of November a fresh attack was led by Robert of Flanders. In order to capture Maʿarrat al-Nuʿmān, the Crusaders used a wooden castle on wheels surpassing the height of the town walls so as better to attack the enemy who, to break the force of the missiles, covered the walls with bags of hay and cotton. Raimond Pilet's sappers succeeded in making a breach in the wall. Not having a very large army, Bohemond negotiated an honourable surrender, proposing to save lives. The town surrendered on 14 Muḥarram 492/11 December 1098. At Christmas 1098, Raymond of Saint Gilles left Maʿarrat al-Nuʿmān to establish himself at Chastel Ruge, and Bohemond also went there after appointing the bishop of al-Bāra in authority over this place. At the beginning of January 1099, while the princes were organising the expedition against Jerusalem from Chastel Ruge, the more impoverished elements of the Frankish army, who wanted to to go Jerusalem without delay, rebelled, and, despite the protestations of the bishop of al-Bāra, set about sacking the town and demolishing the ramparts. Raymond of Saint Gilles returned, gathered his men and abandoned Maʿarra, which he evacuated on 17 Ṣafar 492/13 January 1099, barefoot, as leader of the Pilgrimage. In 496/1103, Riḍwān of Ḥalab reconquered the lost fortresses and, the following year, he occupied Maʿarrat al-Nuʿmān, which the Franks were forced to abandon temporarily. In 505/1111, Mawdūd, *atabeg* of Mawṣil, and Ṭughtakīn, *atabeg* of Dimashḳ, allied against Ḥalab, and marched to Maʿarrat al-Nuʿmān, whose region was at that time peopled by numbers of the Assassins [see AL-ḤASHĪSHIYYA]. On 23 Rabīʿ II 509/15 September 1115, Bursuḳ of Mawṣil was defeated by Roger of Antioch at the Battle of Tall Dānith, to the north of Maʿarrat al-Nuʿmān, on the road from the Euphrates to the Mediterranean. Two years later, after the assassination of Luʾluʾ at Ḥalab, the Franks controlled the roads linking this town with Dimashḳ. In 513/1119 Baldwin II marched on Maʿarrat al-Nuʿmān, and in the following year, Riḍwān concluded a treaty with the Franks of Antioch according to which Maʿarrat al-Nuʿmān, the Djazr situated to the north of the town, Kafar Ṭāb, al-Bāra and part of the Djabal al-Summāḳ reverted to the Franks. Several years later (519/1125) there is mentioned the escape of an important group of Muslim prisoners from the citadel of Maʿarra.

At the beginning of Djumādā I 529/end of April 1135, Zangī captured Maʿarrat al-Nuʿmān and drove the Franks out of the citadel; he re-established on their lands the Muslims who could show their title deeds, and for those who had lost them he checked the payment of *kharādj* in the land registers before restoring their lands. The following year, at the beginning of Shaʿbān/mid-April, the Basileus John II Comnenus traversed the territory of Maʿarrat al-Nuʿmān, without attacking it, and proceeded swiftly towards Shayzar which he besieged in vain.

During the great earthquake of 552/1157, of which Ḥamāt was the epicentre, Maʿarrat al-Nuʿmān was seriously damaged; Nūr al-Dīn visited it in Ramaḍān 552/October 1157. In this prince's time, this town was situated on the southern border of the Ḥalab region and the customs dues (*mukūs*) on merchandise were paid there. Nūr al-Dīn founded a dovecot there, a resting-stage for the pigeon post between Ḥamāt and Ḥalab, which was to be integrated into the system of the Mamlūk air-borne post before being suppressed at the beginning of the 15th century.

In 574/1178, certain villages of the *kūra* of Maʿarra were given in *iḳṭāʿ* by Saladin to the *amīr* Shams al-Dīn Ibn al-Muḳaddam. In the Ayyūbid period, Maʿarrat al-Nuʿmān, due to its position on the border of the territories of Ḥalab and Ḥamāt, changed hands more than ten times in less than a century.

In 548/1188 Saladin went from Ḥalab to Maʿarrat al-Nuʿmān in order to go on pilgrimage to the Shaykh Abū Zakariyyāʾ al-Maghribī, who lived near the tomb of the Caliph ʿUmar b. ʿAbd al-ʿAzīz. In 587/1191, al-Malik al-Muẓaffar Taḳī al-Dīn ʿUmar seized Maʿarra to the detriment of Muẓaffar al-Dīn, and died shortly afterwards. Two years later it was given by al-Malik al-Ẓāhir Ghāzī to al-Manṣūr Muḥammad. In 596/1200, Ibn al-Muḳaddam was in possession of Afāmiya, Kafar Ṭāb and 25 places in the district of Maʿarrat al-Nuʿmān. The following year, during a campaign against Ḥamāt, al-Malik al-Ẓāhir Ghāzī sacked the surrounding area and plundered the town, which sporadically formed part of his domains. In 598/1202 an agreement was reached between al-Malik al-ʿĀdil, sultan of Egypt, al-Malik al-Ẓāhir of Ḥalab and al-

Malik al-Manṣūr Muḥammad, who received Maʿarrat al-Nuʿmān. This town is situated to the north of Shayzar, Afāmiya and Kafar Ṭāb, three possessions of al-Malik al-Ẓāhir, the *amīr* of Ḥalab, whose forces, together with some Bedouin allies, pillaged the territory of Maʿarra from time to time.

In 604/1207-8, the governor of the town was Murshid b. Sālim b. al-Muhadhdhib, vassal of al-Malik al-Ẓāhir. In 617/1220, this town belonged, with the agreement of the Sultan al-Afḍal, to al-Malik al-Nāṣir Kïlïdj Arslan [*q.v.*], lord of Ḥamāt. In 620/1223, al-Malik al-Muʿaẓẓam ʿĪsā, prince of Dimashḳ, attacked Maʿarrat al-Nuʿmān, whose governor fled, leaving the task of negotiating to the notables, who included the father of the historian Ibn Wāṣil. Al-Malik al-Muʿaẓẓam nominated an administrator.

In the decade which followed, the town was disputed between al-Ashraf Mūsā of Damascus and al-Muẓaffar II Maḥmūd of Ḥamāt. The latter reconstructed the citadel of Maʿarrat al-Nuʿmān in 631/1233. In 635/1238, on the death of al-Malik al-Kāmil in Cairo, Maʿarra and its citadel were seized by al-Malik al-Nāṣir Yūsuf of Ḥalab after a short siege assisted by mangonels. Expelled by Čingiz Khān [*q.v.*], the Khwārazmians crossed the Euphrates in 638/1240 and entered Syria, passed to the south of Ḥalab via Djabbūl and Sarmīn, and plundered the region as far as Maʿarrat al-Nuʿmān, governed at that time by al-Malik al-Manṣūr. After Baybars' victory at ʿAyn Djālūt [*q.v.*], the sultan al-Malik al-Muẓaffar Ḳuṭuz [*q.v.*] in 658/1259 handed over to al-Malik al-Manṣūr the towns of Baʿrīn and Maʿarrat al-Nuʿmān, which had been taken from him by the *amīr* of Ḥalab. From this time onwards except for short periods, the town and its region was to remain in the hands of the princes of Ḥamāt; Abu 'l-Fidāʾ, an Ayyūbid prince, geographer and historian, also received them in *iḳṭāʿ* from the sultan Muḥammad b. Ḳalāʾūn in 710/1310; but three years later he was forced to cede them to the ruler of Ḥalab. This is why, in 716/1316, he gave up to the sultan as a donation in the proper official style, the town and castle, which did not prevent him from ceding the town to Muḥammad b. ʿĪsā at the end of the year.

Under the Mamlūks, at the beginning of 742/1341, the principality of Ḥamāt was suppressed; the province belonged from then onwards to the ruler of Egypt, and the district of Maʿarrat al-Nuʿmān constituted a *wilāya* of this province. After the Battle of Mardj Dābiḳ (922/1516) the town became Ottoman; in 924/1518 it was on the northern border of the province of Dimashḳ. A century later, the traveller Pietro della Valle (ii, 136) passed by Maʿarrat al-Nuʿmān, where he found a prince of the Ottoman dynasty.

In the 17th century, Maʿarra was situated on the southern border of the *pashalïḳ* of Ḥalab and the northern border of that of Dimashḳ, where the road from Bālis passes to the Mediterranean, crossing the Orontes at Djisr al-Shughr.

Thévenot describes Maʿarra in 1658 as a "poor town commanded by a 'sangiac' ", and says that it is surrounded by walls (*Voyage*, vi, 703; *Suite du Voyage*, iii, 97-8). Franz Ferdinand von Troilo, a German traveller in the middle of the 17th century, found in the town "two fine inns, one dilapidated, the other in quite a good state" (*Reise Beschreibung*, Dresden 1676, 458). It is in this period that an Arab family settled there coming from the region of Konya, sc. the al-ʿAẓm family who, in the second half of the 17th century, were to set out on a political career which was to be prolonged into modern times. About 1650, two of its members, Ḳāsim and Ibrāhīm, reached Dimashḳ, then went on to Ḥamāt and Maʿarrat al-Nuʿmān. Ibrāhīm, a *djundī*, served in the Ottoman army, settled in Maʿarra and was put in charge of organising the defence of the town against the attacks of the Turkomans. His son, Ismāʿīl Pasha b. al-ʿAẓm al-Nuʿmānī, was born in Maʿarra in 1070/1659-60, where he occupied himself with agriculture, and in the town of his birth became a sufficiently important figure to be nominated governor of Dimashḳ, on 23 Djumādā II 1137/9 March 1725 (being removed at the end of Djumādā I 1143/December 1730). In this period, Pococke, who visited Maʿarra, describes it as a poor town with an independent *agha* who was paying a tribute to the Porte and levying taxes on travellers (*A description* ..., ii, 145-6). Ismāʿīl had two sons, Asʿad Pasha and Saʿd al-Dīn. The first was born in 1117/1706, and was first *mutasallim* in Ḥamāt and Maʿarrat al-Nuʿmān and then governor of Dimashḳ in 1156/1743. In the 18th century the city, like Ḥimṣ and Ḥamāt, was one of the lifetime grants (*mālikāne*) of the *pasha* of Damascus, who held it from the sultan and who himself sub-let it to an *agha*. In Radjab 1135/October 1771, ʿUthmān Pasha al-Kurdjī, governor of Damascus from 1760, was removed, and lost the *mālikāne* of Maʿarra, which Muḥammad Pasha al-ʿAẓm then received.

In the middle of the 19th century, Maʿarrat al-Nuʿmān was the most northerly locality of the *pashalïḳ* of Dimashḳ; it was a *sandjaḳ* governed by a *mutaṣarrif*, then it became a *ḳaḍāʾ* of the *liwāʾ* of Ḥalab and, in 1873, the residence of a *ḳāʾim-maḳām*. According to Sachau, who visited it in 1879, the town had about 400 houses, and led an easy life in the midst of a well-cultivated region. On the other hand, Max van Berchem, a few years later, saw only "a large, miserable-looking village ... in a well-cultivated plain." In 1913, one of the rare telegraphic offices of Syria made Maʿarrat al-Nuʿmān the link between Ḥamāt and Ḥalab.

From the time of the establishment of the French mandate in the Levant, this town became an active centre of resistance by the Syrian nationalists. In 1930, the Mawālī shepherd tribes held much of the lands through which one had to pass between Maʿarrat al-Nuʿmān and Ḥalab. Since 1965 the town has benefited from the economic, industrial and agricultural development of the Ḥamāt-Ḥimṣ zone.

Monuments. The town of Maʿarrat al-Nuʿmān has protected by a wall which was often attacked and damaged, and then repaired; it had seven gates like many cities of the East: Bāb Ḥalāb, al-Bāb al-Kabīr, Bāb Shīth, Bāb al-Djinān, Bāb Ḥunāḳ, Bāb Ḥimṣ and Bāb Kadhāʾ. Defence was also assured by a mediaeval fortress of circular plan called al-Ḳalʿa, built on a mound serving as its foundation and dominating the countryside to the north-west of Maʿarra. It was situated at the entrance of "the great ravine which, from al-Bāra, traverses the eastern side of the mountain, followed by the road which linked the inland plains of the east with the valley of the Orontes" (Tchalenko, iii, 123). After the Crusaders' attacks, it was restored by Zangī in the 6th/12th century. A dovecote (*burdj al-ḥamām*) set up by Nūr al-Dīn in the 6th/12th century linked Ḥamāt and Ḥalab by means of travelling pigeons until the beginning of the 9th/15th century.

The Great Mosque of Maʿarrat al-Nuʿmān occupies the site of an ancient temple which had given way to a church which was turned into a mosque after the arrival of the Muslims. Built on a height in the middle of the city, it was reached by 13 steps; ex-

tensive re-use of ancient remains bears witness to the antiquity of the sanctuary, whose roof is flat. In the courtyard, two kiosks are supported by shafts of ancient columns; the cupola which protects the ablutions basin and its fountain rests on ten ancient columns, and the drum which provides a passage between the decagon of the ground plan and the circle of the cupola, is pierced by semi-circular bays. The square minaret of the Great Mosque, one of the most beautiful in Syria, bears on its west face the signature of the architect Ḳāhir b. ʿAlī b. Ḳānit al-Sarmānī, who in 595/1199 built the town's Shāfiʿī *madrasa*. Creswell attributed this date to the construction of this monument. Herzfeld, stressing the strict relation which exists between the decoration and construction of this five-storeyed minaret and that of Ḥalab, built between 483/1090 and 487/1094, dated it from 550/1155 at the latest. There is every reason to believe that Nūr al-Dīn had it repaired after the great earthquake of 552/1157. Later, this minaret, after the quake of 565/1170, was to undergo other damage and to be repaired in 595/1199 by the architect of the Shāfiʿī *madrasa*.

Some *sūḳs* of very ancient origin surround the Great Mosque, and in the city there are still some remains of covered, vaulted streets like Jerusalem. At the time of his visit to Maʿarrat al-Nuʿmān, Nāṣir-i Khusraw saw an ancient column 10 cubits high with an inscription in non-Arabic characters which was regarded as a talisman, as at Ḥimṣ and Anṭākiya, protecting the town from scorpions.

According to Albert of Aix, quoted by Cl. Cahen (*La Syrie du Nord*, 162, n. 5) there was in the period of the Crusades, in the southern part of the town, a church of St. Andrew, of which some foundations still survive. According to Syriac texts, there was also a Monophysite monastery, whose location is uncertain. There are in the town and its environs a large number of sculpted arch-stones in basalt originating from ancient Christian tombs.

To the south of the Great Mosque is situated a Shāfiʿī *madrasa*, whose foundation is sometimes attributed to Nūr al-Dīn. Following a sculpted inscription on the lowest course of the arch of the doorway, it was built in 595/1119 in the reign of the Ayyūbid prince of Ḥamāt al-Malik al-Manṣūr Abu 'l-Maʿālī Muḥammad by Abu'l-Fawāris Nadjā. The building also bears the signature of the architect Ḳāhir b. ʿAlī b. Ḳānit. This *madrasa* is entered on the east side by a doorway with a trefoiled arch opening on the vestibule covered by a pyramidal cupola on pendentives. In its axis, facing an oblong court, there is a very large *īwān*, at present encroached upon by dwellings. On the south, the prayer hall opens on the courtyard by three doors; the *miḥrāb*, a large niche, is preceded by a cupola on pendentives creating a zone passing from the hexadecagon to the circle of the cupola. On the north side, some rooms are laid out and, at a north-east angle, is placed the tomb of the founder surmounted by a cupola.

Also at Maʿarrat al-Nuʿmān should be noted a *khān* of the Ottoman period which lies to the south of the Great Mosque in the eastern part of the town. It is a great, square *khān* in cut stone with huge stables and a small mosque in the middle of the courtyard. An inscription above the fine southern doorway, dated 974/1566-7, informs us that this building is due to the generosity of Murād Čelebi, *defterdār* of Anatolia (d. 981/1573-4). A second inscription at the vaulted north entrance is a poetic text giving in a chronogram the date 1166/1752-3, presumably the time of Asʿad Pasha al-ʿAẓm.

There are many places of pilgrimage or oratories in Maʿarrat al-Nuʿmān: the *Maḳām Nabī Allāh Yūshaʿ b. Nūn*, often cited as a *djāmiʿ* or *mashhad*, is situated outside the south walls of the town. The tomb of Yūshaʿ (Joshua) is probably on the site of an ancient pre-Islamic sanctuary. Yāḳūt says that this is not the tomb of Yūshaʿ, which is actually in the vicinity of Nābulus. An inscription of 10 lines dated 604/1207 recalls, in the bay above the door, that this place of prayer was reconstructed on the order of al-Malik al-Ẓāhir al-Ghāzī while Murshid b. Sālim b. al-Muhadhdhib governed Maʿarrat al-Nuʿmān. The ground plan of this small-scale *maḳām* is little different from that of a *madrasa* with its rectangular court, its deep *īwān* facing the entrance and the north and south faces occupied by the funerary chamber and prayer hall. Above the entrance arch rises an octagonal minaret with a small cupola supported at the top by four columns. The modern mausoleum of the illustrious blind poet, Abu 'l-ʿAlā al-Maʿarrī [*q.v.*], where there is a part of his epitaph on a stele fragment in stone, is situated in the town.

In the vicinity of Bāb Shīth, there is the tomb of Seth, third son of Adam, who spent part of his life in Syria. The tomb of ʿAbd Allāh b. ʿAmmār b. Yāsir, grandson of a Companion of the Prophet, is mentioned in Maʿarrat al-Nuʿmān by al-Balādhurī, and again by Ibn Baṭṭūṭa and Yāḳūt. There was also a *mashhad* of Yūsuf which was restored by al-Malik al-Ẓāhir Ghāzī.

A short distance to the east of Maʿarrat al-Nuʿmān, at Dayr Naḳīra, identified with the Dayr Samʿān of this district, is the tomb of the caliph ʿUmar b. ʿAbd al-ʿAzīz, in a small enclosure. The earliest author, according to J. and D. Sourdel, to mention this site is Ibn Wāṣil (d. 697/1298). Ṣalāḥ al-Dīn went there on pilgrimage in 584/1188 and visited there the Shaykh Abū Zakariyyā' Yaḥyā b. Manṣūr al-Maghribī, who lived in this place and was buried behind the sepulchre of the Umayyad sovereign. This was a place of pilgrimage frequented from the Ayyūbid period.

In 1953, Tchalenko remarked on the subject of Maʿarrat al-Nuʿmān: "Due to its situation as much as to its urban character and the importance of its mediaeval monuments, this site demands a special study, like several other small towns situated on the edge of the massif."

AL-MAʿARRĪ, Abu 'l-ʿAlāʾ Aḥmad b. ʿAbd Allāh b. Sulaymān, famous Arabic poet and prose author of the late ʿAbbāsid period, was born in 363/973 in Maʿarrat al-Nuʿmān [*q.v.*], a town between Aleppo and Ḥimṣ in the northern part of Syria, where he also was to die in 449/1058. The Banū Sulaymān, his forefathers, belonged to the notable families of Maʿarra. As Shāfiʿī *ʿulamāʾ*, they held the office of *ḳāḍī*, which post was for the first time successfully claimed by a grandfather of Abu 'l-Alāʾ's grandfather. In addition, some of the Banū Sulaymān are mentioned as rather good poets (further information in ʿImād al-Dīn al-Iṣfahānī, *Kharīdat al-ḳaṣr wa-djarīdat al-ʿaṣr*, ii (part on Syria), ed. Shukrī Fayṣal, Damascus 1959, where a genealogical table may be found in the editor's *Muḳaddima*, based on al-Iṣfahānī, *op.cit.*, ii, 49 and Ibn al-ʿAdīm, *al-Inṣāf*, 483-511).

Having been afflicted by smallpox at an early age, Abu 'l-ʿAlāʾ lost his eyesight: "When I was four years old, there was a decree of fate about me, so that I could not discern a full-grown camel from a tender young camel, recently born" (see his correspondence with Abū Naṣr b. Abī ʿImrān, the *Dāʿī 'l-duʿāt*, in Yāḳūt, *Udabāʾ*, i, 198, cf. D. S. Margoliouth, *Abu 'l-ʿAlā al-Maʿarrī's correspondence on vegetarianism*, in *JRAS* [1902], 317). This defect was, however, more than compensated by his extraordinarily retentive memory, which in later biographical collections was to reach fabulous dimensions. Ibn al-ʿAdīm [*q.v.*], who is otherwise very reliable, inserted in his monograph concerning Abu 'l-ʿAlāʾ a "Chapter about deep understanding, natural ability, quick and brilliant memory, shining thought and penetrating insight in connection with Abu 'l-ʿAlāʾ" (*al-Inṣāf*, 551-64). That Abu 'l-ʿAlāʾ started his career as a poet at the early age of 11 or 12 years need not surprise us in view of, for instance, similar statements which concern youthful poetry by al-Mutanabbī [*q.v.*], cf. R. Blachère, *Abou 'ṭ-Ṭayyib al-Motanabbî, un poète arabe*, Paris 1935, 27. Abu 'l-ʿAlāʾ completed his religious, linguistic and literary education, in that he read the text materials required, under supervision of different *shaykhs*, in the first instance those at Maʿarra and Aleppo. Among his teachers were, according to Ibn al-Ḳifṭī, *Inbāh*, in *Taʿrīf al-ḳudamāʾ*, 30, "companions from the circle of Ibn Khālawayh [*q.v.*]", known as one of the participants in the literary reunions at Sayf al-Dawla's court in Aleppo. This grammarian and expert on Ḳurʾān readings died in 370/980-1, when Abu 'l-ʿAlāʾ was still very young. None the less, we find Abu 'l-ʿAlāʾ regretting Ibn Khālawayh's loss to Aleppo in rather strong terms: "Would that God might protect Aleppo, because that town, after Abū ʿAbd Allāh b. Khālawayh's death, ceased to wear any ornament, neither spangle nor bracelet; thus it was found to be far removed from *adab*" (*Risālat al-Ghufrān*, 518, cf. 548-9). Among his teachers should further be mentioned Muḥammad b. ʿAbd Allāh b. Saʿd, who was a *rāwiya* of al-Mutanabbī's poetry. Ibn al-ʿAdīm mentions (*al-Inṣāf*, 515) how Abu 'l-ʿAlāʾ, at one time reading al-Mutanabbī's *Dīwān* under his supervision, corrected Ibn Saʿd's *riwāya*. By comparing the passage concerned with that found in a manuscript from ʿIrāḳ, Abu 'l-ʿAlāʾ's correction was proved to be justified. From this incident we may conclude that Abu 'l-ʿAlāʾ had already at an early age some acquaintance with the poetry of al-Mutanabbī, for whom he was to entertain great admiration at a more advanced age.

Regarding the next phase of Abu 'l-ʿAlāʾ's life, up till his journey to Baghdād, Arabic historians express two different opinions. Some historians suppose the poet to have travelled to some other cities apart from his Baghdād journey. They would have him visit Antioch and Syrian Tripoli so that he might profit from the local libraries. According to Ibn al-Ḳifṭī, *Inbāh*, in *Taʿrīf*, 30, and other historians following him, the poet on his way to Tripoli made a halt not far from al-Lādhiḳiyya (Latakia), at Dayr al-Fārūs, a monastery so called in memory of Jesus's shroud (Greek: φαρος, see Ibn al-Ḳifṭī, *loc. cit.*, n. 1). There he listened to a monk discussing Hellenic philosophy, producing in his mind certain doubts which could afterwards be recognised in his poetry. Some other historians however, are of a different opinion. For example, Ibn al-ʿAdīm is one of those who deny the poet was under the influence of any religion but Islam. As far as Antioch is concerned, Ibn al-ʿAdīm bases his argument on the political situation in Syria: during all Abu 'l-ʿAlāʾ's life-time Antioch lay inside the Byzantine frontiers. From the ex-

pulsion of the Muslims by Byzantine authorities from that town, Ibn al-ʿAdīm infers that "it is neither conceivable that a library should have existed there nor a librarian, as much as that town is inconceivable for somebody to travel to in order there to pursue knowledge" (*al-Inṣāf*, 555). Concerning the supposed existence of a library at Tripoli, also an alleged motive for Abu 'l-ʿAlāʾ's travelling, Ibn al-ʿAdīm points out that such a library was only founded in 472/1079-80, many years after the poet's death (*op. cit.*, 557). Despite Ibn al-ʿAdīm's strong arguments, recent researches after all tend to accept the possibility of an actual visit to the towns mentioned, as may be deduced from certain allusions in Abu 'l-ʿAlāʾ's poetry (see H. Laoust, *La vie et la philosophie d'Abu 'l-ʿAlāʾ al-Maʿarri*, in *BEO*, x [1943-4], 123-4).

The poems of the first half of Abu 'l-ʿAlāʾ's life were collected in his *Dīwān*, which was called *Saḳṭ al-zand* ("The first spark of the tinder"). Here and there in this collection, the poet's reactions to contemporaneous political developments in Syria may be found. About that time, the dynasty of the Ḥamdānids [*q.v.*], with Aleppo for their centre of authority, began to lose much of its power, which having attained its utmost degree in Sayf al-Dawla's days, under his successors gradually was to vanish, finally making place for another line of *amīrs*, the Mirdāsids (see S. Zakkar, *The emirate of Aleppo 1004-1094*, Beirut 1971). Meanwhile, the relative independence of the northern Syrian territory was increasingly threatened from the north by a renewed access of Byzantine military power and from the south by the appearance for the first time of the Fāṭimids [*q.v.*]. At the same time, there was hardly any support to be expected from the Būyid *amīrs* and their nominal overlords, the ʿAbbāsid caliphs in Baghdād. During the reign of the successors of Sayf al-Dawla, in particular Saʿd al-Dawla and Saʿīd al-Dawla, the Fāṭimid *imāms* began trying to extend their influence from Egypt into northern Syria. Especially at the time Saʿīd al-Dawla started his rule, Aleppo came to be the object of several prolonged but futile sieges (Ibn al-ʿAdīm, *Zubdat al-ḥalab min taʾrīkh Ḥalab*, Damascus 1951, i, 185-92). Abu 'l-ʿAlāʾ took a keen interest in these developments, as is apparent from at least four laudatory poems found in his collection, the *Saḳṭ al-zand*. In these poems, important personalities from either party at war are the subjects of his praise. Thus he eulogises one Bandjūtakīn, who was a Fāṭimid general, in his poem with rhyme-word *dhimāmu* (*Shurūḥ Saḳṭ*, ii, 602), while in two other poems of his (the one with rhyme *ḥimyaru*, *Shurūḥ Saḳṭ*, iii, 1087, and the other with rhyme *wiṣālu*, *op. cit.*, iii, 1046) a certain Abu 'l-Ḥasan ʿAlī b. al-Ḥusayn, one of the Banu 'l-Maghribī [*q.v.*] is lauded. The latter had originally acted as a *kātib* and *wazīr* in the Ḥamdānids' service, but having betrayed his masters he filled the Fāṭimid post of financial and administrative superintendent of the army (*mudabbir al-djaysh*), trying to conquer Aleppo for the Fāṭimid cause. On the other hand, it is interesting to note that Saʿīd al-Dawla, too, who only with great difficulty stood his ground in Aleppo, can be found as a *mamdūḥ* in Abu 'l-ʿAlāʾ's poetry. In the *raḥīl* of a *ḳaṣīda*, even his name is mentioned, though in a rather allusive way, "[10] The camels kept asking me, upon which I answered, saying, Our destination will be Saʿīd [however, the name excepted, *saʿīd* also means "fortunate"]. Thereupon the *amīr*'s name came to be their good omen" (from the poem with rhyme *mālā*, *Shurūḥ Saḳṭ*, i, 25). All these laudatory passages are, however, rather curious, because they do not fit the image given by Abu 'l-ʿAlāʾ himself in the Preface to his *Dīwān* (*Shurūḥ Saḳṭ* i, 10), where he says, "I have not knocked so as to be heard at the doors of great lords, whilst reciting my poetry, no more did I praise with a view to acquiring a reward". This contrast between explicit intention and real practice may be explained by the assumption that the poet in such cases had been pressed to compose this sort of poetry against his will (cf. Ibn al-ʿAdīm, *Bughyat al-ṭalab*, f. 215a).

It was in 395/1004-5 that Abu 'l-ʿAlaʾ had to sustain the painful blow of the death of his father, Abū Muḥammad ʿAbd Allāh b. Sulaymān, who had been the first one to teach him. This date given by ʿImād al-Dīn, *Kharīdat al-ḳaṣr*, ii, 5 and Ibn al-ʿAdīm, *al-Inṣāf*, 493, should be preferred to the one indicated by Yāḳūt, *Udabāʾ*, i, 163, who erroneously mentions 377/987-8, which year is correspondingly given by the majority of Western biographers (about the chronology, see ʿĀʾisha ʿAbd al-Raḥmān "Bint al-Shāṭiʾ", in *Abu 'l-ʿAlāʾ al-Maʿarrī*, Cairo 1965, 66-75). Reacting to his father's decease, the poet composed an elaborate elegy (rhyme *'l-dadjni*, *Shurūḥ Saḳṭ*, ii, 907), in which we find him praising his father's poetical talents in glowing terms: "[26] O master of rhymes! How much did their obedience to your wishes contrive, that in your view eloquent Arabs hardly surpass the level of stammering barbarians!" Three years after this event Abu 'l-ʿAlāʾ is reported to have left Maʿarra in order to settle at Baghdād, where, however, he was to stay for merely one-and-a-half years. The poet himself pointed out what motive was prompting him to travel to Baghdād, for in his letters it is explicitly mentioned that nothing more than the libraries in that place excited his interest (Margoliouth, *Letters* 40 and 44, cf. *Risālat al-Ghufrān*, 147, 287). From his *Saḳṭ al-zand* we may know the poet to have been in touch with several personalities employed in Baghdād libraries. One of these was Abū Manṣūr Muḥammad b. ʿAlī, who was a custodian in the *Dār al-ʿilm* [*q.v.*], and for whom Abu 'l-ʿAlāʾ composed a long *ḳaṣīda* (rhyme *'l-khaṭṭu*, *Shurūḥ Saḳṭ*, iv, 1646). Another librarian and scholar was Abū Aḥmad ʿAbd al-Salām al-Baṣrī, "who had been entrusted with the supervision of *Dār al-kutub* at Baghdād" (*Taʾrīkh Baghdād*, xi, 57-8), and to whom Abu 'l-ʿAlāʾ having returned to Maʿarra was to address a poem (rhyme *arbuʿi*, *Shurūḥ Saḳṭ*, iv, 1527) in which he ventilates his melancholy remembrance of Baghdād and mentions their weekly conversations on Fridays. About both these librarians, see Laoust, *La vie et la philosophie* ..., 129. Despite the benefit he might have reaped from a prolonged stay at Baghdād, it was not long before the poet again took his departure. It seems that he got into trouble financially, which need not suprise us in view of his unwillingness to compose laudatory poems for the Baghdād nobility, in which aspect he shows himself quite different from, for instance, al-Mutanabbī. Another reason why he did not stay any longer in Baghdād is given by Abu 'l-ʿAlāʾ himself, in addition to the one already mentioned. In a *ḳaṣīda* (rhyme *bi-Takrīta*, *Shurūḥ Saḳṭ*, iv, 1634) addressed to Abu 'l-Ḳāsim ʿAlī b. al-Muḥassin al-Tanūkhī, son of the well-known author of *Nishwār al-muḥāḍara* (see Yāḳūt, *Udabāʾ*, v, 301-9, vi, 251-67, cf. Brockelmann, S I, 252), the poet later on explains his uneasy position in one poetical line, "[36] There were two reasons which caused me to leave you: a mother whom I have not been able to meet after all, and money reduced to the amount of uselessness."

Apart from these explanations explicitly given for his premature departure, some other events are mentioned by the Arabic historians, which also might have induced him to leave Baghdād. Thus an incident is reported to have happened in the literary salon of an important ʿAlawī *sharīf*, al-Murtaḍā, brother of the Shīʿī poet al-Raḍī (Brockelmann, I, 404, S I, 704, and I, 82, S I, 132). Having expressed some strong criticisms of al-Mutanabbī's poetry, al-Murtaḍā had been the target of a concealed but none the less a very severe attack from Abu 'l-ʿAlāʾ, who was a fanatical admirer of al-Mutanabbī. As a result, al-Murtaḍā had him dragged by his feet out of the salon (for details, see Margoliouth, *Letters*, p. XXVII, and ʿAbd al-Raḥmān, *Abu 'l-ʿAlāʾ*, 108). On the other hand, some late authors, among whom Ibn Kathīr [*q.v.*] in *al-Bidāya*, xii, 73 (*sub anno* 449), report him to have been expelled from Baghdād by the local *fuḳahāʾ*. The poet is said to have aroused their anger by asking some critical questions concerning the application of certain rules of *fiḳh*. For an evaluation of this, as it seems, rather anecdotal report, see Laoust, *La vie et la philosophie* ..., 128, and ʿAbd al-Raḥmān, *Abu 'l-ʿAlāʾ*, 115-16.

In Ramaḍān 400/1010, Abu 'l-ʿAlāʾ began his return journey, but having come home he found his mother already dead. His *Dīwān* contains two elegies (rhyme *iblālu*, *Shurūḥ Saḳṭ*, iv, 1725, and rhyme *hamāmi*, iv, 1453), in which he gives expression to his feelings of sorrow: the announcement of her death was a terrible blow; he would have preferred to precede her into death, but now the only consolation left is for him finally to be buried near her tomb. He is hoping to meet her again on the final day of resurrection, which is, however, yet far away. Then, in his *Risāla*s written just after his leaving Baghdād he declares his intention to seclude himself completely from association with other human beings and to stay in his house for ever: "to remain in the city even though the inhabitants fled through fear of the Greeks" (Margoliouth, *Letters*, 42 (= VII) and 43 (= VIII)). From that moment he was to acquire the sobriquet *Rahn al-maḥbisayn*, "the twofold prisoner" (sc. of his blindness and his house).

This self-imposed confinement was only once to be broken in the period after Baghdād, because of a chance event which in 417/1026-7 occurred in his native town. At that time, Aleppo and its districts were ruled by Ṣāliḥ b. Mirdās, who as a leader of the tribe of Kilāb became the founder of the Mirdāsid dynasty. Ṣāliḥ's *wazīr al-sayf wa 'l-ḳalam*, the Christian Tādhurus b. al-Ḥasan, by his strong policy produced tensions between the Christian and Muslim factions of the population in Aleppo and the surrounding region, and these tensions provoked in Maʿarra the following outburst of violence. On a Friday a woman entered the town's congregational mosque complaining about a molestation suffered at the hands of the Christian owner of a winehouse, where in addition to wine the enjoyment of fair ladies used to be offered. Thereupon all those present in the mosque, the *ḳāḍī* and notables excepted, ran out so as to pillage and destroy the house concerned. At the instigation of his *wazīr*, Ṣāliḥ had a number of the notables imprisoned, among whom was Abu 'l-Madjd, a brother of the poet. Abu 'l-ʿAlāʾ allowed himself to be persuaded to intercede for his fellow-townsmen with Ṣāliḥ, not without success. We find this chain of events recalled in several poems not contained in *Saḳṭ al-zand*, this collection being finished and closed, but in the second collection of poems, the *Luzūm mā lā yalzam*. When recalling this incident, it is evident that the poet strongly endorses the action of his fellow-townsmen,

"[1] On Friday, a woman who was already with child (*djāmiʿ*) came to the congregational mosque (*djāmiʿ*) to recount her case to the witnesses in town.

[2] Supposing they had not risen to help her upon her outcry, I would rather imagine that God's heaven might pour down fiery coals"
(*Luzūm*, ed. Zand, i, 335/Bombay, 138, rhyme *amra-hā*).

As regards his successful mediation, the poet remains so humble, that he is heard giving God all the credit,

"[3] I did not even make my contribution as big as a mosquito's wing, but God did cover them with a wing of His grace" (*Luzūm*, ed. Zand, ii, 234, ed. Bombay, 220, rhyme *ḥanḍali*).

A detailed historic report of these events can be found in Ibn al-ʿAdīm, *Zubdat al-ḥalab*, i, 232-4, and idem, *al-Inṣāf*, 566-8. What happened in Maʿarra and the poet's reaction to it make it already evident that Abu 'l-ʿAlāʾ did not totally seclude himself. On the contrary, his house became the goal of frequent visits by *wazīrs*, scholars and pupils, whilst at the same time he kept up an extensive correspondence in prose by way of his *Risālas*. However, his poetical correspondence such as is found in his first collection of the *Saḳṭ al-zand* probably belongs to the pre-Baghdād period. From those with whom the poet was in contact, the following personalities may be mentioned:

(1) The governor of Aleppo, appointed by the Fāṭimids, Abū Shudjāʿ Fātik b. ʿAbd Allāh al-Rūmī ʿAzīz al-Dawla (reigned from 407/1016-7 till 413/1022-3, see Ibn al-ʿAdīm, *Zubdat al-ḥalab*, i, 215 ff.). He paid a visit to Abu 'l-ʿAlāʾ in order to discuss with the poet an invitation from the Fāṭimid *imām* al-Ḥākim for Abu 'l-ʿAlāʾ to go to Cairo, but the poet finally decided against the suggested stay in Egypt (see *al-Inṣāf*, 570-4, 577-8).

(2) Abu 'l-Ḳāsim al-Maghribī, who was a son of Abu 'l-Ḥasan al-Maghribī, the Ḥamdānid *kātib* mentioned above. In 400/1009-10, at the time when al-Ḥākim had almost all members of the al-Maghribī family executed, Abu 'l-Ḳāsim succeeded in escaping the massacre. After many peregrinations he was finally appointed a *wazīr* in Mayyāfāriḳīn. He was the addressee of several *Risālas* (i.e. Margoliouth, *Letters*, numbers I, II and XXI) written by Abu 'l-ʿAlāʾ, who finally dedicated an elegiac poem to him on the occasion of his death (see *Luzūm*, ed. Zand, ii, 434/ Bombay, 346, rhyme *'l-dirḥāyah*).

(3) Abū Naṣr Aḥmad b. Yūsuf al-Munāzī, both a poet and a *wazīr* appointed by the ruler of Mayyāfāriḳīn (cf. Ibn Khallikān, 58, ed. Iḥsān ʿAbbās, i, 143-5, no. 59). When visiting Abu 'l-ʿAlāʾ, this *wazīr* is reported to have asked him some rather critical questions regarding his ascetic way of life (Ibn al-Ḳifṭī, *Inbāh*, in *Taʿrīf*, 63).

(4) Abu 'l-Faḍl Muḥammad b. ʿAbd al-Wāḥid al-Baghdādī, who as a *wazīr* and ambassador sent by the ʿAbbāsid caliph, al-Ḳāʾim bi-amr Allāh [*q.v.*] to the Zīrid prince al-Muʿizz b. Bādīs [*q.v.*] in Tunis passed al-Maʿarra on his westward journey. Having visited Abu 'l-ʿAlāʾ there, he continued his journey by stages, so as to settle finally in al-Andalus (Ṣafadī, *al-Wāfī*, iv, Wiesbaden 1959, 70-1; cf. Ibn al-ʿAdīm, *al-Inṣāf*, 563 and H. R. Idris, *La berbérie orientale sous les Zirides*, Paris 1962, i, 191-3).

Among Abu 'l-Faḍl's school of pupils should be reckoned Ibn al-Sīd al-Baṭalyawsī, who in the Muslim West was to write an excellent commentary on Abu

'l-ʿAlāʾ's *Saḳṭ al-zand* (for al-Baṭalyawsī, see Brockelmann, I, 427, S I, 758).

(5) Abū Zakariyāʾ Yaḥyā b. al-Khaṭīb al-Tibrīzī (Brockelmann, I, 279, S I, 492), who was for some years Abu 'l-ʿAlāʾ's pupil and is reported to have been a professor at the *madrasa Niẓāmiyya* in his after years. He also composed a commentary on the *Saḳṭ al-zand*. It is interesting to note that in this commentary of his, another, lost commentary by Abu 'l-ʿAlāʾ himself, called *Ḍawʾ al-Saḳṭ*, has been incorporated.

(6) Abu 'l-Makārim ʿAbd al-Wāri̲th̲ b. Muḥammad al-Abharī is reported to have read as a pupil under the supervision of Abu 'l-ʿAlāʾ in the works of the master for a period of four years (Ibn al-ʿAdīm, *al-Inṣāf*, 520). To the tradition of this scholar a third commentary existing to this day can be traced. This commentary called *Ḍirām al-Saḳṭ*, was written in the Muslim East, at Samarḳand, by Ṣadr al-Afāḍil al-Ḳāsim b. al-Ḥusayn al-Khʷārazmī (see *Shurūḥ Saḳṭ*, i, 18, for al-Khʷārazmī's chain of tradition, and in general, Brockelmann, I, 255, S I, 452-3, for all the different commentaries preserved).

For further names of those who came into contact with Abu 'l-ʿAlāʾ, see the two different chapters by Ibn al-ʿAdīm, the one "Treating of those who read under Abu 'l-ʿAlāʾ's supervision and transmitted on his authority, i.e. *ʿulamāʾ*, *udabāʾ* and traditionists from Maʿarra and from outside" and the other "About the great respect he is held in by kings, caliphs, *amīrs* and *wazīrs*" (*al-Inṣāf*, 517, 565).

Finally, in his old age the poet came into touch with a few scholars with Ismāʿīlī sympathies. Thus in 438/1047 the well-known Persian poet and prose-author Nāṣir-i Khusraw passed through Maʿarra on his journey which would eventually lead him to the Fāṭimid *imām* al-Mustanṣir. In the account of his travels (*Sefer Nameh*, ed. Ch. Schefer, text 10, tr. 35-6), he gives a rather curious impression of what he heard about Abu 'l-ʿAlāʾ: that he was very rich, and that all the inhabitants of Maʿarra were his servants, whilst he himself led a thoroughly ascetic life in keeping a constant fast and practising vigils. Thus it appears that the poet had imposed upon himself a life of ascetic poverty, although he was the owner of at least some sort of property in or near Maʿarra. This and the esteem he was held in by the local population—the more so because of the importance of the Banū Sulaymān as one of the distinguished families in town—may explain the position of influence ascribed to him by Nāṣir-i Khusraw.

Some ten years later Abu 'l-ʿAlāʾ had a much more serious, though indirect, intellectual contact in his fairly extensive correspondence with an important Ismāʿīlī propagandist, the *Dāʿī 'l-duʿāt* Abū Naṣr b. Abī ʿImrān al-Muʾayyad fi 'l-Dīn. About 448/1057, by order of the Fāṭimid al-Mustanṣir, al-Muʾayyad undertook a mission to North Syria in order to rally its local rulers against the Saldjūḳ Turks recently come to power in Baghdād (see *Dīwān al-Muʾayyad fi 'l-Dīn, dāʿī 'l-duʿāt*, ed. Muḥammad Kāmil Ḥusayn, Cairo 1949, editor's *muḳaddima*, 40, 64). Whilst carrying out his appointed mission, the *Dāʿī 'l-duʿāt* started a correspondence with Abu 'l-ʿAlāʾ by pretending to seek guidance in pursuance of a poetically-defined way of life given by Abu 'l-ʿAlāʾ. In *Luzūm*, ed. Zand, i, 232, ed. Bombay, 84, rhyme *'l-ṣaḥāʾiḥi*, the poet advises a practical ascetic way of life. There Abu 'l-ʿAlāʾ rejects the eating of fish, meat, milk, eggs and honey, at the same time declaring himself to possess some esoteric knowledge which should remain concealed. The resulting exchange of letters was finally stopped as a senseless business by al-Muʾayyad. The latter in his last *Risāla* made it clear that indeed, Abu 'l-ʿAlāʾ at no time whatsoever might be expected to give any details concerning the esoteric knowledge he claimed (see Margoliouth, *Abu 'l-ʿAlāʾ al-Maʿarrī's correspondence on vegetarianism*). It so happened that Abu 'l-ʿAlāʾ died in 449/1058 just after this correspondence, and therefore it need not surprise us that some Arabic historians try to find evidence for a connection between the correspondence just mentioned and the poet's decease. For instance, Ibn al-Habbāriyya [*q.v.*] in his (lost) book *Fulk al-maʿānī* (*apud* Yāḳūt, *Udabāʾ*, i, 194) says that he committed suicide in order thereby to avoid being deported by command of the *Dāʿī*, who intended, the author suggests, to punish the poet for his heretical ideas. Most historians, however, agree that the poet died from natural causes, and this opinion finds strong corroboration in a report which mentions that the physician Ibn Buṭlān [*q.v.*] was in attendance at Abu 'l-ʿAlāʾ's death-bed. In his very last moments, the poet asked a member of his family present to get pen and writing-paper, so that he could dictate to him something. But in doing this, Abu 'l-ʿAlāʾ committed, as against normal expectation, some errors in his dictation. Thereupon Ibn Buṭlān declared the end to be at hand, "Abu 'l-ʿAlāʾ is dead already" (Ibn al-Ḳifṭī, *Inbāh*, in *Taʿrīf*, 65). In many passages of his poetry, the poet had shown that he regarded procreation as a sin, and that he preferred universal annihilation as the best hope for humanity. He therefore never married, and is said to have desired that the following verse should be inscribed on his grave: "This wrong was by my father done to me, but never by me to anyone". A great deal of Abu 'l-ʿAlāʾ's work is supposed to have been lost as a result of the Crusades, which caused much devastation in Syria, at Maʿarra included (cf. Ibn al-Ḳifṭī, *Inbāh*, in *Taʿrīf*, 49). A list of all his works, either lost or still remaining, can be found in Moustapha Saleh, *Liste des œuvres d'Abu 'l-ʿAlāʾ*, in *BEO*, xxiii (1970), 275. From those still existing, the following works may be mentioned in chronological order, as far as possible.

1. The *Saḳṭ al-zand* contains *inter alia* laudatory poems, some of which have been mentioned above. In this *Dīwān* the poet often follows the tripartite division of the classical *ḳaṣīda* into *nasīb*, *raḥīl* and *madīḥ*, but occasionally he rejects the *nasīb* or eliminates it completely. In this respect, however, he cannot be compared with the poet Abū Nuwās [*q.v.*], whose rejection of it is at the same time a turning towards the description of wine. In the case of the ascetic Abu 'l-ʿAlāʾ, the drinking of wine and its description is disapproved of, water being preferred.

When the poet does accept the *nasīb*, he often stresses its elegiac character by a description of cooing turtle doves. The murmuring note of these doves, who seem to regret a chick once lost long ago, is often compared with the poet's yearning after an unattainable and far-off loved one. In describing all this, the poet ruminates on the way in which the sound of cooing moves him to profound thoughts. In a few other *nasībs*, the poet (being blind) is asking his travelling-companions to trace a distant flash of lightning in the land of the beloved, but when sleeping he himself can discern her deceitful phantom visiting him. The *raḥīl* in his *ḳaṣīdas* is usually most elaborate: one may find all sorts of descriptions, like emaciated camels tired by long travelling, the mirage; among the animals found in the desert, are mentioned the antelope, sand-grouse, ostrich and chameleon. His

preference for description of the night is so conspicuous that some commentaries try to connect this with the poet's blindness. For some further thoughts on the *raḥīl* and the development in his description of the journey in general, see also P. Smoor, *The theme of travel in Maʿarrī's early poems*, in *The challenge of the Middle East*, Amsterdam 1982. Regarding the independent form of the *ghazal* [*q.v.*], Abu 'l-ʿAlāʾ had little interest in it. Further, whenever he does practise it, he appears to feel himself obliged to do so as technical exercise in a certain genre only (cf. Ṭaha Ḥusayn, *Tadjdīd dhikrā Abi 'l-ʿAlāʾ*, Cairo 1963, 201, as against ʿAbd al-Raḥmān, *Abu 'l-ʿAlāʾ*, 49 ff., who sees it as a compensation for the poet being deprived of the enjoyments of life). The *madīḥ* [*q.v.*] as final part of the *ḳaṣīda* often shows extravagant eulogy of the *mamdūḥ*, so that the poet later regretted this in the Preface to his *Dīwān*, "All sorts of hyperbolic description found with me as being related at first sight to a human being, while at the same time in accordance with the attributes of God, He is exalted, should essentially be applied to Him alone" (*Shurūḥ Saḳṭ*, i, 10). In the *Saḳṭ al-zand* Abu 'l-ʿAlāʾ collected together examples of what might also be conceived as another form of the *ḳaṣīda*, sc. the elegy composed in praise of a dead person (*rithāʾ*, *marthiya*), as mentioned above. In certain very sententious lines in Abu 'l-ʿAlāʾ's *rithāʾ*s we may discern the origins of that pessimistic tone later so often to be encountered in the *Luzūm*. (For the influence of al-Mutanabbī's *rithāʾ*s on those composed by Abu 'l-ʿAlāʾ, see Ṭaha Ḥusayn, *Maʿa 'l-Mutanabbī*, Cairo 1962, 203-14). The poetry in *Saḳṭ al-zand* is characterised by its rich ornamentation, and many special figures of style can be discerned; besides quite frequent forms of paronomasia (*djinās*, *tadjnīs*) we find also the figure of "double entendre" (*tawriya*). In applying the latter figure of style the poet shows a superior virtuosity, of which examples can be found in S. A. Bonebakker, *Some early definitions of the Tawrīya*, The Hague 1966, 32-3, 56.

A group of 31 poems in *Saḳṭ al-zand* has been put together under the collective title *Dirʿiyyāt* ("Armour poems"). These poems are marked by the description of one or more coats of mail, the usual themes in the *ḳaṣīda* like *raḥīl* and *madīḥ* being eliminated, while only the *nasīb* may be found in a merely subordinate position in few cases (see P. Smoor, *Armour description as an independent theme in the work of al-Maʿarrī*, in *Actes du 8me Congrès de l'Union Européenne des Arabisants et Islamisants*, Aix-en-Provence 1978, 289-303).

Next to the peculiarity of their content, these poems are also interesting for their form. A major part of them has been composed in the form of a dialogue put in the mouth of somebody who is in some way related to a suit of armour. For discussion of this aspect, see P. J. Cachia, *The dramatic monologues of al-Maʿarrī*, in *JAL*, i (1970), 129-36. From among the great number of editions of the *Saḳṭ al-zand*, only two may be mentioned here. *Shurūḥ Saḳṭ al-zand*, 5 vols. Cairo 1945, is a critical edition of the *Dīwān*, each verse being provided with the previously-mentioned commentaries by al-Tibrīzī, al-Baṭalyawsī and al-Khwārazmī. Further, there exist several editions of the *Dīwān*'s text together with a commentary by Abū Yaʿḳūb Yūsuf al-Khuwayyī (lived in the 6th/12th century, Brockelmann, I, 289 S I, 507), called *Tanwīr Saḳṭ al-zand*, of which the best edition is Būlāḳ 1286/1868-9.

2. The *Luzūm mā lā yalzam* is a second collection of poetry composed in the period after the poet's stay at Baghdād. This collection was much less popular in the Muslim world than *Saḳṭ al-zand*, both because of its unconventional form and contents. The title means "Committing one's self to what is not obligatory" or "The self-imposed compulsion", relating to a peculiarity of rhyme [see LUZŪM MĀ LĀ YALZAM]. For his poetry in the *Luzūm*, Abu 'l-ʿAlāʾ was using a much more difficult form, a double-rhyme instead of the normally prescribed monorhyme. The poet thus created an innovation in the existing rules of rhyme [see ḲĀFIYA], and his method of rhyming was in later books of Arabic theorists to be treated under the generic name of *iltizām*. The contents of the *Luzūm* were described by the poet himself in his Preface as a glorification of God, an admonition for the forgetful and an awakening of the negligent, a warning against the World's derision of God. The poet further declares that he does not want to follow the normally-prescribed themes, stating that "poets aim at embellishing their words by means of lies". In saying this, he has in view the poets' descriptions of their beloved ones in the *ghazal* and *nasīb*, their horses and camels in the *raḥīl*, and of wine, for instance in the *khamriyya* [*q.v.*]. He points out the utterly false pretensions of poets who, leading a quite comfortable life, none the less pretend to have to make exhausting expeditions through the desert. In contrast, Abu 'l-ʿAlāʾ states his poetry to be a searching for veracity and piety, and he therefore thinks himself unable to comply with the accepted conventions in the existing "normal" poetry. On these grounds he finally concludes his poetry in *Luzūm* to be weak (*Luzūm*, Cairo 1959, 3, 47-8). From Abu 'l-ʿAlāʾ's words we may infer that he wishes to consider his work in *Luzūm* in the first instance as a collection of poetry, though it be "weak"; at any rate he does not explicitly state his poetry to be a more or less systematic arrangement of philosophical ideas, nor is it so. Notwithstanding the evident absence of such a system, there can in various places in the *Luzūm* certainly be found many opinions which do not always or do not at all fit into the orthodox Islamic system [see ʿILM AL-KALĀM]. We see the poet sometimes professing a certain dogma, then doubting it elsewhere in the *Luzūm*. Though he is a monotheist, he does not show a strong belief in God's Word as revealed through prophecy. About resurrection and retribution he seems full of doubts. At the same time, he often appears to attach great value to the use of reason as an unfailing guide in human life (on such opinions of his, see the translation and analyses of quite a number of relevant poems and fragments of poems in R. A. Nicholson, *Studies in Islamic poetry*, Cambridge 1921, ch. ii, "The meditations of Maʿarri"). In view of this, some Arabic historians have pronounced unfavourably on the poet's orthodoxy. Thus Ibn al-Djawzī, Ibn al-Ḳifṭī and Sibṭ b. al-Djawzī each quote with more or less approval a report from an historian contemporary with Abu 'l-ʿAlāʾ, Ghars al-Niʿma Muḥammad (Brockelmann, S I, 217), son of the well-known *kātib* Hilāl al-Ṣābiʾ [*q.v.*]. This says that the poet just after his death had been seen in a dream being tormented by two vipers, whilst the following interpretation was given: "This is al-Maʿarrī, the heretic" (given in *Taʿrīf al-ḳudamāʾ*, 26, 56, 152). On the other hand, some Arabic biographers and historians endeavoured to clear him from charges of unorthodoxy, such as Ibn al-ʿAdīm in his monograph on Abu 'l-ʿAlāʾ, *al-Inṣāf wa 'l-taḥarrī fi dafʿ al-ẓulm wa 'l-tadjarrī ʿan Abi 'l-ʿAlāʾ al-Maʿarrī*

("Fair treatment and selection of the best in defending Abu 'l-ʿAlāʾ against unjustified attacks"). Ibn al-ʿAdīm, as a historian, is distinguished for his exactness in making inquiries about Abu 'l-ʿAlā, which he did two centuries after the poet's death by contacting descendants of those in Maʿarra who had been in touch with him, and also by availing himself of local historical sources, all this not without frequently giving *isnād*s and titles.

In the West the *Luzūmiyyāt*, i.e. the poems contained in *Luzūm*, became more widely known as a result of A. von Kremer's now rather obsolete study, *Ueber die philosophischen Gedichte des Abul ʿalâ Maʿarry*, in *SB Ak. Wien, Phil.-hist. Classe*, cxvii, 6, 1889). A more recent treatment of the poet's philosophy as it appears from a number of passages in *Luzūm* is found in Laoust, *La vie et la philosophie d'Abu-l-ʿAlāʾ al-Maʿarrī*, in *BEO*, x (1943-4), 119-56. In the lines cited, Laoust supposes an influence of certain ideas eclectically elaborated and found at the outset of the philosophical and religious school of thought of the Bāṭiniyya [*q.v.*], which was to be adhered to by both the Ḳarmaṭīs [*q.v.*], and the Fāṭimid Ismāʿīliyya [*q.v.*]. In the second half of Abu 'l-ʿAlāʾ's lifetime, the Fāṭimids had finally extended their authority over northern Syria. That there was some discontent about their rule, however, would appear from certain lines in the *Luzūmiyyāt*. A study published in the East is Ṭaha Ḥusayn, *Dhikrā Abi 'l-ʿAlāʾ*, Cairo 1914 and later edns., where in the last part another interesting analysis is given of the poet's philosophical ideas as reflected in the *Luzūm*. Many quotations from the *Luzūm* have been made use of in a psychologically-based biography, *Abu 'l-ʿAlāʾ al-Maʿarrī*, by ʿĀʾisha ʿAbd al-Raḥmān "Bint al-Shāṭiʾ".

Editions of the *Luzūm*: a partial ed. by Ibrāhīm al-Abyārī, *Luzūm mā lā yalzam*, Cairo 1378/1959; vol. i has appeared so far (i.e. 100 *Luzūmiyyāt* as far as the rhyme in *bāʾ*). Among the complete editions of *Luzūm*, the best ones are the lithograph Bombay 1303/1885-6, which contains a faithful reflection of a manuscript text accompanied by some elucidating notes in its margin, and that of ʿAzīz Zand, Cairo 1891-5, 2 vols. A very restricted number of *Luzūmiyyāt* supplied with a commentary by Ibn al-Sīd al-Baṭalyawsī have been edited: *Sharḥ al-mukhtār min Luzūmiyyāt Abi 'l-ʿAlāʾ*, critical ed. Ḥāmid ʿAbd al-Madjīd, Cairo 1970; vol. i has appeared so far.

3. *Zadjr al-nābiḥ* ("Driving away the barker"), is found in the survey of Abu 'l-ʿAlāʾ's works as given by various Arabic biographers. In this book the poet apparently defended himself against orthodox attacks on some lines in his *Luzūm*. Extracts from this lost book have been published, in *Zadjr al-nābiḥ, muḳtaṭafāt*, critical ed. Amdjad al-Ṭarābulsī, Damascus 1385/1965. See for the harmonising method used in explaining certain controversial verses, S. M. Stern, *Some noteworthy manuscripts of the poems of Abu 'l-ʿAlāʾ al-Maʿarrī*, in *Oriens*, vii (1954), 342 ff.

4. *Al-fuṣūl wa 'l-ghāyāt fī tamdjīd Allāh wa 'l-mawāʿiẓ* ("Chapters and endings about glorification of God, and admonitions). Abu 'l-ʿAlāʾ began composing this work in rhymed prose before his journey to Baghdād, only completing it after his return to Maʿarra (Yāḳūt, *Udabāʾ*, i, 180). This work contains a great number of short strophes, which the poet has in each case concluded with an ending or end-rhyme (*ghāya*), so that the book in its totality is found to contain a number of chapters (*fuṣūl*), every one of which contains strophes with their endings always in one particular letter.

Thus one gets *Faṣl ghāyātuh hamza, faṣl ghāyātuh bāʾ* and so on, following the order of the Arabic alphabet. A major part of this work is lost, only its first *djuzʾ* having been discovered in 1918-19 in a not quite complete version, to be edited much later by Maḥmūd Ḥasan Zanātī, Cairo 1356/1938, in a critical edition. The book holds among various other subjects thoughts about God: His omnipotence, justice, goodness and eternity, in addition to and contrasting with a sharp observation of the inescapable changes of fate which dominate man in his ordinary daily life. The idea of God is frequently seen as connected with unavoidable predestination and eternal retribution, which in its turn exhorts man to practise asceticism. The use of rhymed prose, the warnings against impending judgement and the oaths applied now and again by way of confirmation, may all be considered a reason why later historians supposed this book to be an emulation of the Ḳurʾān: the author allegedly aimed, in writing it, at excelling the Ḳurʾān in its *iʿdjāz* [*q.v.*]. In this context, some late historians who apparently never saw the *Fuṣūl* with their own eyes are even found altering its title to *al-Fuṣūl wa 'l-ghāyāt wa-* (or *fī*) *muḥādhāt* (or *muʿāraḍat*) *al-suwar wa 'l-āyāt* (i.e. "Chapters and endings and/about the emulation of sūras and verses"); thus al-Bākharzī, al-Badīʿī, al-Dhahabī and Ḥādjdjī Khalīfa. For an exhaustive study of the work itself, the opinions of Arabic historians and more recent studies in East and West, see A. Fischer, *"Der Koran" des Abu 'l-ʿAlāʾ al-Maʿarrī*, in *Verhandlungen der Sächsischen Ak. der Wissenschaften, Phil.-hist. Klasse*, xciv (Leipzig 1942), 2. For a supposed coherence between the internal rhyme in a strophe and its contents, see R. Hartmann, *Zu dem kitāb al-fuṣūl wa 'l-ghāyāt des Abu 'l-ʿAlāʾ al-Maʿarrī*, in *Abh. Pr. Ak. W., Phil.-hist. Klasse* (Berlin 1944), 2. Some philosophical thoughts in the *Fuṣūl* have been discussed and associated with Epicurean philosophy by Ṭaha Ḥusayn, *Maʿa Abi 'l-ʿAlāʾ fī sidjnih*, Cairo 1963, ch. ix.

5. *Rasāʾil Abi 'l-ʿAlāʾ al-Maʿarrī*, the brief letters written by Abu 'l-ʿAlāʾ on several occasions and addressed to various members of his family and acquaintances (see the biography above). The letters have been composed in a very flowery style, overdone with proverbs, rhymed prose and illustrative verses. There exist two editions of the *Rasāʾil*, the first by Shāhīn ʿAṭiya, Beyrouth 1894, and a second one, with English translation preceded by a Preface containing the biography and a discussion of part of the works, by D. S. Margoliouth, *The Letters of Abu 'l-ʿAlāʾ*, Oxford 1898. Further, a critical edition of Letter XXX (Margoliouth's numbering) has been prepared by Iḥsān ʿAbbās, *Risāla fī taʿziyat Abī ʿAlī b. Abi 'l-Ridjāl fī waladih Abi 'l-Azhar*, Cairo n.d., but later than 1945.

6. *Risālat al-Ṣāhil wa 'l-shāḥidj* ("Letter of a horse and a mule"), which among other works now lost was addressed to Abū Shudjāʿ Fātik ʿAzīz al-Dawla, the governor of Aleppo, on behalf of the Fāṭimid *imāms* (see above). This supposedly lost *Risāla* has recently been discovered in Morocco and subsequently edited with a critical apparatus and introduction, by ʿĀʾisha ʿAbd al-Raḥmān "Bint al-Shāṭiʾ" (Cairo 1975). Abu 'l-ʿAlāʾ completed this voluminous *Risāla* in about 411/1021, i.e. the year of al-Ḥākim's disappearance, when the *imām* al-Ẓāhir acceded to the throne in Egypt (cf. *op. cit.*, 553 where the author qualifies the latter as *amīr al-muʾminīn*).

Another important development, reported upon in the *Risāla*, occurred in 408/1017-18, when ʿAzīz al-Dawla ordered Ṣāliḥ b. Mirdās, a Bedouin leader and afterwards founder of the Mirdāsid dynasty, that he should bring his (i.e. Ṣāliḥ's) mother inside the walls of Aleppo (*Risālat al-Ṣāhil*, 520, cf. Ibn al-ʿAdīm, *Zubdat al-ḥalab*, i, 218). This move was meant to reassure the inhabitants of Aleppo, in view of rumours about a threatening Byzantine attack. The tension caused among the population in North Syria is a theme in the *Risāla*, in which Abu 'l-ʿAlāʾ gradually introduces a number of animals who, being gifted with speech, give among other things their opinion on the political situation in Syria under ʿAzīz al-Dawla's reign. A direct reason for the composition of the *Risāla* was a problem of taxation. There was a question of land owned by members of Abu 'l-ʿAlāʾ's family, for the use of which they would owe a certain amount as taxation due to the *bayt al-māl* [*q.v.*] in Aleppo. At their request, Abu 'l-ʿAlāʾ is writing his letter in order to ask for the annulment of the amount imposed, considering that the land concerned is a waterless tract, giving only a small yield. Then Abu 'l-ʿAlāʾ describes a mule, al-S̲h̲āḥidj, which, blindfolded, is drawing water in order to continually fill a cistern, without, however, profiting from its own labour so as to quench its thirst. Such being its condition, the mule is described as grumbling at first, but then it starts talking. While thus introducing the first of his speaking animals, Abu 'l-ʿAlāʾ explicitly bases himself on quotations from the Ḳurʾān (XXVII, 18, 23), where an ant in the valley of ants and a hoopoe are described as talking, with Sulaymān understanding their utterance. On the other hand, Abu 'l-ʿAlāʾ elsewhere in his *Risāla* compares favourably ʿAzīz al-Dawla with Sulaymān, both of them adhering to the same qualities of wisdom and understanding. Next to the mule, a number of different animals appear on the scene of action, among these a horse, a camel and a fox. The mule wants the horse to convey a complaint to ʿAzīz al-Dawla about the mule's hard life, but the horse, referring to its noble forefathers, haughtily refuses this mission. In the second instance, the camel declares himself prepared to convey the mule's complaint. The mule being erudite, at first intended to cast its complaint in a poetical form, but with respect to the camel it drops its original plan for a reason which reflects Abu 'l-ʿAlāʾ's own attitude towards poetry, "I do not like being described with the image of human beings bringing poetry with them, in order to aim at some profit. . ." (*R. al-Ṣāhil*, 219). Instead of this, the mule then wants the camel to convey strange tidings, which have one meaning directly evident in hearing them, although in reality they have a second esoteric meaning" (*loc. cit.*). The message appears to consist of sorts of riddles involving words with two different meanings (cf. the *tawriya* in Abu 'l-ʿAlāʾ's poetry). When finally the fox arrives on the scene, the situation alters; a vague clamour is suddenly heard from the nearby town, and at the mule's request the fox undertakes to make a reconnaissance. Then the clamour heard is explained by a suddenly-developing panic among the population of Syria in view of an impending Byzantine military expedition. Abu 'l-ʿAlāʾ now begins to make frequent allusions to various political developments of the contemporary period. He mentions, for example, the joint-rule of Basil II Bulgaroctonus and his brother Constantine VIII. He further speculates on the settlement of the succession within the line of the Macedonian dynasty. In view of this, and being aware of the fact that the elder brother remained without children, whereas Constantine had only three daughters, the author wonders whether the Byzantines will deem it suitable to appoint a woman as their Empress (*R. al-Ṣāhil*, 578-80, 606-7). In his *Risāla*, Abu 'l-ʿAlāʾ seems somewhat to ridicule the governor of Aleppo, who is continually designated with honorific formulae after his name, such as "May God prolong him for ever" or "May God give him a great victory". With some humorous feeling, the author mentions a group of slightly more than 30 slaves (*g̲h̲ilmān*), who either had been bought at some time by ʿAzīz al-Dawla from the Byzantine emperor or had been granted by the latter. The exact number of these slaves, and then their circumcision as enjoined by the Fāṭimid governor, are respectively compared with the number of *ʿarūḍ*s (*ʿarūḍ* here meaning "last metrical foot of the first half-verse") formally given by Arabic prosodists, and with the reduction (*ḥad̲h̲f*) of metrical feet (*R. al-Ṣāhil*, 691-2).

Finally in his *Risāla*, Abu 'l-ʿAlāʾ has somebody make a remark on the exceptional dexterity of ʿAzīz al-Dawla, who is able, whilst horseriding, to handle two swords at a time; but then it is remarked upon as much more wonderful that this prince was once seen reading in the *Kitāb al-ʿArūḍ* by al-K̲h̲alīl b. Aḥmad [*q.v.*], see *R. al-Ṣāhil*, 706. It is on behalf of this particular interest shown by ʿAzīz al-Dawla that Abu 'l-ʿAlāʾ pretends to introduce many sayings relating to the principles of metrics. Besides a great display of erudite learning in technical terms for various phenomena in metrics and rhyme, one also finds in the *Risāla* many quotations of poetry which in some way frequently contain descriptions of animals. Such a display of learning and the poetical lines quoted, though originally composed via association, often tend to interfere with the smooth and logical development of events in the *Risāla*. The same phenomenon can be found in the *Risālat al-G̲h̲ufrān* which was composed at a later date. On the other hand, the *R. al-G̲h̲ufrān* is distinguished from its predecessor, the *R. al-Ṣāhil*, by a much greater amount of irony and derision at its protagonist, who is Ibn al-Ḳāriḥ—as compared with ʿAzīz al-Dawla in the first *Risāla*—and also by its greater interest shown in religious questions. For further details, see P. Smoor, *Enigmatic allusion and double meaning in Maʿarrī's newly-discovered* Letter of a Horse and Mule, in *JAL*, xii (1981), xiii (1982).

7. *Risālat al-G̲h̲ufrān* was composed about 424/1033 during the reign of the second Mirdāsid prince Naṣr b. Ṣāliḥ S̲h̲ibl al-Dawla (*R. al-G̲h̲ufrān* 450, cf. 256). The *Risāla* is a reply to a much smaller *Risāla* addressed to Abu 'l-ʿAlāʾ by a certain ʿAlī b. Manṣūr b. Ṭālib al-Ḥalabī Dawk̲h̲ala, also known as Ibn al-Ḳāriḥ, who was a traditionist and grammarian. In his *Risāla*, Ibn al-Ḳāriḥ is complaining of his old age and its concomitant infirmities, at the same time suggesting to Abu 'l-ʿAlāʾ that some sort of support is always welcome. Apart from this, Ibn al-Ḳāriḥ gives a show of his knowledge and orthodoxy in mentioning a number of poets and scholars whom he accuses of being *zindīḳ*s [*q.v.*]. In his reply Abu 'l-ʿAlāʾ ironically imagines his aged correspondent as having died in the meantime. Then he supposes him, after a rather uneasy reckoning at the Day of Resurrection, to have passed the entrance to the Gardens of Paradise. In those Gardens Ibn al-Ḳāriḥ is described as meeting many a poet or scholar whose previous sins when least expected have been for-

given (cf. the meaning of the *Risāla*'s title "Letter of Forgiveness"). While travelling in the Hereafter, Ibn al-Ḳāriḥ is able to pay a visit to Hell, where he is described having discussions with the devil, Iblīs [*q.v.*] and the poet Bashshār b. Burd [*q.v.*], marked out as a heretic. Among the general aspects of the *R. al-Ghufrān* some may be mentioned here. First, the delights of Paradise are based upon a realistic and literal interpretation of the pronouncements given in Ḳurʾān and Tradition. For example, where it says in the Ḳurʾān (LVI, 35 ff.), "We have made them grow up new and made them virgins, loving and of equal age, for those on the right . . .", Abu 'l-ʿAlāʾ is found having them grow like fruits of the trees in Paradise (*R. al-Ghufrān*, 287-8).

Another remarkable aspect of the *Risāla* is the idea of compensation granted for any harm suffered previous in earthly life, this compensation being extended to both human beings and animals. To the latter belongs for example a wild ass, killed and skinned by a hunter during its existence on earth. Thereafter its hide was used for the fabrication of a well-bucket, of which in their turn pious men took advantage for their *ṭahāra* (198). Thus there appear to exist in Paradise two completely different categories: first the material of Paradise, represented by the virgins promised in the Ḳurʾān, and by animals for the purpose of hunting, both of these destined to increase the joys of the blessed; and in the second place there exist human beings and animals destined to enjoy themselves in all eternity on account of their earthly sufferings. As concerns Ibn al-Ḳāriḥ, the ironical attitude of Abu 'l-ʿAlāʾ is very evident, where he is describing the formal act of Ibn al-Ḳāriḥ's *tawba* being testified by official witnesses in a mosque at Aleppo and the subsequent rejoicing in Heaven (517-22). For a comparison between the *R. al-Ghufrān* and Dante's *La Divina Commedia*, see the now rather obsolete study by Miguel A. Palacios, *La Escatologia Musulmana en la Divina Comedia*, Madrid 1919; further, ʿĀʾisha ʿAbd al-Raḥmān, *al-Ghufrān*, Cairo 1954, which also discusses the comparison of the *Risāla* with Ibn Shuhayd [*q.v.*] and his *Risālat al-Tawābiʿ wa'l-zawābiʿ*, and is of general importance as an excellent study of the *R. al-Ghufrān*. Among the European studies there should be mentioned I. Kratschkovsky, *Zur Entstehung und Komposition von Abū 'l-ʿAlāʾ's Risālat al-ghufrān*, in *Islamica*, i (1925), 344-56; M.-S. Meïssa, *Le Message du Pardon*, Paris 1932; and R. Blachère, *Ibn al-Qarih et la genèse de l'Epitre du pardon d'Al-Maʿarrī*, in *REI* (1941-6), 1-15.

Editions: R. A. Nicholson prepared an incomplete edition and translation in several articles: *JRAS* (1900), 637-720; (1902), 75-101, 337-62, 813-47. The best edition is *Risālat al-Ghufrān li-Abi 'l-ʿAlāʾ al-Maʿarrī wa-maʿa-hā Risālat Ibn al-Ḳāriḥ miftāḥ fahmi-hā*, 3rd ed. Cairo 1963 and later ones, by ʿĀʾisha ʿAbd al-Raḥmān "Bint al-Shāṭiʾ".

8. *Risālat al-Malāʾika* is especially concerned with questions on the morphology and etymology of certain Arabic words. Thus in the *Muḳaddima* of this *Risāla* (ed. I. Kračkovskiy, Leningrad 1932), a reply is indirectly given to questions regarding the morphological reduction of certain words and names found in the Ḳurʾān and *ḥadīth*. In this manner, Abu 'l-ʿAlāʾ, who is himself the protagonist in this *Risāla*, is heard propounding several questions to the Angel of Death relating to all possible morphological schemes to which can be reduced words like *malak* and ʿAzrāʾīl. By this method Abu 'l-ʿAlāʾ describes himself as successful in his attempt at postponing the moment of his own death for one hour, the angel being bewildered by such complicated problems. Further questions are concerned with the reduction of words relating to the grave and the Hereafter: its recompense and retribution and the pleasures of Paradise, the latter inducing the protagonist to deal with words like *kummathrā*, *sundus* and *istabraḳ* thereby following the same playful method. The succeeding part has only partially been edited by Salīm al-Djundī, *Risālat al-Malāʾika*, Damascus 1944, 55 ff., the remainder of this ms. being lost. In this additional part, as far as it is at present known from the edition, thirteen more problems are dealt with in a more serious and direct way. In general, the *Risāla*'s *Muḳaddima* reminds one of the *R. al-Ghufrān*, though the latter is much more extensive. It should further be noticed that Paradise in the *R. al-Malāʾika* appears to be very quiet and in conformity with the rules of orthodoxy, while in the *R. al-Ghufrān* it is less orthodox, with ironical passages and the tranquillity of Paradise disturbed by revelling, discussing and even violently quarrelling poets and scholars.

9. *Mulḳā 'l-sabīl* ("What is scattered on the road") is a very short work which was always to remain well-known after Abu 'l-ʿAlāʾ's poetry. Especially in the Muslim West, it has frequently been the object of attempts at emulation (*muʿāraḍa*). The titles of, and some short quotations from, such emulations are given in Ḥasan Ḥusnī ʿAbd al-Wahhāb, *Muʿāraḍāt al-maghāriba li-Mulḳā 'l-sabīl*, in *Taʿrīf*, 455-7. For the edition of a complete *muʿāraḍa* of Abu 'l-ʿAlāʾ's *Mulḳā 'l-sabīl*, see the one composed by Ibn al-Abbār, in Ṣalāḥ al-Dīn al-Munadjdjid, *Rasāʾil wa-nuṣūṣ*.-3-, Beirut 1963, 33-79. The *Mulḳā 'l-sabīl* consists of tiny paragraphs containing rhymed prose, which alternate with other paragraphs containing some poetical lines, with, however, the restriction that each paragraph of rhymed prose is more or less identical with the subsequent paragraph of poetry as far as its contents are concerned. These contents are of a very orthodox nature and no break can as yet be discerned with traditional morality and literary tradition. The editor Ḥasan Ḥusnī ʿAbd al-Wahhāb, *Mulḳā 'l-sabīl*, Damascus 1330/1912, 3, observes some similarity to the pre-Islamic orators, such as Ḳuss b. Sāʿida [*q.v.*]. On the other hand, Kračkovskiy in *Abu-l-ʿAlā al-Maʿarrī. Mulḳā-s-sabīl*, Petrograd 1915, repr. in *Izbrannye sočineniya* ("Collected works"), Moscow 1956, ii, 183 ff., has pointed out that some influence of the poetry of Abū 'l-ʿAtāhiya [*q.v.*] might be traced. Because of the simplicity of the language used, *Mulḳā 'l-sabīl* might have been composed by the author in his youth. In contrast to this opinion, ʿAbd al-Wahhāb suggests it may be a work of the poet's old age, in which he is shown to revert to the original religious principles (cf. Kračkovskiy, *Izbrannye sočineniya*, ii, 186).

Finally, let us consider the author's surviving commentaries existing up till now on the *Dīwāns* of other poets.

1. *Muʿdjiz Aḥmad* is a commentary on the complete *Dīwān* of al-Mutanabbī, which Abu 'l-ʿAlāʾ probably wrote in the prime of his life. This rather simple commentary, of which so far no edition is available, has been discussed by Kračkovskiy, who also gives some examples from the Arabic text of this commentary, in *Al-Mutanabbī i Abū-l-ʿAlā*, Petrograd 1910 = *Izbrannye sočineniya*, ii, 63-115.

2. *al-Lāmiʿ al-ʿAzīzī* or *al-Thābitī al-ʿAzīzī* is a very extensive and as yet unedited commentary on a great number of verses selected from al-Mutanab-

bī's *Diwān*, and therefore quite different from the one mentioned above. It was written by Abu 'l-ʿAlāʾ in his old age, for on the basis of its title it was dedicated to the one who had commissioned it, the Mirdāsid *amīr* ʿAzīz al-Dawla Abu 'l-Dawām Thābit b. Thimāl b. Ṣāliḥ b. Mirdās. The name of this *amīr* is further explicitly mentioned in the short Preface of the manuscript of this work (ms. [Süleymaniye] Hamidiye 1148) and in a passage of the monograph on Abu 'l-ʿAlāʾ by Ibn al-ʿAdīm (*al-Inṣāf*, 540). In view of all this, the name erroneously given by F. Sezgin, *GAS*, ii, 493, should be corrected accordingly.

3. *ʿAbath al-walīd*, a commentary on verses selected from the *Diwān* of the poet al-Buḥturī [*q.v.*], owes its existence to the fact that a manuscript containing al-Buḥturī's poetry was sent from Aleppo to Abu 'l-ʿAlāʾ in Maʿarra, in order that he should correct and criticise its text if necessary (Ibn al-ʿAdīm, *al-Inṣāf*, 541). It is available in the critical edition of Muḥammad ʿAbd Allāh al-Madanī, Medina 1355/1936. However, a far better edition is the one recently prepared by Nādiyā ʿAlī al-Dawla, *ʿAbath al-walīd fī 'l-kalām ʿalā shiʿr Abī ʿUbāda al-Walīd b. ʿUbayd al-Buḥturī*, Damascus 1978.

4. *Dhikrā Ḥabīb*, was a commentary on verses selected from the *Diwān* of Ḥabīb b. Aws Abū Tammām [see ABŪ TAMMĀM]. Though it is lost as an independent work, it has in essence survived because Tibrīzī incorporated it in his own commentary on Abu Tammām's poetry; see *Diwān Abī Tammām bi-sharḥ al-Khaṭīb al-Tibrīzī*, critical ed. by M. ʿAbduh ʿAzzām, Cairo 1964, 25-6 of the editor's *muḳaddima*.

Abu 'l-ʿAlāʾ made a commentary on the poetry of a contemporary of his, the *amīr* and eulogist of the Mirdāsids, Ibn Abī Ḥuṣayna, who also chanced to be an inhabitant of Maʿarra. This commentary was to remain partial only, for the *amīr* survived Abu 'l-ʿAlāʾ and only died in 457/1065 (on him see further IBN ABĪ ḤAṢĪNA). Abu 'l-ʿAlāʾ's commentary is incorporated in the *Diwān Ibn Abī Ḥuṣayna*, critical ed. by Asʿad Ṭalas, Damascus 1375/1956, where incidentally on p. 373 can be found the elegy which was recited at Abu 'l-ʿAlāʾ's grave by Ibn Abī Ḥuṣayna, one among many other poets who are all reported to have recited their respective *marthiya*s on this occasion.

Bibliography: A compilation of biographical source materials taken from historical sources is *Taʿrīf al-ḳudamāʾ bi-Abi 'l-ʿAlāʾ*, Cairo 1384/1965, *taṣwīr* of the edn. Cairo 1944. Monographs: Ibn al-ʿAdīm, *al-Inṣāf wa 'l-taḥarrī fī dafʿ al-ẓulm wa 'l-tadjarrī ʿan Abi 'l-ʿAlāʾ al-Maʿarrī*, in *Taʿrīf*, 483-578; idem, *Bughyat al-ṭalab fī taʾrīkh Ḥalab*, ms. Topkapu Saray 2925 *cilt* 1, ff. 195a-225b; al-Badīʿī, *Awdj al-taḥarrī ʿan ḥaythiyyat Abi 'l-ʿAlāʾ al-Maʿarrī*, Damascus 1944, is a compilation of works by previous historians, but none the less interesting for its quotations from works by Abu 'l-ʿAlāʾ which are now lost. Other historical sources: some of the sources incorporated in the *Taʿrīf* may here be mentioned separately: Thaʿālibī, *Tatimmat al-yatīma*, Tehran 1353/1934, i, 9 (= *Taʿrīf*, 3-4); *Taʾrīkh Baghdād*, iv, 240-1 (= *Taʿrīf*, 5-7); Bākharzī, *Dumyat al-ḳaṣr wa-ʿuṣrat ahl al-ʿaṣr*, Aleppo 1349/1930, 50-2 (= *Taʿrīf*, 8-11); Ibn al-Djawzī, *al-Muntaẓam*, viii, 184-8 (= *Taʿrīf*, 18-26); Ibn al-Ḳifṭī, *Inbāh al-ruwāt ʿalā anbāh al-nuḥāt*, Cairo 1950-5, i, 46-83 (= *Taʿrīf*, 27-66); Yāḳūt, *Udabāʾ*, i, 162-216 (= *Taʿrīf*, 67-141); Sibṭ b. al-Djawzī, *Mirʾāt al-zamān*, in *Taʿrīf*, 143-81; Dhahabī, *Taʾrīkh al-islām*, in *Taʿrīf*, 189-205; Ibn Kathīr, *al-Bidāya wa 'l-nihāya*, Beirut 1966, xii, 72-6 (= *Taʿrīf*, 301-8). For further reference, see the survey by Moustapha Saleh, *Abū 'l-ʿAlāʾ al-Maʿarrī, bibliographie critique*, in *BEO*, xxii (1969), 141-204 ("Première partie: sources"). Modern studies, in addition to those already mentioned in the text of the article: C. Rieu, *De Abul-Alae poetae arabici vita et carminibus*, Bonn 1843; G. Salmon, *Un précurseur d'Omar Khayyam: le poète aveugle*, Paris 1904 ("Introduction et traduction"); ʿAbd al-ʿAzīz al-Maymanī al-Rādjakūtī, *Abu 'l-ʿAlāʾ wa-mā ilayh*, Cairo 1344/1925; a collection of articles in *al-Hilāl*, xlvi/8 (Cairo 1357/1938), "*ʿAdad khāṣṣ*"; Aḥmad Taymūr, *Abu 'l-ʿAlāʾ al-Maʿarrī*, Cairo 1940; Brockelmann, I, 254, S I, 449; ʿĀʾisha ʿAbd al-Raḥmān "Bint al-Shāṭiʾ", *al-Ḥayāt al-insāniyya ʿinda Abi 'l-ʿAlāʾ*, Cairo 1944; a collection of articles in *al-Adīb*, iii/6 (Beirut 1944), "*ʿAdad khāṣṣ*"; a collection of articles in *al-Mihradjān al-alfī li-Abi 'l-ʿAlāʾ al-Maʿarrī*, Damascus 1364/1945; ʿUmar Farrūkh, *Ḥakīm al-Maʿarra*[1], Beirut 1944, [2]1948; Amīn al-Khawlī, *Raʾyī fī Abi 'l-ʿAlāʾ*, Cairo 1945; Amdjad al-Ṭarābulusī, *al-Naḳd wa 'l-lugha fī Risālat al-Ghufrān*, Damascus 1370/1951; Muḥammad Salīm al-Djundī, *al-Djāmiʿ fī akhbār Abi 'l-ʿAlāʾ al-Maʿarrī wa-āthārih*, Damascus 1382-4/1962-4; Muḥammad Yaḥyā al-Hāshimī, *Lughz Abi 'l-ʿAlāʾ*, Aleppo 1968; ʿĀʾisha ʿAbd al-Raḥmān "Bint al-Shāṭiʾ", *Maʿa Abi 'l-ʿAlāʾ fī riḥlat ḥayātih*, Beirut 1392/1972, which is a slightly revised version of her previous study, *Abu 'l-ʿAlāʾ al-Maʿarrī*, see above; Ilyās Saʿd Ghālī, *Ḥadīḳat al-ḥayawān fī Luzūmiyyāt Abi 'l-ʿAlāʾ al-Maʿarrī*, Damascus 1978; Y. Friedmann, *Literary and cultural aspects of the* Luzūmiyyāt, in *Studia orientalia . . . D. H. Baneth*, Jerusalem 1979, 347-65. For further reference, see Moustapha Saleh, *Abū 'l-ʿAlā al-Maʿarrī, bibliographie critique*, in *BEO*, xxiii (1970), 197-309 ("Deuxième parti: études critiques modernes").

(P. SMOOR)

MAʾĀTHIR AL-UMARĀʾ, the name of a celebrated Persian collection of biographies of Muslim Indian commanders from the reign of the Mughal Emperor Akbar (963-1014/1556-1605) till the time of its author, Ṣamṣām al-Dawla Mīr ʿAbd al-Razzāḳ Shāh-Nawāz Khān Awrangābādī (1111-71/1700-58). Born at Lahore, he soon settled in the Deccan in the service of the first Niẓām of Ḥaydarābād [*q.v.*], Niẓām al-Mulk Āṣaf-Djāh, and filled offices in Berār [*q.v.*] and then as *Diwān* or chief minister of the Deccan. His policy in the latter post aimed at checking the growing influences in that state of the French Marquis de Bussy, but army discontent led to his fall in 1170/1757 and his murder in the following year.

The *Maʾāthir al-umarāʾ* was conceived on an extended scale and was unfinished at the author's death, hence completed by his son Mīr ʿAbd al-Ḥayy from notes and fragments left by Shāh-Nawāz Khān. The text of ʿAbd al-Ḥayy's recension was published in the Bibliotheca Indica series, ed. Maulavī ʾAbdur-Rahīm and Maulavī Ashraf ʾAlī, 3 vols. Calcutta 1888-91, and an English tr. made by H. Beveridge and Baini Prasad, Calcutta 1911- . The whole work has been much used for the many studies which have recently appeared on the Mughal nobility and landholding class.

Bibliography: Storey, i, 1094-1100.

(ED.)

MAʿBAD B. ʿABD ALLĀH B. ʿUKAYM AL-**DJUHANĪ**, early representative of Ḳadarī ideas,

executed after the insurrection of Ibn al-As͟hʿat͟h [*q.v.*], in 83/703.

He was probably born about 20/640 or even earlier. He had contacts with Muʿāwiya (41-60/661-80), and ʿAbd al-Malik appreciated him to such an extent that he sent him as an ambassador to Byzantium and entrusted him with the education of his son Saʿīd al-K͟hayr. According to a rather detailed, but perhaps fictitious report he played a certain political role as early as 38/658, during the negotiations between Abū Mūsā al-As͟hʿarī and ʿAmr b. al-ʿĀṣ at Dūmat al-Djandal after the Battle of Ṣiffīn. His reputation was based on his juridical competence. Traces of his *fatwā*s can still be found in our sources. In his use of precedents he obviously did not differentiate between prophetic tradition and the *sunna* of the caliphs; he referred to decisions of Muʿāwiya (an attitude which later jurists were completely unable to understand), and some of his *ḥadīt͟h*s go back to ʿUt͟hmān (reigned 23-44/635-56) whom he may still have met personally. Although probably born in Kūfa, he did not appreciate the juridical tradition connected with ʿAlī (if it existed already at his time); his father, a companion of the Prophet, had already attracted the attention of his Kūfan neighbours by his ʿUt͟hmānī leanings. We do not know why and when, in spite of his favoured position at the court of ʿAbd al-Malik, he joined the ranks of Ibn al-As͟hʿat͟h. He was captured at Mecca, together with his brother Saʿīd, and evidently executed by order of the caliph himself, at Damascus.

Later tradition tended to explain his fate by his Ḳadarī convictions. But this must not have been his primary motive. We do not have any detailed information about his thinking; he was not a theoretician like his younger contemporary al-Ḥasan al-Baṣrī [*q.v.*]. Much of our material results from a *damnatio memoriae* which was initiated by predestinarian circles. But this was a slow process which did not begin before 110/729, when al-Ḥasan al-Baṣrī had died, and was only finished in the second half of the second century when the Ḳadariyya [*q.v.*] as a whole was boycotted by the majority of the *ahl al-ḥadīt͟h*. A decisive moment for the development was apparently the Ḳadarī take-over under Yazīd III in 126/744; anti-Ḳadarī groups in Syria as well as in Baṣra then discovered Maʿbad as a bad example of a doctrinarian who had tried to push through his ideas by means of a revolution. According to them, he had been "the first who talked about *ḳadar* in Baṣra". Later on, not earlier than 130/748, this statement was modified by the assertion that he had taken over his ideas from a Christian or a Magian convert among the *Asāwira* by the name of Sūsan or Susnōya (also other forms are given). The persons responsible for this campaign are to be found in the predestinarian wing of the school of al-Ḥasan al-Baṣrī (e.g. Yūnus b. ʿUbayd, died 139/756 or 140/757; ʿAbd Allāh b. ʿAwn, died 151/768). They wanted to detract the attention from the fact that their master himself had been close to Ḳadarī theories. For them, the decisive point was that al-Ḥasan al-Baṣrī, in contract to Maʿbad al-Djuhanī, had not drawn any political consequences out of them.

Bibliography: A detailed "biography" is given by Ibn ʿAsākir in the unedited part of his *Taʾrīk͟h Dimas͟hḳ*, but there are lots of other (normally short and biassed) reports. The material available up to now has been used in J. van Ess, *Maʿbad al-Ǧuhanī*, in *Islamwissenschaftliche Abhandlungen Fritz Meier zum sechzigsten Geburtstag*, Wiesbaden 1974, 49 ff. Cf. also W. M. Watt, *The formative period of Islamic thought*, Edinburgh 1973 index s.n.; Redwan Sayed, *Die Revolte des Ibn al-Ašʿaṯ und die Koranleser*, Freiburg 1977, 360 and *passim*. (J. VAN ESS)

MAʿBAD B. WAHB, ABŪ ʿABBĀD, one of the great singers and composers in Umayyad times, was born in Medina and died at Damascus in 125/743 or 126/744. Being the son of a negro, he was an *ʿabd* and later on became *mawlā* of one of the Mak͟hzūm families, serving them as overseer of their cattle. Like many other oriental musicians, he is said to have been led to music by a dream, and he took music lessons from Sāʾib K͟hāt͟hir and Nas͟hīṭ. He soon made a name for himself in Medina and followed invitations to sing at Mecca, where Ibn Suraydj set the fashion. Here he carried off the prize at a tournament of song organised by Ibn Ṣafwān al-Akbar (d. 73/692). Maʿbad sang at the courts of the caliphs al-Walīd b. ʿAbd al-Malik and Yazīd b. ʿAbd al-Malik. After the death of Ibn Suraydj (*ca.* 108/726), he reached the zenith of his career as a number of the literary and artistic circle of the prince al-Walīd b. Yazīd. When the latter became caliph in 125/743, he invited the old singer to Damascus. Maʿbad, already weakened in health, fell ill and died in the palace after having suffered from partial paralysis. The caliph himself accompanied the bier to the palace boundaries.

Maʿbad, one of the "four great singers" in early Islam, was the leading musician of the Medinan school of music. As to his way of composing songs, his own description has been handed down: "I back my mount, beat the rhythm with the wand (*ḳaḍīb*) on the saddle and chant the verse until the melody comes right (*Ag͟hānī*³, i, 40). He preferred "heavy" (*t͟haḳīl*) rhythms, abounding in fioriture. Several of his songs became known under specific names, like *al-mudun* or *al-ḥuṣūn* ("cities, fortresses") alluding to places conquered by Ḳutayba b. Muslim [*q.v.*], or *Ḳutaylāt*, three songs on verses by al-Aʿs͟hā on a girl called Ḳutayla. His songs (*viz.* song texts) were collected by his pupil Yūnus al-Kātib in his *K. fi 'l-Ag͟hānī* and, later on, now with indications on melody (*ṭarīḳa*) and rhythm (*īḳāʿ*), by Isḥāḳ al-Mawṣilī in his books *K. Ag͟hānī Maʿbad* and *K. Ak͟hbār Maʿbad wa-Ibn Suraydj wa-ag͟hānīhimā*. Abu 'l-Faradj al-Iṣbahānī made use of these sources in his *K. al-Ag͟hānī*, together with other monographical collections of Maʿbad's songs (*ibid.*³, iii, 305), including a *Djāmiʿ g͟hināʾ Maʿbad* transmitted by al-His͟hāmī.

He seems to have educated numerous singing girls and singers. Among his best-known pupils figure Ibn ʿĀʾis͟ha, Mālik b. Abi 'l-Samḥ and the songstresses Sallāma and Ḥabāba. Through his pupils Ḥakam al-Wādī, Daḥmān, As͟hʿab and Siyāṭ he influenced the early Bag͟hdād musical style. Isḥāḳ al-Mawṣilī (d. 235/850) considered him to be "a consummate singer" having "a talent superior to all his rivals", and he took Maʿbad's songs as models of "pure Arab" music. Al-Ḥasan b. Aḥmad al-Kātib (early 5th/11th century) counted them among the perfect melodies and therefore, contrary to normal practice, not any more allowed to be altered by embellishments. From his lifetime onwards, Maʿbad figures in Arabic poetry (al-Buḥturī, Abū Tammām and others) as the musician par excellence.

(H. G. Farmer - [E. Neubauer])

MAʿBAR, the name given by the Arabs in mediaeval times to the eastern shores of the Indian Deccan, an area corresponding closely, but not exactly, to the Coromandel coast (the latter name from the Tamil *Čolamaṇḍalam*, "the realm of the Cholas", indicating the area formerly ruled by the Tamil Chola *rādjās* from their capital at Tāndjāvūr (Tanjore); hence the alternative Arabo-Persian name, *Barr al-Ṣūliyān* or *Shūliyān* (Tibbetts, *op. cit.* in *Bibl.*, 466), "the coast of the Cholas").

In Arabic, the term *maʿbar* signifies a passage or crossing point. In its application to Coromandel this has been widely interpreted as being a reference to the part played by the coast in the crossing between India and Ceylon or Sri Lanka; thus the *Madras glossary* (439) states that Maʿbar "means the crossing over, that is from Madura to Ceylon". An alternative explanation is offered by Yule who was of the opinion that Maʿbar derived its name from being "in that age the coast most frequented by travellers from Arabia and the Gulf" (*Marco Polo*, ii, 332, n. 1). If, as is generally accepted, the region of Maʿbar lay to the east of Cape Comorin (Ar. *Kumharā*), then Yule's explanation must be considered less satisfactory than that offered by the *Madras glossary*. Coromandel was, in fact, somewhat off the main routes followed by mediaeval Arab shipping. Research into contemporaneous Arab navigational texts indicates that ocean-going vessels generally touched at Malabar [*q.v.*] rather than Maʿbar (Tibbetts, *op. cit.*, *Detailed chart of India and the Bay of Bengal*); in any crossing from Malabar to Southeast Asia, these vessels would have passed around Dondra Head (Ar. *Ra's Dannūr*), the southernmost point of Sri Lanka, thus avoiding Maʿbar altogether unless specifically destined for that area or for Bengal (see, however, Waṣṣāf's definition of Maʿbar [below], which includes a substantial part of the southern Malabar coast). The compilers of *Hobson Jobson* (526) suggest as an alternative that "Maʿbar" may simply be an attempt to give meaning in Arabic to a local South Indian name; however, no suggestion is made as to a possible Dravidian etymology. A fourth possible explanation is that the "crossing" referred to was that from the well-known Arabian Sea to the less familiar *Taḥt al-Rīḥ* (i.e. "beneath the wind", the Bay of Bengal and the seas of Southeast Asia), a region where Arab mercantile power, supreme to the west of Cape Comorin, met with serious competition from Indian and Chinese vessels (in this context, note the descriptions of Maʿbar offered by Yāḳūt and Waṣṣāf, see below).

According to Yule, the earliest application of the term Maʿbar to the Coromandel coast occurs in ʿAbd al-Laṭīf's short description of Egypt (*al-Ifāda wa'l-iʿtibār fī 'l-umūr al-mushāhada wa'l-ḥawādith al-muʿāyana bi-arḍ Miṣr*; see De Sacy, in *Bibl.*, 31), a study written *ca.* 600/1203, when the Chola *rādjā* Kulottunga III still ruled over the eastern Deccan, see *Hobson-Jobson*, 526 (Coromandel is still renowned for its mat-weaving industry, mentioned in this passage, see P. K. Nambiar, *op. cit.* in *Bibl.*, *passim*).

Mediaeval Arab scholarship in unclear as to the exact extent of Maʿbar. According to the geographer Yāḳūt, "Maʿbar is the extremity of the land of Hind, then come the cities of China, the first of these is Java" quoted in Nainar, *op. cit.* in *Bibl.*, 53. In his *Tazdjiyat al-amṣār wa-tadjriyat al-āthār* (700/1300), the historian ʿAbd Allāh Waṣṣāf states that Maʿbar extends in length from Kūlam [*q.v.*] (Quilon) to Nilāwar (Nellore), nearly 300 *parasangs* (i.e. 1,800 km.) along the sea-coast (in fact, the distance is nearer 1,200 km. (tr. in Elliot and Dowson, iii, 32)

In his *Djāmiʿ al-tawārīkh* (710/1310), Rashīd al-Dīn repeats Waṣṣāf's description of Maʿbar almost word-for-word, but elaborates somewhat on the products of the region, mentioning silken stuffs, aromatic roots and large pearls (tr. in *ibid.*, i, 69). According to Abu 'l-Fidā, *Kitāb Taḳwīm al-buldān* (*ca.* 731/1330), Maʿbar is the third *iḳlīm* of Hind, beginning at about three or four days journey to the east of Kawlam (Quilon), the first locality in Maʿbar being Rās Kumhūrī (Cape Comorin) (tr. in Nainar, *op. cit.*, 55).

Abu 'l-Fidā's description of the geographical extent of Maʿbar corresponds more closely to the Coromandel coast than that offered by Waṣṣāf and Rashīd al-Dīn, and indeed, after Abu 'l Fidā's time the term Maʿbar seems to have become increasingly associated with the coast of South India east of Cape Comorin rather than east of Quilon; nevertheless, Maʿbar, even in this truncated form, may not be considered synonymous with Coromandel. The latter is defined by *Hobson-Jobson* (256-8) as "the Northern Tamil Country, or ... the eastern coast of the Peninsula of India from Point Calimere northwards to the mouth of the Kistna, sometimes to Orissa"; thus Maʿbar extended south of Coromandel to include the shoreline of the Palk Straits and the Gulf of Mannar.

The term Maʿbar, although originally an exclusively Arab designation, gained considerable currency beyond the confines of the Muslim world; thus Marco Polo (*ca.* 692/1292) writes at some length concerning "the great province of Maabar which is styled India the Greater; it is best of all the Indies and is on the mainland" (Yule, *Marco Polo*, ii, 331-59). In a letter also dating from 692/1292, or possibly one year later, John of Monte Corvino describes in some depth "Upper India, which is called Maebar, in the territory of St. Thomas" (Yule, *Cathay and the way thither*, iii, 58-70). Maʿbar is mentioned in the Chinese Annals as one of the foreign kingdoms which sent tribute to Ḳubilay Khān [*q.v.*] in 667/1268 (Yule, *Marco Polo*, ii, 337). Although no mention of Maʿbar occurs in the *Ying-yai sheng-lan* of Ma Huan [*q.v.*], *Ma-pa-erh* was certainly well-known to the Chinese during Ming times, and is listed in Feng Ch'eng-chün's *Hsi-yü ti-ming* (see *Bibl.*).

Until the beginning of the 8th/14th century, relations between Maʿbar and the Muslim world were generally limited to peaceful Arab trading contacts. The historian and poet Amīr Khusraw, who was attached to the court of the Khaldjī Sultans at Dihlī, celebrates the advances of the Muslim armies in the northern Deccan (*ca.* 710/1310) and adds that "there

the arrow of any holy warrior had not yet reached" (tr. in Elliot and Dowson, iii, 85-6).

During the first half of the 7th/13th century, however, the powerful Chola Kingdom which had dominated the south-eastern Deccan for over four centuries, entered a period of final decline. In *ca.* 678/1279, Rādjendra IV, the last Chola monarch, fell from power; his territories were divided between two rival Hindu kingdoms based on Madurai and Mysore (Basham, *op. cit.*, in *Bibl.*, 76). In 708/1308 the third Khaldjī sultan, ʿAlāʾ al-Dīn, having defeated the invading Mongols, felt able to turn to the military conquest of the Deccan. Under the capable generalship of Mālik Kāfūr, the Muslim armies subjugated the Yādava rulers of Devagiri and the Kākatīya rulers of Warangal; in 710/1310 Kāfūr broke through to the southern Deccan, and for the first time Muslim armies were able to despoil the great Hindu temples of Maʿbar. It was as a direct consequence of this victory that Ibn Baṭṭūṭa, who visited the Deccan in or about 739/1338, found the Dravidians of Maʿbar under the rule of a Muslim sultanate with its capital at Madurai (Gibb, *op. cit.* in *Bibl.*, 261-5).

The success of Muslim arms in the southern Deccan was nevertheless to be shortlived. Within a few years of Mālik Kāfūr's invasion, the independent Hindu kingdom of Vidjayanagar was established in 731/1336. Maʿbar passed under the control of the *rādjā*s of Vidjayanagar in 772/1370 (Thapar, *op. cit.* in *Bibl.*, i, 325); under a succession of Hindu rulers, the region was to maintain its independence from the Muslim north until the equally short-lived conquest of the Mughal emperor Awrangzīb [*q.v.*] in the late 11th/16th century.

(A. D. W. Forbes)

AL-MAʿBARĪ, Shaykh Zayn al-Dīn b. ʿAbd al-ʿAzīz b. Zayn al-Dīn b. ʿAlī b. Aḥmad, the author of *Tuḥfat al-mudjāhidīn fī baʿḍ aḥwāl al-Purtukāliyyīn*, is said to have lived in Ponani, Malabar District (Kerala, India) during the rule of the ʿĀdil Shāh ʿAlī (965-88/1558-80), his patron, to whom he dedicated the book. The date of his birth or death is not known, but he wrote the work *ca.* 985/1577. The *Tuḥfat al-mudjāhidīn* deals with the geography of Southern India, and gives an account of Islam in Malabar and the Portuguese campaigns in India. It has an introduction and four chapters. The first chapter deals with the merits and necessity of *djihād* [*q.v.*]; the second gives an account of the first appearance of Islam in Malabar [*q.v.*]; the third with the strange usages and customs of the Hindu inhabitants of Malabar, and the fourth is an historical account of the Portuguese campaigns from the time of their first arrival in Malabar in 1498 A.D. up to 1583. This work, in the opinion of S. M. Ḥ. Nainār, might be different from the work of the same name from which Firishta took extracts, but this needs further careful investigation (See *Tuḥfat al-mudjāhidīn*, tr., Introd., 7).

The author was inspired to write the book for reasons given by him in his Preface: after the spread of Islam in Malabar the Muslims had "disregarded the favours of Allāh" and had "sinned and set up feuds among themselves." So Allāh "empowered over them the people of Purtukāl from among the *Afrandj*", who oppressed them for eighty years until the condition of the Muslims reached "the worst consequences of decay, poverty and humiliation." But neither they nor the resourceful rulers and the rich Muslims of Malabar cared to "repel the misfortune" or "declare a holy war" against the Portuguese. Hence, the author says, he "compiled this narrative with a view to inspire in the faithful the desire of fighting the worshippers of the Cross; for a holy war with them is an obligatory duty, because they invaded the territories inhabited by the Muslims ..." (Nainār, tr., 12-13). Obviously, the author wrote the book from a religio-political point of view to exhort the Muslims of Malabar to a holy war against the Portuguese. His style is "very simple and direct without rhetorical ornament, yet he is not free from the affection of ornate style so common with most theologians who had steeped their minds in the Qurʾan and *Traditions*" (Nainar, Introd., 7-8).

Bibliography: In addition to Brockelmann's *EI*¹ article AL-MAʿBARĪ, see *Tuḥfat al-mujāhidīn, an historical work in the Arabic language*, Eng. tr. S. Muḥammad Ḥusayn Nainār, University of Madras 1942; edition by Ḥakīm Shams Allāh Ḳādrī, Hyderabad, Deccan 1931 (without the first chapter; Nainar, Introd., 4); an abridgement of the work (in Arabic) is included in a collection of some accounts on Islam in Malabar entitled *Djawāhir al-ashʿār wa-gharāʾib al-ḥikāyāt wa 'l-akhbār*, etc. by Abū Muḥammad ʿAbd al-Ḳādir b. al-Shaykh Yūsuf b. Sayfī b. Muḥyī 'l-Dīn, Edava, Travancore 1358/1939, 205-34.

(S. Maqbul Ahmad)

MĀBEYN (A. *mā bayn* "what is between"), in the organisation of the Ottoman palace, the intermediate appartments lying between the inner courts of the Sarāy and the Ḥarem, a place where only the sultan, the eunuchs and the womenfolk could penetrate and where the corps of select pages known as *mābeyndjis*, an élite group from amongst the forty *khāṣṣ odalis*, waited on the monarch for such intimate services as dressing and shaving him [see KHĀṢṢ ODA].

Till the end of the 11th/17th century, the *Mābeyndjis* were headed by the *Silaḥdār Agha* or Swordbearer, as chief page. But under Aḥmed III (1115-43/1703-30) there was a re-organisation of the palace service, involving the decline of the white eunuchs' influence, elevation of the Silaḥdār Agha's position

and depression to some extent of the *Mābeyndjis*, henceforth regarded as inferior to the principal pages of the *Khāṣṣ Oda* or Privy Chamber. Hence there were now three grades of pages there: (1) the *Bičaklï Eskis* or Superior *Aghas* (so-called because they wore a gilded or silverplated dagger, *bïčak*, in their belts); (2) the *Mābeyndjis*; and (3) the Inferior *Aghas*, with no special designation. Writers from the later 18th and 19th centuries, such as the Ottoman historian ʿAṭāʾ and the European D'Ohsson, mention several specific offices held by the principal ones of twelve *Mābeyndjis* (thus numbered by D'Ohsson), headed by the *Bash Čuḳadār* or Head Valet, the *Sirr Kātibi* or Confidential Secretary (both still highly influential because of their close contacts with the sultan), the *Ṣarïkčï Bashï* or Chief Turban-folder, the *Ḳahwedji Bashï* or Chief Coffee-maker, etc.

(C. E. Bosworth)

MADAGASCAR, with its 627,000 km² the third largest island in the world, after New Guinea (785,000 km²) and Borneo (733,000 km²). Its area is slightly greater than that of France 550,880 km²), of Belgium (30,000 km²) and of Holland (33,000 km²) combined. The large African island is oriented from north-north-east to south-south-west, measuring 1,600 km at its greatest length and 580 km at its greatest width, with a coastal perimeter of 5,000 km. It has a population in excess of 8 million inhabitants which is increasing at a fairly rapid rate (3.2 %).

Although the Comoros (see ḲUMR) are entirely Muslim, Madagascar's Muslim population is confined to the north-west coastal region and the south-east, where the descendants of the first Muslims to arrive on the island remain. However, archaeological studies have shown that the Muslims of the Indian Ocean were the transporters of the initial African population, and were responsible for trade between the Great Island and the rest of the world from the 10th to the 18th century. In the 19th century, Indian Muslims engaging in commerce settled in their turn.

In the religious sphere, Malagasy Islam has always tended to be absorbed by the traditional religion, to such an extent that continual contributions are necessary for the maintenance of Muslim establishments. Most curiously, in the south-east of the island a tradition of Arabic-Malagasy manuscript writing is perpetuated.

The island has been known by the names of *al-Ḳumr* by the Arabs; *Bukini* (literally, the place where there are (*ni*) Buki) by the Bantus of neighbouring East Africa; *Isle of St. Lawrence* by the Portuguese who discovered it in 1506 on the feast-day of this saint, 10 August; and finally *Madagascar*, according to the narrative of Marco Polo. The unvocalised spelling جزيرة القمر has given rise to the play on words *djazīrat al-ḳamar* "Island of the Moon" which was employed by Portuguese historians in the 16th and 17th centuries and which apparently survived until the end of the 19th century among the seafarers of Southern Arabia.

The name of Ḳumr seems to figure for the first time in the *Kitāb Ṣūrat al-arḍ* of Muḥammad b. Mūsā al-Khwārazmī (d. 220/835 or 230/845), in the context of the famous "mountain of Ḳumr" (*djabal al-Ḳumr*) which was believed to be the source of the Nile. But the interpretation as *Djabal al-Ḳamar* "mountain of the moon" was ancient as early as the 9th century, since it is encountered in the ὄρησεληναῖα of Ptolemy, whom the majority of Arab geographers and al-Khwārazmī in particular took as their model. The mountain known as that of Ḳumr or the Moon is mentioned by all the Muslim geographers who have described East Africa. It is totally different from the homographic term Ḳumr, which in the 17th century, as Trimingham has shown, signifies the Great Island, but also the neighbouring archipelage of the Comoros, which alone has retained this name to the present day.

In his study on the *K'ouen-louen et les anciennes navigations interocéaniques dans les Mers du Sud* (in *JA*, xiii-xiv [1919]), Ferrand suggested an association with the name of the Kmers and that of the 崑崙 K'un-lun of the Chinese texts, a daring association, even though these Chinese texts are by no means ignorant of Africa. More interesting for our purposes would seem to be the comparison, by the same Ferrand, of Wāḳ-wāḳ [*q.v.*] with *vahoaka*.

The term *Buki*, which denotes Malagasy in Swahili, and *Bukini*, Madagascar, have been audaciously linked with *Bugi* (people of the Celebes) by J. C. Hébert. In Madagascar, the term appears in literature for the first time in 1613, in the writing of the Portuguese Father Luis Mariano.

The current name of Madagascar is revealed to us in the account of Marco Polo under the form *Madeigascar* (cf. *The book of Ser Marco Polo*, ed. H. Yule, revised and corrected H. Cordier, ii, 411 ff.). As was demonstrated by Yule a long time ago, Marco Polo did not visit Madagascar, spoke of it only through hearsay and presented under this heading certain information relating to the neighbouring East African coast. In this sense, the question may be regarded as settled. As Ferrand already indicated in studying afresh this chapter of Marco Polo, *Madeigascar* is without doubt a slightly incorrect compound of the *Zangbār* type, to be amended to *Madeigascar-bār*, denoting "land of the Malagasy", in the same way that the former has the sense of "land of Zang or the Zangs" (cf. *Trois étymologies malgaches*, in *Mémoires Soc. de Ling. de Paris*, xiii [1905-6]). This reconstruction is based on the following facts: in the previously mentioned account, Father Luis Mariano tells of a kingdom in the south-east of Madagascar which he calls *Mitacassi*, *Matacaci*, *Matacasi* (or Matakasi). Three years later, in 1616, Father Almeida, travelling in the same region, also mentions a kingdom of *Matacassi*. In his *Relation* published in 1651 by Morisot (*Relations véritables et curieuses de l'isle de Madagascar et du Brésil*, 10, 49, 99, 124, 127, 134), Cauche refers to a province called *Madegache* and known by others as *Madegasse*, whose inhabitants he calls *Malegasses* and *Mallegasses*. He also employs the term *Madagascarois*, but in the broader sense of the inhabitants of the entire island. Flacourt (*Histoire de la grande isle Madagascar*, 1661, 1) says: "The Island of Sainct-Laurens is called Madagascar by the geographers, *Madecase* by the inhabitants of the land, Menuthias by Ptolemy, Cerne by Pliny ..., but its true name is *Madecase*". Later writers have all been inspired to a greater or lesser extent by the work of Flacourt; therefore, there is no purpose in employing their testimony. These variant readings may be reduced to two: *Madagasi* and *Malagasi*

which correspond exactly to the two major categories of dialect: dialects with voiced dental (*d*) and dialects with liquid dental (*l*). It is the latter form that has prevailed throughout the island, sometimes with the sibilant *Malagási*, sometimes with the fricative *Malagáci*. Both are paroxytones. In addition, the modern colloquial language frequently employs the abbreviated form *gasy* and even *gasa*. These observations seem to justify the interpretation proposed above for the name of Madagascar which we owe to Marco Polo.

The doublet *Malagási-Madagási*, *Malagási-Madagási* remains obscure. According to the morphology of the language, it may represent a compound *mala* or *mada gási* which resembles nothing known, since it consists of the voiced form *mada-gási*, or of the unvoiced form noted by the Portuguese *mata-kási*. Furthermore, it is not known whether this is a western Indonesian construction or a Bantu construction. Whatever the case may be, it is likely that here we have a foreign tribal name, the origin of which, eastern or western, cannot currently be explained by reference to the ancient and modern language.

The account of the *Periplus of the Erythraean Sea*, probably written by a Greek of Alexandria in the 3rd century A.D., describes a voyage along the eastern coast of Africa as far as the port of Rapta. Madagascar seems to be unknown to the author of the *Periplus*, and it is probable that it was still uninhabited. Indonesian and African migrations seem to have populated the island only in the 2nd or 3rd centuries of the Hid̲j̲ra, at the earliest.

In about the year 945, the island of Ḳanbalū, probably situated in the archipelago of the Comoros, was the object of invasions by marine pirates possibly based on Madagascar. The book of *The marvels of India* by Buzurg b. S̲h̲ahriyār, a Persian of Rāmhurmuz, states in fact: "Ibn Lakis tells me that he has seen the people of the Wāḳ-wāḳ perform amazing things. It is thus that in 334/945-6, they came upon them in a thousand ships and fought them with the utmost vigour, without however achieving their end, since Ḳanbalū is surrounded by a strong defensive wall around which stretches the water-filled estuary of the sea, so that Ḳanbalū is at the centre of this estuary like a fortified citadel. When people of the Wāḳ-Wāḳ subsequently came ashore there, they asked them why they had come specifically there and not elsewhere. They replied that this was because among them there were to be found products sought after in their country and in China, such as ivory, tortoise shell, panther hides and ambergris, and because they were seeking out the Zand̲j̲, on account of the ease with which they endured slavery and on account of their physical strength. They said that they had come from a distance of one year's sailing, that they had pillaged islands situated six days' journey time from Ḳanbalū and had taken possession of a certain number of villages and towns of Sofāla of the Zand̲j̲, to say nothing of others which they did not know. If these people spoke the truth and if their account was accurate, this would confirm what Ibn Lakis said of the islands of the Wāḳ-wāḳ: that they are situated opposite China". Today there is a consensus that these pirates were Indonesians based in Madagascar who pillaged the Comoros and the coast of the Zand̲j̲.

Among the Arab geographers, the first detailed mention of the island of Komr-Madagascar is supplied by the *Kitāb Nuzhat al-mus̲h̲tāḳ fī 'k̲h̲tirāḳ al-āfāḳ* (1154) of al-S̲h̲arīf al-Idrīsī, who sometimes includes the large African island in the land of the Zand̲j̲. "The inhabitants of the islands of Zabag = Sumatra," he says in the seventh section of the first chapter, "come to the land of the Zand̲j̲ in large and small ships, and they use it for the sale of their merchandise, seeing that they understand one another's language" (B.N. ms. 2221, fol. 29 a, I, 15; the editor of the *Book of Roger*, Naples-Rome, i, 1970, 61, reads al-Rānad̲j̲ in place of al-Zābad̲j̲; cf. index of the *Murūd̲j̲*, s.v. *Zābad̲j̲*). This passage is very important, because it shows that in the 12th century contacts were maintained between the east and the west of the Indian Ocean and that mutual comprehension was practised by the Indonesians settled in Madagascar on the one hand, and those natives of Indonesia on the other.

In his *Muʿd̲j̲am*, completed in 1224, Yāḳūt merely says (iv, 174): "al-Ḳumr is an island in the middle of the sea of the Zand̲j̲ which contains no island larger than it. It comprises a large number of towns and kingdoms. Each king makes war on the other. On the shores are found amber and the leaf *al-ḳumārī* (*sic*). This is a perfume; it is also called betel leaf. Wax is also obtained from it." The *Kitāb al-Mus̲h̲tarik* of the same author contains identical information borrowed from the *Muʿd̲j̲am* (ed. Wüstenfeld, 358); but the latter text has, more correctly, "the leaf *al-ḳumrī*".

Ibn Saʿīd (7th/13th century [*q.v.*]) wrote a geographical treatise, of which the Bibliothèque Nationale of Paris possesses, under no. 2234, a copy once belonging to Abu 'l-Fidāʾ and dating from 714/1314-15. This treatise contains an interesting association between the Asiatic peoples and the people of Ḳumr, which Ferrand summarises thus: "The Ḳumr, who have given their name to the mountain of this name situated in eastern Africa, are brothers of the Chinese. They dwelt originally with the Chinese in the eastern regions of the world, that is to say, in the interior of the continent of Asia. Discord having broken out between them, the latter drove the Ḳumr towards the islands. After a certain period of time, with dissension erupting among the Ḳumr who had emigrated to the islands, the king and his family emigrated again, made their way to the large island of Ḳumr = Madagascar and the king established himself in a town of this large island called Ḳumriyya. These Ḳumr, having arrived on the large island, grew in number and proliferated in the various capitals of the island in question; but new dissensions provoked a new exodus and a large number of them departed to settle in the south, at the commencement of the inhabited territory, along the mountain range which bears their name." (Ferrand, *Relation de voyages*, ii, 316 ff.).

A contemporary of Ibn Saʿīd, Ibn al-Mud̲j̲āwir al-S̲h̲aybānī of Damascus, wrote his *Taʾrīk̲h̲ al-Mustabṣir* in *ca.* 1230 (B.N. ms. 6021). In the 25 folios which the author devotes to the history of Aden, there is mention in folio 72 a-b of voyages by the Ḳumr from their country of origin to Aden and, in particular, in 626/1228, from Madagascar to the coast of Africa and to Aden (cf. *JA*, xiii [1919], 469-83).

The following authors al-Dimas̲h̲ḳī (*ca.* 725/1325), al-Nuwayrī (d. 732/1332), Abu 'l-Fidāʾ (1273-1331), Ibn K̲h̲aldūn (*ca.* 1375) and al-Maḳrīzī (1365-1442) tell us nothing of substance about the island of Ḳumr. The towns which some of them place on the great African island are in fact situated in Ceylon or further east, or are unidentifiable (cf. Ferrand,

Relations de voyages, ii, index, *s.vv. Ḳomor* and *Ḳomr*).

Besides mentioning numerous towns, al-Dimashḳī tells of the presence on Ḳumr of the famous *rukh* bird. This bird, which has haunted the legends of the Arabs of the Indian Ocean, is probably the aepyornis, a giant flightless bird which was exterminated by the Madagascans *ca.* 1500.

In the 9th/15th century, the information supplied by Arab geographers is more reliable. This no longer consists of learned treatises or compilations, but of "route-maps" written by navigators, the most eminent being Ibn Mād̲j̲id and Sulaymān al-Mahrī [*q.vv.*]. Ferrand was the first to draw attention to the importance of these documents in the Bibliothèque Nationale of Paris, and he published them in facsimile without French translation; before him, this nautical data was known only from a second-hand Turkish text, the *Muḥīṭ* of Sayyid ʿAlī. Today, for Ibn Mād̲j̲id, we are fortunate in having at our disposal the interpretation by Shumovski relating to another manuscript, that of Leningrad, and the cartographical analysis of the navigators' documentation made by Grosset-Grange.

While admitting the interest of the nautical instructions of Ibn Mād̲j̲id, Ferrand recognised that the information given by Sulaymān al-Mahrī was more precise. In fact, in his *Umda Mahriyya*, in chapter iv, which deals with the topography of the islands and the maritime routes along their coasts (cf. *Instructions nautiques et routiers arabes et portugais*, ii, fol. 22 a), the following is stated: "We begin with the island of Ḳumr because it is a large island which stretches along the coast of the Zand̲j̲ and of Sufāla. Its northern extremity is called Rās al-Milḥ (= Cape of Amber); it is situated at 11 *iṣbaʿ*s from Naʿsh (αβγδ of the Great Bear = 8° 37′ south approximately; true latitude approximately 11° 57′). Its southern extremity which is called Hūfā (= Cape Sainte-Marie ?) is at 3 *iṣbaʿ*s from Naʿsh (= 21° 37′ south, true latitude approx. 25° 38′), according to some, at 1 *iṣbaʿ* from Naʿsh (= 24° 51′ south), according to others. This last latitude is the more exact. There is a difference of opinion [on the direction] of maritime routes along its coasts, because this island is far removed from inhabited land. As regards the direction of route on its eastern coasts, there are two opinions: according to some, a course should be set to south-west-one-quarter west, according to others, to south-west. There is a third opinion which recommends a course set to west, from one extremity of the island to the other. This last opinion is that of the ancient [masters of navigation]. In my view, adds Sulaymān al-Mahrī, it is possible that the route could be to west-south-west, to south-west-one-quarter west, to south-west, and in yet another direction, for two reasons: the first is that this is a large island, it has a long coastline and the route is equally long. The second reason is that the above-mentioned routes have not been verified, on account of the small number of journeys which have been made to this island and the insufficient nautical data provided by those who have travelled there. Masters of navigation (*muʿallim*) of the Zand̲j̲ have told me that the course on the eastern coast, from Rās al-Milḥ as far as the place where Naʿsh is at 8 *iṣbaʿ*s (= 13° 30′ south), is to the south, and from this place to the southern extremity of the islands, to south-one-quarter-south-west. On the western coast, from Rās al-Milḥ to the place where Naʿsh is at 6 *iṣbaʿ*s (= 16° 44′), the coast is entirely safe; from 6 *iṣbaʿ*s to its southern extremity, there is a *rikk* ("bank" or „shoal") of a length of some 2 *zāms* (6 hours) sailing-time or more, as far as the coastal area. Between the island of Ḳumr and the coast [of East Africa] there are four large inhabited islands, close together, which are frequented by the peoples of the Zand̲j̲. The first of these islands is Angazidya (= Grand Comoro). It is at 11 *iṣbaʿ*s and one-quarter from Naʿsh (= approx. 9° south: Mroni, the capital of Grand Comoro is at exactly 11° 40′ south). Between it and the coast [of East Africa], there are 16 *zāms* (= 48 hours) of travelling. The second, Mulālī (known to us as the island of Moheli), is at 11 *iṣbaʿ*s from Naʿsh (= 8° 37′ south, true latitude approx. 12° 20′); the third, Dumūnī (capital of the island of Anjouan), which is at 11 *iṣbaʿ*s from Naʿsh (= 8° 37′ south, true latitude 12° 15′) is to the east of Mulālī; the fourth, Mawutū (currently the island of Mayotte), is at 10 *iṣbaʿ*s and one-half from Naʿsh (= 9° 25′ south, true latitude 12° 46′ 55″). To the east of these islands, lies a large reef of rocks, at about 4 *zāms* (= 12 hours) of travelling, called *ʿAyn al-Baḥr* ("eye" or "source of the sea"). The ports of the western coast of Ḳumr are: Langānī (at 15° 17′ south), Saʿda (true latitude approx. 13° 54′) and Manzalād̲j̲ī (currently the bay of Mahadzamba, of which the western extremity is at a true latitude of approx. 15° 12′). Those of the eastern coast are: Bandar Banī Ismāʿīl (on the same latitude as Langānī on the western coast) and Bīmārūh (currently Vohemar, at 15° 21′ 15″). All these ports are dangerous [for shipping], with the exception of Langānī. Note that between Rās al-Milḥ and the coast of the Zand̲j̲ there are 50 *zāms* (= 150 hours) of travelling, and that at 20 *zāms* (= 60 hours) of travelling to the east of Rās al-Milḥ lies an inhabited island called Munawwara (one of the southern Maldives ?). To the south-east of Ḳumr, lie numerous islands called Tīrrakhā (the Mascareignes group ?); they are at 12 *zāms* (= 36 hours) of travelling from the island of Ḳumr."

In his *Kitāb al-Minhad̲j̲ al-fākhir* (fol. 73 b of the same manuscript), Sulaymān al-Mahrī provides a second description of the island of Ḳumr which does not differ from the foregoing. Four pages previously, in fol. 71 b, the same author mentions some other ports of the island of Ḳumr with their latitude calculated according to the elevation of the Great Bear: Island of Munawwara at 11 *iṣbaʿ*s; Bandar Ismāʿīl or Banī Ismāʿīl, on the eastern coast and Lulangānī or Langānī, on the western coast, at 10 *iṣbaʿ*s; Bīrmārūh, on the eastern coast, Anāmil, on the western coast, at 9 *iṣbaʿ*s; the island of amber (*d̲j̲azīrat al-ʿanbar*), on the eastern coast, and Bandar al-Nūb on the western coast, at 8 *iṣbaʿ*s; Noshim (?), on the eastern coast, and Malawīn (?), on the western coast, at 7 *iṣbaʿ*s; Manakāra, on the eastern coast (true latitude 22° 08′ 30″) and Bandar (al-) Shuʿbān (port of the shoals), at 6 *iṣbaʿ*s; Bandar Hadūda, on the eastern coast, and Bandar Kūrī, on the western coast, at 4 *iṣbaʿ*s; Wabaya (?) (according to the Turkish text of Sayyid ʿAlī; this name is illegible in ms. 2559), on the eastern coast, and Bandar Hīt (or Hayt), on the western coast, at 3 *iṣbaʿ*s; Bandar Hadūda (*sic*), on the eastern coast, no name known on the western coast at this latitude, at 2 *iṣbaʿ*s; and Bandar Kūs (or Kaws), on the eastern coast, and the bay of Ḳūrī, on the western coast, at 1 *iṣbaʿ*.

A number of these ports, including Saʿda, Manzalād̲j̲ī and Bīmārūh have been rediscovered and have been subjected to archeological studies. Those of the north-west were also known through an oral tradition,

assembled in Madagascar itself by Commandant Guillain (Vérin, 1975, 89-91).

In the light of recently discovered data, the settlement of Madagascar may be summarised as follows. Between 700 and 1000, Indonesians and Africans created through biological and cultural cross-breeding the proto-Malagasy civilisation in the north of Madagascar and, no doubt also, in the archipelago of the Comoros (especially at Mayotte).

From this period onward, Muslim seafarers of the Persian Gulf and the Ḥaḍramawt took part in migrations and in commerce. In particular, they taught navigation to the Sawāḥil peoples of the east coast of Africa, as a result of which Bantu migrations were extended to the islands. The Muslims established after the 10th century contacts between Sīrāf and Ṣuḥār on the one hand, and the Malagasy Comoran ports on the other. A green ceramic, called Sasano-Islamic, has been discovered at Irodo, in the far north of Madagascar, a site dated to the 10th century by the RC 14 test.

Between the 12th and 14th centuries, Muslim establishments frequented by the latter proliferated, especially at Bemanevika, Ambariotelo and Mahilaka. The ceramics imported then were of the sgraffiato type, very similar to that of Takht-i Sulaymān. The first stone-built mosques appeared at this time, as well as stone-built houses, fortifications and well-shafts. At the turn of the 14th century, the influence of the Ḥaḍramawt became perceptible, corresponding no doubt to the monopoly control of the gold trade in the region by the Mahdali.

The 14th and 15th centuries constituted a golden age for the Muslim settlements in Madagascar. The towns of Vohemar, Saʿda, Langānī (Manzaladjī) and Kingānī were particularly prosperous. They imported fabrics, pearls and Arab and Chinese ceramics. They exported rice, livestock, and chlorite slate.

At the end of the 15th century, the Portuguese invaded the Malagasy coasts. They sacked Kingānī, Saʿda and Langānī. Despite certain vicissitudes, the Muslim settlements of Madagascar were never to be subjected to the Portuguese crown. Progressively, commerce developed with other foreign nationals: French, English, Dutch and even Danish.

In the 16th century, the slave trade became important. Settlements controlled by Malagasy sovereigns, mostly Sakalava, but enlivened by native-born or immigrant Muslims, became intensely prosperous. African slaves were imported to Madagascar to cultivate the crops of Sakalava farmers; but, at the same time, Madagascans taken prisoner in the course of internal wars were exported to the Mascareignes (Filliot). In the 17th century, Langānī declined, but commercial activity continued at Boeny. Vohemar was prosperous at this time, but it too declined in the 18th century. In the second half of the 18th century, Boeny was supplanted by Majungs which, together with Nosy Be, has remained a major commercial centre until the present day. Indian Muslims settled in Madagascar in the 19th century in the course of trade missions to Majunga and Nosi Be.

Malagasy Islam is active among the Antakarana and the new converts (*moridy/murīd*), especially following the conversion of Tsimiaro in 1843.

In the south-east, certain of the Antambahoaka and Antaimoro, possessors of *sorabe* (Arabico-Malagasy manuscripts) still respect the authority of Islam, while also practising Malagasy customs.

Finally, still among the Madagascans of old stock, there should be counted the descendants of the former inhabitants of the Muslim trading-stations of the north-west called Antalaotse. Among them live some Makos, more recent arrivals from Africa and many of them converted. These various Malagasy Muslim groups may be numbered at around 100,000. They live in the coastal towns, but also in the urban settlements of central and western Madagascar, the descendants of Indian Muslim immigrants. 15% of these Indians are Sunnīs; some of these Sunnīs have introduced a ceramic type from Sind which has gradually replaced the local Malagasy pottery of the north.

Among the Shīʿī Indians, predominant are the Bohorās [*q.v.*], the most numerous (about 5,000); the Khōdjas [*q.v.*] of whom some 2,500 arrived shortly after 1900 with Amode Khōdja by way of Majunga, but whose most active centre is at Morondava; and finally, the Agha-Khānites [see AGHA KHĀN] (2,500), who arrived *ca.* 1885 and are linked to a remarkably structured international organisation.

Among the foreign Muslims of Madagascar, there are a number of Somalis and Yemenis who have settled since the colonial period, and 25,000 Comorans who live mostly in the north-west, but no longer dwell in Majunga, which they evacuated following the tragic events of December 1976.

The inhabitants of Madagascar all speak an Indonesian language modified by a Bantu substratum. Vérin, Kottak and Gorlin (1968) have acknowledged three groups of dialects, giving a separate place to the group of the north, apparently more isolated in ancient times than the centre-east and west-south groups.

In the article on Madagascar in *EI*[1], Ferrand clearly showed the lexical contribution of African in Malagasy languages. There is an old Bantu stock which could emanate from the language ancestral to Comoran and Swahili, but also from more recent borrowings from Swahili, at the time when, in the 15th century, this language was commonly spoken in the Muslim coastal settlements.

The basic vocabulary of Malagasy is 90% Indonesian, but in addition to Bantu expressions, there exist some words of Sanskrit origin; scholars are divided as to whether this Sanskrit lexical stock was brought to the island by the original Indonesian immigrants, or was absorbed through later contact with Indian civilisations.

Certain words of Arabic origin have made their way into Malagasy through the intermediary of Swahili (e.g. *sokany*, Ar. *sukkān* "rudder"). But others have been introduced directly through borrowing.

Among these borrowings from Arabic are the following:

1. Some commercial terms, e.g. *mizana* (*mīzān*) "scales", but also the names of days of the week, described by Ferrand in the following terms: *alatsinainy, talata, alarobia, alakamisy, zoma, asabotsy, alahady* (Ar. *al-ithnayni, al-thalāthāʾ, al-arbiʿāʾ al-khamīs, al-djumʿa, al-sabt, al-aḥad*). It will be noted that the Arabic definite article has been retained for Monday, Wednesday, Thursday, Saturday and Sunday and omitted for Tuesday and Friday. The names of the days are given here in Merina dialect; the forms of the other dialects show only minor phonetic variations.

2. The names of the twelve months in the dialect of the Merina and that of some other tribes reproduce the Arabic names of the twelve signs of the Zodiac: *alahamady, adaoro, adizaoaza, asorotany, alahasaty,*

asambola, *adimizana*, *alakarabo*, *alakasoy*, *adizady*, *adalo* and *alohotsy*, where the following are recognised without difficulty: *al-ḥamal*, *al-thawr*, *al-djawzā'*, *al-saraṭān*, *al-asad*, *al-sunbula*, *al-mīzān*, *al-ʿaḳrab*, *al-ḳaws*, *al-djady*, *al-dalw* and *al-ḥūt*. A fairly large number of tribes are aware of the Merina system, but still use names of months of Sanskrit origin which will be considered below.

3. The names of the 28 days of the month (the south-eastern Madagascars at least formerly had a year of 336 days) which have been preserved for us by Flacourt (*Histoire*, 1661, 174), recall those of the 28 Arab lunar mansions (see ANWĀ' and MANĀZIL). In Madagascar, to avoid the fragmentation of mansions, corresponding to the different signs of the zodiac, 3 mansions have been allotted to the 1st, 4th, 7th and 10th signs, and 2 to each of the 8 others.

Signs of the Zodiac	*Lunar mansions*	
I. Alahamady (al-Ḥamal)	1. Asharatainy	al-Sharaṭāni
	2. Alabotaini	al-Buṭayn
	3. Azoriza	al-Thurayyā
II. Adaoro (al-Thawr)	4. Adabara	al-Dabarān
	5. Alahaka	al-Hakʿa
III. Adizaoza (al-Djawzā')	6. Alahana	al-Hanʿa
	7. Azira	al-Dhirāʿ
IV. Asorotany (al-Saraṭān)	8. Anasara	al-Nathra
	9. Atarafy	al-Ṭarf
	10. Alizaba	al-Djabha, etc.

The Arabic names of the lunar mansions have thus become the names of the 28 days of the Malagasy month. When mentioned in conjunction with a day of the week, they take the place of the day of the week, which the Arabico-Malagasy texts very rarely indicate by a figure. This method seems already to have fallen into disuse in the current language, and is hardly ever employed except in witchcraft.

4. *Shikili* (dialectal variants *sikily*, *sikidy*: Ar. *shakl* "figure") is the divinatory art. It has as its object the finding of remedies and is practised throughout the island, with minor variations, between one tribe and another; *sikidy*, to use the form generally employed, is a direct derivation from the *ʿilm al-raml* "science of sand", or Arab geomancy (cf. the *Kitāb al-Faṣl fī uṣūl ʿilm al-raml* of the *shaykh* Muḥammad al-Zanātī, Cairo lith. n.d.).

Although today it constitutes nothing more than a precious relic, Arabico-Malagasy remains an essential element of the patrimony of the Great Island. The manuscripts which exist emanate from the regions of Vohipeno and Fort-Dauphin. The most ancient are stored in the Bibliothèque Nationale of Paris, but some also exist in various European countries (Norway especially), and naturally enough in the Malagasy Academy, as well as in the region of Vohipeno (south-east).

At the beginning of the 19th century, the king Andrianampoinimerina invited some Antaimoro soothsayers to the court of Tananarive, including the eminent Andriamahazonoro. Arabico-Malagasy was thus held in high regard in Iuerina until the beginning of the reign of Radama I. The latter subsequently had the Latin alphabet adopted for the writing of Malagasy.

The enterprise of adapting the Arabic alphabet to the transcription of Malagasy was both delicate and difficult; it has however been successfully achieved under satisfactory conditions. The Malagasy phonemes *b*, *d*, *f*, *h*, *l*, *m*, *nr*, *r*, *s*, have been transcribed by their Arabic equivalent; *d* is represented by a subpointed ڊ. The other phonemes are rendered thus: Malagasy g by ڠ; *ṅ* guttural by ع and sometimes by غ; the group *ṅg* also by ڠ; the phonemes *dr* and *tr*, as in the English *drive* and *travel* (they are pronounced further back in the non-Merina dialects), generally by رٌ, sometimes by ر with a *tanwin* (for example *antrendry* "date-palm" is rendered by اَرْرٌ and only the context indicates whether ر should be read *dr* or *tr*; Malagasy *t*, by sub-pointed ط; the phoneme *ts*, by Arabic ث; Malagasy *v*, by و, but Arabic ض is also pronounced *v*; Arabic رمضان *ramaḍān*, Malagasy *ramava*; Malagasy *z* by ي pronounced *z*: يي *zaza* "small child"; the phoneme *dz*, by ج and in modern Arabico-Malagasy sometimes by ذ. The non-Semitic Islamised peoples who have adopted the Arabic alphabet and have found it necessary to transcribe the occlusive *p*, have resorted to various notations. The Malays have rendered it by ڤ. The Persians, and following their example, certain Muslims of the Comoro archipelago, by پ; the Swahilis of East Africa by ب. The Malagasies adopted an unexpected solution; until the 18th century they rendered *p* by ڤ, meaning ڤ surmounting by a vertical *tashdīd*, then by ڤ. Unlike in Malay, each letter is vocalised, which facilitates the reading of Arabico-Malagasy texts, in spite of graphical variants which are too numerous to be mentioned here.

The Arabico-Malagasy alphabet was formerly used over a fairly wide geographical area; it is currently employed only on the south-eastern coast, where a great many natives were still using it at the end of the 19th century. The Malagasy Muslims of the north-west and west rather employ the Arabico-Comoran or Arabico-Swahili alphabets. The latter represents by ثٓ a *tr* identical to the Malagasy *tr*, but this form is current only in the island of Anjouan. The dialect of this island possesses a *ẓ*, the transcription by ڠ of the *č* of Persian and Turkish. The other Arabic letters ث، ح، خ، ذ، ز، ص، ض، ظ، ق، are not encountered in Malagasy except in mentions of Arabic words and they are pronounced respectively *s*, *h*, *k*, *dz*, *z*, *s*, *v*, *z*, and *k*.

Ferrand did a great deal of work on the Arabico-Malagasy manuscripts; his researches have been pursued by Gautier, Julien, Mondain, Faublée, Ramiandrasoa, Munthe and especially Dez, who has recently completed a vocabulary with which he intends to decipher and transcribe, with the aid of F. Viré, B.N. ms. 26.

Madagascar, having integrated harmoniously in its civilisation African, Indonesian, Arab and European elements, today practises in the context of its international relations a policy of worldwide contacts. In this manner, the Great Island maintains close relationships with numerous Arab and Muslim countries.

(G. FERRAND - [P. VÉRIN])

AL-**MADĀ'IN**, "the cities" (pl. of *al-madīna*), the Arabic translation of the Aramaic Māḥōzē or Medīnāthā referring to the Sāsānid metropolis on the Tigris about 20 miles southeast of Baghdād where several adjacent cities connected by a floating bridge stretched along both banks of the river. This was the imperial administrative capital, the winter residence of the king, the home of the Jewish Exilarch and the seat of the Nestorian Catholikos. Among the mixed population of Aramaeans, Persians, Greeks, and Syrians were Jews, Christians and Zoroastrians. The residential, industrial and commercial zones of the metropolis were interspersed with palaces, villas, parks, gardens, ceremonial buildings, monuments, and large open areas.

Although tradition names seven cities, there were really four or five main population centres in the late Sāsānid period. The oldest city on the east bank was Ctesiphon, founded by the Parthians in the 1st century B.C. and called "the old city" (*al-madīna al-ʿatīḳa*) by the Arabs. The old royal residence called "the White Palace" (*Ḳaṣr al-abyaḍ*) was here and this city was a local administrative centre. Next to it, the sprawling, unwalled residential district of Aspānbur grew up in the late Sāsānid period, with its great ceremonial hall (*Īwān Kisrā*), palace complex, bath, treasury, possibly a mint, game preserve and stables. About three miles away, Khusraw I founded the city of Veh Antiokh-i Khusraw in 540 A.D., where he resettled the captives taken from Antioch in Syria. Called al-Rūmiyya by the Arabs, this town had its own hippodrome and bath, was a local administrative centre and had a population of 30,000 in the late 6th century.

On the west bank stood the round, walled city of Veh-Ardashīr founded by Ardashīr I in *ca.* 230 A.D. and called Behrasīr by the Arabs, Maḥozā by Jews and Kōkhē by Christians. This city was mainly commercial and industrial, a local administrative centre west of the Tigris with its own mint, and the location of the cathedral church of the Catholikos. Heavily populated by wealthy Jews, it was also the residence of the Exilarch. Parts of this city had been abandoned by the 6th century. Sābāṭ, about three miles south of Veh-Ardashīr guarding the bridge over the Nahr al-Malik where it met the Tigris, is sometimes included in the metropolitan area.

When al-Madā'in fell to the Arabs in Ṣafar 16/ March 637, the Sāsānid royal family, nobles, and army had fled. Some soldiers were captured there, along with huge amounts of booty from the royal treasures. The people in the White Palace made peace with Saʿd b. Abī Waḳḳāṣ for the payment of tribute (*djizya*), which terms were extended to the rest of the population, while the people of al-Rūmiyya made their own peace terms. Saʿd occupied the White Palace and quartered his army in empty houses. When the soldiers settled in permanent quarters at Kūfa, they took the doors from their houses in al-Mādā'in with them.

The native population of al-Mādā'in was fairly stable immediately after the conquest. There were Persian notables (*dahāḳīn*) there in 37/657. The Exilarch and Catholikos remained there and by the late 1st/early 8th century it was also a Manichaean centre. The main change was the replacement of the Sāsānid upper classes by a small Muslim Arab garrison posted from Kūfa (300 horsemen in 43/663, 1,000 in 76/695) and led by Kūfan notables (*ashrāf*), the tribal leaders of Azd and prominent early Muslims (*buyūtāt al-nās*) who married local women at first and acquired local land. Their Friday mosque was in Madīnat al-ʿAtīḳa.

In the early Islamic period, al-Madā'in was considered the key to the Kūfan territory because it controlled the main road to the east and served as the administrative centre for the Diyāla region (*arḍ Djukhā*) under the governor of Kūfa. Salmān al-Fārisī, who died there in the caliphate of ʿUthmān (23-35/644-56), was an early *amīr*. Ḥudhayfa b. al Yamān, the first fiscal agent there under ʿUmar, established the tax rates for *arḍ Djukhā* and died at al-Madā'in in 36/657. However, early Muslim governors at al-Madā'in often combined the responsibilities for war, worship and finance, and resided in the White Palace. Al-Madīna al-ʿAtīḳa was also a mint for post-reform Umayyad dirhams.

Because of their Kūfan connections, the Muslims of al-Madā'in appear consistently as pro-ʿAlid and anti-Khāridjī. Saʿd b. Masʿūd, ʿAlī's governor 36-40/656-660 secured the city against the Khawāridj in 37/657. In 41/661 al-Ḥasan b. ʿAlī retreated there and stayed in the White Palace before coming to terms with Muʿāwiya. In 43/664 the governor, Simāk, prevented the Khawāridj of al-Mustawrad from crossing to the eastern city from Behrasīr. The Muslims of al-Madā'in supported the ʿAlids in the second *fitna* and in 65/684 Saʿd b. Ḥudhayfa, an early *ḳāḍī* there, joined the "Penitents" of Sulaymān b. Ṣurad with 170 Shīʿis from Kūfa who had settled in al-Madā'in. The Shīʿis of al-Madā'in suffered the consequences of their partisanship later when the Azāriḳa Khawāridj sacked the city in 68/687 and massacred the Muslim population. The city was also occupied by Shabīb in 76/696. By the 2nd/8th century, the Shīʿis of al-Madā'in were extremists (*ghulāt*). The Ḥārithiyya sect which believed that whoever knew the *Imām* could do as he liked was founded there and supported the ʿAlid rising of 126/744. The extremist Isḥāḳiyya sect was there in the 4th/10th century.

Although al-Manṣūr (136-58/754-75) stayed briefly at al-Rūmiyya, where Abū Muslim was in 137/754 killed, al-Madā'in declined in political and commercial importance after the foundation of Baghdād in 145/762. Most of the population, the Catholikos and the Exilarch moved to Baghdād. The White Palace was partially demolished by al-Manṣūr, and although he ordered it to be rebuilt in 158/775, it remained ruined. Its demolition was completed by al-Muktafī (289-95/902-8) in *ca.* 290/903, and the materials used to build the Tādj palace at Baghdād. By the 3rd/9th century, al-Madā'in's importance was more agricultural and the position of *ḳāḍī* there tended to be combined with that of Baghdād and other places, although the tombs of Salmān near the Īwān and of Ḥudhayfa near the river had been built at Aspānbur by then. By the 4th/10th century, al-Rūmiyya was deserted, but the rest of the town on the east bank was a flourishing suburb of Baghdād, with brick buildings, markets and two Friday mosques, while there was a large fire temple on the west bank.

There was still a small town on the east bank in the 6th/12th and 7th/13th centuries. The office of *ḳāḍī* was held by local people and the tomb of Salmān was visited annually on 15 Shaʿbān by Sunnī barbers of Baghdād and on variable dates by Shīʿis. There was a village of Imāmī Shīʿī farmers on the west bank and coins found at Tell Baruda confirm settlement at Behrasīr as late as the 7th/13th century. Behrasīr remained a small Shīʿī town in the 8th/14th and 9th/15th centuries.

The tomb of Salmān was rebuilt by the Ottoman sultan Murād IV (1032-49/1623-40) and restored in 1904-5. The village of Salmān Pāk has grown up around the tomb in the modern period, with *khāns* for Shīʿī pilgrims who often stop there when visiting the other ʿIrāḳī shrines.

On 22-3 November 1915, in the battle of Ctesiphon, the Turks defeated the Anglo-Indian army of General Townshend, stopping its advance towards Baghdād at a line east of the ruins of the Īwān.

Bibliography: The main sources for the topography of al-Madāʾin are Procopius, *Wars*, ii, 14; Yaʿḳūbī, *K. al-Buldān*, 321; Ṭabarī, i, 898, 959-60, 819, ii, 982; Dīnawarī, 70-1, 163, 376; Ḳazwīnī, *Athār al-bilād*, ed. Wüstenfeld, 303; and Yaḳūt, *Buldān*, i, 768, iv, 446-7. Modern historical and topographical studies begin with the review of Arabic sources and European traveler's accounts by Father Anastase the Carmelite, *Sulwān al-asrā fī Īwān Kisrā*, in *al-Mashriḳ*, v (1902), 673-81, 740-6, 780-6, 834-40 and M. Streck, *Die alte Landschaft Babylonien nach den arabischen Geographen*, Leiden 1900-1, ii, 246-79, followed by his *Seleucia und Ktesiphon*, in *Der Alte Orient*, xvi (1917), then by E. Herzfeld and F. Sarre, *Archäeologische Reise im Euphrat- und Tigris Gebiet*, ii, Berlin 1920, 47-76, and by E. Meyer, *Seleukia und Ktesiphon*, in *Mitteilungen der Deutschen Orient-Gesellschaft*, lxvii (April 1929), 1-27. J. Obermeyer, *Die Landschaft Babylonien im Zeitalter des Talmuds und des Gaonats*, Frankfurt a. M. 1929, 161-77, contributed information on the Jews of the city. The most important recent treatments are those by J. M. Fiey, *Topographie chrétienne de Mahoze*, in *L'Orient Syrien*, xii (1967), 397-420; idem, *Topography of al-Madaʾin*, in *Sumer*, xxiii (1967), 3-38; and by Ṣ. A. al-ʿAlī, *al-Madāʾin fi 'l-maṣādir al-ʿarabiyya*, in *Sumer*, xxiii (1967), 47-65; partially translated into English as *Al-Madāʾin and its surrounding area in Arabic literary sources*, in *Mesopotamia*, iii-iv (1968-9), 417-39.

On the question of mints at al-Madāʾin, see H. Lavoix, *Catalogue des monnaies muselmanes de la Bibliothèque Nationale*: *Khalifes orientaux*, Paris 1887, 102; J. Walker, *A catalogue of the Arab Sasanian coins*, London 1941, xcli; F. D. J. Paruck, *Sāsānian coins*, Bombay 1924, 139, 144, 158-9, 186-7; R. Göbl, *Sasanidische Numismatik*, Brunswick 1968, 80-2, 84; idem, *Der Sāsānidische Münzfund von Seleukia* (*Vēh-Ardašēr*) *1967*, in *Mesopotamia*, viii-ix (1973-4), 246-8, 232-3.

For the conquest of al-Madāʾin by the Muslims, see Balādhurī, *Futūḥ*, 262-3, 277; Yaʿḳūbī, *Taʾrīkh*, ii, 165; Dīnawarī, 133; Ṭabarī, i, 2357-8, 2424-35, 2439-42, 2451, 2497; Ibn al-Athīr, iii, 396-403; and Yaḳūt, i, 769, iv, 446. On Muslim settlement and early administration, see Abū Yūsuf, *K. al-Kharādj*, Cairo 1382, 48; Ibn Saʿd, *K. al-Ṭabaḳāt*, vi, 8-9, 65, vii/2, 64, 66; Yaʿḳūbī, *Taʾrīkh*, ii, 218; Ṭabarī, i, 2374-5, 2463, 2645, 3259, 3366, 3372, ii, 2, 39, 46, 57, 504, 561, 635, 899, 929, 979-80, 982, 1069; Dīnawarī, 163, 218; and Ibn al-Nadīm, *Fihrist*, ed. Fluegel, 334. For ʿAlid and Shīʿī connections and Khāridjī attacks, see Dīnawarī, 218; Ṭabarī, i, 3259, 3366, ii, 2, 39, 504, 561, 755, 886-7, 892, 949; Nawbakhtī, *K. Firaḳ al-Shīʿa*, 29; al-Khaṭīb, *Taʾrīkh Baghdād*, vi, 380-1; and L. Massignon, *Salmân Pâk et les prémices spirituelles de l'Islam Iranien*, Tours 1934. On the period of decline, see Ṭabarī, iii, 320, 385; Masʿūdī, *Murūdj*, ii, 200; al-Iṣṭakhrī, *K. Masālik al-mamālik*, 86; Ibn Ḥawḳal, *K. Ṣūrat al-arḍ*[1], 244; Muḳaddasī, *Aḥsan al-taḳāsim*, 122; Ibn Rusta, *al-Aʿlāḳ al-nafīsa*, 186; Yāḳūt, i, 109, 809, ii, 867; and Ḳazwīnī, *Āthār*, 303.

The results of the first real archaeological excavations at this site may be found in O. Reuther, *Die Ausgrabungen der deutschen Ktesiphon-Expedition im Winter, 1928-9*, Berlin 1930; idem, *The German excavations at Ctesiphon*, in *Antiquity*, iii (1929), 434-51; E. Kühnel and F. Wachtsmuth, *Die Ausgrabungen der zweiten Ktesiphon-Expedition* (*Winter 1931/32*), Berlin 1933; J. Upton, *The Expedition to Ctesiphon 1931-32*, in *Bulletin of the Metropolitan Museum of Art*, xxvii (Aug. 1932), 188-97; and J. H. Schmidt, *L'expédition de Ctésiphon 1931-32*, in *Syria*, xv (1934), 1-23. The recent work of the Italians is published in the journal *Mesopotamia*, starting in 1966, and there is a summary of the work by the ʿIrāḳīs in T. Madhlūm, *al-Madāʾin* (*Ṭisfūn*) *1970-1971*, in *Sumer*, xxvii (1971), 129-46. The results of the Italian expeditions have been summarised by A. Invernizzi, *Ten years' research in the Al-Madaʾin area*: *Seleucia and Ctesiphon*, in *Sumer*, xxxii (1976), 167-75. (M. Streck - [M. Morony])

AL-MADĀʾINĪ, ʿAlī b. Muḥammad b. ʿAbd Allāh b. Abī Sayf, Abu 'l-Ḥasan, early Arabic historian, was born, according to his own information, in 135/752 (*Fihrist*, 100). Little is known about his life. He was a client of Samura b. Ḥabīb b. ʿAbd Shams b. ʿAbd Manāf, i.e. of the Companion ʿAbd al-Raḥmān b. Samura [*q.v.*]; according to *Fihrist*, 101, al-Madāʾinī dedicated a monograph to him. Al-Madāʾinī, who was in Baṣra in 153/770 (see al-Djāḥiẓ, *al-Bayān wa 'l-tabyīn*, ii, Cairo 1367/1948, 93), later went to al-Madāʾin and Baghdād at an unknown date. It is also unknown whether his *nisba* originated from a stay in al-Madāʾin or whether such a stay was derived from an already-existing *nisba*. The same *nisba* is in any case also carried by ʿUtba b. ʿAbd Allāh, grandson of ʿAbd al-Raḥmān b. Samura (Yāḳūt, i, 644). Al-Madāʾinī is explicitly said to have been a pupil of the Muʿtazilī Muʿammar b. ʿAbbād al-Sulamī (d. 215/830) of Baṣra, who lived in Baghdād (see Ibn al-Murtaḍā, *Ṭabaḳāt al-Muʿtazila*, Beirut 1961, 54); elsewhere (*ibid.*, 140) he is counted among the people of Kūfa. It is indeed possible that he stayed also in this city, because there are a great number of Kūfan people among his informants. He found a friend and patron in the musician and scholar Isḥāḳ b. Ibrāhīm al-Mawṣilī (d. 235/850 [*q.v.*]), in whose house he is said to have died. The data on the year of his death in Baghdād vary; 215/830, 224/839, 225/840, 228/843 (*Fihrist*, 100 al-Ṭabarī, iii, 1330; al-Masʿūdī, *Murūdj*, vii, 287, = § 2973; Yāḳūt, *Udabāʾ*, v, 309 ff.; *Taʾrīkh Baghdād*, xii, 55). Since he is said to have died over 90 years old, as Yāḳūt (iv, 215) still mentions him for the year 226/841, and since his great historical work on the caliphs (see below) is said to have treated of the reign of al-Muʿtaṣim (218-27/833-42), the year 228/843 seems the most probable (see G. Rotter, *Zur Über-*

lieferung einiger historischer Werke Madā'inīs in Ṭabarīs Annalen, in *Oriens*, xxiii-xxiv [1970-1], 104).

Al-Madā'inī, a highly productive scholar with many-sided interests, wrote more than 200 works (see *Fihrist*, 101-4; Yāḳūt, *Udabā'*, v, 312-8; Y. al-ʿIshsh, *al-Khaṭīb al-Baghdādī, mu'arrikh Baghdād wa-muḥaddithuhā*, Damascus 1364/1945, index; P. Sbath, *Choix de livres qui se trouvaient dans les bibliothèques d'Alep (au XIII^e siècle)*, in *Mémoires de l'Institut d'Égypte*, xlix, Cairo 1946, index). An important part of his works deals with historical subjects, reaching from the origins of Islam until his own days. In treating the genealogy of the Ḳuraysh, pre-Islamic items are brought together with Islamic ones. He is concerned not only with the *maghāzī* of the Prophet, but also with his settlements, sermons, peace treaties, envoys and correspondence. The events during the period of the four rightly-guided caliphs have his interest no less than the history of the Umayyads and the ʿAbbāsids, the conquests as well as the marriages of the *ashrāf*. He wrote about the *akhbār* of poets and singers, dealt with geographical items like al-Madīna and mountains and valleys in its neighbourhood, but also with (famous) fools, traitors, with coinage and exchange of money, with miserliness and jealousy, with animals in general and horses in particular. Only two works, the *Kitāb al-Murdifāt min Ḳuraysh* and the *Kitāb al-Taʿāzī* (two *djuz'*s) (see below) have come down to us as separate manuscripts.

To Muslim scholars, al-Madā'inī was a great and extremely reliable specialist in the *akhbār*. On the one hand, this can be deduced from their opinion about him. Aḥmad b. al-Ḥārith al-Kharrāz (see below) for instance transmitted that scholars considered al-Madā'inī as the authority on Khurāsān, Hind and Fārs (*Fihrist*, 93, l. 23). According to al-Marzubānī (*Nūr al-ḳabas al-mukhtaṣar min al-Muḳtabas*, Beirut 1384/1964, 182 ff.), "He who aspires to [knowledge of] the *akhbār al-Islām* should keep to al-Madā'inī's works". Abū Zakariyyā' al-Azdī (*Ta'rīkh Mawṣil*, Cairo 1967, 25) considered him an authority in the field of the history of the Prophet and the *akhbār* of the Arabs, while al-Khaṭīb al-Baghdādī (*Ta'rīkh Baghdād*, xii, 55) adds: "... also [in the field of] their genealogy, the *futūḥ*, the *maghāzī* and the transmission of poetry". On the other hand, the high esteem in which al-Madā'inī's oeuvre was held may be seen from the quotations in the works of many Muslim scholars. Appearing with his *kunya*, *nisba*, *ism* or as Ibn Abī Sayf, al-Madā'inī's name is in the earlier period mostly mentioned in connection with an *isnād*, later together with the respective book-title. ʿAbd al-Ḳādir al-Baghdādī (d. 1093/1682) is one of the last authors to quote him in his *Khizānat al-adab*. Muslim scholars were interested not only in al-Madā'inī's historical works, but also in his books on *adab*, geography, zoology and poetry. For further information, see Badrī Muḥammad Fahd, *Shaykh al-akhbāriyyīn Abu 'l-Ḥasan al-Madā'inī*, Nadjaf 1975, 141 ff.

While al-Madā'inī was an historian by interest, his working method was that of a *muḥaddith*: from works or accounts of others he chose those parts which seemed appropriate to him, and with those building-stones of varying size he composed his book. These selected pieces of information are sometimes preceded by *isnāds* which go back to eye-witnesses or contemporaries of the event in question, sometimes by *isnāds* which contain only his immediate source and eventually its authority or transmitter. This procedure is certainly to a high extent postulated already by the working method of his source; in opposition to Abū Mikhnaf for instance, ʿAwāna b. al-Ḥakam [*q.v.*] hardly ever gives *isnāds* which go back to the account of an eye-witness. Sometimes *isnāds* even fail altogether, and this again may depend on the nature of the source at our disposal in which al-Madā'inī is quoted. Even in passages where al-Madā'inī summarises the accounts of several authorities (see al-Ṭabarī, ii, 1236, 1286, 1308, iii, 38), or in an *adab* work like the *Kitāb al-Taʿāzī*, the style of giving information does not change; there is only the detailed rendering of the events without commentary. Not the subtle saying or the polished turn of speech seems to be important, but the historical framework in which the words quoted were uttered. Al-Masʿūdī pertinently compares al-Madā'inī with the latter's contemporary al-Djāḥiẓ when mentioning al-Djāḥiẓ's death (*Murūdj*, viii, 33 f. = § 3146): "Among the transmitters (*ruwāt*) and scholars no one has written more books than he (al-Djāḥiẓ). To be sure, al-Madā'inī too has written very much, but he limits himself to reproducing what he has heard, while the works of al-Djāḥiẓ—notwithstanding their well-known [dogmatic] deviations—illuminate the mind [of the reader]."

The variety of al-Madā'inī's interests brings about the fact that he refers to a considerably larger group of authorities than Abū Mikhnaf, the historian of the preceding generation with whom he may be compared in that their working methods show resemblances. But when describing events which are interrelated through causality, he apparently relies on a smaller number of authorities. He then depends on works of, among others, ʿAwāna b. al-Ḥakam, Abū Mikhnaf, Abū Bakr al-Hudhalī (Sulmā b. ʿAbd Allāh d. 159/775 *et var.*, see Ibn Ḥadjar, *Tahdhīb al-tahdhīb*, Ḥaydarābād 1325-7, xii, 45), al-Mubārak b. Faḍāla (d. 164/780, see *ibid.*, x, 28 ff.), Ḥammād b. Salama (d. 167/783, see *ibid.*, iii, 11-6), Abu 'l-Yaḳẓān (see *GAS*, i, 266 ff.; for the list of his works, see *Fihrist*, 94), al-Mufaḍḍal al-Ḍabbī and ʿAlī b. Mudjāhid. But, as is shown—among other things—by the descriptions of interrelated events, he also makes use of earlier works by authorities who have not yet become renowned to us as historians.

As direct transmitters of al-Madā'inī's works are mentioned Aḥmad b. al-Ḥārith al-Kharrāz al-Kūfī (who is said to have heard the reading of all the books of al-Madā'inī, see Yāḳūt, *Udabā'*, i, 407 ff.), Abū Bakr Aḥmad b. Abī Khaythama (who is reported to have learnt from him all about the *ayyām al-nās*, see *ibid.*, 128 ff.), and al-Ḥārith b. Abī Usāma (*ibid.*). Al-Balādhurī [*q.v.*], ʿUmar b. Shabba [*q.v.*], Khalīfa b. Khayyāṭ [see IBN KHAYYĀṬ AL-ʿUṢFURĪ] and Isḥāḳ b. Ibrāhīm al-Mawṣilī [*q.v.*] also prove to be his direct transmitters.

In the quotations from al-Madā'inī's works there are parallel passages which are nevertheless divergent from one another. In order to explain this it should be kept in mind that, during his long life as a scholar, al-Madā'inī certainly revised and completed his earlier works in later years, and that they have been transmitted as such. The material is overlapping, due to the fact that he wrote monographs on individual persons (like for instance the *Kitāb Akhbār al-Ḥadjdjādj b. Yūsuf*) or on separate subjects (like for instance the *Kitāb al-Taʿāzī*, in which al-Ḥadjdjādj b. Yūsuf is also taken into account), as well as compendia (like the *Kitāb Akhbār al-khulafā' al-kabīr*). It is possible that al-Madā'inī himself is responsible for the different forms and lengths with which material appears in the various

passages (see also Rotter, *op. cit.*, 127 ff.). Attention should further be paid as to whether the quotations under consideration are introduced with *anna*, for this always indicates that the wording has been revised or summarised (see U. Sezgin, *Abū Miḥnaf*, Leiden 1971, 92).

The two works which have been preserved are: *Kitāb al-Murdifāt min Ḳuraysh*, ed. ʿAbd al-Salām Hārūn, in *Nawādir al-makhṭūṭāt*, i, Cairo 1951, 57-80, and *Kitāb al-Taʿāzī*, ed. by Ibtisām Marhūn al-Ṣaffār and Badrī Muḥammad Fahd, Nadjaf 1391/1971. A great number of quotations from the latter work are also found in the *Kitāb al-Taʿāzī* of al-Mubarrad (d. 286/899), ed. Muḥammad Dībādjī, Damascus 1396/1976 (see Index), so that those parts which have not been preserved in the manuscript of al-Madāʾinī's work can be reconstructed. In the two *djuz*ʾs which have come down to us, the author uses *isnād*s and refers to *ca.* 80 authorities (a few transmitters, other scholars and mainly persons who can be traced in al-Ṭabarī's *Taʾrīkh*), mostly just for one quotation. From a comparison with al-Mubarrad's work, it becomes clear that al-Madāʾinī compiled from abundant historical material about the way in which the caliphs, prominent and learned ment sought consolation, for themselves or for others, for the death of a close relative or friend; poems, philosophical or lexicographic explanations are hardly found. One aspect of al-Madāʾinī's working method, throwing at the same time some light on the great number of his works, becomes clear. Since he mentions several times people like al-Ḥadjdjādj b. Yūsuf, Iyās b. Muʿāwiya and Muḥammad b. Sīrīn, it may rightly be assumed that this material was also to be found in the monographs which he wrote on these men. The description of the epidemics of the plague were certainly also found in the *Akhbār al-ṭāʿūn* (see below) quoted by al-Mubarrad.

Al-Madāʾinī's works quoted by later authors, with named titles, include: *K. al-Faradj baʿd al-shidda* (A. Wiener, in *Isl.*, iv [1913], 276); *K.* (*al-Khatm wa*) *'l-rusul* (Ibn Ḥadjar, *Iṣāba*, ii, 205, 264, 764, iii, 1018); *K. al-Samīr* (al-Tanūkhī, *Faradj*, ii, 174); *K. al-Djawābāt* (*K. al-Aghānī*, Cairo 1927, xvi, 176; al-Hamdānī, *Mukhtaṣar K. al-Buldān*, 39-40); *K. Akhbār Thaḳīf* (Ibn Ḥadjar, *Iṣāba*, iii, 1258); *K. al-Nisāʾ al-nāshizāt* (al-Baghdādī, *Khizāna*, i, 479-80, iv, 366-7, = ? *al-Nawāḳiḥ wa 'l-nawāshiz*, *ibid.*, i, 10, 84, and al-Ḥuṣrī, *Dhayl Zahr al-ādāb*, Cairo 1353, 283-5, = ? *K. al-Nisāʾ al-fawārik*, in *Khizāna*, i, 408); *K. Ummahāt al-khulafāʾ* (Ibn Abi 'l-Ḥadīd, *Sharḥ Nahdj al-balāgha*, Cairo 1368/1959 ff., xi, 69); *K. al-Aḥdāth* (*ibid.*, xi, 44-6; Ibn Maʿṣūm, *al-Daradjāt al-rafīʿa*, Nadjaf 1381/1962, 6-8); *K. al-Djamal* (Ibn Abi 'l-Ḥadīd, *Sharḥ*, i, 253, 256, vi, 215, ix, 113, 115, 317; Ibn ʿAbd Rabbih, *al-ʿIḳd al-farīd*, iv, 318 ff.; al-Ṭabarī, cf. Rotter, *op. cit.*, 115 ff.; U. Sezgin, *Abū Miḥnaf*, 102 ff.); *K. Ṣiffīn* (Ibn Abi 'l-Ḥadīd, *Sharḥ*, ii, 246, 268, vi, 134-6); *K. al-Khawāridj* (*ibid.*, ii, 271-2); *K. Akhbār al-ḳilāʿ* (*wa 'l-akrād*) (al-Masʿūdī, *Murūdj*, ii, 70; Ibn Mākūlā, *Ikmāl*, Ḥaydarābād 1962 ff., iv, 198); *K. Zakan Iyās* (*b. Muʿāwiya*) (al-Maydānī, *Madjmaʿ al-amthāl*, i, 120); *Nawādir al-ḳuḍāt* (al-Tawḥīdī, *al-Baṣāʾir*, ii, 700-1, and 795-6?); *Akhbār Zufar b. al-Ḥārith* (Yāḳūt, iv, 369; al-Balādhurī, *Ansāb*, v, 303-4); *Akhbār al-ṭāʿūn* (al-Mubarrad, in *K. al-Taʿāzī*, 209, and also in *ibid.*, 211, 216, 218, perhaps further 210 [from al-Madāʾinī, also in al-Tanūkhī, *Faradj*, i, 187, ch. vi, according to Wiener, *op. cit.*, 278]; Ibn Taghrībirdī, Cairo, i, 313; Khalīfa b. Khayyāṭ, *Taʾrīkh*, Nadjaf 1965, 471; al-Dhahabī, *Taʾrīkh al-Islām*, ii, Cairo 1368, 383; other citations in al-Mubarrad, *op. cit.*, 209 n.); *al-Makāʾid* (Ibn ʿAbd al-Barr, *Istīʿāb*, Cairo 1358/1939, ii, 197; Ibn Ḥadjar, *Iṣāba*, i, 535); *K. al-Mugharribīn* (al-Baghdādī, *Khizāna*, i, 10, ii, 109).

Other quotations refer probably to the following works: *Asmāʾ man ḳutila min al-Ṭālibiyyīn* (al-Iṣfahānī, *Maḳātil*, often through Aḥmad b. al-Ḥārith al-Kharrāz, Iṣfahānī, *Maḳātil*, index); *K. Akhbār Ziyād b. Abīhi* (al-Zubayr b. Bakkār, *Muwaffaḳiyyāt*, 304-6; Ṭabarī, ii, 25-6; Ibn ʿAbd al-Barr, *Istīʿāb*, i, 198); *K. Akhbār al-khulafāʾ al-kabīr* (Yāḳūt, ii, 319, iii, 499; *Aghānī*, vii, 2 ff.; Ibn Abi 'l-Ḥadīd, ii, 25); *K. Adab al-sulṭān* (al-Tawḥīdī, *Baṣāʾir*, iv, 294-5); *K. Maḳtal ʿUthmān* (see U. Sezgin, *Abū Miḥnaf*, 51, 102; Ibn Abi 'l-Ḥadīd, x, 6-7); *K. al-Ghārāt* (Ibn Abi 'l-Ḥadīd, ii, 114 f.; cf. al-Thaḳafī, *al-Ghārāt*, Tehran 1395, 418 f.); *K. Banī Nādjiya wa-Khirrīt b. Rāshid wa-Maṣḳala b. Hubayra* (al-Thaḳafī, 332 ff.); *K. Khuṭab ʿAlī* (Ibn Abi 'l-Ḥadīd, vi, 136); *K. ʿAbd Allāh b. ʿĀmir al-Ḥaḍramī* (al-Thaḳafī, 373-412 = Ibn Abi 'l-Ḥadīd, iv, 34-53; see U. Sezgin, *Abū Miḥnaf*, 56); *K. Mardj Rāhiṭ* (al-Balādhurī, *Ansāb*, v, 131, 137, 144; Ibn ʿAbd al-Barr, *Istīʿāb*, iii, 525); *Akhbār al-Ḥadjdjādj* [*b. Yūsuf*] *wa-wafātihi* (al-Zubayr b. Bakkār, *Muwaffaḳiyyāt*, 103, 108, 475); *K. Khabar al-Baṣra wa-futūḥihā* (with a subtitle *Wilāyat al-Mughīra b. Shuʿba*, fragment in *Aghānī*, xvi, 91, 95-6; Yāḳūt, iv, 833, 845, 971; see Rotter, *op. cit.*, 124 ff.); *K. Akhbār Abi 'l-Aswad al-Duʾalī* (*Aghānī*, xii, 298, 309-10, 311-8, 322, 323-5, 328-9, 330-1, 334; Ibn Ḳifṭī, *Inbāh al-ruwāt*, i, 16; Ḥuṣrī, *Dhayl*, 167-8; al-Azdī, *Taʾrīkh Mawṣil*, 167); *K. al-Awāʾil* (al-ʿAskarī, *K. al-Awāʾil*, index).

Al-Ḳalḳashandī's *Ṣubḥ al-aʿshā* contains many quotations which are referred partly to al-Madāʾinī, partly to a certain Muḥammad b. ʿUmar al-Madāʾinī, and to the latter's (?) *K. al-Ḳalam wa 'l-dawāt*. It is, however, probable that in all cases ʿAlī b. Muḥammad al-Madāʾinī is meant.

(Ursula Sezgin)

MADANIYYA, a branch of the Shādhiliyya [*q.v.*] Ṣūfī order named after Muḥammad b. Ḥasan b. Ḥamza Ẓāfir al-Madanī (1194-Djumādā I 1263/1780 - April-May 1847), who was originally a *muḳaddam* [*q.v.*] of Mawlāy Abū Aḥmad al-ʿArbī al-Darḳāwī [see DARḲĀWA]. From 1240/1824-5 al-Madanī presented himself as independent head of a *ṭarīḳa* [*q.v.*] in his own right (ʿAbd al-Ḳādir Zakī, *al-Nafḥa al-ʿaliyya fī awrād al-Shādhiliyya*, Cairo 1321/1903-4, 233) while retaining the essentials of Shādhilī teaching and liturgical practice (see Muḥammad Aḥmad Sayyid Aḥmad, *al-Anwār al-dhahabiyya li 'l-ṭarīḳa al-Shādhiliyya*, Alexandria n.d., *passim*). By that time, he had settled in the Tripolitanian town of Miṣrāta, where he died and where his shrine may be visited today.

Under his son and successor Muḥammad (Shaʿbān

1244 - 2 Radjab 1321/February 1829 - 24 September 1903) the order spread in Tripolitania, Cyrenaica, Fazzān, Tunisia, Egypt (Alexandria, Cairo and Suez) and the Ḥidjaz (Zakī, 239). In 1289, Muḥammad went to Istanbul upon the request of Maḥmūd Nadīm Pasha [*q.v.*], the former *wālī* of Tripoli who had then become Grand Vizier. In this city al-Madanī was introduced to the future Sultan ʿAbd al-Ḥamīd, who was initiated by him into his *ṭariḳa*. Later, from 1293/1876 onwards al-Madanī took up permanent residence in Istanbul. For a period of about thirty years he acted as an adviser to Sultan ʿAbd al-Ḥamīd II, whose accession to the throne he had correctly predicted and who believed strongly in his magical powers and skills ([Ibrāhīm al-Muwayliḥī], *Mā Hunālika*, Cairo 1896, 200). The Sultan built al-Madanī a *tekke* [*q.v.*] in Beshikṭāsh where he himself occasionally attended *dhikr* [*q.v.*] sessions. In this *tekke*, al-Madanī was buried following his death in 1903.

On the Sultan's behalf, he communicated with Aḥmad ʿUrābī [*q.v.*] during the events leading up to the British occupation of Egypt in 1882 (cf. A. Schölch, *Ägypten den Ägyptern! Die politische und gesellschaftliche Krise der Jahre 1879-1882 in Ägypten*, Zürich-Freiburg-im-Br. 1973, 214, 350, n. 99). In 1898, he was instrumental in the appointment of Khayr al-Dīn Pasha [*q.v.*] to the office of Grand Vizier. His closeness to the Sultan seems to have been envied by another advisor of the Sultan, the head of the Rifāʿiyya order, Abu 'l-Hudā al-Ṣayyādī. According to this *shaykh*, who sought to discredit al-Madanī whenever the occasion presented itself, al-Madanī's father had been the son of a renegade Jew from Thessaloniki (al-Muwayliḥī, 203. See also C. Snouck Hurgronje, *Verspreide Geschriften*, iii, 158 ff.; Walī al-Dīn Yakan, *al-Maʿlūm wa 'l-madjhūl*, i, Cairo 1911, 100 f.; Rifʿat al-Djawharī, *Djannat al-Ṣaḥrāʾ: Siwa aw Wāḥat Āmūn*, Cairo 1946, 98).

The Sultan seems to have supported the Madaniyya in the presumption that it would reverse the growth of the Sanūsiyya order [*q.v.*] as well as counter European influence in North Africa (cf. E. de Remzi, *Nozioni sull'Islâm con speciale riguardo alla Tripolitania*, Tripoli 1918, 89). Here, a major role was played by Muḥammad's brother Ḥamza, who, from Tripolitania and with Ottoman support, directed agitation against the French in Tunisia (G. Charmes, *La Tunisie et la Tripolitaine*, Paris 1883, 275-7, 392).

After Muḥammad Ẓāfir's death, a dispute about the succession as head of the order arose between his brother Ḥamza and his son Ibrāhīm, who had already been acting as his father's deputy for several years. The dispute was settled when, following intervention by the Sultan, Ibrāhīm was duly installed as his father's *khalīfa* (Zakī, 244), By then, however, several branches of the Madaniyya had emerged in Egypt (al-Hāshimiyya, al-Marzūḳiyya al-Shādhiliyya, and al-Ḳādiriyya al-Madaniyya) and in the Middle East (al-Yashruṭiyya, and al-Fāsiyya). These had reduced the order's membership, while the *zāwiyas* in Tunisia and Algeria had become completely autonomous (Remzi, 90). In addition, Ibrāhīm lost control over the *zāwiyas* in Tripolitania and Cyrenaica in consequence of the Italian occupation of Libya in 1912. In these territories, Muḥammad b. Muḥammad Ẓāfir (d. 1917), who was Ibrāhīm's brother, was subsequently recognised as the local head of the Madaniyya. This left Ibrāhīm with control over the *tekke* in Istanbul and the Ḥidjāz only (Remzi, 89). From the last decade of the 19th century, the number of Madaniyya *zāwiyas* steadily declined: in Tripolitania, e.g., the number of *zāwiyas* decreased from more than 12 in the 1880s to about 9 in 1918 and to 7, all in the town of Miṣrāta, in 1925 (L. Massignon, *Annuaire du monde musulman*, Paris 1925, 97).

Today, the original Madaniyya seems to be limited to Egypt, where it is under the direction of a grandson of the order's founder. Its followers are encountered mainly in the coastal area between Sīdī al-Barrānī, where this grandson lives, and Alexandria. Active lodges existed (in 1981) in both of these towns, in the towns of Marsā Maṭrūḥ and Burdj al-ʿArab, and in the oasis of Sīwa.

Bibliography: No comprehensive study of the history of the Madaniyya order exists, and the data at present available concerning Muḥammad b. Muḥammad's role at the court in Istanbul are few and imprecise. A study of the order's history based upon the Istanbul archives could remedy this situation. In addition to the references given in the article, see Aḥmad b. Ḥusayn al-Nāʾib al-ʿAwsī al-Anṣārī, *al-Manhal al-ʿadhb fī taʾrīkh Ṭarāblus al-Gharb*, Istanbul 1317/1899-1900; al-Ḥasan b. Yūsuf al-Marzūḳī, *al-Fuyūḍāt al-raḥmāniyya, sharḥ al-waẓīfa al-Madaniyya*, Cairo 1940, 171 (for data concerning the founder's son). See also O. Depont and X. Coppolani, *Les confréries religieuses Musulmanes*, Algiers 1897, 218 ff., 514 ff., and F. De Jong, *The Ṣūfī orders in post-Ottoman Egypt, 1911-1981* (forthcoming), chs. 2 and 7. For the order's *awrād* [see WIRD] and *aḥzāb* [see ḤIZB] as well as its *waẓīfa* [*q.v.*], see Muḥammad Aḥmad Sayyid Aḥmad, *al-Anwār al-dhahabiyya li 'l-ṭarīḳa al-Shādhiliyya*, Alexandria n.d., *passim*. Muḥammad b. Muḥammad b. Ḥasan b. Ḥamza Ẓāfir al-Madanī, *al-Nūr al-sāṭiʿ wa 'l-burhān al-ḳāṭiʿ*, Istanbul 1301/1883-4 (also published as an appendix to Muḥammad Aḥmad b. ʿAbd Allāh al-Madanī, *al-Silsila al-dhahabiyya fī 'l-tawassul bi 'l-sāda al-Shādhiliyya*, Cairo n.d.) is basically a manual setting out the fundamentals of Shādhilī mystical method and practice. (F. DE JONG)

AL-**MADD** WA 'L-**DJAZR** (A.), literally "the ebb and flow", the name given by the Arabs to the phenomenon of the tide, which they explained by following the various theories inherited from the classical world; the latter assert in the main that the tide possesses a universal character resulting from the moon's having a stronger influence than the sun over the mass of the Ocean's waters. The classical writers reached this conclusion after having studied the accounts of their great navigators such as Pytheas and Nearchus. Also, Theophrastus (327-287 B.C.), relying on the work of Nearchus, says that in the islands of the Indian Ocean one can see from out at sea trees whose branches are under water at high tide, while their roots are dry at low tide; as for the origin of the tides, he seems to attribute it to the action of the winds. Archimedes and Posidonius, for their part, maintained, as did al-Kindī later on, that the surface of the seas was spherical and that the centre of this sphere was the centre of the earth. On the other hand, Eratosthenes, in order to explain

the intensity of the marine currents, especially in straits, asserted that the seas had variable levels which were due, like the tides in the Ocean, to the height of the moon: when it rises and sets, the flow begins, and when it passes by the upper or lower meridian of the observation place, it ends. It was also observed that the height of the tides depended on the position of the sun and moon on the ecliptic (opposition, conjunction, quadratures) and on the position of the observation place (Seleucus, Hipparchus).

However, the classical author who is most interested in these problems is Posidonius of Apamea (135-50 B.C.), who arrived at a series of generally exact conclusions after having studied the authors mentioned above and having listened to the accounts of the sailors of Cadiz. His opinions were adopted by Pliny, Seneca and Cicero. On the other hand, Pomponius Mela (*ca.* 42-5 B.C.), if he clearly accepted the moon's influence, also presented two other hypotheses: for him, the tides were the result of the earth's breathing (which is also asserted by Brunetto Latini, d. 1295) or of the cavities in it (cf. R. Almagià, *La conoscenza del fenomeno delle maree nell'antichità*, in *AIHS*, xxviii [1949], 893, and *La dottrina della marea nell'antichità classica e nel medio evo*, in *Memorie della Reale Accad. dei Lincei* [1904]).

It is hard to know to what extent the Arabs were aware of these theories, for we do not know the chain of possible transmitters. In any case, we find in Arabic texts an echo and development of certain doctrines sketched in antiquity. Also, Ibn Khurradādhbih (230/844) gives quite a fair explanation of the phenomenon, and al-Kindī (d. 256/870) wrote a *Risālat al-Madd wa 'l-djazr* (cf. E. Wiedemann, *Al-Kindis Schrift über Ebbe und Flut*, in *Annalen der Physik*, lxxvii [1922], 374-87) which is not the same as that which, bearing the same title, was studied and translated by the author of the present article (in *Mem. de la Real Acad. de Buenas Letras de Barcelone*, xiii [1971-5], 135-212; a résumé of this *Risāla*, Barcelona 1957). The explanations given by Abū Ma'shar al-Balkhī (d. 272/886) in his *Kitāb al-Madkhal ilā 'ilm aḥkām al-nudjum* (translated into Latin as *Introductorium in astronomiam*) are interesting as having rapidly become known to Christian authors. Also, for example, the text attributed provisionally by R. C. Dales (see *Isis*, lvii [1966], 455-74) to Robert Grosseteste, is, in the order and arrangement of the ideas and despite the mention of al-Biṭrūdjī which it contains (see 459, 460, etc.), in large part derived from Abū Ma'shar, as can be appreciated by comparing it with the *Introductorium* (see 461, 462, 465, 466, 467 of Dales and the résumés of L. Martínez Martín, art. cited, *passim*).

For Abū Ma'shar, the tides depend on the movement of the stars and are due to the "attraction" of the moon: the waters of the flow come up boiling from the sea bed, which explains why they are warmer than those of the ebb; he analyses the inequality of the ebb and flow in the two hemispheres and establishes eight distinct causes for it, of which some very reasonable ones are of an astronomical or topographical nature.

As for al-Mas'ūdī (d. 345/956), he sometimes follows the *Introductorium* in his *Murūdj al-dhahab* (i, 244-55 = §§ 259-69) and presents all kinds of theories, of which some are purely para-scientific; in the *Tanbīh* (French tr. Carra de Vaux, 104-5), he states that there are some authors for whom the tide is due to an angel who produces the ebb and flow by plunging his foot or his fingers into the sea and withdrawing them. For their part, the *Rasā'il* of the Ikhwān al-Ṣafā' attribute the tides to the heating of the rocks on the sea bed by the moon's rays. Ibn Rushd (d. 595/1198), in the *Expositio media* of the *Meteors* (cf. Aristotle, *Omnia opera*. Averroes' Commentary, vi, Venice 1560, 29-30) seems to have been influenced by the theory of Eratosthenes relating to the straits, for he says that the waters flow into the Ocean from the seas higher than it and it flows into the lower seas; meanwhile, in the latter, the waters are set in motion by the winds which arise in their midst because of the moon's heat, and flow towards the Ocean in an upward movement, while the Ocean sinks.

We know that the establishment of harbours is presented for the first time in a graphic and systematic manner in the *Atlas catalan* of 1375 (see D. Gernez, *Les indications relatives aux marées dans les anciens livres de mer*, in *AIHS*, xxviii [1949], 671-91), but in some earlier Arabic texts, particularly those which concern the Indian Ocean, some passages figure which allow us to state that the phenomenon was known and put to good use by sailors: also, for example, in § 17 and p. 46, n. 2 of the *Relation de la Chine et de l'Inde* (851), ed.-French tr. J. Sauvaget, Paris 1948 (in the rest of the world, cf. Bede, *apud* Duhem, in *SM*, iii, 20; Needham, in *Science and civilization in China*, iv/2 [1965], 217, 410). In the Islamic world, A. Mez (*Renaissance*, Spanish tr. esp. 553; Eng. tr., 466) following al-Muḳaddasī (*Aḥsan al-taḳāsīm*, 124-5) remarks the existence in Baṣra (in 375/985) of mills operated by the tide, which is not astonishing if one takes account of the height of the town at the head of the Persian Gulf, a thousand years ago when the alluvial deposits had still not made it distant from the coast (cf. Ibn Ḥawḳal, *Ṣūrat al-arḍ*, French tr. Kramers-Wiet, i, 229; al-Dimashḳī, *Cosmographie*, French tr. Mehren, 223; Pellat, *Milieu*, 16-7). Al-Muḳaddasī says, in fact, "The flow constitutes a miracle and an advantage for the inhabitants of Baṣra. The water inundates it twice a day, rises into the canals, waters the gardens and helps the boats reach their anchorage. The ebb is equally useful, for it operates the mills situated at the mouth of the water courses". The tidal mills of this type (which must not be confused with other of a similar name, but functionally very different; cf. Mez, *loc. cit.*; F. M. Feldhaus, *Die Technik*, Munich 1965, 1297, etc. and related terms; Wiedemann, *Über Schiffmühlen*, in *Geschichtsblätter für Technik, Industrie und Gewerbe*, iv [1917], 25; al-Idrīsī, ed. Dozy-de Goeje, 236, 237, 263, etc.) are the precursors of those to be found in the 11th century in Venice, in the 12th in France (cf. H. Goblot, *Premières recherches*, roneoed text *ca.* 1977) and whose origin may go back to the Atlantic littoral of Islamic Spain (coasts of Huelva?), where harbours were established with a two to three hour tidal cycle, the title reaching a height as acceptable, if not higher, than that which could be achieved at Baṣra in the 4th/10th century. With regard to this, one should take account of the rather confused text in which Abu 'l-Fidā (*Taḳwīm*, ed. Paris 1840, 26-7), copying al-Idrīsī, notes the value of the establishment of harbours similar to that which has been cited.

Tidal mills appear to have been known on the coasts of Islamic Spain, and it is from there that they must have proceeded, following the estuaries, as far as the North Atlantic (cf. Goblot, *op. cit.*; W. E. Minchinton). However, the rare evidence which we have been able to find on this type of mill does

not allow us at present to elucidate this question with certainty. We can nevertheless mention the early presence (well before the 17th century) of these mills in Lequeitio (cf. José A. García Diego, *Don Pedro Bernardo Villareal de Berriz*, in *Revista de obras publicas*, August 1971), and probably in other places on the Basque coast which we know of indirectly, but from information of the same author, at Errotatxiki, Busturia, Baracaldo, Orio and Plencia.

Bibliography: Given in the article.

(L. Martínez Martín)

MADDĀḤ (Turkish *meddāḥ*), an Arabic word which means "panegyrist"; the term was used by the Ottoman Turks as a synonym of *ḳiṣṣa-k͟hʷān* (Arabic *ḳāṣṣ*) and *s͟hehnāme-k͟hʷān* to designate the professional story-tellers of the urban milieux; it was used in the same way by the Persians, but more rarely; as for the Arabs, they used it, in a fairly late period, to designate the "begging singers of the streets" (see Köprülüzāde M. Fuʾād, *Meddāḥlar*, in *Türkiyyāt Med̲j̲mūʿasi*, i [1925], 11-12). In North Africa, however, the *məddāḥ* is a kind of "religious minstrel who goes to festivals to sing the praises of saints and of God, and holy war, and who is accompanied on the tambourine and flute" (Dozy, *Supplément*, s.v.); he is also the heir of the *ḳāṣṣ* [*q.v.*], who at a late date tours the country and cities, recounting heroic legends and stories drawn from the répertoire of the story-tellers of the Middle Ages, sometimes aided today by bands, and which are sketched out very often without any connection with the subject of the story. The activity of the *məddāḥ*, his technique and his sources, would merit being made the object of thorough research.

In an early stage of the evolution of their art, the Turkish *meddāḥs* or *ḳiṣṣa-k͟hʷāns* derived their themes either from episodes of the Iranian epic, the *S͟hāh-nāma* (whence their name of *s͟hehnāme-k͟hʷān*) and the historico-legendary works relating the acts and deeds of the champions of Islam such as Ḥamza, ʿAlī, Abū Muslim, Baṭṭāl, or the first Turkish conquerors of the land of Rūm, such as Dānis͟hmend G͟hāzī. From the 11th/17th century onwards, the term *meddāḥ* begins to take on a more specific meaning to designate the teller of realistic accounts drawn either from old, classic collections such as the *Thousand and one nights*, or from popular stories, or else inspired by scenes from the everyday life of the cities of the empire. The teller of edifying stories on religious and heroic themes, called *ḳiṣṣa-k͟hʷān* or *s͟hehnāme-k͟hʷān* for preference, retains the monopoly of the epic-romantic narration in the urban milieux, sometimes in simple sessions of declaiming. However, Ewliyā Čelebi, when he describes (*Seyāḥat-nāme*, i, 525) the procession of the guilds in Istanbul, mentions the *meddāḥs* and *ḳiṣṣa-k͟hʷāns* under the same rubric, as numbering eighty; it can be deduced that in the 11th/17th century, the two terms were still synonymous and the same artist could perform both kinds of narration. It is only from the 18th century onwards that the *meddāḥs* specialise more and more in the narration of entertaining narratives on realistic themes, and these supplant, at least in oral tradition, the heroic themes. The public audition sessions of this latter type survived until the second half of the 19th century; a document of 23 January 1864 informs us that at this date, in an Üsküdar café (on the outskirts of Istanbul) a "reader" of narratives drawn from the *S͟heh-nāme* used to find an interested audience (see Metin And, *Geleneksel Türk tiyatrosu*, Ankara 1969, 69-70).

Numerous texts have come down to us of great heroic narratives of the chivalrous romance types of the Western Middle Ages; some, such as the *ʿAntar-nāme* [see ʿANTAR, SĪRAT], or the deeds of Abū Muslim and Baṭṭāl [*q.vv.*], were translated or adapted from Arabo-Persian literature; the others, such as the *Dānis͟hmend-nāme* were composed by Turkish authors; they attest, by their style and subdivision into chapters presented as auditory sessions on successive evenings (see I. Mélikoff, *La Geste de Melik Dānismend*, ii, Paris 1960, 18 and *passim*) that, from the earliest centuries of Turkish written literature, these works were not written only for the individual reading of the educated, but also constituted the narrative répertoire of the *ḳiṣṣa-k͟hʷāns* exercising their art before a collective audience.

As for the collections of realistic narratives, not a large number are extant and they are not of an early date. They are of two kinds: some, abridged texts of oral narration, sometimes written by the story-tellers themselves with a certain pedantry of style, to be offered to the sovereigns or dignitaries, and to be read individually by an élite public; the others appear as outlines to serve as an aid to the memory of the story-tellers themselves. The oldest of the collections of realistic narratives go back to the 10th/16th century, and, for the most part, they remain unpublished.

Of the poet D̲j̲enānī (d. Muḥarram 1004/September 1595) there has come down to us a collection entitled *Bedāyiʿ al-āt͟hār*, composed after 998/1589 as an offering for Murād III. Information on the biography and work of this poet, gathered by Köprülüzāde (*op. laud.*, 22 ff.) informs us that his collection of realistic and fabulous stories had been used by a *meddāḥ* of the court nicknamed Eglend̲j̲e to divert the sovereign during narration sessions. A copy dated 1039/1629-30 has been preserved in Cambridge University Library (Browne, *Supplementary hand-list* . . ., Cambridge 1922, no. 1553/6, Or. 680/8).

The work of D̲j̲enānī contains accounts of very varied themes: scenes from everyday life, "true life" adventures of his contemporaries with *d̲j̲inns* or vampires, accounts of journeys combined with themes of popular stories and legends. The author is, very often, anxious to inform us of the origin of his narratives and to mention his informants; on the whole, he drew largely on oral tradition. One of the narratives (fols. 97a-103a) is the oldest version of a *ḥikāye* [see ḤIKĀYA, iii] of which the author of the present article has collected, under the title of *Yaralı Mahmud*, three versions of the *âşıks* of Eastern Anatolia (see P. N. Boratav, *Halk hikâyeleri ve halk hikâyeciliği*, Ankara 1946, 19, 160-1). Two narratives of the collection (fols. 15a-17a and 19a-23a) are variants of stories inventoried in the international catalogue (A. Aarne and S. Thompson, *The types of the folk tale* [= AaTh], Helsinki 1964, nos. 1510 and 938) and in the Turkish catalogue (W. Eberhard and Boratav, *Typen türkischer Volksmärchen* [= TTV], Wiesbaden 1953, nos. 278 and 136).

In the same manuscript (fols. 191a-218b) is inserted the collection of a certain Nag͟hmī (or Nag͟hamī?) who was a contemporary of Selīm II (1566-74); the compilation of his work would then be earlier than that of D̲j̲enānī's collection (cf. fol. 192a-b of the ms.). His narratives present the same characteristics as those of D̲j̲enānī; he says, in his introduction, that he has compiled his texts from the stories related in the evenings among friends. He has divided them into three chapters: (1) stories

about sovereigns and viziers; (2) anecdotes about poets; and (3) adventures with beautiful women.

The *Kitāb-ı Kümek* (?) of ʿAzmī of Gediz, dated 995/1586, is of the same period; the copy preserved in the British Museum (Or. 7836) contains 88 leaves. It is composed of realistic stories drawn from oral tradition; some adventures take place in towns such as Istanbul or Samsun; there are also narratives inspired by folk tales (fols. 43a-44b: AaTh 1540, 1600, 1643, 1775; TTV 323, 324, 331, 339) and popular jokes (fol. 86b).

From the 11th/17th century we possess the texts, always in an abridged form, of a whole cycle of narratives, relating the adventures, in turn gallant and fantastic, of the bourgeois of Istanbul: people of various trades, courtiers, men of independent means, slaves, ladies of all categories and morals. At times, the sultan himself intervenes to arrange things to the satisfaction of the listeners—and readers—by chastising the wicked and rewarding the good. The composition of a series of these small novels of manners is attributed to the poet Ṭıflı Aḥmed Čelebi, a courtier of Murād IV (see Köprülüzāde, *op. laud.*, 31 ff.). Four of these texts have come down to us: *Laṭāʾif-nāme*, entitled *Khandjerli Khānım* in a slightly altered version, with the names changed, *Ḳanlı Bektāsh* and *Sansar Muṣṭafā*; there are lithographed editions—and, later on, printed ones—of the first three; a manuscript of the *Sansar Muṣṭafā* is preserved in the Istanbul University Library, no. 1208. It is to be noted that in the texts of these narrative works the story-teller himself is involved in the adventure; he is the principal character of *Ḳanlı Bektāsh*; and in all cases he is invited by the Pādishāh "to relate the adventure by word of mouth". This particular characteristic of this genre is already attested by certain compilers of the 10th/16th century. Two other narratives with the same characteristic, *Djevrī Čelebi* and *Ṭayyārzāde*, of which we possess printed editions, belong themselves to the narrative cycle of the reign of Murād IV (see Boratav, *op. laud.*, 122 ff.; Ö. Nutku, *Meddahler ve meddah hikâyeleri*, Ankara 1976, 99).

Other collections remaining unpublished, which were probably compiled as an aid to the memory for the use of *meddāḥs*—sometimes by the story-tellers themselves—deserve mention: from the 18th century, *Ḳiṣṣa-yi Djelāl u Djemāl* (cf. the narrative of the same title analysed by Nutku, *op. laud.*, 93, 100, 102, 110, 111, 129-30, 187-90), composed by Sheykh Muṣṭafā Dāʿī, of 194 leaves (Brit. Mus. Or. 11309; copy mutilated at the beginning and end).—*Khānife* (or *ʿAfīfe*?) *Khānım sergüzeshti*, of 107 leaves, composed in 1192/1778 (Brit. Mus. Or. 7303).—A collection of 53 leaves (Brit. Mus. Rieu, Add. 10,003), of which a large part is occupied by the adventures of Meḥmed Agha and Feraḥ-Dil; the copy was made at Izmir in 1223/1808; with reference to a session of narration in Cairo at which the hero of the narrative was present, the author mentions the names of two *meddāḥs* of Istanbul, Kehle Meḥmed and Shekerdji Ṣāliḥ; furthermore, the latter is also known as a famous story-teller of the 18th century (see Nutku, *op. laud.*, 34-5), which leads us to think that the compilation of the work goes back to this period.

A manuscript of the 18th century, preserved in Istanbul University Library (T.Y. no. 6758), and entitled *Medjmūʿa-yi fewāʾid*, a collection of disordered texts (poems, medicinal recipes, a short account of Ottoman history in verse, maxims) is of particular interest for the study of the tradition of the *meddāḥs*. For the first time, Metin And has briefly analysed the part concerning our subject (*op. laud.*, 74-5); he has reproduced the list of the names of 16 *meddāḥs* and the titles of 56 narratives in which they figure. A deeper analysis of this document has been carried out by Nutku (*op. laud.*, 101-2). The latter also published in his work (179-223) the 13 narrative texts inserted in the manuscript, the only ones, of the 56 titles constituting the outlines of *meddāḥ* narrations; there are brief notes on the names of people and places, as well as essential facts in the unravelling of the action. These texts too, are, on the whole, conceived and written as an aid to the memory of storytellers. The compiler also indicated, for a certain number of narratives, the names of famous *meddāḥs* of the period whom he had heard telling the tales in question. There should be added to this list of the 18th century a text which has come down to us in a French version, from the narration of a Turkish *meddāḥ* of the reign of Aḥmed III, reproduced in Joseph-Pierre Agnès Méry's book, *Constantinople et la Mer Noire*, Paris 1855; Nutku (225-33) has provided a Turkish retranslation.

Among the narratives of the 18th century, of the texts reproduced under the numbers 1 to 13 in Nutku's work (179-223), several are adaptations of popular tales with the narrative scenarios of the *meddāḥs*. Also, no. 1 is a variant of the tale type AaTh 681 (TTV 134); nos. 5, 6, 9. 10 and 12 are, respectively, to be compared with tale types AaTh 910 (TTV 315, motifs 1-3), AaTh 882 (TTV 272 and 272iv; a version of this tale is to be found in M. Nicolas and A. Flamain, *Contes de Turquie*, Paris 1977, 62-7), AaTh 1510 (TTV 278), TTV 299 and TTV 279.

For the two centuries following, we possess texts collected by the orientalists Georg Jacob, Ignaz Kunos, Friedrich Giese and Herman Paulus (see *Bibl.*), and more recently, those recorded on tape by Turkish researchers (see Nutku, 297-391). There also we find examples of the adaptation of popular stories to the narration of *meddāḥs*; in Nutku's work; no. 17 is a variant of tale type AaTh 881 (TTV 195) and no. 21 is to be compared with AaTh 882 (TTV 272, 272iv). No. 17 is, furthermore, attested in an altered text in *ḥikāye* form by ʿĀshıḳ ʿAlī ʿIzzet Özkan (see Boratav, in *Turcica*, i [1969], 114-20).

The narrative technique of the *meddāḥs* followed a parallel evolution to that of the themes. Gradually as realistic themes supplanted heroic themes, the narration was enriched by dramatic elements; the actor was substituted for the story-teller; he embodied the deeds, by miming and, by changes in the intonation of his voice, the various people of his narratives; and indirect speech gave way to direct speech animated by dialogues. It is this other aspect of the art of the *meddāḥs* which has interested specialists in the history of the theatre as much as the researchers on the narrative genre.

According to the testimony of literary and iconographic sources, as well as of direct observers, the *meddāḥ* used to perform his art in a public place (in a café usually), and used to install himself on a platform, at a higher level than his audience; he held in his hand a cane which he used for making a noise; a napkin placed on the shoulder was used to obtain, by its application to the mouth at the desired time, the various effects of vocal intonation of the person imitated. The *meddāḥ* began and ended his narration with dedicatory formulas which contained, essentially, excuses for the situation in which the listeners might be vexed by the fortuitous resemblance of

names of people or places, or by too daring subject matter.

The later *meddāḥ*s of the beginning of our century attempted to enlarge their répertoire by drawing on themes in the popular novels of contemporary authors (see Boratav, *100 soruda Türk halk edebiyatı*, Istanbul 1978, 79). Some modern novelists and journalist chroniclers, for their part, (Ahmed Rasim, Hüseyin Rahmi, Ercümend Ekrem and Burhan Felek, to cite only a few names) owed much to the procedures and narrative style of the *meddāḥ*s (see Boratav, *Halk hikâyeleri ...*, Ankara 1946, 81 ff., 121 ff.; idem, *Folklor ve edebiyat*, ii, Ankara 1945, 130 ff., 163).

AL-**MĀD͟HARĀʾĪ**, name of a family of high officials and revenue officers, originating from ʿIrāḳ, who held important positions in Egypt and Syria between 266/879 and 335/946. The *nisba* is derived from a village Mād͟harāya, in the neighbourhood of Wāsiṭ (see al-Samʿānī, *Kitāb al-Ansāb*, fol. 499a; Yāḳūt, *Muʿd͟jam*, iv, 381).

Abū Bakr Aḥmad b. Ibrāhīm al-Mād͟harāʾī with the nickname al-Aṭras͟h ("the partially deaf one", see Lane, *Lexicon*, s.v.), was given the control of finances of Egypt and Syria in 266/879 by Aḥmad b. Ṭūlūn, and so became the founder of his family's influence. He appointed his son ʿAlī—whose *kunya* is unknown—as his representative in Egypt, and sent another son, Abū ʿAlī al-Ḥusayn, called Abū Zunbūr ("the hornets' man"), to Syria in the same quality. Abū Bakr b. Ibrāhīm died in 270/884, the same year as Aḥmad b. Ṭūlūn.

ʿAlī b. Aḥmad al-Mād͟harāʾī became *wazīr* of the Ṭūlūnid K͟humārawayh (270-82/884-96), kept this function under D͟jays͟h b. K͟humārawayh and was killed on the same day as this Ṭūlūnid in 283/897.

Already during the last years of the Ṭūlūnid régime, Abū Zunbūr al-Ḥusayn b. Aḥmad al-Mād͟harāʾī, in his quality of director of finances in Syria, had taken up relations with the ʿAbbāsids. After their victory over the Ṭūlūnids in 292/904, he was nominated director of finances of Egypt, where he replaced his nephew Abu 'l-Ṭayyib Aḥmad b. ʿAlī al-Mād͟harāʾī (d. 303/915). Because of his close relations with Bag͟hdād, Abū Zunbūr, and soon also other members of his family, became involved in the fight for power between the *wazīr* ʿAlī b. ʿĪsā [*q.v.*] and the Banu 'l-Furāt [see IBN AL-FURĀT], in which the Mād͟harāʾīs were always on the side of the opponents of the Banu 'l-Furāt. Therefore, during the second vizierate of ʿAlī b. ʿĪsā (301-4/913-16) Abū Zunbūr became director of finances in Syria and his nephew Abū Bakr Muḥammad b. ʿAlī b. Aḥmad director in Egypt. The change of the vizierate in Bag͟hdād in 304/916 caused the Mād͟harāʾīs to be deposed and imprisoned; Abū Zunbūr was brought to Bag͟hdād. Towards the end of 306/May 919 he became again director of finances in Egypt, but in 310/922 he was deposed again by his friend ʿAlī b. ʿĪsā. In the next year, Ibn al-Furāt summoned him to Bag͟hdād and imposed on him and his family a penalty of 5,000,000 *dirhams*. In 313/926 Abū Zunbūr was again in al-Fusṭāṭ as director of finances of Egypt and Syria. In 317/929 he died there.

Abū Zunbūr's nephew Abū Bakr Muḥammad b. ʿAlī b. Aḥmad al-Mād͟harāʾī (258-345/871-956) came in 272/885 to Egypt, where his father appointed him deputy director of finances. After the murder of his father in 283/890, Abū Bakr Muḥammad became vizier of the Ṭūlūnid Hārūn b. K͟humārawayh, and after the fall of the Ṭūlūnids in 292/905, he and many of his followers were brought to Bag͟hdād. He remained there until 301/913, when in all honour he returned to Egypt as director of finances. The sources available do not indicate any reason why in 304/916 he returned to private life; he remained in al-Fusṭāṭ and apparently devoted himself to the administration and increase of the enormous fortune of the family. In 318/930 Abū Bakr Muḥammad again took charge of finances in Egypt and kept his function until the death of his friend the governor Takīn in 321/933. The Mād͟harāʾīs remained in the end victorious during the subsequent struggles with Muḥammad b. Takīn. When in 322/934 Abu 'l-Fatḥ al-Faḍl, a member of the Ibn al-Furāt family, was nominated vizier by the caliph al-Rāḍī, he appointed Muḥammad b. Ṭug͟hd͟j al-Ik͟hs͟hīd [see IK͟HS͟HĪDIDS] as governor of Egypt. The latter tried to reach a friendly agreement with the Mād͟harāʾī, but Abū Bakr Muḥammad rejected the proposal and offered resistance. His troops, however, went over to the Ik͟hs͟hīd, who in Ramaḍān 323/August 936 was able to enter al-Fusṭāṭ without fighting. Abū Bakr Muḥammad went into hiding until Abu 'l-Fatḥ al-Faḍl b. al-Furāt came to al-Fusṭāṭ and arrested the Mād͟harāʾī. He was forced to disgorge great parts of his wealth and the Ik͟hs͟hīd put him in prison until the death of Ibn al-Furāt in 327/939. After his release, Abū Bakr Muḥammad soon attained honour and influence again. Under the young Abu 'l-Ḳāsim Unūd͟jūr b. al-Ik͟hs͟hīd he held the *de facto* position of regent, but was overthrown and put into prison in 335/946 during a rebellion plotted by Abu 'l-Faḍl D͟jaʿfar b. al-Furāt. A year later he was set free by Kāfūr [*q.v.*] and retired into private life. He died in al-Fusṭāṭ on 11 S͟hawwāl 345/16 January 957, having been a devout Muslim who, between 301/913 and 322/938, performed the pilgrimage yearly and was lavish in distributing favours to the inhabitants of the Holy Cities. With him died the last important representative of the Mād͟harāʾīs.

MAD͟HḤID͟J, a large tribal group, now inhabiting in the main the areas of D͟hamār and Radāʿ in the modern Yemen Arab Republic. The traditional genealogy, given by e.g. Ibn Durayd, *Is͟htiḳāḳ*, ed.

Wüstenfeld, 237 ff., and by Yāḳūt, Beirut 1374-6/1955-7, v, 89, is from Mālik b. Udad b. Zayd b. Yas̲h̲djub b. ʿArīb b. Zayd b. Kahlān b. Sabaʾ b. Yas̲h̲djub b. Yaʿrub b. Ḳaḥṭān. The numerous component *ḳabāʾil* of Mad̲h̲ḥidj are listed in full by al-Malik al-As̲h̲raf ʿUmar, *Ṭurfat al-aṣḥāb fī maʿrifat al-ansāb*, ed. K. V. Zettersteén, Damascus 1949, 9; those most frequently encountered in South Arabian history are ʿAns, Balḥārit̲h̲ b. Kaʿb, Djanb, Ṣudaʾ and Sinḥān, and *buṭūn* of these *ḳabāʾil* include also Namir and ʿAbs.

Mad̲h̲ḥidj appear in pre-Islamic South Arabian inscriptions as *mdḥgm* (see A. Jamme, *Sabaean inscriptions from Maḥram Bilqîs (Mârib)*, Baltimore 1962, 316, 372). In the year 519 contingents of the tribe accompanied the Ḥimyarite king Maʿdīkarib Yaʿfur on an expedition into central Arabia, and in 521 they were amongst the tribes nominally influenced by Judaism and sent by D̲h̲ū Nuwās [*q.v.*] against the Christian centre of Nadjrān.

The tribal lands of Mad̲h̲ḥidj in early times are said by al-Bakrī to have been situated near a certain place called Tardj "on the road to Yemen" (see *Muʿdjam*, Cairo 1364-71/1945-51, 309). In the period just before the rise of Islam they participated, together with their sister tribes K̲h̲at̲h̲ʿam and Murād [*q.vv.*] in warfare against ʿĀmir b. Ṣaʿṣaʿa, which included a famous "day", much hymned in old poetry, at Fayf al-Rīḥ (see al-Bakrī, iii, 1038). Towards the end of Muḥammad's mission in Medina, when he was extending his control over the outlying parts of Arabia, the Prophet utilised Mālik b. Murāra of the component group Ruhāʾ of Mad̲h̲ḥidj as an envoy to the south-western tribes; and in *ca.* 10/632 he confirmed Farwa b. Musayk of Murād as Muslim governor over the tribes of Murād, Mad̲h̲ḥidj and Zubayd (Ibn His̲h̲ām, 950-1; Wellhausen, *Skizzen und Vorarbeiten*, vi, 28 ff.).

The role of Mad̲h̲ḥidj in the early Islamic conquests was considerable. They formed an element of the army which invaded Egypt, setting in Fusṭāṭ, and their leaders were represented in the malcontents who came to Medina and besieged and killed ʿUt̲h̲mān. In the *miṣr* of Kūfa, they were amongst Yemenī tribes to settle, together with Ḥimyar, Hamdān, Azd and Kinda, and their associated tribe Murād had there a *djabbāna*, perhaps here a large, open-air praying area, used as a tribal rallying-ground [see AL-KŪFA]. Subsequently, they showed themselves in the forefront of pro-ʿAlid and anti-Umayyad movements. At Ṣiffīn, Mad̲h̲ḥidj and Hamdān placed themselves under the leadership of Mālik al-As̲h̲tar [*q.v.*] of the *ḳabīla* Nak̲h̲aʿ of Mad̲h̲ḥidj; they fought valiantly as part of ʿUbayd Allāh b. Abī Bakra's "Army of destruction" in Afg̲h̲ānistān in 79/698 (see C. E. Bosworth, in *Isl.*, l [1973], 277 ff.); and they took part in the revolt of the old Arab tribal aristocracy shortly afterwards under Ibn al-As̲h̲ʿat̲h̲ [*q.v.*]. They do not, however, seem to have produced any poets of great significance.

In the post-classical period, those elements of Mad̲h̲ḥidj or their *ḳabāʾil* who had remained behind in south-western Arabia played a part in the tortuous politics and military events of the region. For example, contingents of the tribe rallied to the aid of the Zurayʿid Sabaʾ b. Abi 'l-Suʿūd in his successful struggle against another member of the family, ʿAlī b. Muḥammad, in *ca.* 531/1136. In 545/1151 also, Mad̲h̲ḥidj, and particularly Djanb, joined the Zaydī forces of the *Imām* Aḥmad b. Sulaymān against the Ḥātimī family of Yām controlling the Ṣanʿāʾ area. A long series of hostilities ensued, after which the Zaydīs and their Mad̲h̲ḥidj allies were repelled from Ṣanʿāʾ and the latter, after a personal appeal to them in D̲h̲amār by Ḥātim b. Aḥmad, swung round to the Ḥātimī side against the Zaydīs. Djanb were also prominent in relieving the Mahdid siege of Zurayʿid Aden, begun in 561/1165. The Zurayʿid leader, Ḥātim b. ʿAlī, having resisted the siege for seven years, journeyed to Ṣanʿāʾ to enlist the support of ʿAlī b. Ḥātim, the son of Ḥātim b. Aḥmad, whose family of Yām, it will be recalled, controlled the area. They too were Ismāʿīlīs, as were the Zurayʿids. ʿAlī b. Ḥātim agreed to help break the siege of Aden, but only, he stipulated, with the assistance of Djanb from Dhamār. The Zurayʿid, Ḥātim b. ʿAlī won over Djanb, so that an alliance of his troops, those of ʿAlī b. Ḥātim from Ṣanʿāʾ and those of Djanb descended on Aden and were able to drive away the Mahdids, killing many. At this stage Djanb returned home, much to the disappointment of ʿAlī b. Ḥātim, who appears to have had territorial designs on Mahdid land in Tihāma.

(G. R. SMITH - C. E. BOSWORTH)

MĀḌĪ (A.) "preterite", a technical term of Arabic grammar used to denote the verbal form devoted to the expression of past time; its counterpart is *muḍāriʿ* [*q.v.*], the term denoting the author verbal form "resembling" [the noun] and devoted to the expression of the present and future (*ḥāḍir*, *mustaḳbal*).

The majority of Arab grammarians define the verb as a word which indicates the matching (*iḳtirān*) of a happening (*ḥadat̲h̲*) with a time (*zamān*). Already Sībawayh considered (*Kitāb*, i, 11-12) that the verb is formed to demonstrate that a happening has taken place (*waḳaʿa*) in time which has gone past (*maḍā*) or that it will take place in time which has not yet gone past (*lam yamḍi*). In regard to the past, one of the earliest definitions is that of al-Zadjdjādjī (*K. al-Īḍāḥ*, 87): "an occurrence in the past is one which has been completed (*taḳaḍḍā*) and which has involved at least two distinct periods of time, one in which it had existence (*wudjida*) and one in which gets information about it (*k̲h̲ubbira ʿanhu*)". Ibn Yaʿīs̲h̲ sets forth the same idea (*S̲h̲arḥ al-Mufaṣṣal*, vii, 4): "an occurrence in the past is one that no longer has existence (*ʿudima*) after it did in fact exist, and whose affirmation (*ik̲h̲bār*) takes place at a time posterior to its existence".

However, the Arab grammarians very soon saw that the *māḍī* was not used solely to express an occurrence in the past, and al-Astarābād̲h̲ī (*S̲h̲arḥ al-Kāfiya*, ii, 225) enumerates the different cases when this verbal form expresses a time different from the past. First of all, the *māḍī* can express the future, viz. in a request (*ṭalab*) by means of a prayer (*duʿāʾ*) or an order (*amr*), and in the expression of future happenings by determining (*ḳaṭʿ*) their occurrence (*wuḳūʿ*), for in these two cases, the speaker positively desires the taking place of the occurrence, and it is as if it had already taken place and was past; in the reply to an oath (*ḳasam*), unless it is negated by *lā* or *in*; in the expression of a condition (*s̲h̲arṭ*), if it is preceded by *in*; and in a circumstantial

clause, if it is preceded by *mā* = "so long as". The *māḍī* can moreover express either the past or the future when it follows the particle *a-* of equivalence (*istiwā'*) in an alternative; the relatives *hayt͟humā* and *kullamā* in a phrase comprising two parts; a particle of urging (*taḥḍīḍ*) in an incitement; and the relative pronoun *allad͟hī* at the outset of a phrase comprising two parts, because in all these cases, there is a nuance (*rā'iḥa*) of a condition. Finally, in an enunciatory (*ins͟hā'ī*) speech utterance or a productive (*īḳā'ī*) one, the *māḍī* has the value of a present; thus, for example, in *bi'tu*, the act of selling is realised (*yaḥṣulu*) in the present (*ḥāl*) by means of this word which brings it into existence (*mūd͟jid lahu*), whereas with *abī'u*, the act of selling is realised by another word.

From the morphological point of view, the Arab grammarians consider that the form of the *māḍī* is "based" (*mabnī*) according to the vowel *a* or the vowel *u* in the third person, and according to the absence of the vowel in the other persons.

Bibliography: G. Troupeau, *La notion du temps chez Sībawayhi*, in *Comptes rendus du GLECS*, ix (1962), 44-6; H. Fleisch, *Traité de philologie arabe*, ii, 201-6. (G. Troupeau)

MADĪḤ, MADḤ (A.), the normal technical terms in Arabic and other Islamic literatures for the genre of panegyric poetry, the individual poem being usually referred to as *umdūḥa* (pl. *amādīḥ*) or *madīḥa* (pl. *madā'iḥ*). The author himself is called *mādiḥ* or, as considered professionally, *maddāḥ*. The root itself is sometimes used without technical connotations, as also are commonly the various other roots signifying "praise": *ḥ-m-d*, *m-d͟j-d*, *ḳ-r-ẓ*, *t͟h-n-y*, *ṭ-r-w/y*, etc.

1. In Arabic literature.

As both an independent unit and a component of the *ḳaṣīda* [*q.v.*], the genre has been so widespread in Arabic literature at all times that only a few poets prided themselves on not writing in it at all, or as rarely as possible, e.g. Abu 'l-'Atāhiya and al-Ma'arrī. Some, like al-Mutanabbī, were panegyrists before all else. The high proportion of panegyric in Arabic poetry has been one of the major obstacles to full appreciation of the latter by the average Western reader, who tends traditionally to be concerned with criteria of "sincerity", "criticism of life" and "seriousness of purpose". Such a lack of sympathy ignores the fact that virtually all pre-modern Arabic poetry had to be written, for socio-economic reasons, under patronage or to commission. "Political" panegyrics are still written in most Arabic-speaking countries.

The somewhat exiguous and sporadic written tradition of Arabic poetic criticism is usually more preoccupied with biography, exegesis, prosody and tropes than with genres in any Western sense. But most discussions of poetry refer to the category of *madīḥ*, and a few attempt to distinguish it from other genres, particularly its counterparts: *fak͟hr/mufāk͟hara*, personal or group boasting; *rit͟hā'/mart͟hiya/mart͟hāt*, elegy or lament; and *hid͟jā'*, poetry of insult or abuse (see the relevant articles for each). The last is more or less the converse of *madīḥ*, while the other two may naturally contain elements of panegyric. In the case of the elegy, this is almost invariably so: some (e.g. the celebrated and courageous elegy by Abu 'l-Ḥasan al-Anbārī on the executed Būyid vizier Abū Ṭāhir) are virtually pure *madīḥ*, though it is usually obvious that the subject is deceased, and a note of sincere regret is often present, as in that particular instance. Special types of *madīḥ* are numerous, two of the most common being poems of excuse or apology, and poems celebrating victories or other happy events (see also below).

Besides individuals, a panegyric might be addressed to a land, a city or a group. By no means all such poems were expected to produce immediate or direct material benefits: some expressed simple gratitude, some were addressed to a recipient with fine poetic taste of his own, and some were produced as an inescapable duty of one of pensioner status. When a panegyric did not produce an expected result, it would sometimes be followed up by an appendix (which some critics, again, would classify as a special type of "reminder panegyric"). According to period and circumstances, the panegyrist might declaim his own poem, or might deputise a talented *rāwī* to do so; or it might simply be received and read by (or to) the subject himself (*al-mamdūḥ*).

The *madīḥ* is usually (and was expected to be) exaggerated in statement and style. However, according to Ḳudāma (see *Bibl.*), only personal and "moral" qualities might be praised; and all these (in men) are subsumed under the categories of intelligence, courage, justice and "modesty" (*'iffa*). (It should be noted that the relatively rare poems in praise of women are classified by Ḳudāma as "erotic"!) Al-'Askarī (see *Bibl.*) is in general agreement with Ḳudāma, but Ibn Ras͟hīḳ (see *Bibl.*) would allow praise of physical attributes and of ancestry and "association" as well. Another corrective to excessively gross exaggeration is the generally agreed condition that the primary qualities praised should be appropriate to rank and function—courage in a military man, justice in a judge, and so on. On this basis, Ḳudāma would even regard the *madīḥ* as potentially applicable to vagabonds and bandits for the good qualities necessarily inherent in their styles of life.

With all this, the *madīḥ* tends in practice to a stereotyped homogeneity, so much so that some panegyrists (e.g. al-Buḥturī on several occasions) had no difficulty in offering the same poem to a second or further patron, where the original reception was inadequate or relations had become strained in the meantime. Some panegyrics (as well as elegies) were obviously "prewritten" for general contingencies.

Ṭāhā Ḥusayn (and others: see *Bibl.* under pseudo-Ḳudāma) have argued that the above critical posture towards the *madīḥ* clearly derives from Greek sources, particularly Aristotle. This position, however, must be seen as exaggerated: what influence there was can only have been—as with philosophical and scientific ideas—remote and indirect.

Bibliography: As indicated, most Arabic works of literary criticism do not really discuss genres as such, and the Western studies have tended to follow suit. The following are the essential items: Abu 'l-'Abbās Aḥmad T͟ha'lab, *Ḳawā'id al-s͟hi'r*, ed. C. Schiaparelli, in *Procs. of the VIIIth Intern. Congr. of Orientalists*, ii/1 (Semitics), fasc. 1, Leiden 1891, 173-214, also ed. M. 'A. K͟hafād͟jī, Cairo 1367/1948, and R. 'Abd al-Tawwāb, Cairo 1386/1966; Ḳudāma b. D͟ja'far, *Naḳd al-s͟hi'r*, Constantinople 1302/1885, also ed. S. A. Bonebakker, Leiden 1956; (Pseudo-) Ḳudāma, *Naḳd al-nat͟hr*, ed. Ṭ. Ḥusayn, etc., with valuable introduction, Cairo 1352/1933; Abū Hilāl al-'Askarī, *Kitāb al-Ṣinā'atayn*, Constantinople 1320/1902; idem, *Dīwān al-ma'ānī*, Cairo 1352/1933; Ibn

Rashīḳ, *al-ʿUmda fī ṣināʿat al-shiʿr wa-naḳdihi*, Cairo 1344/1925, also ed. M. M. ʿAbd al-Ḥamīd, Cairo 1383/1963; Ibn Khaldūn, *Muḳaddima*, tr. Rosenthal, see General Index under "poetry", *passim*; J. Bencheikh, *Poétique arabe*, Paris 1975; A. Trabulsi, *La critique poétique des Arabes*, Damascus 1955. (G. M. Wickens)

2. In Persian

It appears from the written records that survive—chronicles, official correspondence, and narrative poetry and prose—that formal, conventional praise (*madḥ, sitāyish, thanā*) of rulers and their chief officials was a pervasive feature of Islamic Iranian court life from its inception. The most-highly-developed vehicle for *madḥ* was the panegyric ode, or *ḳaṣīda-yi madīḥa*, a genre that was already fully articulated by the time of Rūdakī. Indeed, Rūdakī's joint panegyric of the Sāmānid ruler Naṣr b. Aḥmad and the Ṣaffārid *amīr* Abū Djaʿfar is both the earliest example we have of a complete *ḳaṣīda-yi madīḥa* and a work of considerable stylistic maturity.

The Persian *ḳaṣīda-yi madīḥa* shares similarities of theme and sensibility with the Arabic caliphal panegyrics of the ʿAbbāsid period (see S. Sperl, *Islamic kingship and Arabic panegyric poetry in the early 9th century*, in *JAL*, viii [1977], 20-35), but its thematic structure is more predictable and uniformly ordered.

The opening portion of the *ḳaṣīda*, called variously the *nasīb, tashbīb* or *taghazzul*, presents pleasing images that are usually drawn from a conventional repertory—the arrival of spring (*naw-rūz*) or, less commonly, autumn (*mihrgān*) in the palace garden; the lover's complaint; carousal. Yet many *ḳaṣīdas* celebrate particular occasions, such as the departure of the monarch on a hunt or a campaign, or his successful return from one, or the birth of a son or the receipt of a gift, and when they do, the occasion provides the governing metaphor of the *nasīb*. The opening portion concludes with a line or two of transition that shifts the focus of the poem to the person of the patron (*mamdūḥ*), whose name and title are mentioned—either fully or in part—in a line called the *gurīz-gāh* or *takhalluṣ* which marks the formal boundary between the opening section and the panegyric proper (*madīḥ*). While the images of the *nasīb* have, in the majority of instances, a narrative or metaphorical unity, those of the *madīḥ* do not. They present the *mamdūḥ* in a series of stereotyped poses drawn from the spheres of activity special to his office. For the monarch (*sulṭān, amīr, shāh*), the *mamdūḥ* of preference throughout most of Iran's history, these were the court—in both its formal and informal aspects—the hunt, and the battlefield. Thus in any given *ḳaṣīda-yi madīḥa*, the monarch will appear, in no particular order, as the chosen of God, a fearsome and heroic warrior, a superb huntsman, the unfailing refuge of the weak and needy, a cheerful reveller, and, of course, a generous patron of poets.

In keeping with the stereotyped and iconic quality of these images, the metaphors employed in the *madīḥ* are richly hyperbolic. As a warrior, the *mamdūḥ* can put Rustam and Isfandiyār, the paramount heroes of the Iranian national epic, to flight, and even terrify the forces of nature. As a monarch, he is served by the rulers of the great empires of the world—the *ḳayṣar* of Rūm, the *čīpāl* of Hind, the *khāḳān* of Turkistān and the *faghfūr* of Čīn. As a patron, his generosity outdoes that of Ḥātim Ṭāʾī, and even that of nature; and so on.

The final section of the poem is the *duʿāʾ*, or prayer, but there is usually a bridge passage between *madīḥ* and *duʿāʾ* in which the poet addresses himself directly to his patron, either to plead for reward or to boast of his skill, or both. The *duʿāʾ* itself is quite brief, no more than two or three *bayts*. As its name suggests, it is a prayer for the enduring, indeed, the perpetual, prosperity and rule of the monarch and his court. This prayer is expressed in language that elevates the monarch above the sphere of the mortal to that of the semi-divine. He is identified with the enduring processes of nature, which undergo change, but not decline. "So long as *nawrūz* comes every Spring,/May you reign and prosper."

As must be apparent from this summary description, the purpose of the *ḳaṣīda-yi madīḥa* is to celebrate the institution of rule, not the ruler. One finds no individualised portraits of the monarch here, nor of any of the other officials who filled the role of *mamdūḥ*. Indeed, the royal *ḳaṣīda-yi madīḥa* in all its many exemplars appears as the text of a ritual celebration of monarchy that gave the members of the court an appropriate public occasion on which to affirm their commitment to the myth of the supreme, all-competent monarch as guarantor of the security and well-being of the Islamic state.

For the monarch, the *ḳaṣīda-yi madīḥa* provided the means of being publicly celebrated as the living embodiment of the ancient tradition of kingship in Iran. In this, the *ḳaṣīda-yi madīḥa* paralleled the common practice of concocting false genealogies that connected the sultan of the moment with the house of Sāsān as a means of asserting symbolic legitimacy.

The first great period of the *ḳaṣīda-yi madīḥa* in Persian was that of the early Ghaznawids. Maḥmūd, the founder of that dynasty's great prosperity, expended vast sums to gather around himself a circle of distinguished poets, chief among them being ʿUnṣurī and Farrukhī [*q.vv.*]. Tales of his extraordinary generosity to them became part of the mythology of patronage, and provided the model for subsequent rulers and their poets. Although Iranian courts from that time to this have generated an endless stream of royal patrons and eulogists, and the *ḳaṣīda-yi madīḥa* has attracted master poets in virtually every period, no later court has achieved an exemplary status comparable to that of the Ghaznawid.

The Ghaznawid period also saw the appearance of what might be called the spiritual panegyric or anti-court *ḳaṣīda*. That is, the Ghaznawid bureaucrat and littérateur-turned Ismāʿīlī propagandist, Nāṣir-i Khusraw [*q.v.*], used the language of court poetry and the genre of the *ḳaṣīda* to compose works that revile secular rulers and rebuke court poets for devoting their art to praising them. His argument runs that since Maḥmūd cannot assure the poets' well-being in the next world, they should rather expend their skill in celebrating those rulers of eternal, spiritual power—the Shīʿī *Imāms*—who can.

The example of Nāṣir Khusraw found few imitators in the centuries immediately after his death—although his influence on the great 6th/12th century *ḳaṣīda* writer, Khāḳānī Sharwānī [*q.v.*], can be seen in that poet's pilgrimage *ḳaṣīdas*—but in the Ṣafawid period, the spiritual panegyric virtually replaced the secular. Later dynasties reinstated the secular as the preferred mode. There was a final efflorescence of the *ḳaṣīda-yi madīḥa* under the Ḳādjārs that was, in large part, stimulated by the rediscovery of the poetry of the Ghaznawid panegyrists.

Unfortunately, the fantastic exaggeration of the panegyric style has proved so unpalatable to

modern students of Persian poetry that they have not given the *ḳaṣīda-yi madīḥa* the careful attention that its central position in Persian literary history merits. The prevailing approach to this substantial body of work is to treat the opening portion as the only true poetry, and to ignore the contents of *madīḥ* and *du*ʿ*ā*ʾ—which make up two-thirds or more of any poem—as of negligible interest. The assumption is that court poets wrote panegyrics only out of economic or political constraint, not sincere, personal conviction, and this want of sincerity vitiates the literary interest of their work. The studies by Gh. Yūsufī, *Farrukhī Sīstānī*, Mashhad 1341/1963, and J. W. Clinton, *Manūchihrī Dāmghānī*, Minneapolis 1972, are among the few exceptions to this rule.

Bibliography: General accounts of the *ḳaṣīda-yi madīḥa* will be found in the standard literary histories of Iran. Principal among these are: Browne, *LHP*; J. Rypka *et alii*, *History of Iranian literature*, Dordrecht 1968; Furūzānfar, *Sukhan wa sukhanwarān* (2 vols. in 1), Tehran 1350/1972; Dh. Ṣafā, *Taʾrīkh-i adabiyyāt dar Īrān*[2] (3 vols. in 4 parts), Tehran 1353/1975; and, for the 19th century, Y. Āryanpūr, *Az Ṣabā tā Nīmā*, Tehran 1351/1973, i. In addition, recent editions of the *dīwān*s of *ḳaṣīda* writers include in their introductions such biographical details of poets and their patrons as are readily available.

The section on poets in the *Čahār maḳāla* of Niẓāmī ʿArūḍī Samarḳandī (*ca.* 550/1155), ed. M. Ḳazwīnī, with notes by M. Muʿīn, Tehran 1333/1955, provides a contemporary, and anecdotal account of the role of the court poet that is of great interest (Eng. tr. E. G. Browne, *The four discourses*, London 1921; Fr. tr. I. de Gastines, *Les quatre discours*, Paris 1968). The most complete and detailed statement of the art of the *ḳaṣīda*, including the *ḳaṣīda-yi madīḥa*, is in the *Muʿjam* of Shams-i Ḳays (*al-Muʿdjam fī maʿāyīr ashʿār al-ʿadjam*, by Shams al-Dīn Muḥammad b. Ḳays al-Rāzī, ed. M. Ḳazwīnī, revised M. Raḍawī, Tehran 1338/1960), completed in the early 7th/13th century, and never improved upon. (J. W. CLINTON)

3. In Turkish

In accordance with the well-established tradition that regulated the structure and use of the *ḳaṣīda*, *madīḥ* is the technical term used to refer to the section of this type of poem devoted to the praise of God, the Prophet, the sultan, the grand vizier, etc. Among the Muslim Turks, and especially the Ottoman Turks in the 19th century, the collective abstract form —*madḥiyya*—used in exactly the same sense, was preferred. The same term designates any poem composed for the purpose of extolling an individual. The *nefes* or *ilāhī* types of poems written or uttered by members of the mystic orders to eulogise God or leading personalities (*pīrān* and *bābās*) of these religious fraternities, and even more, the secular poems circulated by the literary innovators of the last century, are generally given this designation also (see S. N. Ergun, *On dokuzuncu asırdanberi Bektaşi-Kızılbaş Alevi şairleri ve nefesleri*, Istanbul 1956, 359, and Şinasi, *Müntahabât-ı eş'âr*, in *Külliyat*, i, Ankara 1960, 47-53 respectively).

It was, however, in the *ḳaṣīda*, the paramount verse form of the Muslim panegyrist, that Ottoman Turks such as Bāḳī [*q.v.*] and the premier *ḳaṣīda*-writer Nafʿī [*q.v.*] displayed their most characteristic and enduring *madāʾiḥ*. The presentation of a laudatory poem to those in positions of influence and power was the accepted and almost expected way for the literati to attract the attention of potential patrons for the purpose of securing employment or obtaining rewards and favours from them. The initial introduction of an aspiring poet, for example, to a grandee may have been through the good offices of a friend or teacher, but ultimately it was the persuasive and pleasing *madīḥ* featured in a suitable *ḳaṣīda* that forged the more lasting association with the patron or assured the most urgent favour. One may cite, among many other examples, the case of Meḥmed Ḳara Faḍlī [*q.v.*], who launched a successful career as *dīwān* secretary to several princes thanks to a *ḳaṣīda* he presented to Sultan Süleymān at the suggestion of his mentor Dhātī [*q.v.*] (see Ḥasan Čelebī, *Tadhkirat al-shuʿarāʾ*, British Museum, London, ms. Add. 24,957, fol. 281a, and Riyāḍī, *Riyāḍ-i shuʿarāʾ*, Nuruosmaniye, Istanbul, ms. 3724, fol. 116), and the experience of the poet and vizier Aḥmad Pasha [*q.v.*] who, having been incarcerated for an indiscretion, secured his release with a panegyrical *ḳaṣīda* to Sultan Meḥemmed II (see Laṭīfī, *Tadhkira-yi Laṭīfī*, Istanbul 1314/1896-7, 78, and Ali Nihad Tarlan, *Ahmed Paşa divanı*, Istanbul 1966, 60-3).

In structure and form, the traditional *ḳaṣīda*s, including those composed by the Ottomans, remained fairly constant. Following the exordium (*nasīb* or *tashbīb*) and, sometimes, a short set of lyrical couplets (*taghazzül*), the poet very ingeniously eased the reader or listener into the *madīḥ* by means of the device known as the *gürizgāh* (see Gibb, *Hist. of Ottoman poetry*, i, 84) in which the real purpose (*maḳṣad*) of the poem was revealed, either by openly naming the patron who was to be the subject of the encomium that followed immediately or by a clever allusion that rarely left any doubt as to the identity of the patron (see Fahir İz, *Eski türk edebiyatında nazım*, Istanbul 1966, i/1, 73, 106). The *madīḥ* was then followed by further praise in the *duʿāʾ* soliciting prayers for the patron and mentioning the poet's name.

Frequently, the above format and sequence were disregarded in favour of the more direct approach. Forsaking the exordium and the *gürizgāh*, the panegyrist began his *ḳaṣīda* with the *madīḥ* (see *Nadīm dīwānī*, ed. Khalīl Nihād, Istanbul 1338-40/1920-2, 34-6, and contrast 21-4, 36-8). This tendency becams especially prevalent when indoctrination and instruction replaced gain and advancement as the purpose of the poem. Particularly in the 19th century, when acclamation of new ideas or of a certain political point of view displaced the praise of the individual, the *madīḥ* became the essence and indeed the only section of the *ḳaṣīda* (see Mehmet Kaplan, *Şiir tahlilleri*, Istanbul 1969, 23-5, and Kenan Akyüz, *Batı te'sirinde türk şiiri antolojisi*, Ankara 1970, 61-3).

As a feature of the *ḳaṣīda*, the message, spirit and language of the *madīḥ* was necessarily determined by its particular function and objective. It was made up of a varying number of couplets extolling such attributes or virtues, real, imagined or fabricated, of the individual or concept as courage, wisdom, justice, piety, generosity and benefits. It was mainly characterised by extravagant laudation that was often completely unjustified or misplaced, and by the use of every conceivable rhetorical device, the hyperbole of which was sustained by epithets and allusions that only those familiar with the elevated Islamic literary tradition could comprehend and appreciate. The epic similes and the imagery which were an intrinsic part of the *madīḥ* were considerably removed from the realities of a restricted social milieu

that expected, accepted and even cherished ingenious flattery and procacious insincerity garnished with flowery language. However, the *madīḥ*, as some of the examples given above indicate, had a certain utilitarian function and, incidentally, may very well have met a need in its symbolism and reflections of an aesthetic ideal, as recently suggested by W. G. Andrews in his *Introduction to Ottoman poetry*, 148-50. It must be noted, at the same time, that it, along with many other verse forms, affords one many fine illustrations of the Turkish literary genius, versatility and inventiveness.

4. In Urdu

Eulogy probably existed in Urdu poetry from the earliest period of literary activity—certainly as far back as the second half of the 16th century A.D., though few early examples have survived. Two broad categories developed, according to the subject of the eulogy, sc. the secular and religious. The first was addressed to rulers, governors, nobles, and other rich or influential lay persons. It was usually termed *madḥ* rather than *madīḥ*, other terms being *taʿrīf* and *sitāʾish*. The religious category had its own distinctive terminology, though usage was not completely uniform, and might depend, to some extent, on the vagaries of copyists and editors. Praise of God was called *ḥamd*, that of the Prophet Muḥammad *naʿt*. That of the fourth caliph, ʿAlī, and of subsequent Shīʿī *Imāms*, was called *manḳabat*, whilst eulogy of other religious figures, living or dead, including the first three Orthodox Caliphs, was generally called *madḥ* or *taʿrīf*.

Like other major poetical genres in Urdu, *madīḥ* was derived from Persian. In some instances, Persian eulogistic odes were translated, or more properly adapted, into Urdu. More often, the *zamīn* (metre and rhyme) of a Persian ode would be imitated in an Urdu ode. The debt to Persian models was no secret; from the 16th century onwards, there are frank admissions or indications by various Urdu poets that they are vying with Persian poets in their mastery of the *madīḥ ḳaṣīda*. The chief poets to whom they were indebted were Anwarī, Khāḳānī and ʿUrfī. Muḥammad Ḳulī Ḳuṭb Shāh (*ca.* 1568-1611) begins a *naʿt* ode: "The name of Muḥammad in the world is to me like a hundred Khāḳānīs". It is worthy of note that ʿUrfī was court poet to the Mughal Emperor Akbar in Dihlī, and died there in 1590-1, when Ḳulī Ḳuṭb Shāh was in his early twenties. Apart from Indian local colour, including Hindu references, it is difficult to distinguish any single major feature in Urdu *madīḥ* which breaks completely new ground. Nevertheless, some poets achieved such mastery in it that they seemed to breathe new life into it, and thus they gained recognition for their originality.

Urdu *madīḥ* has been composed in almost all poetical forms, including *mathnawī*, *mukhammas*, *musaddas*, *tardjīʿ-band*, *tarkīb-band*, and, extremely rarely, even *ghazal*. But the eulogy form par excellence was the *ḳaṣīda* or ode. True, this form was used in other fields, particularly satire. But such has been the predominance of eulogy, that the term *ḳaṣīda* is usually understood to mean "eulogy", as an abbreviation of *ḳaṣīda-yi madḥiyya*. Consequently any account of Urdu *madīḥ* must, of necessity, show how the pre-Islamic Arabic ode, as modified in later Arabic poetry, and brought to India via Persia, was adopted and adapted to the new environment. Unfortunately, it is hard to find an account of the Urdu *ḳaṣīda* form which is full and explicit without being discursive or biassed. In some accounts, the pre-Islamic ode, as exemplified in the *Muʿallaḳāt*, is over-emphasised, and there is too much reliance on Ibn Ḳutayba and Ibn Rashīḳ. What is lacking is a definitive comparison of the Persian and Urdu *ḳaṣīda*s. Though most Urdu eulogists were not unfamiliar with Arabic poetry, its chief influence on them was in vocabulary. Occasional mention of Arabic *ḳaṣīda*-writers, such as Dhawḳ's reference to Labīd, al-Aʿshā, Djarīr and al-Maʿarrī, must be regarded chiefly as "name-dropping" designed to impress the hearer, rather than an indication of indebtedness. It may be that al-Būṣīrī's *Ḳaṣīdat al-burda*, which was translated into Dakkanī Urdu by Muḥammad b. Riḍā, around the turn of the 17th and 18th centuries, influenced the religious *ḳaṣīda*; and Kaʿb b. Zuhayr's celebrated ode in praise of the Prophet, *Bānat Suʿād*, was at times mentioned by poets and critics to justify the inclusion of an explicitly erotic prelude in *naʿt* odes. But the *ḳaṣīda* which came into Urdu poetry via Persian is as much akin to that of ʿAbbāsid poets such as al-Mutanabbī, al-Buḥturī and Abū Tammām, as to the pre-Islamic ode.

The form of the Urdu *madīḥ* ode was fully developed by the middle of the 18th century, if not earlier. Like its Arabic and Persian counterparts, it was a monorhyme poem, usually in weighty metre, with elevated and rich diction, of roughly between 30 and 150 verses. The two hemistiches of the first verse, called the *maṭlaʿ*, also rhymed: and if the *ḳaṣīda* were long, there might be one or more subsequent verses with this internal rhyme at irregular intervals in the poem, known as *maṭlaʿ thānī*, *maṭlaʿ thālith* and so on, more than four in all being rare. As is often the case in Persian and Urdu poetry, the rhyme (*ḳāfiya wa-radīf*) was often rich and difficult, and the poet's ability to sustain it was regarded as a proof of his skill.

There were four main sections to the *ḳaṣīda*. The first was the *tamhīd* or prelude, usually called *tashbīb*, a throw-back to the erotic prelude or *nasīb* of the Arabic ode. The opening verse (*maṭlaʿ*) however, was considered so important in attracting the hearer's interest, that it is often discussed as if it were a separate section, not merely the start of the *tashbīb*. The erotic theme was seldom used, and was often frowned on unless it were chaste. A wide range of other topics was substituted, whether singly or in combination. Pride of place was given to the description of spring, an ode with such a *tashbīb* being called a *ḳaṣīda bahāriyya*. This topic was considered particularly suitable, as suggesting youth and vitality, which were regarded as implicit in the term *tashbīb*, and flattering to the *mamdūḥ* or subject of the poem. Moreover, this topic allowed for description of natural scenes, gardens, flowers and birds, which was part of the poet's stock-in-trade.

This theme might be extended by a comparison

between spring and autumn. Further, the two might be depicted as kings or generals marshalling their armies to fight another, spring, of course, being the victor. Like practically all *tas͟hbīb* topics in Urdu, this extension of the spring motif goes back to Sawdā (1717-81), who is generally regarded as both the pioneer and the finest exponent of the full *ḳaṣīda* form in Urdu. Amīr Mīnāʾī (1828-1900) developed this theme further in one ode, by a vivid description of the actual battle. But, according to Saḥar, (*op. cit.*, in *Bibl.*, 229), this had already been done in Persian.

Again, the *tas͟hbīb* might be devoted to the days of youth, or complaints of the times in which the poet lived, or of his own misfortunes. *Fak͟hr* ("pride, boasting"), philosophising and moralising were other topics. As the basic form of the *ḳaṣīda* was stereotyped, poets were always searching for fresh ways of composing the *tas͟hbīb*: for it must be borne in mind that the *madīḥ* ode was frequently recited to the patron in public, in the presence of other poets and men of taste and learning. The poet's reputation and his reward were at stake.

One interesting device was to turn the *tas͟hbīb* into a disputation or *munāẓara*. In Persian, Asadī-yi Ṭūsī the Elder is said to have initiated this device, with *munāẓarāt* between night and day, and heaven and earth among others. In Urdu, Sawdā has one between greed and reason, whilst Amīr Mīnāʾī pairs knowledge and imagination, and comb and mirror. Into this category should go the *mukālama* (colloquy) favoured by ʿAzīz Lakhnawī (1882-1935), as, for example, one between beauty and love (*ḥusn wa-ʿis͟hḳ*).

Occasionally the *tas͟hbīb* consisted of an anecdote, possibly with dialogue, and somewhat dramatic. When intimate in tone and straightforward in language, it could form a charming contrast with the high-flown praise section which was to follow. A fine example of this is Sawdā's eulogy of Āṣaf al-Dawla Rustam D͟jang, chief minister of the Mug͟hal emperor, with the rhyme *-ām* (*Kulliyyāt* 293 f.). The poet begins by relating how, prevented from sleeping or eating by the *d͟jinns*, he consults Doctor ʿAḳl, who prescribes blood-letting and a purgative. The poet objects that the tax-collector had drained all his blood, while purgatives are for the over-eater, whereas he has been fasting for Ramaḍān. Can the Doctor prescribe a more effective treatment? What that is, we shall see, when discussing the second section of the *ḳaṣīda* (see below).

Two devices deserve mention which could be used effectively in the *tas͟hbīb*, without necessarily being independent topics. One was the personification of abstract ideas or inanimate objects. This certainly goes back to Persian poetry, a famous example being Manūčihrī's "Candle ode". It could feature in the *munaẓāra* topic already mentioned. The other was *sar-ā-pā nigārī* ("head to foot description"). A human being might be described—perhaps the poet's beloved in an erotic *tas͟hbīb*. But the most effective examples are descriptions of a houri or peri, often seen by the poet in a dream, or while lying awake in bed. Ins͟hāʾ (1756-1817) commences an ode to Prince Sulaymān S͟hikōh (*Kalām*, 206), by describing himself as tossing and turning in bed one morning, unable to sleep because of the spring wind. He sees a beautiful peri by the bed, and gives a detailed description of her. His contemporary Muṣḥafī (1756?-1826) has an ode with the same rhyme, also containing a description of a peri. Amīr Mīnāʾī describes a profligate peri in an ode to Nawwāb Kalb ʿAlī K͟hān; he not only uses the same rhyme, but also refers back to Ins͟hāʾ and Muṣḥafī in half-quotations.

The *tas͟hbīb* was regarded as an important pointer to the poet's merit: yet to many critics, the second section was the acid test. It was usually called *gurēz* (Persian "deviation, flight"), but the Arabic terms *mak͟hlaṣ*, *talk͟hīṣ*, and even *tak͟halluṣ* are given as alternatives. Though very short—sometimes a single verse, and seldom more than four, it was crucial: for it was the link between two apparently unconnected sections, the *tas͟hbīb* and the actual praise. Unless the *gurēz* were skilfully constructed, the *ḳaṣīda* would lose its unity. Many felicitous examples could be quoted from the leading poets, but one must suffice. We left the ode by Sawdā with the poet asking for an alternative prescription for his illness. In the succeeding *gurēz*, the Doctor, in two verses, suggests that Sawdā take his complaint to the court of him (that is, Āṣaf al-Dawla) under whose protection the weak ant may be revenged on the elephant. Hearing this, and taking his *ḳaṣīda* as a present, the poet attends at court. This *gurēz* of only three verses leads to the praise, which is almost an ode within an ode.

The third section was called *madḥ* or *mamdūḥ*, and it was the most conventional. The qualities described had to be appropriate to the status of the *mamdūḥ*. Thus a ruler or *wazīr* was praised for his justice, manliness, nobility, virtue, fear of God, generosity and clemency. To men of religion, other qualities were appropriate—learning, asceticism, attendance to religious duties. But the distinction tended to be blurred when the *ḳaṣīda* developed in north India. Thus K͟hāliḳ And͟jumān (*op. cit.*, in *Bibl.*, 261 f.) remarks that Sawdā hardly distinguishes between secular and religious subjects in this respect. In addition to the personal qualities of the *mamdūḥ*, the poet could refer to his environment and associations, and the trappings of power and wealth. In praising a ruler, his sword, horse and elephant might be described. According to Hās͟himī (*op. cit.* in *Bibl.*, 107), this was not so in the Deccan—though it must be pointed out that Ḳulī Ḳuṭb S͟hāh certainly refers to Imām ʿAlī's sword D͟hu 'l-Fiḳār, and Walī Dakkanī (1667-1707) to the mule Duldul given to ʿAlī by the Prophet. With Sawdā, sword, horse and elephant were described fairly briefly. But some later poets such as Dāg͟h of Dihlī (1831-1905) somewhat extended these descriptions, and turned them into separate sections, with headings such as *dar ṣifat-i asp* and *dar taʿrīf-i-pīl*. A lesser 19th century poet, Kalaḳ, of Meerut (1832 or 1833-1879), includes such sections, admittedly shorter than Dāg͟h's, in odes to fairly undistinguished recipients. To the present writer, this clear division of the *ḳaṣīda* into sections other than the four main ones was a continuing tendency which started before Sawdā. The latter interpolates a *g͟hazal* in one *ḳaṣīda*, but Walī had already done this. Unlike Sawdā, however, he did not have several *maṭlaʿ*s in one ode.

Thus the content of the *madḥ* section was restricted. Nor could the poet escape by making it brief, as courtesy required that the *tas͟hbīb* must not be longer than the *madḥ*—so if the latter were curtailed, so must the former be. Hence the mode of expression was all-important in the *madḥ* section. This was dependent on a rich and pompous diction, similes, metaphors, and all the apparatus of *ṣanāʾiʿ wa-badāʾiʿ*, with considerable play on words. Some of this was derived from Persian, but in any case, after Sawdā it rapidly became cliché-ridden. To give but one

example, a ruler or minister was often compared with Solomon. Sawdā expresses this neatly in the eulogy of Āṣaf al-Dawla already mentioned:

> *Kuchh kam nahīn d͟jihān mēn Sulaymān sēn tērād͟jāh Gū alsina pah Āṣaf-i-Dawla hay tērā nām.* ("Your splendour in the world is no less than Solomon('s), Although on (people's) tongues your name is Āṣaf-i Dawla") (*Kulliyyāt*, 295).

This verse loses part of its effect, unless one knows that, in Muslim lore Āṣaf [b. Barak͟hyā] [*q.v.*] was Solomon's Grand Vizier. Exaggeration in praise was taken for granted, though some 19th century poets such as G͟hālib (1797-1869) disliked it. S͟hiblī Nu'mānī, in his celebrated study of Persian poetry, *S͟hi'r al-'Ad͟jam* (1908-18) (v, 21-6) tried to lay down conditions for acceptable panegyric. Firstly, the person praised must be praiseworthy; secondly, the qualities commended in him must be genuine: thirdly, the poet must describe them convincingly. S͟hiblī admitted that all these three conditions were never fulfilled by any Persian poet, and went on to commend the sincerity of Arabic *madīḥ*, in a way which would strike many Arabists as idealistic, if not naïve. At the same time, S͟hiblī denied that the *ḳaṣīda* caused subservience in the poet and egotism in his patron, since both realised that what was said was "pure exaggeration and word-play". S͟hiblī was not speaking of Urdu *madīḥ*, but what he says of Persian could equally apply, and is often quoted by modern Urdu critics. D͟hawḳ (1789-1854) is generally regarded as second only to Sawdā as a eulogist, yet he exaggerated like other poets, calling the Mug͟hal Emperor Akbar S͟hāh II "shadow of God and deputy of the Prophet of God". This poet's biographer, Tanwīr Aḥmad 'Alawī (*op. cit.* in *Bibl.*, 249-51), quoting this and other examples, justifies them by saying: "the person praised seems to be not an individual, but a symbol of his time. In this sense, D͟hawḳ's praise is very near to reality and realism."

The final section of the *ḳaṣīda* was called the *k͟hātima*: and the term *maḳṭa'* might be applied to it as a whole, or merely to the last verse or two —since an impressive ending to an ode was considered as important as an impressive beginning. In contrast to Persian practice, except with 'Urfī, the Urdu eulogist usually gave his *tak͟hallus*. This would normally be somewhere in the *k͟hātima*, though there are instances where it is given earlier, alternatively or additionally. Sawdā makes his *tak͟hallus* the first word of his eulogy of Āṣaf al-Dawla already quoted, and gives it again in the *k͟hātima*. Nor is this the only *ḳaṣīda* in which he gives his *tak͟hallus* in the first verse. The secular's ode's *k͟hātima* has two subsections, *ḥusn-i ṭalab* and *du'ā'*. The former is the poet's request for recompense, for which critics laid down various conditions. Summarised, they require the poet to steer a middle course between perfunctoriness and importunity—between taking the patron's generosity for granted and implying that he was mean. Some poets disliked begging: D͟hawḳ, in his extant odes, avoids it, sometimes substituting the expression of his inability to praise his patron adequately. Sawdā also often avoided begging. *Du'ā'* ("prayer, blessing") was the expression of the poet's wishes for long life and prosperity for his patron. In the religious *ḳaṣīda* the *k͟hātima* was somewhat different. The poet might express his own faith, and ask for a blessing to maintain it: and he might pray for the triumph of Islam, with suitable variations where the *mamdūḥ* was a S͟hī'ī *imām*. Here Sawdā was often felicitous, a good example being the *manḳabat* to *Imām* 'Alī with the rhyme *-ār* (*Kulliyyāt*, 243-7), which ends with the four requests, the last being that all "friends in both the two worlds may recognise the authenticity of the pure *imāms*".

Some indication of the style expected in the *ḳaṣīda*, has already been given. It was regarded as a linguistic and stylistic *tour de force*, and occupied a position in Urdu literature comparable to that of the *maḳāma* in Arabic. The poet was allowed to go to extreme limits of abstruseness to demonstrate his skill and learning, using in some instances scientific technical terminology. Thus Ins͟hā' used much philosophical vocabulary. *Taḍmīn*—the interpolation of extraneous material—was common. This often took the form of quoting from some other poet, Persian or Urdu. Another type, particularly suitable to the Indian environment, with its numerous languages, was for the poet to introduce hemistiches or verses in several languages. Every poet was expected to know Persian and Arabic, and he would normally know one or more of the other literary languages of the subcontinent. Ins͟hā' was addicted to this sort of virtuosity, and is said to have incorporated material from ten or more languages apart from Urdu. D͟hawḳ was rewarded with the title of *K͟haḳānī-yi Hind* by the Mug͟hal emperor for a *ḳaṣīda* in seven languages, of which only a few lines have survived.

Thousands of eulogy poems must have been written in India over a period of 400 years, but comparatively few have survived, and of these a disproportionate number are of the religious type. Various reasons may be given for this. Early Urdu poetry, in both the Deccan and North India, seems to show a preference for the *mat͟hnawī*. From the mid-18th century onwards, *g͟hazal* dominated the poetic scene, and did not have a serious rival apart from the S͟hī'ī *mart͟hiya* perfected by Anīs and Dabīr in the second and third quarters of the 19th century. Many poets wrote *ḳaṣīdas*, but for an overwhelming number, *g͟hazal* was their forte. The only absolute exception is Sawdā, whose *ḳaṣīdas* have been almost universally considered superior to his *g͟hazals*- -though some would argue that his satirical odes surpass even his eulogy. Of later poets, D͟hawḳ and Amīr are credited with equal skill in *madīḥ* and *g͟hazal*. Moreover, when a poet's works were collected, first in manuscript, and later in print, they were largely limited to *g͟hazals*, and few *ḳaṣīdas*, if any, were included. As was often the case in Persia, *ḳaṣīdas* tended to be copied separately, and were liable to be lost. It was not unusual for a *ḳaṣīda* to be copied in abridged form. This might be understandable where the purpose was to omit *taḍmīn* passages in other languages. But it is difficult to see why two *manḳabat* odes by G͟hālib should be thus abridged (see Mihr, *Dīwān-i G͟hālib*, 294-6, 296-8). At the same time, it seems clear that the writing of eulogies for gain was often looked down on by poets, critics, and people at large. In any case, the *ḳaṣīda* was very much a poème d'occasion and was liable to lose its appeal with the passage of time. Whatever the cause, the odes of hundreds of minor poets seem to have disappeared, whilst some by acknowledge masters of the form are missing. D͟hawḳ was court poet in Dihlī for fifty years, and must have composed 200 odes or more in the course of his official duties: yet only about 30 are extant. Some of Amīr's eulogies are known to have been lost, among them those in his first *dīwān*, which was destroyed in the Indian Mutiny. Only 28 of his *ḳaṣīdas* have survived.

Nevertheless, the ability to write a good *ḳaṣīda* was often said to be a hall-mark of poetic skill.

Ghālib once said: "Whoever cannot write an ode should not be accounted a poet". Thus it has been argued (Tanwīr Aḥmad ʿAlawī, *op. cit.*, 225) that Inshāʾ wrote odes, and gave of his best in them, in order to complete his art.

Only a few brief remarks will be made here on the history of *madīḥ* in Urdu. Further information can be obtained from the works mentioned in the *Bibliography*. It is convenient to speak of three stages based on geography, and obviously overlapping —the Deccan, Dihlī and Lucknow. Very little is known about the Dakkanī *ḳaṣīda*. But in general it was short and simple, as can be seen from the printed odes of Muḥammad Ḳulī Ḳuṭb Shāh, Sultan of Golkondā [see ḲUṬB-SHĀHĪ]. They are all religious, and seldom of more than 40 verses, sometimes of under 20. There is little indication of the four sections of the later *ḳaṣīda*. True, of about 50 poems which come under the heading of *madīḥ* (*Kulliyyāt*, i, 1-46, iii, 3-39), one (iii, 38-9) is a fragment of 16 verses entitled *Ek ḳaṣīda-yi manḳabat-kī tashbīb kē čand ashʿār*. It is beautifully written, and begins:

> In the black sea of night the golden skiff sank,
> As it sank, a hundred thousand bubbles rose.

But even if it is by Ḳulī Ḳuṭb Shāh, there is nothing to show that it is really the *tashbīb* of a *ḳaṣīda*, and this seems unlikely. From the metrical standpoint, it is interesting to note that in a few of his *ḳaṣīdas*, he divides the hemistiches into two, with internal rhyme, thus producing something like an amalgam of *ḳaṣīda* monorhyme and *rubāʿiyyāt*. Walī Dakkanī is considered the father of Urdu poetry, and he visited Dihlī at least once. He was primarily a Ṣūfī *ghazal* writer, and never composed poetry for gain. However, he wrote eight religious eulogies—six *ḳaṣīdas* and two *tardjīʿ-bands*. All the *ḳaṣīdas* are of modest length, save a composite one of 121 verses which is devoted successively to the praise of God, the Prophet, the *Imāms* ʿAlī, al-Ḥasan and al-Ḥusayn, followed by exhortation (*mawʿiẓat*), a *ghazal* on the love of God and a *khātima*. Of Walī's *ḳaṣīdas*, only two, to Muslim saints, show clear signs of conformity with the four-section form described earlier. They are addressed to Ḥaḍrat Mīrān Muḥyī 'l-Dīn (*Kulliyyāt*, 367-71) and Shāh Wadjīh al-Dīn (*ibid.*, 371-6). It should be noted that in both he mentions Persian eulogists—Khāḳānī and Anwarī in the former, and ʿUrfī in the latter, as if to put himself on a level with them.

Whether or not Walī was the link between the Dakkanī and Dihlī *ghazal*, there seems no question of any link so far as the *ḳaṣīda* is concerned. For not only does internal evidence suggest that his *madīḥ* poems were composed before he visited Dilhī, but there is a hiatus until the mid-18th century, before the *ḳaṣīda* emerged in Dihlī. Critics explain it in various ways, none fully convincing. Either practically no eulogies were composed, or such as were composed were short, weak and formless—or again, the Urdu language had not developed sufficiently to provide the right poetic diction. Sawdā is variously described as having originated, reformed or perfected the *ḳaṣīda*. At any rate, until examples of the eulogy ode composed by other poets during the period 1700-40 come to light, we must acquiesce with those who state that Sawdā followed Persian, rather than Urdu, models. And there is no denying that he was, and remains, the leading Urdu *madīḥ* poet. His *tamhīd* is varied in theme and manner, his gurēz neat, and his *madḥ* cleverly expressed. Succeeding poets imitated him, but seldom equalled him and never surpassed him. Variety and freshness are the keynote of his odes, and they are rarely of extreme length: of the 38 *ḳaṣīdas* in the Nawal Kashōr edition of his *kulliyyāt*, only seven have more than 70 verses, and of these only five more than a hundred. The language is rich, drawing freely onPersian and Arabic. His contemporary Mīr [Taḳī Mīr] (1722-1810) wrote a good deal of eulogy poetry, mostly religious. There are only seven *ḳaṣīdas*; the rest consists of *mukhammas*, *musaddas*, *tardjīʿ-band*, and *mathnawī*. Mīr was a prolific *ghazal* writer; but his pessimistic temperament was unsuited to eulogy.

In the latter part of the 18th century, Inshāʾ was a leading *ḳaṣīda* writer. As we have seen, he was a virtuoso of languages, but he did not reach the top flight in any poetic form. His longest ode, of 170 verses, is in praise of King George III of England. During the same period, Muṣḥafī wrote over 60 *ḳaṣīdas*. He was definitely influenced by Sawdā, and resembled him in the variety of his *tashbīb* topics. But though he has a persuasive protagonist in Abu 'l-Layth Ṣiddīḳī, he is not favoured by critics in general. He was the first famous eulogist of the Lucknow school. But, owing to political upheavels in Dihlī, due to Afghān and Marāṭhā incursions, many Dihlī poets gravitated to Lucknow, including Sawdā himself at the age of 60.

Still, Dihlī had its distinguished eulogists in the first half of the 19th century. Pride of place goes to Dhawḳ [*q.v.*], considered second only to Sawdā. Much of his *madīḥ* poetry is lost. Of what remains—22 *ḳaṣīdas*, a *mukhammas*, and a few shorter poems and extracts—all is secular save a few fragments. The general scope of his eulogy poetry is narrower than that of Sawdā. For example, it is nearly all addressed to the Emperor Akbar Shāh II and to his son Bahādur Shāh II. While his *tashbīb* does not show Sawdā's range, nor his ability to appeal by directness at times, he is by no means stereotyped. One *tashbīb*, for example, is a delightful description of happiness. Dhawḳ was a learned man, whose hobbies were astrology, music and medicine, and his language is both rich and dignified. His contemporary Ghālib [*q.v.*] (1797-1869), often considered the prince of Urdu poets, is not generally included among the leading eulogists, and he was too proud to indulge in *madīḥ*, except when absolutely necessary. S. F. Mahmud (*Ghalib*, 200-4) quotes and commends the *tashbībs* of two early *manḳabat* odes to *Imām* ʿAlī; and the originality and individuality present in his *ghazal* is found also in his *madīḥ*. Yet another contemporary, Muʾmin (1800-54) excelled in *ghazal*, but also wrote nine *ḳaṣīdas*, only two of them secular. He has been praised by Brēlwī for his originality in the form. Finally, in discussing the Dihlī school, Dāgh [*q.v.*] (1831-1905) deserves mention. His Urdu *dīwān* contains six odes, all secular. Five of them are addressed to the Niẓām of Hyderabad, at whose court he spent the last 19 years of his life. Mention has already been made of his inclusion of sections on horse and elephant.

Madīḥ thrived at the court of the Nawwābs of Oudh [see AWADH] until 1856, when the British exiled Nawwāb Wādjid ʿAlī Shāh to Calcutta and the court of Rāmpūr took its place. Two types, or, more properly, two tendencies, have been mentioned by critics—the more forceful and dignified based on Sawdā and the Dihlī school; and a softer type, influenced by *ghazal*, and by the licentious Lucknow atmosphere. Most of the poets of the Lucknow school of eulogists are now forgotten. Not so, however,

Amīr Mīnā'ī. It is sometimes said that the Urdu *ḳaṣīda* began with Sawdā and ended with Dhawḳ; but it would be truer to say that it ended—or nearly ended—with Amīr. This poet was a man of considerable scholarship, compiler of the first two volumes of an Urdu dictionary which, if completed, would have been on a very large scale. His mastery of words stood him in good stead in his *madīḥ* odes, of which only 28 have survived. Of the two Lucknow types, they are more akin to that based on the Dihlī school. Most of them are secular, and have a dignity bordering on the epic, especially in the varied *tashbībs*. His language is at times heavy; but in general, it is less intricate than Dhawḳ's, and superior in beauty and freshness. He spent 43 years as court poet in Rāmpūr. In 1900, he was invited to join Dāgh in Hyderabad, but died there shortly after his arrival.

By this time, the *madḥiyya ḳaṣīda* was becoming obsolete. After the Indian Mutiny, India came under British control, and those splendid courts which had nurtured eulogy poetry were a thing of the past; though some rulers of the "native states" patronised poetry, it was not on the same scale. Poets increasingly introduced their new poems to the public in *mushāʿaras* [*q.v.*], newspapers and magazines, or at meetings of cultural and learned societies. A new attitude to poetry developed, fostered by the ʿAligaṛh Movement, with the call for "natural poetry". Alṭāf Ḥusayn Ḥālī [see ḤĀLĪ] attacked the traditional *ḳaṣīda* in his *Muḳaddima-yi shiʿr-ō-shāʿiri*, published in 1893. The virtues described in eulogy poetry, he said, were mostly imaginary; in fact, they were often the very opposite of the *mamdūḥ*'s qualities. If he were an ignoramus, he would be praised for his knowledge; if he were a tyrant, for his justice and impartiality; if he were an idiot, for his sagacity (*op. cit.*, 82). Taking the Arabic poet as his ideal, Ḥālī castigated lying and exaggeration in eulogy (*ibid.*, 93 f.). The poet, he said, had an important function to perform: by bringing to light virtues and vices, he should encourage reform. In fact, Ḥālī was proposing a role for the Urdu poet not unlike that played by Aḥmad Shawḳī and Ḥāfiẓ Ibrāhīm in Egypt not long afterwards.

In the 20th century, a few Urdu poets continued to write *ḳaṣīdas*. For example, Aḥsan Mārahrawī (1876-1940) wrote one in *tarkīb-band* for King George V's coronation in 1911. ʿAzīz Lakhnawī gained something of a reputation for his eulogies, all directed to the Prophet and his family. But in India and Pakistan today, the *madīḥ ḳaṣīda*, whether religious, or in praise of public figures, is found chiefly in magazines and newspapers.

Yet the *ḳaṣīda* was not merely a useless and regrettable by-way of Urdu literary history. At its best, it had a sort of Baroque brilliance. Its style, even when the *tashbīb* was devoted to *taghazzul*, differred from that of *ghazal*. It had a strength and dignity which, derived in part from the early narrative *mathnawī*, in its turn influenced the 19th century *marthiya*. Its rich vocabulary and idiom influenced not only other poetry, however, but also prose. Without the *ḳaṣīda*, it could be argued, *Urdū-ē-muʿallā*—high literary Urdu—would have been much the poorer.

Bibliography: General accounts of *ḳaṣīda* form will be found in ʿAbd al-Salām Nadwī, *Shiʿr al-Hind*, Aʿẓamābād n.d., ii, 324-46; Abu 'l-Layth Ṣiddīḳī, *Lakhnāo kā dabistān-i shāʿirī*, Lahore 1955, 266-71; Muḥammad Sadiq, *A history of Urdu literature*. Karachi-Lahore-Dacca 1964, 30-2, gives a rather oversimplified account. Most of the critical studies of individual poets and editions of their works given below give some information on the form. For a historical account, see Djalāl al-Dīn Aḥmad Djaʿfrī, *Ta'rīkh-i ḳaṣā'id-i-Urdū*, Allāhābād n.d. For adverse criticism of Urdu *madīḥ*, see Alṭāf Ḥusayn Ḥālī, *Muḳaddima-yi-shiʿr-ō-shāʿiri*, Sartādj Publishing Company, Lahore n.d. 81-3. General criticism of the Persian *ḳaṣīda* often applied to Urdu will be found in Shiblī Nuʿmānī, *Shiʿr al-ʿAdjam*, Lahore 1924, v, 1-28, especially 20 ff. The following works are recommended for particular poets: Ḳulī Ḳuṭb Shāh, *Kulliyyāt*, ed. Sayyid Muḥyī 'l-Dīn Ḳādir Zōr, Hyderabad, Deccan 1359/1940; *Kulliyyāt Walī*, ed. Djanāb ʿAlī Aḥsan, Awrangābād 1927, introd. 62-70, text, 338-76; Shaykh Čānd, *Sawdā*, Hyderabad, Deccan n.d., 118-120, 180-215; Khāliḳ Andjumān, *Mirzā Muḥammad Rafiʿ Sawdā*, ʿAligaṛh 1966, 241-70; *Kulliyyāt Sawdā*, Nawal Kashōr Press, Lucknow 1932, i, 219-327; *Kulliyyāt Mīr*, ed. ʿIbādat Brēlwī, Karachi-Lahore 1958, 960-1060, 1183-1200, 1344-66, 1387-96, 1432-38; *Kalām-i-Inshā'*, ed. Mīrzā Muḥammad ʿAskarī, Allāhābād 1952, 289-331; Tanwīr Aḥmad ʿAlawī, *Dhawḳ—sawāniḥ awr tanḳīd*, Lahore 1963, 214-71; Rāḥat Afzā Bukhārī with Nādira Zaydī, "Shaykh Ibrāhīm Dhawḳ" = Ch. v (b) of *Ta'rīkh-i-Musulmānān-i-Pākistān-ō-Hind*, viii, Lahore 1971, 157-61; *Dīwān-i-Dhawḳ*, ed. K. M. Sardār Khān, Lahore n.d.; for Muṣḥafī, Ṣiddīḳī, *op. cit.*, 266-83; Sayyid Fayyaz Mahmud, *Ghalib—a critical introduction*, Lahore 1972, 121-2, 200-4; *Dīwān-i Ghālib*, ed. Ghulām Rasūl Mihr, Lahore 1967, 294-350; ʿIbādat Brēlwī, *Mu'min awr muṭālaʿa-yi-Mu'min*, Lahore-Karachi 1961, 256-64; *Kulliyyāt-i-Mu'min*, ed. Brēlwī, Lahore-Karachi 1955, 179-232; Dāgh, *Urdū Dīwān*, ed. Sibṭ al-Ḥasan, Lahore 1962, 506-57; Abū Muḥammad Saḥar, *Muṭālaʿa-yi-Amīr*, Lucknow 1965, 219-59; *Dīwān-i-Amīr maʿrūf ba-ism-i-ta'rīkhī "Mir'āt al-ghayb"*, Lucknow 1922, 2-40, 335-44; Ḳalaḳ, *Kulliyyāt*, ed. Kalb ʿAlī Khān Fā'iḳ, Lahore 1966, 458-551. ʿAbd al-Waḥīd, *Djadīd shuʿarā'-i-Urdū*, Lahore 1954, gives short accounts of Aḥsan Mārahrawī and ʿAzīz Lakhnawī, with examples of their *ḳaṣīdas* (330-6, 419-32). Ṣiddīḳī gives further information about the odes of ʿAzīz Lakhnawī (*op. cit.*, 796-803). Muḥammad Sadiq (*op. cit.*) and Ram Babu Saksena, *A history of Urdu literature*, Allāhābād 1927, refer to various poets mentioned in this article, but neither gives much information about their *madīḥ* poetry. Naṣīr al-Dīn Hāshimī, *Dakkan mēn Urdū*, Lucknow 1963, makes a few brief references to the Dakkanī *ḳaṣīdas*, for example, Ghawwāṣī, 107, and Muḥammad b. Riḍā, 371 f. For further accounts of the poets mentioned above, see the various articles in the *Urdu Encyclopaedia of Islam* being published by the University of the Punjab, Lahore.

(J. A. HAYWOOD)

5. In Swahili

Praise poetry is an important category in the literatures of several Bantu peoples, such as the Zulu, Swazi, Tswana, Rwanda, etc. It is a general aspect of African oral traditions which has survived Islamisation in the literatures of the Somali and Hausa. In Swahili, some of the oldest preserved manuscripts contain praise poems, in the first place the famous Ode of Liongo in self-praise. Praising oneself (Swah. *kujigamba, kujivuna*) is a common aspect

of many African oral traditions, and this includes extolling one's ancestors, commemorating their exploits as well as one's own. Liongo's Ode is composed in the *ukawafi* metre of 15 syllables in the line. Cf. v. 6.: "I am a young lion! I have instilled the wish to die in my heart! I fear only the disgrace when the enemy sees my back." The lines are arranged in couplets of two lines, the last line rhyming in *-ma* throughout the poem; this is the oldest-preserved type of metre other than dance songs. It may have been composed before 1600. A later poet added three lines to every couplet, making it a *tahamisa* (*takhmīs* [*q.v.*]). This structure became the model for later poets who were Muslims (unlike Liongo) and who composed hymns to the Prophet Muḥammad in this metre.

In Swahili, the word *kasida* normally refers to a poem praising the Prophet. The oldest *kasida* is dated 1062/1652, the first dated poem in the Swahili language. It is a translation of the *Hamziyya* by al-Būṣīrī [*q.v.* in Suppl.]; without the Arabic text, the Swahili could not be deciphered. The second surviving *kasida* is the famous scroll now in the library of Trinity College, Dublin. It begins, like Liongo's self-praise, with the word *wajiwaji*, perhaps not originally so pronounced, which has since then become the term for a *kasida* or *waʿaḍ* (Swah. *waadhi*, perhaps owing to the similar shape). A special kind of *kasida* is the *maulidi* [see MAWLID]. Two well-known Arabic *ḳaṣīda*s are the two *Burda* odes, both of which have been translated into Swahili; in particular, the *Burda* of al-Būṣīrī and the *Hamziyya* are still recited during Swahili ceremonies.

The Swahili word *madaha* is normally limited in meaning to the praises of God, many of which are nowadays sung in the mosques, for which reason they are simply referred to as *dua*. Numerous are the *dua* that have been composed in Swahili, some in the *ukawafi* metre, many in the easier but equally serious *utenzi* metre. Swahili verbs like *sabihi* and *himidi* refer exclusively to the praises of God.

The verb *sifu* or older *swifu* corresponds with the noun *ṣifa*, which can mean "quality, description" as well as "praise name", as in *Kulla swifa njema ndake Nabiya* "All worthy praise names are for the Prophet", the first line of the *Mawlid* of Barzanji. *Swifa* is used likewise for praising living men and women (for the praises of the dead, see MARTHIYA); these praise poems fall into two categories, those for religious leaders, such as *walī*s and *sharīf*s and those for political leaders. Lamu is the centre for the poetry in praise of religious leaders such as the Egyptian Aḥmad al-Badawī and ʿAbd al-Ḳādir [*q.vv.*], as well as the founding *Sharīf*s of the mosque at Lamu. This poetry is published in Lamu and Mambrui in Arabic script.

Inserted in the Swahili epic songs there are many praise poems; one of the oldest is ʿAlī's praise of himself in the *Utenzi wa Herekali* (Heraclius) which is itself traditional: "I am the lion of God. He has given me the sword Dhu 'l-Fiḳār. He made me the Breaker of Cities, His tool to punish the Kāfirs. "The Prophet praises himself in the same epic in the letter to the Emperor Heraclius, and there are several passages in which he is praised by others, as "the first-created seal of the prophets, God's favorites". Other heroes, like ʿUmar and Miḳdād, also praise themselves and are praised in the epic.

The Swahili tradition of composing praise songs was put to good use by the German administrators, who encouraged Swahili poets to write praises on the German governors and even on the Kaiser; one successful poet was even sent to Berlin and received by the Kaiser and "richly rewarded", exactly as a Muslim prince ought to have done. The poet's name was Hamisi Auwi, and the refrain of the poem is "Who has the true authority if not the Kaiser?".

The First World War produced some interesting songs, one in praise of General Smuts, who defeated the Germans south of Mombasa, and a new category of political songs, called the Beni dance songs, in which groups of (originally military) dancers praised their own "regiment", and chided rival dance groups, with political allusions.

Since independence, political verse has seen a new prosperity. The preparations for the elections are not complete without songs of praise for the leading candidates and mockery for their opponents. Some of these poems may appear in the press, but since the poet has to be cautious, he will use cryptic language, comprehensible only to the few insiders of the political arena. After the elections, the winning candidate will, of course, be lavishly praised, since there is nothing more praiseworthy than success. President Nyerere is probably the most poetically-praised political leader of East Africa. Thus gradually the Swahili word *madaha* has acquired the meaning of "flattery, eagerness to please", and even "self-complacency, arrogance, pride".

Schapera, *Praise poems of the Tswana chiefs*, all three in the *Oxford Library of African Literature*. On Somali: B. W. Andrzejewski and I. M. Lewis, *Somali poetry*, in the same series; for Hausa, M. Hiskett, *A history of Hausa Islamic verse*, London 1975, 23. For Liongo's Ode, see Knappert, *Four centuries of Swahili verse*, London 1979, 92-4. For the *Hamziya*, see Knappert, *The* Hamziya *deciphered*, in *African Language Studies*, ix (London 1968), 52-81. For the Dublin ms., see idem, *The discovery of a lost Swahili manuscript from the eighteenth century*, in *African Language Studies*, x (1969), 1-30. On the *Burda*, see idem, *Swahili Islamic poetry*, Leiden ii, *The two Burdas*. For the *Mawlid*, see *op. cit.*, iii. For metre, see idem, *Swahili metre*, in *African Language Studies*, xii (1971), 108-29. For the *Maulid* of Barzanji, see *Swahili Islamic poetry*, iii, 339 n. For the *Utenzi wa Herekali* and the Emperor Heraclius, see Knappert, *Traditional Swahili poetry*, Leiden 1967, ch. 3. For the exploits of Miḳdād in Swahili epic, see J. W. T. Allen, *Tendi*, London 1971. For the poetry of the German period, see C. Velten, *Prosa und Poesie der Suaheli*, Berlin 1907, 343, and J. Knappert, *The antecedents of World War I in Swahili literature*, giving a translation of the poem on Smuts. For an example of "election poetry", see idem, *A survey of Swahili songs*, Toronto, forthcoming. For the Beni dance songs, see idem, *Four centuries of Swahili verse*, 1979, 37-8. When President Nyerere met President Banda of Malawi at Dar es Salaam Airport in 1964, a special song was sung in praise of President Banda. (J. KNAPPERT)

MAʿDIN (A.), "mine, ore, mineral, metal". In modern Arabic, the word *mandjam* denotes "mine", while *muʿaddin* means "miner" and *djamād* is a mineral.

In the vast Islamic empire, minerals played an important part. There was a great need for gold, silver and copper for the minting of coins and other uses. Iron ore was indispensable for the manufacture

of iron and steel for arms and implements. Other minerals such as mercury, salt and alum, as well as pearls and precious stones, were necessary for everyday life. The empire was richly endowed with the various mineral resources; the mining industry was an extensive one and the metals, whether precious or not, were the object of a certain amount of international trade.

The article is divided in the following sections:

1. Economic aspects
2. Mining technology
3. Mineral exploitation in the Ottoman empire
4. In Islamic art

1. Economic Aspects

In the period of the Umayyad and ʿAbbāsid caliphs, the output of the mines in their dominions was apparently sufficient to meet the demands for some of the most important metals. In later periods when the empire was dismembered into various kingdoms one often warring with the other, many of the Islamic countries needed one or several of the metals and had to import them from non-Islamic regions. This was due to the fact that the metalliferous ores were distributed over the Islamic countries very unevenly. Some of them had rich deposits of several metals, others almost none. Certain regions on the eastern fringes of the Islamic world were relatively rich in metals, especially Īlāḳ, Farg͟hāna, Us͟hrūsana in Central Asia and the mountains near Bāmiyān (eastern G͟hūr). Also, Fārs had many mines which were very productive. The same was true for the country on the western frontier of the *dār al-Islām*, namely Spain. Al-Ḳazwīnī (*Āt͟hār*, i, 338) could write that in this Islamic country there were mines of gold, silver, lead and iron in every district. It seems that mining, which had somehow declined in the Visigothic period, was revived and flourished under the rule of the Spanish Umayyads.

In the times of the caliphs, there were still in Arabia a considerable number of mines, from which significant quantities of gold [see D͟HAHAB] were derived. Egypt had the famous mines of Wādī al-ʿAllāḳī, on the eastern shore of the Nile [see AL-ʿALLĀḲĪ]. There were also gold mines in Us͟hrūsana and Īlāḳ, near S͟hās͟h and at Harāt. But altogether, the output of gold in the Islamic countries was not sufficient for the regular coinage of gold *dīnār*s, especially after Spain had slipped away from the ʿAbbāsid empire. This is clearly borne out by the slow spread of gold coinage in the eastern countries of the caliphal empire. In fact, the Islamic countries were always dependent upon the supply of gold from the present countries of Senegal and Mali. When they had established their rule over the whole of North Africa and with this, the northern terminals of the commercial routes which were the outlets for the trade with these gold-producing regions, the mints of ʿIrāḳ and Persia could be supplied with sufficient stocks of gold. *Dīnār*s began to be struck in Marw in 842, in Rayy in 849, in Samarḳand in 861 and in Ād͟harbāyd͟jān in 885. The success of the Fāṭimids in gaining control over the former ʿAbbāsid province of Egypt was undoubtedly to a very great extent due to their riches in West African gold.

On the other hand, there were in the caliphal empire rich silver [see FIḌḌA] or argentiferous lead mines which made it possible regularly to strike silver *dirham*s. Most of them were in the countries then contained in the extensive province of K͟hurāsān. The most renowned were those of Pand͟jhīr, not far from the eastern sources of the Kābul river, and in D͟jārbyā, in the same district. Others were in Andarāb, to the east of Balk͟h, in the neighbourhood of Ṭūs, and in Farg͟hāna. The province of Fārs also had silver mines. In the flourishing period of the ʿAbbāsids, in the 9th century, the output of all these mines must have been considerable, as the gold-silver ratio changed, silver becoming cheaper, although the quantities of gold increased. Spain, too, was rich in argentiferous ore. It was exploited in the districts of Murcia, Alhama, Cordova and Beja (in the present Portugal).

Copper (*nuḥās*) was derived from mines in several provinces of the caliphal empire; in Sardan in the province of Fārs, in some places in Gīlān, Ād͟harbāyd͟jān, Buk͟hārā, Us͟hrūsana, Farg͟hāna; and in the Muslim West, in Igli in the Oued Saoura (in Western Algeria) as well as in Spain. The copper mines in Cyprus were always an important source. However, the accounts of the Arabic authors of that period leave no doubt that the copper production of the empire was not sufficient for the manifold employments of the metal. For copper was needed for the striking of locally-circulating small coins (*fulūs*), the roofing of mosques, the covering of gates of towns and public buildings, but above all, for the thriving industry of fabricating copper utensils, e.g. kettles, receptacles and various other vessels. The big cauldrons of Samarḳand and the copper vessels manufactured in Farg͟hāna and in many towns of Persia were renowned all over the Islamic world. So from early times, copper had to be imported from Europe. In the period preceding the Crusades, when trade between K͟hʷārazm and Persia, on one hand, and Eastern Europe on the other, was intense, apparently great quantities of copper were imported from the Urals. A report of al-Idrīsī obviously refers to that period.

Metalliferous ores which contained lead (*raṣāṣ*, *usrub*) and tin were not lacking altogether in the caliphal empire. Lead was taken from mines in the neighbourhood of Balk͟h, at several places of Anatolia, Upper Mesopotamia, al-Mad͟jd͟jāna (in eastern Algeria) and at Cabra in Andalusia. But the demand for this metal was very great. It was used for aqueducts, for the installation of public and private baths and for the roofing of public buildings. So it is doubtful whether the production was sufficient, and whether additional quantities had not therefore to be imported from non-Islamic regions. This was certainly the case as far as tin (*raṣāṣ ḳalʿī*, *ḳaṣdīr*) was concerned. Tin was found in Spain, in the province of Algarve, and Judaeo-Arabic Geniza letters, dating from the last years of the 10th century and the beginning of the 11th century, testify to the export of copper, lead and tin from Spain to the Near East. But already in that early period, tin had to be imported both from Cornwall and Devon in Britain and from Malaysia. The name given to tin by the Arabs, viz. *ḳalʿī* [*q.v.*] after Kalah, a well-known port on the peninsula of Malacca, bears witness to this fact.

Iron (*ḥadīd* [*q.v.*]) deposits were insignificant in the Near East, but one could procure sufficient quantities from other provinces of the caliphal empire and neighbouring countries which were tributary to the caliphs and their successors or otherwise dependent upon them. Armenia had mines which produced excellent iron, such as that, for instance, used for the Ḳusāsī swords. On the eastern slopes of the Caucasus, near Darband, there were iron mines which supplied a flourishing industry of weapons with raw material.

The province of al-Mawṣil, Fārs, Khurāsān (near Nīshāpur), Farghāna and Shāsh also had rich iron deposits. Even in Kirmān there were some iron mines. In Spain, iron was taken from mines in the Guadalquivir valley, near Cordova, Toledo and Murcia, and elsewhere. In the Maghrib, about ten iron mining areas were exploited, from Morocco to Libya; iron ore was produced and exported from Sicily, and some mines were worked in Nubia and on the Red Sea coast. The supply was sufficient for the production of various utensils, such as knives, needles, scissors, chains and lances. This industry was highly developed in Khʷārazm, in the major towns of Khurāsān such as Harāt, Nīshāpūr and others and also in al-Mawṣil and in Toledo in Spain.

The term *tūtiyā* (calamine or tutty) was used to denote the natural zinc ores, especially zinc carbonate, or the white zinc oxide which was obtained during the treatment of the ores. The major mines for *tūtiyā* were in the province of Kirmān, but it was available also in various mining areas in Spain.

Mercury (*ziʾbaḳ*) came chiefly from Spain [see AL-MAʿDIN]; another source was Farghāna.

Salt (*milḥ*) was produced in numerous localities and, in some areas, on a very large scale, notably in the southern Sahara [see AZALAY]. Other important salt mines or production centres were in Khurāsān, Arabia and Armenia.

The alum (*shabb*) of Yemen was famous for its quality, but according to al-Idrīsī, the major source was in Chad; it was exported to all the countries of North Africa and to Egypt.

Egypt was further a major production centre for both alum and natron (*naṭrūn* [*q.v.*]).

Among the many other minerals that were known and utilised was asbestos (*ṭalḳ*) from Badakhshān, out of which wicks and fire-resistant cloths were made.

Coal (*faḥm*) was also known and was used in some areas such as Farghāna where it was mined and sold. It was used as a fuel for ovens (*tannūr*, pl. *tanānīr*) and its ashes utilised as a cleaning agent.

Petroleum (*naft* [*q.v.*]) deposits were exploited on a large scale.

Precious stones of various kinds were mined. Arabic works on lapidary such as al-Bīrūnī's *K. al-Djamāhir* are celebrated, and deserve detailed study. Rubies were mined in Badakhshān and were also brought from Ceylon. Diamonds came from Hindustān and Ceylon, agates from Yemen, emeralds from Egypt, turquoises from Nīshāpūr, lapis lazuli from Egypt and onyx from Yemen. Corundum came from Nubia and Ceylon. Rock crystal (*billawr* [*q.v.*]) was mined in Arabia and Badakhshān. Diving for pearls was a flourishing industry, and coral was obtained from the coasts of North Africa and Sicily [see further, DJAWHAR, in Suppl.].

When the empire of the caliphs crumbled, the unevenness of the distribution of metal deposits resulted, of course, in some countries suffering a temporary or permanent lack of important raw materials. Although the countries which had belonged to the empire remained to a great extent an economic unity, exchanging their products and keeping their economic structures, the stopping of the supply of metals which served as raw materials for manufactured goods and bullion for the mints was used as a weapon in the political struggle. Mediaeval statesmen were of course aware that cutting off the gold supply of the enemy's country meant weakening its financial resources and that curbing its supply of iron dealt a blow to the production of arms.

Already in the second half of the 10th century, the supply of the mints of ʿIrāḳ with bullion for the coinage of gold *dīnārs* was deficient, as the mines in the provinces which had remained under the sway of the ʿAbbāsid caliphs, or were accessible to them, were poor. The *dīnārs* of the later Būyids of ʿIrāḳ and southwestern Persia were of bad alloy. Even the mines of Wādī al-ʿAllāḳī yielded in that period insignificant quantities of gold. Ibn Saʿīd, writing in the 13th century, reports that the gold derived from these mines was worth no more than the expenses paid for the work. Consequently, Egypt was during the Ayyūbid and Mamlūk periods wholly dependent upon the supply from West Africa, that is, the gold mines of the countries called by the Arabs Ghāna or Takrūr. This supply rendered possible the regular coinage of gold *dīnārs* of full weight and excellent alloy until the 15th century, when the Portuguese diverted to themselves part of the West African gold. In the year 1425, the *dīnār* of the Mamlūks was devalued for various reasons, one of them probably being the reduced supply of bullion. The coinage of ʿIrāḳ and Persia became from the middle of the 13th century essentially monometallic, as the silver money predominated overwhelmingly.

Even the supply of the Islamic countries with silver was in the later Middle Ages very irregular. In the 11th and 12th centuries there was everywhere a silver famine, so that the striking of silver *dirhams* had to be discontinued. The catalogues of recently-found coin hoards of the Saldjūḳs, like that published by T. Khodjaniyazov (Akhshabad 1979), confirm the supposition of a great silver famine (see also M. A. Seyfeddini, *Monetnoe delo i denežnoe obrashčenie v Azerbaydžane XII.-XV. vv.*, i, Baku 1978). There were several possible reasons for this phenomenon. It may be that the campaigns of Maḥmūd of Ghazna in India and the flow of great quantities of gold from the subcontinent to Afghānistān and to Persia brought about as a concomitant the export of silver to the newly-conquered provinces (this being the opinion of Blake). According to another hypothesis, the silver famine resulted from the loss of enormous amounts of *dirhams*, which were used as payment for the commodities purchased by the Muslim merchants in Russia and were finally hoarded there. Against the latter supposition one can adduce the fact that the silver famine in the Islamic countries began when the trade with Russia had already considerably declined. Perhaps the technological shortcomings of mediaeval mining were a major reason for the silver famine; al-Idrīsī recounts in fact that work on the "Silver Mountain", on the way from Harāt to Sarakhs, had to stop because of technical faults and the lack of wood for melting the ore. But it seems that the shortage of silver was in that period a world-wide phenomenon, which was felt in India too (cf. S. Digby in *BSOAS*, xxxvii, 469). Anyhow, at the end of the 12th and at the beginning of the 13th century, silver coinage revived in ʿIrāḳ, in Syria and in Egypt. Apparently this was made possible by Central Asian silver being brought by the Mongol conquerors, or flowing to the Near East in the wake of their campaigns, when trade between Central Asia and the Levant had been intensified after the establishment of Mongol rule over Persia. This supposition would be enhanced by the fact that a new crisis which happened in Syria and in Egypt in the middle of the 13th century was overcome after a new invasion by the Tatars. From that time onwards, Persia and ʿIrāḳ had a

monetary system based on a silver *dīnār* (of 12.9 gr.). In the early days of Īlkhānid rule, the increase of good silver coins in circulation was a striking feature of monetary development. When Ghāzān Khān again struck gold *dīnārs*, the exchange rate was based on the gold-silver ratio of 12:1. That means that great amounts of silver were available and that it was consequently cheap. The bullion was undoubtedly supplied both by mines in the Middle East and in Central Asia. Ḥamd Allāh Mustawfī, writing in the 1330s, has included in his *Nuzhat al-ḳulūb* a list of silver mines, most of them in Central Asia. But there were also, according to his account and to other sources, rich mines in Gümüshkhāne, between Amasya and Erzindjān, and in Lūlū in Asia Minor. Ibn Baṭṭūṭa recounts that Syrian and ʿIrāḳī merchants came to Gümüshkhāne, of course, to purchase the white metal. But the quantities of silver recovered from these mines were by no means sufficient for the needs of the mints and the silversmiths of the Near East. Egypt and Syria were in the later Middle Ages supplied with silver both from Central Asia and from Europe. The American chemist A. A. Gordus has elaborated a method of neutron activation which renders it feasible to find out the origin of silver by establishing its gold impurity. By this method, he has found that the bullion used by the Mamlūk mints for striking silver *dirhams* was very diverse, coming both from Central Asia and from the European countries. Another silver famine from which the Near East suffered at the end of the 14th century and at the beginning of the 15th century came to its end some years after the campaigns of Tīmūr. So the supposition that this was due to the renewal of trade with Central Asia and the flow of silver therefrom to the Near East is at least a good working hypothesis. However that may be, the supply of silver to the Near Eastern mints was sufficient throughout the 14th and the 15th centuries, though it slowly diminished. The difference between the gold-silver ratio in that region, at most less than 10:1, against 11:1 or more in Europe, brings it home.

Just as the Persian and Turkish countries were in the later Middle Ages richer in silver, so the supply of copper was much more abundant. In these countries and in some neighbouring ones, there were indeed mines which produced good and abundant copper. Some of them were in Ādharbāydjān, others in Armenia, Syria and Egypt, which urgently lacked copper deposits, had to import it from Europe. The abundant issue of copper coins and the manufacturing of manifold copper vessels would have been impossible if the Venetians and the Genoese had not carried to the Near East heavy shipments of the German, Slovakian and Bosnian copper. The countries of the Maghrib, on the other hand, could supply themselves with copper, produced in the mines of Morocco, such as at Dai and elsewhere. But they had recourse to the import of silver coins from Europe. The Near Eastern countries also lacked lead and tin and were reduced to purchasing these metals from southern European traders, who imported them from Serbia, Bosnia, Germany and England. The Persian countries were supplied with lead from mines in Bukhārā, Ushrūsana and Farghāna.

Even as far as iron was concerned, the resources of the Near Eastern countries were utterly deficient, and they were dependent upon a supply from Europe, where this export trade was stigmatised by the Church as treason against Christianity, and transgressors were threatened by ecclesiastical and secular authorities with severe punishment. Nevertheless the Italian merchants supplied the Muslims with this (and other) "forbidden merchandise", and the republic of Pisa, by a treaty concluded in 1173 with Saladin, formally undertook to sell iron to Egypt.

The newly-emergent Ottoman empire included various metalliferous regions, so that it could provide itself with some of the metals at least which it needed. Great quantities of good copper were hauled from the mines of Ḳasṭamūnī, not far from the shorses of the Black Sea. The output of these mines was so abundant that, in the 15th century, Italian merchants exported great quantities of it to Syria and Egypt. When the Ottomans conquered Bosnia and Serbia, the rich deposits of gold, silver, copper and lead of Novo Brdo, Olovo, Srebrenica and other mines fell to them. Much excellent iron was produced in the mines of Samokov (formerly called Samakov) to the south-east of Sofia. Gold, however, was still imported from the Western Sudan, so that in the 16th century the Turkish gold coins were struck in Cairo, where the precious ore first arrived.

The output of the Central Asian mines had great importance for the economy of the Khānates of Bukhārā and Khīva and other Islamic states of that region from the 17th to the 19th centuries. In Farghāna, gold was collected from the sand of the rivers Mukan and Uzun Nahmad and especially from the rivers in the district of Namanghān. Lead was extracted from mines in Namanghān and Marghīlān, and lead mixed with silver in the district of Andidjān. Farghāna was also rich in silver, and in the 17th century the production was considerable. The production of iron and copper, on the other hand, was both in Farghāna and Khoḳand sufficient for local demand only. In Badakhshān, mining flourished especially in the 17th century, and one mine produced both gold and silver. Bukhārā and Khīva produced gold and silver. Gold was found in the sand of the Zarafshān river and Ḥiṣār river. The mining of silver, copper, lead and iron yielded an abundant output in eastern Bukhārā. The export of gold and silver from the Khānates of Central Asia to Russia had in the middle of the 18th century and also in the 19th century a great volume, as is borne out by the registers of the custom offices of Orenburg and Troitsk. In the years 1748-55, 800 kg of gold and 75.5 tonnes of silver passed through Orenburg, and in 1760 3.6 tonnes of silver. Even to Siberia, the Khānates exported considerable quantities of precious metals.

2. Mining technology

1. *Islamic mines*

In the vast Islamic empire, minerals played an important part. There was a great need for gold, silver and copper for the minting of coins and for other uses. Iron ore was necessary for the manufacture of iron and steel for arms and implements. Other minerals such as mercury, salt and alum were indispensable for everyday life. The empire was richly endowed with the various mineral resources, and the mining industry was an extensive one. *Maʿdin* (pl. *maʿādin*) denoted "mine" in Arabic sources, and *muʿaddin* means "miner". In modern Arabic, the word *mandjam* denotes "mine", while *maʿdin* or *maʿdan* is now used mostly for "metal" or "mineral".

Information on Islamic mines occurs in geographical works, in alchemical treatises, in books on mineralogy and in various other sources. But these, and archaeological discoveries, have not yet been searched for the purpose of writing a history of mining technology, although some studies have appeared on the distribution of Islamic mines. We shall mention here only some of the minerals and a few of the mining centres, since it is not possible here to list all the mines.

Gold (*dhahab* [*q.v.*]) mines were found in western Arabia, Egypt, Africa and in some eastern Islamic lands. But the first major gold mining area was at Wādī al-ʿAllāķī, which is a right-bank tributary of the upper Nile. It lay in the Budja country, which was between Ethiopia and Nubia [see BEDJA]. The mines were in a desert area between the Nile and the Red Sea. The nearest towns were Aswān [see al-USWĀN] on the Nile and ʿAydhāb [*q.v.*] on the Red Sea. The second major gold mining area was called by al-Bīrūnī the Maghrib Sūdān. This is the area south of the Sahara in Senegal and on the Upper Niger in Mali. According to al-Idrīsī, Wangāra was the most important gold mining centre on the upper Niger. Salt, cloth and other commodities were exchanged for gold.

Silver (*fiḍḍa* [*q.v.*] was either mined individually or in association with lead ores. The major silver mines were in the eastern Islamic provinces. Prominent among these were the mines of the Hindū Kūsh in the towns of Pandjhīr and Djāriyāna, both in the neighbourhood of Balkh. According to one report, there were about 10,000 miners working at Pandjhīr. Other important silver mines were in Spain, the Maghrib, Iran and Central Asia.

Lead (*usrub*, *raṣāṣ*) was obtained mostly from galena (lead sulphide), which was of very common occurrence. This lead ore is often associated with small quantities of silver. Only two other lead ores have any importance as raw materials. One is cerussite (lead carbonate) and the other, which is of minor importance, is anglesite (lead sulphate). Lead ores, especially galena, were exploited in Spain, Sicily, the Maghrib, Egypt, Iran, Upper Mesopotamia and Asia Minor.

Copper (*nuḥās*) ore deposits were exploited in various areas, including the important mines of Spain in the west, and several deposits in the east, such as those in Sidjistān, Kirmān, Marw, Farghāna, Bukhārā, Ṭūs and Harāt. The copper mines in Cyprus were always an important source.

The word calamine or tutia (Arabic *tūtiya*) was used to denote the natural zinc ores (especially zinc carbonate), or the white zinc oxide which was obtained during the treatment of the ores. The major mines for tutia were in the province of Kirmān in the east. Tutia was available also in various mining areas in Spain.

Tin (*raṣāṣ ķalʿī*, *ķaṣdīr*) came from the Malaysian peninsula, which was known as Kala, hence the name *ķalʿī* for the metal.

Iron and steel were in great demand in the Islamic empire. Hence iron ores were utilised whenever it was feasible. These ores were distributed in most Islamic lands. Five major iron mining areas were utilised in Spain. These included the mines near Toledo, and near Murcia. In the Maghrib, about ten iron mining areas were exploited in Morocco, Algeria and Tunisia. These included mines in Djabal al-Ḥadīd in the Atlas mountains, the Rīf, Gawr al-Ḥadīd in Algeria, and Madjdjanat al-Maʿdan in Tunisia. Iron ores were produced and exported from Sicily. Iron ore was mined in the Libyan desert and in the Fezzān. Egypt exploited those ores that were available, for example in Nubia and on the Red Sea coast. Syria was famous for its iron and steel metallurgy (Damascus steel), and the iron ores were obtained in the south and in the mountain ranges between Damascus and Beirut. The Islamic countries of the east (al-Mashriķ) were better endowed with iron ores than Egypt, Syria and ʿIrāķ. The province of Fārs had at least four important iron mining centres. There were also iron mines in Khurāsān, in Transoxania, in Ādharbāydjān and in Armenia.

Mercury (*ziʾbaķ*) came chiefly from Spain. Al-Idrīsī mentions the mine to the north of Cordoba, where more than one thousand men worked in the various stages of mining the ores and extracting the mercury. Another source was Farghāna in Transoxania.

Salt (*milḥ*) was produced in numerous localities. It was an essential commodity, and production was undertaken in some areas on a very large scale for export purposes, for example in the Maghrib, where the salt mines were on the desert edges in the south. Salt was produced and carried by caravans south of the Sahara to be exchanged for gold. Thousands of men and camels were involved in these operations. Other important salt mines or production centres were in Khurāsān, Arabia and Armenia.

The alum (*shabb*) of Yemen was famous for its quality, but according to al-Idrīsī, the major source was in Chad. It was exported to Egypt and to all the countries of North Africa. Egypt was also a major production centre for both alum and natron. Among the many other minerals that were known and utilised was asbestos from Badakhshān, from which wicks and fire-resistant cloths were made. Coal was also known and used in some areas such as Farghāna

in Transoxania, where it was mined and sold. It was used as a fuel for ovens (*tanānīr*, sing. *tannūr*), and its ashes were utilised as a cleansing agent. Petroleum deposits were exploited on a large scale [see NAFT].

Precious stones of various kinds were mined. Arabic works on lapidary such as al-Bīrūnī's *al-Djamāhir* are celebrated and deserve detailed study. Rubies were mined in Badakhshān, and they were brought from Sarandīb. Diamonds came from Hindustān and Sarandīb, agate from Yemen, emeralds from Egypt, turquoise from Nīshāpūr, lapis lazuli from Egypt and onyx from Yemen. Corundum came from Nubia and Sarandīb. Crystal was mined in Arabia and Badakhshān. Diving for pearls (*luʾlu* [*q.v.*]) was a flourishing industry, and corals were obtained from the coasts of North Africa and Sicily.

2. *Mining technology.*

Although mining operations in Islamic civilisation were very extensive, yet like most aspects of Islamic technology no attempt has yet been made to study the technology of mining. This is another field that requires extensive research. There is therefore a noticeable gap in the history of mining in general, and whereas much information and archaeological research has been published on ancient and Roman mining, research is completely missing for the period between the 1st/7th and 9th/15th centuries. Not only should this gap be filled, but there are academic reasons for re-examining much of the material that has been published on ancient and Roman mining technology.

It is possible to give here an outline of Islamic mining technology by looking into the brief accounts of the geographers and some of the lapidary books. In Europe it was not until A.D. 1556 that the first book on mining, that of Agricola, made its appearance. Before that time, only a few books on lapidary techniques, mainly translated from Arabic, were available.

There was not just a single mining technology in Islamic lands. Methods differed from mineral to mineral, from country to country, and from one method of ownership to another. In any one country could be found a range of technologies, from the primitive to the highly developed.

As with modern mining, there were two major types of operation—the underground and the open-cut. In brief words, al-Biruni says: "The search for *laʿl* (a kind of ruby) is of two types: one is to dig the mine under the mountain, and the other is to search for it among the gravel and earth which result from the collapse of the mountains by earthquakes or their erosion by floods" (*al-Djamāhir fī maʿrifat al-djawāhir*, Hyderabad 1355/1936-7, 83).

In underground mining, one method was to sink shafts vertically into the soil, and to drive horizontal passages when the veins were reached. In Syria, the shaft of the mines was called the *bīr*, i.e. the well, and the horizontal tunnel the *darb*, i.e. the road. In the Lebanese mountains, a typical shaft was only 6-7 metres deep, and the tunnels were "very long". Al-Idrīsī saw the mercury mines to the north of Cordoba in Spain, and he was told that the depth from ground level to the bottom of the mine was 250 fathoms (*ḳāma*) (*Nuzhat al-mushtāḳ fī 'khtirāḳ al-āfāḳ*, section on al-Maghrib, Arḍ al-Sūdān, Egypt and al-Andalus, Leiden 1864, 214). Other mines of intermediate depth were reported. Thus in the silver mines in the Maghrib, the depth was 20 cubits (*dhirāʿ*). The technique of drilling vertical shafts and horizontal tunnels was a familiar operation in the Islamic countries if we remember the great tradition of constructing the underground *ḳanāt* systems [*q.v.*], with the exacting technical experience which they require.

More often, however, in underground mining miners preferred to dig horizontal adits into the slopes of a mountain and follow the veins, rather than to sink shafts. This method was easier and less expensive for a miner who was working for himself. It is noticeable that the reports of mines with vertical shafts usually apply to mines owned by the state. A vivid description of the silver mining activities in Pandjhīr in eastern Khurāsān, where 10,000 men were employed in the mining industry, is given by Abu 'l-Fidāʾ. He says: "The people of Pandjhīr made the mountain and the market-place like a sieve because of the many pits. They only follow veins leading to silver, and if they find a vein they dig continuously until they reach silver. A man may spend huge sums of money in digging, and he may find silver to such an extent that he and his descendants become rich, or his work may fail because he is overpowered by water or for other reasons. A man may pick a vein, and it is possible that another man picks the same vein in another position. Both start digging. The custom is that the miner who arrives first and intercepts the passage of the other miner wins the vein and its results. Because of this competition, they execute a work that devils cannot achieve. When one arrives first, the expenses of the other are wasted. If they arrive together, they share the vein and then they continue digging as long as the lamps are burning. If the lamps are extinguished and cannot be relit, they stop their progress because anyone who reaches that position would die immediately. [In this business] you will see that a man starts his day owning one million, and by nightfall he owns nothing. Or he may start poor in the morning and by evening he becomes the owner of uncountable wealth (*Taḳwīm al-buldān*, ed. Reinaud and de Slane, Paris 1840, 465).

The main tool of the miner was the pickaxe (*minḳār*, *ṣāḳūr*). It had a sharp end to peck the stone and a flat end to hammer or to drive wedges. There were also various hammers, chisels or wedges, crow-bars, hoes and shovels.

Windlasses were used for hauling ores and materials out of the shafts. An efficient and simple form of windlass was used in the iron mines in Syria, and is still used in constructing the *ḳanāt* system in Iran, in drawing water, and in the building industry. Here an assistant sits on a bench on one side of the mouth of the shaft or well, pulling the horizontal bars of the windlass towards him with his hands and pushing the opposite ones away with his feet at the same time. The ore is loaded into a small bucket about 30-35 cm. in diameter, which has two handles. The rope is attached to the bucket by hooks fastened at its end. More sophisticated capstans were used for haulage also, when loads were heavier.

Oil lamps were used for illumination. The lamps were useful for aligning the direction of the digging, and were also good indicators of the adequacy of fresh air supplies, as was the case in the silver mines of Pandjhīr. In Arabic technical literature, there are different designs of ingenious lamps. One such design, suitable for outdoor use and protected against being extinguished by winds, was described by the Banū Mūsā.

Ventilation was an important problem. In Pandjhīr,

as we have seen, with thousands of small miners working for themselves in a frantic search for silver, capital investment was kept to a minimum, and no provision for ventilation was usually made. The miner simply abandoned the digging if the lamps stopped burning. In the more organised mining work, especially in the state mines, a means of ventilation was always provided. This would be essential, particularly in the very deep mercury mines which we mentioned. Special ventilation shafts were provided. When installing a drainage system, several shafts were needed for this purpose, and these also served as ventilation shafts. Special ventilation shafts have been found in Iran, and some of these go back to pre-Islamic times. The problem of ventilating wells and mining shafts attracted the attention of Muslim engineers. They designed special ventilating machines. The Banū Mūsā describe a design for "a machine for use in wells which kill those who descend in them. If a man uses this machine in any well, it will neither kill nor harm him. This machine is suitable for wells that kill and for dangerous pits. If a man has this machine, which we shall describe, with him, he can descend in any well immediately without fearing it and it will not harm him" (*Kitāb al-Ḥiyal*, Arabic tex ed. A.Y. al-Hassan, Aleppo 1981, 374, Eng. tr. D. R. Hill, Dordrecht 1979, 240).

The other important problem in mining was drainage of the mines. Here also, small miners of silver could not afford to solve the problem, as we have seen in Pandjhīr. On the other hand, in the state silver mines in Zakandar in the Maghrib, drainage was carried out properly, as al-Ḳazwīnī reports: "Here are the silver mines. Anyone who wishes can undertake processing them. There are underground mines in which many people are always working. When they descend 20 *dhirā*ʿs, water appears. The sultan installs water-wheels and water is raised until the mud appears. Workers bring this mud up to the surface of the ground and wash it. He does this in order to take the fifth ... Water is raised in three stages, since it is 20 *dhirā*ʿs from the ground level to the surface of the water. He installs a wheel down in the mine on the water surface. Water is lifted and it is discharged into a large tank. Another wheel is installed on this tank. It lifts the water and pours it into another tank. On this tank a third wheel is installed. It lifts the water and discharges it on to the surface of the ground to irrigate the farms and gardens. This operation cannot be undertaken except by a very rich person possessing thousands. He sits at the mouth of the mine and employs artisans and workers, who bring out the mud and wash it in front of him. When the work is done, the fifth of the sultan is put aside and the rest is given to him. It may come to be smaller than his expenditure, and it may be [more]. This depends on the man's efforts" (Zakariyyā al-Ḳazwīnī, *Āthār al-bilād*, Beirut 1960-1, 199-200).

The technique of water raising by water-wheels was highly developed in Islamic civilisation, and it flourished in North Africa and Spain. The above passage by al-Ḳazwīnī is important, and should prompt a reconsideration of archaeological findings, since it is quite certain that other mines in Spain and North Africa were being drained in a similar manner. The Muslims carried out extensive mining operations in central and southern Spain in the areas of Cordoba, Almáden, Ovejo, Huelva, Murcia, Ilbira and elsewhere. Water-raising devices of various types were used. These included the compartmented wheel, the chain-of-pots wheel, the Archimedean screw, the rag-and-chain pump and the piston pump. Archaeologists have found a screw pump in a mine near Cordoba with an oak screw and a barrel of sheet lead, but R. J. Forbes has expressed doubts as to whether this pump was really of Roman date (*Studies in ancient technology*, vii, Leiden 1966, 219).

We come now to a discussion of the dressing of ores. This includes the crushing, sifting and washing of ores. Such operations were usually conducted at the mines' sites before the transport of the ores to the metallurgical centres. The ores were pounded or reduced in size, and in the case of gold ores they were crushed or milled to a finer degree. The milling operation was more important with the reef gold which occurs in quartz veins. Milling or crushing of these ores was done either by querns or by water driven trip-hammers. Al-Bīrūnī in his *Djamāhir*, 233-4, discusses this operation: "Gold may be united with stone as if it is cast with it, so that it needs pounding. Rotary mills (*ṭawāḥin*) can pulverise it, but pounding it by *mashādjin* is more correct and is a much more refined treatment. It is even said that this pounding makes it more red, which if it is true is rather strange and surprising. The *mashādjin* are stones fitted to axles which are installed on running water for pounding, as is the case in the pounding of flax for paper in Samarḳand". This is an important text since it indicates that water driven trip-hammers (*mashādjin*) were already established for crushing ores before the 4th/10th century.

3. *Pearls and underwater resources.*

The exploitation of corals and pearls involved very extensive activity. Pearls of the Gulf area were highly valued; the Chinese considered them to be the best pearls. The operations were organised by entrepreneurs. One of these would hire divers for two months and pay them regularly; such enterprises were often highly profitable. However, we read detailed descriptions of the great dangers which faced the divers.

Al-Bīrūnī gives in his *Djamāhir* again (149-50) a detailed description of a diving operation, including a description of a new diving gear: "I was told by a man from Baghdād that divers had invented in these days a method for diving by which the difficulty of holding the breath is eliminated. This enables them to frequent the sea from morning to afternoon, as much as they wish and as much as the employer favours them. It is a leather gear which they fit down their chests and they tie it at the [edges ?] very securely and then they dive. They breathe in it from the air inside it. This necessitates a very heavy weight to keep down the diver with this air. A more suitable arrangement would be to attach to the upper end of this gear opposite the forehead a leather tube similar to a sleeve sealed at its seams by wax and bitumen, and its length will be equal to the depth of diving. The upper end of the tube will be fitted to a large dish at a hole in its bottom. To this dish are attached one or more inflated bags to keep it floating. The breath of the diver will flow in and out through the tube as long as he desires to stay in water, even for days".

An ingenious dredging machine was designed by the Banū Mūsā in their *Book of ingenious devices*. They say: "We wish to explain how to make a machine by which a person can bring out jewels from the sea if he lowers it, and by which he can extract things which fall into wells or are submerged

in the rivers and seas". This worked on exactly the same principle as the modern clamshell grab (*Kitāb al-Ḥiyal*, text 376, Eng. tr. 342).

4. *Non-ferrous metallurgy.*

Much information about metallurgy can be gained from the alchemical and chemical treatises. There was a close relationship between the work of the metallurgist and the chemist, and the Arabic sources reflect the experience gained in the laboratory and in the metallurgical furnace.

Gold. Speaking about native gold which is collected from gold mines, al-Bīrūnī says that it is usually not free from impurities and therefore this gold can be refined by smelting only, or by other methods. He gives details of the amalgamation method that was used in the mines on a commercial scale: "After pounding the gold ore or milling it, it is washed out of its stones, and the gold and mercury are combined and then squeezed in a piece of leather until mercury exudes from the pores of the leather. The rest of the mercury is drived off by fire" (*Djamāhir*, 234).

He further describes (236) how gold is mined from the deep waters of the Sind river: "At its sources there are places in which they dig small pits under the water, which flows over them. They fill the pits with mercury and leave it for a while. Then they come back after the mercury has become gold: This is because at its start the water is rapid and it carries with it particles of sand and gold like mosquitoes' wings in thinness and fineness. Water carries these particles over the surface of the mercury which picks up the gold, leaving the sand to pass away".

The cupellation process was used extensively both on the laboratory and the industrial scales. The gold is alloyed with lead in a special crucible and it is then oxidised by means of a strong current of air blown on to the surface of the molten metal. The base metals such as copper are drossed, while the gold and silver remain as a button of silver-gold alloy. The separation of the gold from the silver was done by what is known as the salt and sulphur process. The liquation process was also used in combination with the cupellation process. What is new in these processes—and this was an Islamic innovation—is the use of nitric acid in the separation of gold from silver. Djābir b. Ḥayyān [*q.v.*] described this process, and it was also mentioned by other later writers. Gold was tested by various methods. These included the touchstone (*al-miḥakk*), measuring the specific gravities, and noting the speed of solidification of gold after it had been removed from the furnace.

Silver and lead. Unlike gold, native silver was not found in alluvial deposits or in the sands and gravels of rivers, but was to be sought in mountainous regions in embedded veins. In general, however, native silver was not abundant, and the main source was from galena (lead sulphide), which was usually associated with small amounts of silver. The first step would be to obtain the lead itself (which usually contains silver) from the earth and stones (i.e. the galena). This was done first by roasting, followed by smelting. The resulting lead could then be treated to extract silver. In Arabic literature, we find the results of some experiments indicating the amount of silver which could be recovered from an ingot of lead. This was usually in *dirhams* in one *maṣla* (one silver *maṣla* = 50 *raṭls*). There were smelters (*sabbākūn*) specialising in gaining silver from lead ingots.

Sometimes silver was associated with gold in what is called electrum. Here also, as we have seen, methods were adopted to separate these two precious metals. Silver was also obtained from its ores, or from lead or copper ores.

These different sources of silver necessitated the application of various techniques which were mastered by Islamic smelters and chemists, such as roasting, smelting, oxidation, liquation, leaching, cupellation and amalgamation. Details cannot be given here, but these methods fascinated the alchemists and were largely responsible, in our opinion, for the vast alchemical literature that resulted from the alchemists' experiments with stones (*aḥdjār*) and metals (*adjsād*).

Tin, zinc, antimony and arsenic. Tin was one of the seven malleable metals or bodies. It was brought mainly to the classical Islamic countries from the Malaysian peninsula and, to some extent, from Spain and the West.

Zinc was not known as a distinct metal by the early Islamic metallurgists and chemists. It was first known, and used extensively, through tutia (zinc oxide) which was one of the stones (*aḥdjār*). Later, as we shall see, zinc (*rūḥ al-tūtiya*) was known as a distinct metal. Tutia is usually the pure zinc oxide which is obtained from natural zinc carbonate. Various authors described the method of producing the pure product from the natural one. The ore is placed in furnaces which contain long ceramic rods. Upon heating the ores, the smoke of tutia ascends and adheres in films to the ceramic rods. Al-Muḳaddasī, 470, saw the "curious tall furnaces in the mountain villages" in Kirmān. They later also attracted the attention of Marco Polo when he visited the same area. Before the 10th/16th century, *rūḥ al-tūtiya* (zinc) as a metal was known and was used with copper to form brass. It replaced *kharṣīnī* as the seventh metal. Abu 'l-Faḍl in the *Āʾīn-i Akbarī* gives several compositions employing *rūḥ al-tūtiya* (E. Wiedemann, *Aufsätze zur Arabischen Wissenschafts-Geschichte*, i, Hildesheim 1970, 706).

Antimony was obtained from antimony sulphide (Sb_2S_3) and was one of the constituents of copper alloys. Arabic chemical books described this process.

Arsenic was unimportant as a metal. But we read a description of the "preparation of the mercury of arsenic sulphide". This was a preparation of metallic arsenic from its sulphides. We may note that these metals which were not among the original seven were given such names as *rūḥ al-tūtiya* or "mercury of arsenic sulphide". The same remark applies to mineral acids, which were not classified originally, and hence were attributed to their salts.

Copper and its alloys. Copper was usually obtained from the sulphide ores. It seldom occurred as oxides or carbonates. These latter ores required only the simple treatment of heating with charcoal, while the sulphides (*zādjāt*) required roasting, smelting with fluxes and partial oxidation. An interesting discovery took place in Spain. The sulphide ores, on exposure to air in the presence of water, are oxidated to soluble sulphates. "The Moors then found that if water containing copper sulphate is allowed to run over iron, pure copper is deposited and the iron dissolved. As iron was cheap and abundant in Spain, this discovery yielded an efficient method of recovering copper from sulphide ore, and direct mining of copper ore became less necessary" (Singer *et alii*, *A history of technology*, ii, Oxford 1979, 11).

Bronze (*ṣafr*, *isfidrūy*) is an alloy of copper and

tin. It was much used for plain kitchen wares and implements, and was the alloy upon which coppersmiths based most of their work.

Brass (*shabah, birindj*) is an alloy of copper and zinc. Zinc with copper forms an alloy which is stronger, harder and less malleable than pure copper. Various kinds of brasses are obtained by varying the zinc content. A 20% brass simulates the colour of gold. When zinc was not known as a metal, copper was heated in a mixture of powdered zinc ore and charcoal. A proportion of the zinc formed in the vicinity of the copper was diffused into it by cementation. Later we read in the *Āʾīn-i Akbarī* about three qualities of brass with increasing amount of zinc content: one is ductile in the cold state, the second is ductile when it is heated, and the third is not ductile but can be cast (Wiedemann, *Aufsätze*, i, 706-7).

A cheaper quality of alloy was called by al-Bīrūnī *bitrūy* and by some authors *rūy*. This was a kind of bronze alloyed from copper and lead. It was also *shabah mufragh*, and was used for hardware.

Kharṣīnī was a metal (or alloy) which was listed as one of the seven metals of early Islamic alchemy. It was attributed to China. All Muslim writers said that it was not available and was extinct. A time came when it was replaced by zinc in the list of the seven metals. Some historians now think that *kharṣīnī* was zinc. Others believe that it was a cupronickel alloy. *Ṭaliḳūn* was another alloy (or metal) of uncertain composition. This uncertainty existed since al-Bīrūnī's days, but the general opinion is that it was a kind of copper alloy.

5. *Iron and steel.*

The importance of iron (*ḥadīd*) in Islamic civilisation is exemplified in Sūrat al-Ḥadīd, LVII, 25: "God sent iron down to earth, wherein is mighty power and many uses for mankind". Indeed, iron was considered as essential as food and clothing and it was always a source of power. Even after the sword had ceased to be a major military weapon, the manufacturing of iron and steel in our days is a basis for industrial civilisation and hence for economic and military power.

We have seen that iron mines in the Islamic empire were spread from Spain in the west to Transoxania in the east and there were famous steel production centres like Harāt, Bukhārā, Damascus, Yemen and Toledo. Iron and steel technology in the Islamic lands has had a long and flourishing history, associated with the sword until recent times, and the excellence of steel for these swords was represented by Damascus steel. As is the case with other major issues in the history of technology, the history of iron and steel, and the history of Damascus steel in particular, have been a source of controversy. Islamic iron technology was ignored and the important sources were not taken into consideration. At one extreme, some writers have alleged that Damascus steel was alien to Damascus and to Islamic lands.

In this vast subject, we can only give extracts from some of the major Arabic sources, the best authorities on this subject known until now being al-Kindī and al-Bīrūnī, both of whom had critical minds that rejected legends and subjected scientific knowledge to actual observation and testing. The second main group of sources is the alchemical and chemical treatises of Djābir, al-Rāzī, al-Djildakī and others. The third group is the military treatises which discussed the manufacture of steel for swords, its heat treatment and the care for its *firind*; but there are numerous other sources of information, all of which deserve attention.

Types of iron and steel. From studying some of these sources, we conclude that the following main kinds of iron and steel were utilised in Islamic metallurgical centres: (1) Wrought iron (*narmāhin*); (2) Cast iron (*dūṣ*); (3) Meteoric steel (*shabūrḳān*); and (4) Manufactured steel (*fūlādh*).

Wrought iron (*narmāhin*) is soft and it is the "female". It could not be heat treated, but could be used where strength was not important, and it was used as a raw material for manufacturing steel (*fūlādh*).

Cast iron (*dūṣ*). It is very important to know that cast iron was produced, since this was not realised by historians of technology and was totally ignored. al-Bīrūnī says in his *Djamāhir* that *dūṣ* is the water of iron and that it is the liquid which flows during the melting and the extraction of metal from iron stones. Al-Rāzī defined *al-dūṣ* as water of iron. In a commentary by al-Djildakī on the *Kitāb al-Ḥadīd* by Djabīr, we read the following description of the production of cast iron: "Chapter. Learn, brother, that it is your comrades who found (*yaskubūn*) iron in foundries [especially] made for that purpose after they have extracted it (i.e. the ore) from its mine as yellow earth intermingled with barely visible veins of iron. They place it in founding furnaces designed for smelting it. They install powerful bellows on all sides of them after having kneaded (*yaluttūn*) a little oil and alkali into the ore. Then fire is applied to it (i.e. the ore) together with cinders and wood. They blow upon it until it is molten, and its entire substance (*djismuhu wa-djasaduhu*) is rid of that earth. Next, they cause it to drop through holes like [those of] strainers, [made in] the furnaces so that the molten iron is separated and is made into bars from that earth. Then they transport it to far lands and countries. People use it for making utilitarian things of which they have need" (ms. 4121, Chester Beatty Library, fols. 1a-2b).

The properties of this cast iron can be summarised from al-Bīrūnī's *Djamāhir* as follows: (1) It is quick to flow like water when smelting iron ores; (2) It is hard and whitish-silvery in colour. Its powder had sometimes a pinkish reflection; (3) It cannot be forged to make swords; (4) It does not resist blows. Its shatters into pieces: "breakage and brittleness are characteristic of it"; and (5) It is mixed with wrought iron in crucibles for making steel. *Dūṣ* was sold as a raw material in the 9th/15th century. We learn that there were at least two commercial brands, one from ʿIrāḳ, the other from Iṣṭakhr.

Meteor steel (*shaburḳān*) is often mentioned in early Arabic literature, with the comment that this was a rare material.

Manufactured steel (*fūlādh*). *Fūlādh* was usually manufactured in the molten state. It was made, in some cases, from wrought iron bars by cementation. The iron bars were packed with charcoal and heated until they absorbed enough carbon. In the molten state, steel was made in Islamic lands by the following methods: (1) By decarbonisation of cast iron; (2) By carbonisation of wrought iron; and (3) By the fusion of a mixture of wrought iron and cast iron; here we obtain two qualities of steel, depending upon the degree of fusion.

We have given above a text from al-Djildakī commenting on Djābir describing the production of cast iron. Let us now give the rest of the text to see

how the rods of cast iron are utilised to produce steel by carbonisation: "As for the steel workers, they take the iron bars and put them into the founding-ovens (*masābik*) which they have, suited to their objectives, in the steel works. They install firing equipment (*akwār*) in them (i.e. the ovens) and blow fire upon it (i.e. the iron) for a long while until it becomes like gurgling water. They nourish it with glass, oil and alkali until light appears from it in the fire and it is purified of much of its blackness by intensive founding, night and day. They keep watching while it whirls for indications until they are sure of its suitability, and its lamps emit light. Thereupon, they pour it out through channels so that it comes out like running water. Then they allow it to solidify in the shape of bars or in holes made of clay fashioned like largely crucibles. They take out of them refined steel in the shape of ostrich eggs, and they make swords from it, and helmets, lanceheads, and all tools". This refining of iron from its blackness is a decarbonisation process; already, the *Lisān al-ʿArab* states that steel (*fūlā*<u>*dh*</u>) is refined iron.

The other method of producing molten steel in crucibles by carbonising wrought iron is described by the following text from al-Bīrūnī in his *Dj*<u>*a*</u>*māhir*, 256:

"Mazyad b. ʿAlī, the Damascene blacksmith, [wrote] a book describing swords, specifications for which were included in al-Kindī's treatise. He commenced by dealing with the steel composition and the construction of the furnace (*kūr*) as well as with construction and design of crucibles, the description of [the varieties] of clay, and how to distinguish between them. Then he instructed that in each crucible five *raṭl*s of horseshoes should be placed, and their nails, which are made of *narmāhan* (Pers. "soft iron"), as well as a weight of ten *dirhāms* each of *rusu*<u>*kh*</u>*ta*<u>*dj*</u>, golden marcasite stone, and brittle magnesia. The crucibles are plastered with clay and placed inside the furnace (*kūr*). They are filled with charcoal and they (i.e. the crucibles) are blown upon with *rūmī* bellows, each having two operators, until it (i.e. the iron) melts and whirls. Bundles are added containing *ihlīla*<u>*dj*</u> (myrobalan), pomegranate rinds, salt [used in] dough and oyster shells (*aṣdāf al-luʾluʾ*, lit. "pearl shells"), in equal portions, and crushed, each bundle weighing forty *dirhams*. One [bundle] is thrown into each crucible; then it (i.e. the crucible) is blown upon violently for an hour. Next, they (i.e. the crucibles) are left to cool and the eggs are taken from the crucibles".

The third method of producing molten steel in crucibles from a mixture of cast iron and wrought iron was also described by al-Bīrūnī. This was the method of producing cast steel in Ḥarāt. Two qualities of steel can be obtained. One is obtained if the components are "melted equally so that they become united in the mixing operation and no component can be differentiated or seen independently". Al-Bīrūnī says that "such steel is suitable for files and similar tools". A second quality of steel is obtained if the degree of melting of wrought iron and cast iron is different for each substance "and thus the intermixture between both components is not complete, and their parts are shifted and thus each of their two colours can be seen by the naked eye and it is called *firind*".

Some of the above important texts were confirmed by observers and travellers who described the making of crucible steel in Bu<u>kh</u>ārā in the last century. In 1820 Anossoff, a Russian expert, was in Bu<u>kh</u>ārā and found that crucible steel was made by carburising wrought iron with charcoal and other organic matter. Later Massalski, another expert who was also in Bu<u>kh</u>ārā, wrote in 1841 that Damascus steel was made there from a mixture of wrought iron and cast iron, as al-Bīrūnī had reported 900 years earlier from Harāt. Observers thought that these reports were conflicting, but it is now clear that there is no contradiction; steel was made from different materials, and the quality obtained varied with these materials and with other manufacturing conditions (P. Annossoff, in *Annuaire du Journal des Mines de Russe, 1841*, 192-236; Massalski, in *ibid.*, 297-308).

The Damascus sword and the *firind*. C. S. Smith noted that "In comparison with the relative neglect of structure by the European metallurgist, the enjoyment and utilisation of it in the Orient is impressive. In the Orient, etching to display patterns depending on composition difference was in use contemporaneously with the European pattern-welded blade, and was thereafter continually developed to a high artistic level" (*A history of metallography*, Chicago 1965, 14). The best achievement in this direction is the Damascus sword, which were made in all the Islamic centres and in India. Because of its excellence, its name was given later to all swords with a pattern. Islamic lands exported and imported steel and swords. They imported from India and they exported to it. Al-Bīrūnī mentions that steel eggs were cast in Harāt and then sent to India. Al-Idrīsī says that iron was exported from the Ma<u>gh</u>rib to India. In general, we may say that Islamic lands and India formed one area of Damascus steel culture.

Patterned swords (with a *firind* or <u>*dj*</u>*awhar*) were in use before Islam. Imruʾ al-Ḳays (d. *ca.* 540 A.D.) describes the *firind* of the sword as resembling the tracks of ants. Another poet, Aws b. Ḥa<u>dj</u>ar, a contemporary of his, describes the blade of the sword as if it has a water whose wavy streaks are like a pond over whose surface the wind is gliding. In fact, in Arabic poetry the beauty of the sword with the *firind* was always a source of inspiration. Damascus steel was thus a speciality of the Islamic world and India for many centuries; as Smith notes, "The geographical distribution of these swords seems to have been practically coextensive with the Islamic faith, and they continued to be made well into the nineteenth century" (*op. cit.*, 14).

In Europe, steel was produced by hearth-carbonisation of wrought iron rods. To imitate the *firind* or pattern of the Damascus sword, they resorted to placing together strips of iron and steel and welding these together; but these imitations never matched the qualities of the true Damascus steel.

Cast iron was first produced in Europe in the 15th century A.D. and crucible steel in the 18th one. But a steel comparable in quality to Damascus steel was still required. For more than 150 years, a large number of metallurgists in European countries carried out extensive research on Damascus steel, including eminent scientists like Faraday. Smith, in a chapter "European attempts to duplicate Damascus steel", says that these attempts failed to reproduce true Damascus steel; what happened later was that the "interest in the duplication of the blade declined as European steelmakers developed their own techniques and the introduction of Bessemer and Siemens processes gave homogeneous steel more adaptable to large-scale production".

There were, however, some advantages behind

this research, in that we came nearer to an understanding of the structure of Damascus steel. According to Smith, "Damascus blades are made of a very high carbon steel (about 1.5-2.0%) and owe their beauty and their cutting qualities alike to the inherent structure of the cakes of steel from which they were forged". "The light portion contains numerous particles of iron carbide (cementite), while the dark areas are steel of normal carbon content (approximately eutectoid). The structure, of course, is clearly visible only after etching, which was done with a solution of some mineral sulphate". It is amazing how close is this modern interpretation of the *firind* to that of al-Bīrūnī.

Welded "Damascus" gun barrels and swords. Another beautiful technique which flourished in later centuries in Islamic lands and India was the welding technique for gun barrels and swords, which was quite different from that of cast Damascus steel, but which was also called "Damascus". According to Smith, "the technique seems to have originated in the Near East in the sixteenth century, and such guns were a famous product of the Kashmir smiths in the early nineteenth century" (*op. cit.*, 30). The manufacture of barrels of this type in Europe started in the 18th century, and during the 18th and 19th centuries great efforts were exerted in Europe to use this technique for both gun barrels and blades.

In 1798 Nicholson made a Damascus-textured metal by compressing fillings of steel and wrought iron in a die, restriking the compact at a welding heat and forging it into a plate; Smith says that this is an interesting anticipation of modern power metallurgy. But according to al-Bīrūnī, a somewhat similar procedure was practised in the 4th/10th or 5th/11th century: "I was told by somebody who was in the land of Sind that he sat by a smith who was making swords. He looked into them and found that their material was wrought iron (*narmāhin*), on which he was sprinkling a finely pulverised drug (*dawāʾ*) whose colour gave a reddish shade. He sprinkles and welds by driving the powder deep, then he takes it out and elongates it by forging and he sprinkles again and repeats the work several times. He said: Then I asked him what that was. He glanced at me derisively. Then I looked carefully into it and realised that it was cast iron (*dūṣ*) which he mixes with wrought iron (*narmāhin*) by forging to elongate and hammering [to drive in] to obtain a steel similar to that of the eggs that are obtained in Harāt by melting".

6. *Furnaces, crucibles and other equipment.*

We can learn much about Islamic metallurgical equipment from a study of the alchemical equipment. The *istinzāl* operation is mainly the smelting of ores to obtain metals. There was, according to al-Rāzī, "equipment for melting metals (*a<u>dj</u>sād*) and stones" and there was "equipment for the further processing of these metals". Iron melting was given special attention in the alchemical apparatus. We can safely assume that the alchemical equipment was the pilot-plant size of the actual metallurgical equipment. Sometimes the details in construction were identical, as we shall presently see. Iron production from ores was achieved by blast furnaces. Further research will reveal how the design of these furnaces had developed in Islamic lands. We know that cast iron was produced before the 4th/10th century. Al-<u>Dj</u>ildakī (see above) gave a description of the melting process; historians reported experiments on the casting of large field cannon from cast iron at the turn of the 10th/16th century in Egypt; and at the end of the 12th/18th century, a typical blast furnace in the Lebanese mountains was 16 spans (3.84 metres) high by 7 spans (1.68 metres) wide and was constructed from masonry. Twenty men worked on the site. Layers of fresh wood and iron ore were stacked in the furnace; two horizontal bellows gave the necessary blast of air, each being operated by one man. The air from the bellows was combined in one outlet, and iron that accumulated at the bottom was taken out in small amounts. This iron was decarbonished in several hearth furnaces and forges on the same site in order to produce wrought iron for making useful articles. About 450 kg. a day were produced from this furnace; similar furnaces were in use in the Ma<u>gh</u>rib.

Crucible steel was melted in small crucibles. The text by al-Bīrūnī which was cited above on the making of crucible steel by a smith in Damascus shows that several crucibles were put in the furnace. Several bellows were used, each operated by two men. Such an installation was still used in 1840 in Bu<u>kh</u>ārā to make Damascus steel, and was of the same design as that described by <u>Dj</u>ābir ten centuries earlier.

3. MINERAL EXPLOITATION IN THE OTTOMAN EMPIRE

Our treatment of the subject of mining and metallurgy in the Ottoman Empire is based on the assumption that both in terms of the laws enforced and the organisational principles applied, and even the types of minerals exploited, Ottoman mining can be clearly divided into two distinct periods. The first period spans all of Ottoman history up until the mid-19th century, while the second is concentrated in the last few decades of the existence of the Ottoman state as the mining industry developed under the impact of foreign investment. Because of the wide scope of the subject both from the standpoint of periodisation and the profusion of ancillary topics involved, the focus is limited to those time periods whose first-hand archival documentation we have studied most closely (i.e. the 9th-11th/16th-18th centuries) and those subjects which have been least fully studied in the published literature. For the principal publications in the important fields of Ottoman mining law, and Islamic and Ottoman metallurgy, see *Bibl.*, sections II-III, and for developments in Ottoman mining during the 19th century section V.

In what follows, mining law and administration are first discussed under the following headings: A. Administrative modes, and B. Organisation of labour, and then there is a description of the principal mineral types and their geographical distribution. In this second section, the principal subdivisions are as follows: (A) Classification of mineral types and (B) Marketing and distribution:

A/I. Bullion and other smelted ores, i.e. 1. Gold; 2. Silver; 3. Copper; 4. Iron; 5. Steel (including some data on prices of the principal metals).

A/II. Crystaline formations and other minerals mined from pits in their solid state, or extracted through a process of distillation from their liquid state, i.e. 1. Alum; 2. Sulphur and Saltpetre; 3. Salt [see MILḤ]

Finally there is a short summary of major developments in Ottoman mining in the post-*Tanẓīmāt* [*q.v.*] period, and brief discussion of mining technology in both the classical and the modern periods.

Introductory remarks on the economic importance of the mines and uses of metals in the Ottoman Empire.

Possession of and control of the sources of mineral wealth was of critical importance to the state. The Ottoman interest in the conquest of Serbia from the early 8th/14th century arose in part from a desire to secure the rich silver production of the Balkan mines, thus providing a vital financial basis for further expansion. In a very real sense, the mines were the ultimate source of prosperity for the emerging Ottoman state and an assured supply of metals of military importance such as lead, iron and tin was essential to state security. Because of the critical importance of their uninterrupted production, mineral resources were carefully protected and closely regulated by the Ottoman government (see section below on market organisation, distribution and supply).

One of the principal uses for precious metals was to supply the imperial mints located throughout the empire, usually in the vicinity of the mines. While during the reign of Süleymān I (926-74/1520-66) the treasury enjoyed an abundant surplus, requiring even the opening of a treasury annex at the Yedi Kule fortress in Istanbul, in the 11th/17th century production levels lagged far behind money in circulation. Information from the state treasury budgets from the time of Murād IV (1032-49/1623-39) indicates that while the mines produced silver for striking some 160 million *aḳçes*, deficit spending at the level of 200 million *aḳçes* a year and more was common (see the Kepeci budgets listed in the *Bibl.*). In order to balance the budget, recourse was commonly made to the practice of debasing the currency. The following list shows the steady drop in the silver content of the *aḳçe* over the 150-year period 1490-1640:

Date	no. of *aḳčes* struck from 100 *dirhams* raw silver
half-century leading up to 1566 *	420
1566-1584	450
1584-1600	800
1600-1611	950
1611-1640	1,000

Source: Barkan (1970), 571-7.

* For an idea of the relative stability of the *aḳče*'s silver content before the 16th century, compare the table in İnalcık (1951), 678.

Despite these measures, the surpluses stored in the Sultan's inner treasury (*khazīne-yi enderūn*) periodically became depleted to dangerously low levels. According to the report of the Venetian *bailo* Contarini, after the large outlays for the Ottoman recapture of Baghdād in 1048/1638, the inner treasury reserve sank to only 15 million gold pieces (Barozzi and Berchet, *Relationi*, i/1, 363). No new sources of silver were either discovered or exploited, and by the 19th century state bankruptcies became an almost chronic problem, leading in the end to the establishment of a foreign-controlled public debt commission (see DUYŪN-I ʿUMŪMIYYE). Parts of the silver-producing areas of Serbia had been ceded to Austria as early as the treaty of Passarowitz in 1130/1718, and from that date the Ottoman mineral resource base in the Rumelian provinces continued to shrink.

According to Islamic law, minerals and hidden treasures made up a special category, *rikāz*, whose product was made subject to the payment of a one-fifth tax, the so-called *khums-i sherʿī* (Ḥalebī, i, 150-1). Building on these principles laid down in the canonical law, the Ottomans introduced some refinements and customary practices in their own administrative law as it applied to mines, taking into account new conditions and changes as they occurred over the course of time. The reign of Bāyezīd II (886-918/1481-1512) was perhaps the most important period for the standardisation and codification of Ottoman mining law. Since there already exists a rich literature on this subject (see *Bibl.*, section II), there is no need to enter into the details here except to emphasise the fact that Ottoman practice incorporated applied knowledge from previously existing Saxon mining law. The extent of their indebtness to their predecessors in this field is indicated by the use in the Ottoman *ḳānūn-nāmes* of Saxon and Slavic loan words for many technical terms and specialised skilled professions.

Administrative modes: the factors determining Ottoman mining activity through the ages.

There were three principal ways in which mining activity was organised in the Ottoman Empire and the choice as to which mode was to be employed was determined to a large degree according to the source of the capital invested to bring a mine into active production. The expenses for equipment, fuel to operate the forges and the wages of the mine workers were considerable, and since such large investments were beyond the means of the average individual, most large-scale mining operations tended to be undertaken either directly by the government itself or by means of investment partnerships. The three commonly used administrative modes were: (1) *emāneten*, direct administration of mines or mining districts through state-appointed superintendents; (2) *iltizāmen*, farming out of mining revenues to investors on a short-term contract basis (the usual term for these contracts in the mining context was six years); and (3) *iḥāle*, long-term concessionary leasing of state lands for purposes of mining exploration to licensed individuals or mining companies. These broad generalisations may help to clarify the position of the lands administered under each of these headings, but in actual practice we often find that a mixture of government and private financing, as well as the phenomenon of subcontracting of mining leases, resulted in some hybrid form of two or more of these administrative categories. Nevertheless, generally speaking it may be said that direct state administration tended to be applied in the case of disused mines or those requiring a relatively greater level of investment to render them profitable. In such cases, after careful analysis of ore samples (*čashnī*) and estimation of requisite expenditures for improvements by technical experts, the state agreed to undertake all risks and meet all expenses for operation and development of the mine. When, on the other hand, it was a question of operative mines with a known and regular yearly production which could be auctioned competitively, the usual procedure was to farm out the operation of these mines to private investors. In such cases, the investor gambled that he would make up his original investment consisting of the *bedel-i iltizām* payment on entering the contract

plus costs. The third category, *iḥāle*, seems to have been widely used only beginning with the 13th/19th century when new types of minerals came into demand. This system was used to encourage mineral exploration in abandoned (*mawāt*) lands and lands of low population density. Although usually no previous mining activity would have taken place on such lands, after a determination had been reached on the basis of expert reports that they did possess a potential for development, the investor undertook to make whatever improvements were needed to realise maximum productiveness. According to the terms of the *iḥāle* system, the original investment consisted of the *resm-i berāt* or *fermān kharḏjî* paid to register a claim to work the land, but unlike the *iltizām* system, the government then claimed only a small percentage of the mineral production realised, ranging from between 1-5% for unrefined ore found in scattered deposits, and between 1-5% for unrefined ore found in scattered deposits, and between 10-20% for unrefined ore occurring in concentrated deposits. Although we have no way of estimating the proportion of lands which fell into one category as opposed to another, the following table gives an idea of the extent to which the *iḥāle* method was employed in the 19th century, particularly for the mining of coal and other near-surface minerals:

Statistics on mining concessions in the Ottoman Empire at the turn of the 20th century

type of mineral needed	extent of land exploited (in *djerībs*) *	% of total
chrome	19,076	7.0
lignite	13,340	5.0
argentiferous leads	12,357	4.6
other (coal, etc.)	225,227	83.4
Total	270.000	100%

Source: *Iḥṣāʾiyyāt-i māliyye*, 1325/1907, 100.
* one *djerīb* = 10 *dönüms* = approx. 1 hectare.

From the above discussion, it may be seen that ability to invest was an important factor in determining the mode of administration selected for a given mining enterprise. A second factor which was critical in determining the intensity of mining activity at a particular time was the price of metals on the international market. The fluctuation in the price of metals in turn was tied to levels of production in the three principal mining centres of America, Europe and the Ottoman Empire, as well as to the relative balance between the three at given time. Thus for instance, while we know that production of silver in the Americas increased five-fold in the century 1520-1620, the impact of this influx of cheap metal was felt more sharply and immediately in Europe than in the Ottoman lands. While European mining suffered an almost immediate collapse, the Ottoman mines continued to find markets for their production, both as a result of long-lasting disruptions in the heartlands of the European mining industry during the Thirty Years' War and because of continued upward pressure on prices based on rising demand for basic metals in the military and industrial sectors of the internal economy of the Ottoman Empire. Until now, it has been generally assumed (particularly among the Balkan historians, see *Bibl.*, works of Dinić, Kovaćević, etc.) that the production of the Balkan mines suffered an irreversible collapse coinciding with the Turkish occupation of Serbia completed in 1460. The issue of mining decline is considerably more complex than that, and depends on a detailed study of price fluctuations of precious metals over the long term. Since this study has not been undertaken for the Ottoman Empire, it is at present very difficult for us to present any conclusive evidence or to chart accurately the course of periods of expansion and decline in the mining industry. A further factor to be considered, linked with the question of price and having a direct bearing on intensity of mineral production, is the application of new technology and mechanisation in mining. Since it was only when demand for a metal was high that investment in technical improvements was economically feasible, such improvements were usually introduced through state planning and initiative (examples in Refik, 45 (doc. dated 1029/1618), in which the government provides 150,000 *aḳçes* to install four new water-wheels (*čarkh*) to power the lifts and pumps of a silver mine at Inegöl; and Refik, 52 (doc. dated 1128/1716), in which the government approves the transfer of money from a provincial treasury to allow for continuation of work on a drainage channel which has been abandoned by private developers due to insufficient funds).

Dramatic improvements both in the quantity and the quality of mineral production were achieved in the 19th century as the result of the introduction of mechanical aids. While the purity of copper smelted in small forges equipped with hand-operated bellows was uneven at best, with the erection of large, state-built and state-operated smelting houses with mechanically-driven bellows, a consistent level of purity of 85% was achieved (for examples describing the impact on production of the building of state smelting houses at Ergani in 1266/1850 and subsequently at Tokat, see *Iḥṣāʾiyyāt-i māliye, 1325/1907*, 263; on the effect of mechanisation on mining yields in the 13th/19th century, see below). Nevertheless, the price was always the final determinant in deciding whether a proposed improvement was cost effective. When, as a result of downward market pressures of foreign competition the price of a metal fell, this could result in the closing of a mine which had been profitable and even worthy of investment for improvement under the earlier pricing structure.

The organization of labour

In order to ensure that an adequate work force was available to operate the mines, workers in the state mining operations (*maʿdendjis*), like the guardians of the mountain passes (*derbendjis*) and keepers of the way-stations on the imperial highways (*menzildjis*), were registered in the cadestral surveys under a special category of functionaries exempt from the payment of the extraordinary *ʿawāriḍ* [*q.v.*] taxes. As an example of how this system operated, a survey of 1082/1672 covering 155 mining villages attached to Srebenica is illustrative (BBA, KK 5175, pp. 60-2). In this survey, each individual village is assigned a specific duty in connection with the mining process. Some were assigned as excavators (*ḳuyudjus*), others were charged with preparing charcoal for the forges (*kömürdjüs*) or as lumbermen and wood-cutters (*domrukdjular we odundjular*). Tasks ranged from the very specialised, as in the case of one village whose people were designated as makers of rope for operating the pulleys in the mine shafts (*urghandjis*) to unspecified casual

labour (*aylāḳ*). Those villages were required to provide work crews as long as the mining operations in their region continued, and *maʿdendji* status was even passed on from father to son and from generation to generation. In order to insure against production loss due to absenteeism, the *maʿdendjis* were also required not to leave the mine for any period of time without specific permission from the supervisor of the mine (Refik, 26). On the other hand, they were exempted from being called away for the performance of other kinds of labour, such as road repair and fortress building, which was required as a compulsory service (*mukellef khidmet*) in partial satisfaction of the *ʿawāriḍ* tax obligation of other *reʿāyā* (see orders preventing summoning (*iḥḍār*) of mine workers for other tasks on the part of the provincial governors, Refik, 27-9, 32-3, etc.). As skilled workers, the conditions under which the registered *maʿdendjis* performed their jobs in the mines were carefully specified in special regulations, and care was taken to enforce their application. In the first place, mining activities tended to be seasonal, most intensive work taking place in the $7^1/_2$-month period between *Newrūz* (21 March) and *Rūz-i Ḳāsim* (7 November). In addition, the working week was defined as lasting five days, the remaining two days being designated as idle days (*awāre*) (Anhegger-İnalcık, 7, 12, 14, 15, etc.). Since registered *maʿdendjis* with some experience were usually in short supply, their numbers had to be bolstered by the use of hired labour. Statistics from salt mining operations published by Güçer suggest that the proportion of workers registered as *tuzdjus* and enjoying a share of the mine's production (sometimes $^1/_{12}$, sometimes $^1/_9$) was about equal to those workers taken on seasonally and paid a cash wage (example in Güçer, 106-7, citing the case of the Beçin salt works in Muğla province where of a total of 415 workers 195 (47%) were registered *tuzdjus* and the remaining 220 hired labour). Due to the hard physical nature of work in the mines, crews were normally expected to work only two-hour shifts with rest periods in between. By means of revolving duty, the mines could be kept in continous operation on a 24-hour basis. A document of 1126/1714 (Refik, 50-1) suggests that a work crew of 20 men could be kept working for 20 days at this pace, but every 20 to 30 days a fresh crew would be called in to replace them. During the period in which they were engaged in working at the mines, mine workers were provided with food rations and shelter at government expense. In 1126/1714, in addition to weekly wages amounting to one *ḳurush* for every simple labourer (*irghāḍ*) hired to work in the mines, an allowance of two *paras* each day was paid as a cash equivalent for food rations. Sometimes however the food rations were paid in kind in the following amounts: 141 pounds (50 *wūḳiyyes*) of wheat per month per worker, with a weekly supplement of $5^1/_2$ pounds (2 *wūḳiyyes*) of leavened bread (*khamir*). In an interesting document dealing with the terms of operation of a state salt works in Zwornik province published by Handžić (see *Bibl.*, Handžić [1959]), we learn that working conditions and the share of workers in the profits of a mine could even become a subject for collective arbitration. In this example, the workers' share in the salt works had previously been determined as the product of three days' work, and the treasury share as the product of four days' work each week. However, on consulting with the parties concerned, the workers proposed a more equitable accommodation whereby they agreed to take their share in the proceeds of the mine each day in kind, in an amount defined in detail and guaranteed in the specific wording of their agreement (*muḳāwele*). This latter system of apportioning shares in kind, rather than as the product of a particular day's work, protected both the workers and the treasury, since it was in neither party's interest to slow down or abandon production on the days devoted solely to the other's account. Other examples from different mining operations and forms of organised group labour show that the working conditions, and terms of recompense for workers, even those recruited for compulsory services such as fortress building, were negotiated so as to equal or to better the current rates in effect at the time (see Murphey, *Mosul*, 167).

Apart from the simple labourers who did the hard physical work excavating the mines, there was a whole range of more specialised skilled workers and supervisors. Their positions, like those of the *maʿdendjis*, were confirmed by imperial diploma (*berāt*) and carried with them certain special conditions and privileges. As an example (BBA, Ibn ul-Emin, "Meʿādin", no. 108) a document confirming the inherited position as *maʿdendji-bashī* to a certain Meḥmed in charge of inspecting all the mining shafts and forges at Gümüsh-khāne in order to ensure smooth operation and to guard against concealment or theft of silver ore, states that the holder of this office was to enjoy a customary revenue (*ʿawāʾid*) of one basket of ore for every forge under his inspection. The distribution of the mineral production between these various experts, foremen and inspectors working in a mine followed long-established tradition and was based on a division of the production of each mining shaft into 66 distinct shares (*ḥiṣṣe*) (Beldiceanu 1964, 86). However, further deductions (*kesim*) and fees both in pure metal and as cash assessments were set aside as the share of the money coiners (*ṣarrāfīn*) and other mint officials to whom the refined ore was usually sold.

Because of the risks and expenses involved in mining exploration, and the hard physical nature of the work, we find in some instances that the local populace deliberately falsified prospecting reports and tried to discourage the opening of new mines in their districts or the reopening of abandoned shafts (see Refik, 46-57, doc. dated 1112/1700, in which the populace of Sidrekapsı oppose the reopening of an abandoned mine in order to avoid forced labour requirements). With the intensified production of the 13th/19th century, in particular in the coal mining industry, the labour situation changed completely (on this, see the study by Quataert in *Bibl.*).

One should note as a preliminary that the sites exploited by the Ottomans were to a very large extent centres which had been known and mined since ancient times. In the pre-Ottoman period, the major mining centres were in Serbia (see survey by Jireček based on records preserved in the Ragusan archives) and in northeastern Anatolia (for ancient times, see P. de Jesus; for the Byzantine period, Vryonis). Contrary to what is sometimes claimed (in particular by the Balkan historians, see above), the establishment of the Ottoman state in these lands did not result in a collapse of the indigenous mining industry. In fact, with regard to the Serbian mines, for instance, we know from the observations of Iacopo de Promontorio in 1475 (cited by Vryonis, 15) that the Ottomans were responsible for dis-

covering and exploiting new sites which had previously lain idle, thus opening the way for a new period of expansion in Balkan mining.

Categories and regional distribution of Ottoman mineral resources.

In the fifteenth section of the *Menāẓir al-ʿawālim* (Nuruosmaniye ms. 3426, fols. 349b-351a), Meḥmed ʿĀs̲h̲iḳ organises his information under three broad headings: precious metals (*filid̲h̲āt*), precious stones (*aḥd̲j̲ār*) and precious oils (*edhān*). In accordance with the traditional classification, the first group (fols. 347b-352b) is subdivided into the seven principal metals (*haft hos̲h̲*), i.e. gold, silver, copper, lead, tin, iron and speculum metal (*k̲h̲ār-i ṣīnī* [*q.v.*]).

The sources for gold mentioned by ʿĀs̲h̲iḳ as most productive in his time (fol. 349b) were the mines in the environs of Sid̲j̲ilmāssa [*q.v.*]. Another source for fine quality gold used in the Cairo mint was in the same region at Ud̲j̲le (S. Shaw, *The financial and administrative organization ... of Ottoman Egypt*, 128). An indication of the extent of the production of these mines is given when one remembers that the yearly treasury contribution (*irsāliyye* [*q.v.*]) of Egypt was fixed at 500,000 gold pieces (Shaw, *op. cit.*, 284-5). Although a part of the *irsāliyye* was sometimes paid with other coins, it was typically made up of at least one-half gold (see orders to that effect to the governors of Egypt dating from the reign of Murād IV (1032-49/1623-39); University Library, Istanbul, ms. T.Y. 6110, fols. 46b-47b, 80a-80b, 91a-92b, all dealing with *k̲h̲azīne irsālī*).

The principal silver mines of the Ottoman Empire were concentrated in Serbia, with other important centres in Thrace (Sidrekapsı and Pravišta) and Macedonia (Üsküb/Skopje, Kratova, etc.). The value of the annual production of ten of the largest of these mines is summarised in the following table:

Name of mine or mining region	yearly value of lease of tax-farm (*muḳāṭaʿa* [*q.v.*])	*year*
Skopje	4,695,915	1584
Zaplana	4,600,000	1603
Sidrekapsı	3,690,000	1585
Demirhisar	1,710,000	1589
Lofča and Berkofča	1,633,333	?
Pravišta	851,182	1590
Srebrenica	848,105	1858
Trepča	333,333	1585
Rudnik	273,333	1585
Novobrdo	216,666	1585

Source: R. Murphey, *Silver production* ..., 82-5.

Although estimates for overall production levels of the silver mines in Rumelia vary considerably, official statistics from the turn of the 11th/17th century indicate an annual production of silver somewhere in the neighbourhood of 1,600,000 ounces (Murphey, *Silver production*, 79).

As for Anatolia, silver deposits were to be found in the mines at D̲j̲and̲j̲a near present-day Gümüs̲h̲-k̲h̲āne. Register MM 922 in the Istanbul archives gives us an idea of the scale of this mine's production in the year 1010/1601. At this date, during a four-month period, a quantity of 149,949 *dirhems* or 14,802 troy ounces was produced. This indicates a yearly production of silver at D̲j̲and̲j̲a of around the 450,000 *dirhems* level. However, after the 11th/17th century, silver was no longer produced in large quantities at D̲j̲and̲j̲a. This was due partly to a failure to recover from disruptions during the D̲j̲alālī rebellions [*q.v.*] period, and partly to natural exhaustion of the surface veins. Peysonnel's report of 1787 indicates a significant decline in the intensity of mining activity in the mines around Gümüs̲h̲-k̲h̲āne by stating that in his day only eighteen forges remained in operation (Peysonnel, 82). Both silver and gold were also produced in the mines at Ergani, in the northwest sector of Diyārbekir province. A document dating from 1155/1742 (BBA, KK 5192) indicates that during a twelve-month period a total of 201,157 *dirhems* of gold (19,885,06 troy ounces) and 1,136,810 *dirhems* of silver (112,208,04 troy ounces) were smelted in 3,982 separate forges, each under the direction of an expert known as the *ifrāzd̲j̲i*. Each *mit̲h̲āl* of gold (1 *mit̲h̲āl* = 1.5 *dirhems*) was valued at 460 *aḳčes*, while silver was priced at 12.5 *ḳurus̲h̲s* per *čeki* (1 *čeki* = 100 *dirhems*) or 15 *akčes* per *dirhem* at the standard rate of 120 *aḳčes* to the *ḳurus̲h̲*. A second register compiled five years previously in 1149/1737 (BBA, MM 18,404) records that 3,216 forges were in operation, producing a yearly quantity of 134,521.5 *dirhems* (13,277 troy ounces) of gold and 522,272 *dirhems* (51,548 troy ounces) of silver. Unlike the silver mines at D̲j̲and̲j̲a, at Ergani a high level of production was maintained well into the 19th century.

Apart from gold and silver, with regard to other mineral resources the Ottoman Empire was in a particularly favorable position. Copper was supplied from the mines in the province of Ḳasṭamonu, in particular the mine of Küre in the *sand̲j̲aḳ* of Inebolu and the mines in the township of Čankiri [*q.v.*] (*Ḳasṭamonu wilāyeti sālnāmesi, sene 1316 H.*, 533-4). Copper production at the Küre mine is well documented from archival sources. The earliest account dates from 919/1513 (BBA, Ibn ul-Emin Tasnif, "Meʿādin", no. 3) and records the operation of 29 forges producing 28,638 *wuḳiyyes* (36.74 metric tons) for an 8½ month period. The pure copper once extracted was valued at 68 *aḳčas* per *wuḳiyḳe*. Subsequent records for the year 1081/1670 (BBA, MM 15997) give only the lump-sum valuation of the tax-farm lease for the operation of the mine fixed at 3,500 *batmans* or 24.85 metric tons, without specifying actual production. However, a still later register dating from 1200/1785-6 (BBA, KK 2945), while not exclusively concerned with the Küre mine but recording shipments of copper ore from the Black Sea region as a whole, permits us to make some more precise estimations about overall levels of copper production. This register records 23 separate shipments made from the port of Samsun in the early months of 1200/1785-6, including 22,243 pieces constituting a total weight of 71,911 *batmans* or 510.57 metric tons (note: the equivalent of 431,466 *wuḳiyyes*, 150 *dirhems*, given for the shipments totalling 71,911 *batmans*, allows us to fix the true weight of the *batman* in use for metals at this time at 5.5379 *wuḳiyyes* or 7.1 kg). Since, however, these shipments were made directly to the cannon foundry in Istanbul, they cannot be regarded as accurately reflecting the overall output of even the mines of the Black Sea area. D. Urquhart writing in 1833 describes Küre as "perhaps the richest copper mine in the world" and notes that its yearly production reached some three million *oḳḳas* or 3,800 metric tons. One-quarter of this total was supplied directly to the imperial arsenal in Istanbul for gun casting, one-third was consumed by local industry, and the remaining surplus of about 41%

exported to foreign markets, in particular India. Peysonnel (see summary statistics in *Bibl.*) also provides some information on copper exported from the Black Sea ports. Aside from Küre, we know from Edwards' account of Ottoman mining in 1914 (Edwards, 195) that there were rich copper deposits in the Hendek basin east of Adapazarı, in addition to which Solakian (62-70) speaks of dozens of small mines along the Harshit river valley near Tirebolu. (For further information on copper production, see also the Farley report cited in *Bibl.*, and Issawi, 278-9.) According to Meḥmed ʿĀshıḳ (*Menāẓir al-ʿawālim*, fol. 351b), there existed some copper deposits in the Osogovska mountains near Kratovo and in various locations in the mountains of Bosnia.

Iron ore was excavated in large quantities in the mines of Samakov in present-day Bulgaria, and shipped to Istanbul for various uses in civil and military construction via the Black Sea port of Ahyolu (Barkan, *Süleymaniye Cami*, i, 367). There were numerous other smaller mining centres throughout Bosnia which could also be mobilised in time of need (on the smaller iron-producing mines in the vicinity of Novo Brdo, see *Bibl.*, Handžić, 1976). An interesting example of the reopening of a mine at Kamengrad in northern Bosnia is to be found in vol. xxi of the *Mühimme defter*s for the year 980/1572. The document is addressed to the governor of Bosnia and specifies that, in order to meet a pressing need for cannon balls at the front, the responsible authorities in the area are to recruit the necessary workmen from the neighbouring villages without delay and resume production at the mine immediately. A fact which should not be overlooked when analysing the pattern of Ottoman mining activity is that, in addition to the richness of a given deposit, geographical proximity to the place where military need was the greatest could also be a major factor in determining which mines were exploited and also the level of production which was sought in particular locations.

Information about the two largest consumers of iron products, namely the imperial naval yards (*tersāne-yi ʿāmire*) and the imperial arsenal (*djebe-khāne*) allow us to make rough estimates about the levels of production in the major iron-producing regions. In the case of the naval yards, a register dated 1073/1663 (BBA, MM 1800) specifies that 1,328 *ḳanṭar*s or about 75,000 kg. of raw iron were provided from Samakov at a cost of 623,267 *aḳče*s or approximately 470 *aḳče*s per *ḳanṭar*. An *idjmāl* register prepared by the overseeing agent (*nāẓir*) of the Samakov mine covering a two-year period from Muḥarrem 1025 to Dhu 'l-Ḥidjdja 1026/January 1616 to December 1617 (BBA, MM 2067) indicates that the following finished goods were sent to the arsenal in that year: 1,024 shovel blades (*küreks*), 2,552 picks (*ḳazmas*), 2,000 axes (*balṭa*) and 14 crowbars (*küskü*). Ewliyā Čelebi (*Seyāḥat-nāme*, vi, 128) speaks of a yearly quantity of 8,000 wagonloads of raw iron being sent to the central lands of the Empire chiefly via the seaport of Salonica. In Anatolia, one of the principal iron ore deposits exploited by the Ottomans was at Kiği in the mountainous region southwest of Erzerum. (on the production of cannon balls and other finished iron products at Kiği, see Murphey, *The construction of a fortress* ..., documents in the addenda). Another centre of iron production in Anatolia, at least one that was active in the 19th century, was in the township of Zeytūn north of Marʿash. According to the yearbook for Aleppo province for the year 1321/1906 (446), there were two active mines producing a yearly quantity of 2,500 *wuḳiyye*s of raw iron (on these mines, see also Edwards, 193, and Solakian, 51-2).

The provenance of steel used in the Ottoman Empire was various. From the east, it was brought from India and Caucasia, in particular Derbend, and found its way to Damascus, where it was fashioned into various finished products, such as sword blades, by the celebrated artisans of that city (see *Bibl.*, section iii). Some steel also came from Europe and was known as *frengi*, although there were also indigeneous centres in the Rumelian provinces at Buda and Samakov. Because of its foreign origin and the costly nature of the process by which it was refined, tempered steel, referred to as "Frankish steel" (*čelik-i frengi*), fetched the highest unit price among the baser metals, commonly being sold at 4,000 *aḳče*s per *ḳanṭar* (91 *aḳče*s per *wuḳiyye*) and in one instance for as much as 4,300 *aḳče*s per *ḳanṭar* or 98 *aḳče*s per *wuḳiyye* (BBA, MM 6760, register dated 1006/1597-8). The regulated prices as set in 1049/1640 fixed a maximum price of 70 *aḳče*s per *wuḳiyye* for the *čelik-i frengi* supplied to the rasp-makers' guild (*türpüdjüyān*) in Istanbul (*Esʿār defteri*, Topkapu Sarayı Library ms. Revan 1934, fols. 107a-108b), but clearly there were extensive gradations in quality. The official price regulations of 1049/1640 established the following four categories:

(1) *frengi čelik* - 70 *aḳče*s per *wuḳiyye*;
(2) *Peshte čelik* - 35 *aḳče*s per *wuḳiyye*;
(3) *Samakiv čelik* - 25 *aḳče*s per *wuḳiyye*;
(4) *čelik* of low quality not suitable for use by the file-makers - 20 *aḳče*s per *wuḳiyye*.

For the prices of various other metals used in the production of ordnance, an account register of the imperial cannon foundry (*ṭop-khāne-yi ʿāmire*) from 1006/1597-8 gives us some precise data (BBA, MM 6760). At this date, *copper* was supplied to the foundry at a price of forty *aḳče*s per *wuḳiyye* (1 *wuḳiyye* = 1.2828 kg.). Tin varied in price between 3,800-3,900 *aḳče*s per *ḳanṭar* (1 *ḳanṭar* = 44 *wuḳiyye*s), or 86-89 *aḳče*s per *wuḳiyye* according to its provenance. In one notation, an item of expense of 1,372 *aḳče*s for the cost of a pack horse to transport tin from Semendire is recorded.

Other minerals

Apart from the seven precious metals (*haft-i hosh*), another class of minerals was made up of ores of low intrinsic, but high practical value. Principal among these ores were alum (*shab*), sulphur (*kükürt*) and saltpeter (*göherčile*).

Alum was used in the textile industry during the dying process, as well as in the paper-making and other industries. Its manufacture in Turkey dated back at least to the 8th/14th century (İnalcık, *Classical age*, 134; Cl. Cahen, *Pre-Ottoman Turkey*, 160-1; W. Heyd, *Histoire du commerce du Levant*, ii, 565-71). Until alternative sources were discovered, Anatolia was the major and almost unchallenged supplier of alum to the European textile industry, principally through the intermediacy of Genoese merchants. A Florentine merchant of the early 14th century lists five fully distinguishable grades and regional varieties of alum from Anatolia, as follows: (1) Kütahya alum; (2) alum from Ḳaraḥiṣār (= Shebin-Ḳaraḥiṣār); (3) alum from Phocea (= Yeñi Foča); (4) alum from around Ulubād on the western shore of Apolyont Gölü; and (5) impure alum from the various islands of the Marmara sea (known as

alum of Cyzicus (= Ḳapudaghī yarīm-adasī) (Pegolotti, *La pratica della mercatura*, 43, 293, 369). (For the reversal of this state of affairs with regard to the Turkish predominance in the production and supply of alum to the West by the 12th/18th century, see below.) The principal alum pits were found in north-central Anatolia at Shebin-Ḳaraḥiṣār and in western Anatolia in the area around Kütahya. The toponym Shabkhāne still in use today in the vicinity of Gediz, and other variants such as Shabdji near Tavshanlī, attest to the former importance of the alum deposits in this region. Additional deposits were found at Maronea near Gümüldjine [*q.v.*] in Thrace (*Sharʿiyya* court records of Aleppo, *Ewāmir-i sulṭāniyye*, xiv, 70-1) and at Ipsala (Singer, 89-94).

Since sulphur and saltpetre were two of the principal ingredients used in the manufacture of gunpowder [see BĀRŪD], it is not surprising that supply of these essential materials was controlled by means of a special regulatory system. The accounting system applied for securing gunpowder supplies was known as the *odjaḳlīḳ* or special fund allocated for purchases and requisitioning of essential supplies (the same system was used to secure supplies for the imperial kitchens, the imperial navy and other branches of state service). The regions whence the essential minerals for the production of gunpowder could be procured within the Empire were limited. For supplies of sulphur, the government turned to either extreme of the Empire. A document dated 978/1570 indicates that a yearly quantity of 2,000 *ḳanṭārs* was supplied to the government by the governor of Hakkārī province from his own region together with Erdjish (Refik, 7-8). On the other side of the empire, an indication of sulphur being mined in Selānik province is found in a budget for the year 1079-80/1669-70 (Barkan 1955, 249), where an expenditure of 33,000 *aḳčes* is recorded for hiring of pack animals to transport the ore. Since we know from other sources (Refik, 7-8) that the standard rental fee for each draught animal was 200 *aḳčes*, we may interpret these figures as representing 165 animals, each bearing the standard load of 18 *batmans* or about 300 pounds. Saltpetre, too, because it required specially humid climatic conditions, such as those found on the edges of the salt lakes of Ḳaramān province, or in the Nile delta of Egypt, though more abundant than sulphur, could only be produced in certain places. Like sulphur, it too was supplied to the government by means of the yearly fixed contribution in kind. The level of this contribution was supposed to be constant, but additional extraordinary requests could be made in time of need. The yearly level fixed for Ḳaramān province as a whole was 500 *ḳanṭārs* or 28,222 kg. (Konya, *Sharʿiyya* court records for the year 1040/1630, 30). More often than not, the saltpetre was produced in a number of smaller workshops or distilleries called *kennes* (*Derleme*, viii, 2744), to be collected and transported to centrally-located factories for the manufacture of gunpowder. One such centre was at Bor, which annually produced a quantity of 91,000 *wuḳiyyes* (approx. 2,000 *ḳanṭārs* or 112,890 kg.) of finished gunpowder for delivery to the arsenal in Istanbul (Önen, 21). Egypt's regular contribution (*irsāliyye*) was 3,000 *ḳanṭārs* (Ferīdūn, ii, 201-2), but in some years it reached as high as 10,000 *ḳanṭārs* (see the order addressed to Tabānī-Yassī Meḥmed Pasha, governor of Egypt 1038-40/1628-30, in *Ṣuwer*, fols. 43b-44a).

Table. Statistics on Anatolian mining in the 10th-11th/17th-18th centuries

Minerals found	Location*	Yearly value of the *muḳāṭaʿa* in *aḳčes*	Yearly volume of production	Price per unit	Source of information	Date
silver	(Aleppo)	17,346			MM 7075, p. 8	1046/1636
silver	(Tokat)	67,000			MM 7075, p. 26	1046/1636
silver	Djandja (Gümüsh-khāne)	1,500,000			MM 7075, p. 12	1046/1636
silver	Inegöl (Bursa)	80,000			MM 7075, p. 32	1046/1636
silver	(Aleppo)	17,346			MM 7075, p. 8	1046/1636
silver	Djandja (Gümüsh-khāne)		450,000 *dirhems* **	9.5 *aḳčes* for pure silver, 1.5 for ore	MM 922	1010/1601
silver	Ergani		1,136,810 *dirhems*	15 *aḳčes*	MM 5192	1155/1742
gold	Ergani		201,157 *dirhems*	306 2/3 *aḳčes*	MM 5192	1155/1742
copper	Ardanuč (Erzerum)	300,000			MM 7075, p. 15	1046/1636
copper	Küre (Ḳasṭamonu)		28,638 *wuḳiyyes* ***	68 *aḳčes*	Ibn ul-Emin, Meʿādin, no. 3	919/1513
iron	Čankiri (Ḳasṭamonu)	117,879 ****			MM 7075, p. 28	1046/1636
iron	(Muğla)	6,333 *****			MM 7075, p. 38	1046/1636
alum	Ḳaraḥisār-i Sharḳī	1,382,650			MM 7075, p. 15	1046/1636
alum	Gediz (Kütahya)	316,666			MM 7075, p. 35	1046/1636

* Place-names given between parentheses designate *sandjaḳs*. This is used both as an aid to location and in order to differentiate individual figures for specific mines from summation figures for a district as a whole; ** One *dirhem* equals 3.07 g; *** One *wuḳiyye* equals 1.2828 kg; **** This figure of 117,879 also reflects some revenues from the salt works of Čankiri; ***** Tax-farm of the smelting works (*ḳal-khāne*).

Mineralogical map of Anatolia.

1. IRON: Biledjik (Refik, 1-4), Čankiri (MM 7075), Muğla (MM 7075), Divriği (Kātib 624), Kiği (Refik, 15, 21, 46);
2. COPPER: Ardanuč (Refik, 54, and MM 7075), Kağizman (Refik, 45-46), Küre/Ḳasṭamonu (ʿĀshıḳ, f. 351b);
3. LEAD and SILVER: Gümüsh-khāne (Ewliyā II, 405 and MM 7075) Ergani (Refik, 29, 39) Inegöl/Bursa (Refik, 45, and MM 7075), Ispiye/Tirebolu (Refik, 30, 31, 34);
4. SULPHUR: Erdjish (Refik, 7-8), Hakkārī (Refik, 7-8);
5. SALTPETRE: Erdjish (Refik, 13), Ḳaramān (Refik, 11-12, 18), Bor (Ewliyā, iii, 190);
6. ALUM: Shebin Ḳaraḥiṣār (MM 7075), Gediz (MM 7075).

For the purpose of quick reference, a table follows which shows the scale of various mining enterprises in Anatolia. An accompanying map shows the geographical distribution of the principal minerals.

Market organisation: distribution and supply.

The principal purpose of the state regulation of mines was to ensure self-sufficiency, particularly in materials of strategic significance. It seems moreover that in order to achieve this, the state was even willing to sacrifice a measure of efficiency in production. This is most obvious in those mines administered by *iltizām* (see above and MÜLTEZIM). Under this system, after deducting expenses for materials and payment of the treasury tithe, an investor was left with only some 60% of the production with which to pay his workers and realise a profit for himself. As is indicated in a memorandum on the subject written in about 1600 (see Murphey, *Silver production*, 90), this left little margin for experimentation with new techniques or investment in production-boosting improvements. In point of fact, the Ottoman Empire was independent of outside sources of supply for all significant minerals with the possible exception of tin (on the import of tin from the Cornish mines, see BĀRŪD at i, 1063, and H. İnalcık, *The socio-political effects* . . ., 215 ff. Also, Ewliyā Čelebi mentions that the supply of tin for the Istanbul craft-guilds came from England (*Seyāḥāt-nāme*, i, 579: *Ingiltere diyārından*). Modern geological exploration has determined that the only place in the Middle East where tin occurs in any appreciable deposit is the Lebanon (see de Jesus, i, 53, and ii, 395, map). However, there is no evidence that the Ottomans made use of this site (on the 17th century tin trade between England and Turkey, see Hedges, 84-5).

While mining production itself was also carefully monitored, strict government control was exercised, particularly in the marketing phase. One aspect of state regulation of the market place was the limiting or total prohibition of export of some mineral products at times when local stocks became depleted. Examples of the periodic imposition of trade restrictions in iron and lead, as well as other metals, are recorded in the well-indexed catalogue volumes of the Public Record Office in London (see *Bibl.*). These trading bans were imposed only as an exceptional measure, but with regard to the sale and distribution of certain scarce resources within the empire itself there was a whole range of restrictive regulations, ranging from government price control to the enforcement of artificial market boundaries known as *örü*.

To illustrate the fundamentally protectionist principles of the state with regard to mineral production and distribution, the conditions regulating the state alum mines are particularly revealing. Details on the marketing of alum mined at Shebin-Ḳaraḥiṣār (Ḳaraḥiṣār-ı Sharḳī) for use in the manufacture of gunpowder and other products are provided in the *sharʿiyya* court records from Aleppo. In an order dated 11 Muḥarrem 1194/19 January 1780 to the authorities in Aleppo, one of the restricted areas where the ore could be sold, the government barred the competition of European traders (*efrendjiler*)

who sought to flood the market with cheaper alum. Ship captains were warned that if they persisted in attempting to sell their cargoes at the deflated price of six *ḳurush̲s* per *ḳanṭar* (56.443 kg.), as opposed to the fixed price of forty-three *ḳurush̲s* per *ḳanṭar* set for the produce of the state-operated mines at Ḳaraḥiṣār, their cargoes would be confiscated (Damascus, *Markaz al-wat̲h̲āʾiḳ al-taʾrīk̲h̲iyya: Ewāmir-i sulṭāniyye* (*Ḥalab*), xv, 384-6). Another order dated 25 Muḥarrem 1191/5 March 1777 provided guarantees for the maintenance of treasury revenues deriving from alum sales by blocking access to the market to all suppliers until such time as all the state-produced alum had been sold. The order also provided that any shipments of alum not authentically proven to have originated from the state mines by the issuance of a treasury agent's permit (*tedh̲kire*) would be made subject to immediate confiscation, as well as to the payment of an indemnity amounting to twice the value of the seized shipment (*Ewāmir al-sulṭāniyye* (*Ḥalab*), xiv, 70-1). Such harsh restrictions and overtly monopolistic marketing practices based on defined areas called *örü* were applied in connection with a limited number of mineral products such as salt and alum. Nevertheless, the government applied similar restrictions on some precious metals as well, both with an eye to protecting treasury revenues, and to assuring the availability of scarce materials which, by their very nature, could easily be made the subject of hoarding and speculation. Thus the sale and circulation of raw silver was strictly controlled by the government. A limit was fixed for the use of the jewellers and related craft-guilds (such as the *sīrma-kesh̲ān*) by the comptroller of the mint (*ḍarb-k̲h̲āne nāẓīrī*), and unauthorised export of silver was also forbidden (on this question, see the references in Murphey, *Silver production* . . ., 89). Furthermore, by periodic regulation of the coinage (*taṣḥīḥ-i sikke*) to account for fluctuations in the market value of silver, official government rates of circulation (*rāʾidj̲*) for all major currencies, both internally and externally-minted, were determined and were universally applied in all provinces of the empire. Thus all phases of Ottoman mineral production, minting, and circulation followed the same rule of strict government regulation and control aimed at preserving self-sufficiency and at assuring abundance in the supply of precious metals for the home market.

Concerning the distribution for use of mineral resources, it is clear that the greater part of the empire's mineral production was set aside and made directly available to the state for two principal uses:

(1) *military use*

- a. the imperial cannon foundry (*top-k̲h̲āne-yi ʿāmire*)
- b. naval shipyards (*tersāne-yi ʿāmire*)

(2) *use in civil construction*

- a. buildings serving the public need
  - (1) mosques
  - (2) schools
  - (3) hospitals
  - (4) *ʿimārets*
- b. buildings reserved for state use
  - (1) royal palaces
  - (2) residences of high government functionaries.

A relatively smaller proportion was distributed to the craft guilds for the production of household utensils and consumer goods. Manufacture of common household items such as copper cooking pots (*ḳazg̲h̲an*), charcoal burners for household heating (*mangal*) and copper eatingware (*ḳab*) also used up large quantities of metal. According to Ewliyā's list (*Seyāḥāt-nāme*, i, 579) in Istanbul alone there were some 1,000 separate metal founders' shops (*dökmedj̲is*) employing some 1,300 skilled craftsmen. It was only when these two needs had been fully satisfied, that is to say, the needs of the state and the needs of the internal consumer market, with a substantial surplus kept in reserve in case of emergency need, that the issue of export could even arise. When export did occur, the state also carefully supervised all aspects of these transactions in order to determine the appropriate trading partners, the volume of the trade, and the proper price level.

These peculiarities of the Ottoman marketing system are nowhere more in evidence than with respect to the distribution and sale of salt [see MILḤ]. For purposes of salt sales, each production district or *örü* was further divided into sub-units called *dīwāns*, to which salt was distributed for sale on the basis of carefully calculated population estimates. The purpose of such a system was obviously to guard against the occurrence of shortage caused by price speculation on the part of merchants who knew how to profit from a naturally occurring price differential based on the geographic proximity of their potential markets to the centre of production. Figures for several salt works in Anatolia and Rumelia published by Gücer indicate that the distribution of salt typically followed a repeating pattern: 85% of the salt produced in a given production district (*örü*) was blocked for distribution at fixed prices to local industries (bakeries, etc.), while only 15% made its way outside the confines of the *örü*, either as a contribution to a state organisation such as the imperial kitchen (*maṭbak̲h̲-i ʿāmire*) or for distribution in another *örü* experiencing a temporary shortage. Of the total of 85% consumed locally, Güçer was able to determine that 70% was sold directly at the mine or in its immediate environs, and a further 15% was sold in remote rural sales districts (*dīwāns*) with limited access to the mine. Far from being oppressive, these sales restrictions were designed to ensure equitable distribution of commodities which were either naturally scarce or liable to become the object of price speculation.

Nineteenth-century developments in Ottoman mining.

In considering the development of Ottoman mining in the 13th/19th century, one should note the three areas of fundamental change:

(a) Mining law. (For this, see the relevant articles from the *Düstür* listed in the *Bibl.*, section II. On the law governing capital investment and ownership of land by foreigners, see Engelhardt, i, 211 ff., and Solakian, 5-6. On the concessionary régime, see IMTIYĀZĀT.) (b) New mineral types exploited in the 19th century and the role of foreign capital in the development of Ottoman mining. (c) New technology and the impact of mechanisation. Only the major themes and issues relating to the last two topics, in particular, that of mechanisation in Ottoman mining (see below), will be treated here.

The exploitation of other mineral resources in the Ottoman Empire such as chrome and nickel and the more intensive exploitation of existing fields as in the coal industry, began on a large scale relatively late in Ottoman history. Under the impetus of increased demand sparked off by the Industrial Revolution in Europe, mineral exploitation rights in

Table. Statistics on Anatolian mining in the 19th century

Minerals found	Location	Yearly volume of production	Price per unit	Source of information	Date
copper	Erğani	6,172 metric tons	72 *para*	*Iḥṣāʾiyyāt*, 263	average over 1859-1907
gold	Bulgar Dağı (Adana)	6¼ *oḳḳa*s (8.4 kg.)		*Iḥṣāʾiyyāt*, 263	average over 1805-25
silver	Bulgar Dağı	922 *oḳḳa*s (1,183 kg.)		*Iḥṣāʾiyyāt*, 263	average over 1805-25
copper	Küre (Ḳasṭamonu)	340 metric tons		Issawi, 279	1851
fuller's earth	Ankara	7,408,720 metric tons		*Iḥṣāʾiyyāt*, 265	average over 1820-5
meerschaum	Eskişehir	5,648 *ṣandiḳ*s (one *ṣandiḳ* = approx. 35 kg.)		*Iḥṣāʾiyyāt*, 264	average over 1820-5

Anatolia became the subject of intense competition between the various capitulatory nations and were often made a specific article of agreement in the bilateral negotiations for the financing of such large-scale projects as the Ḥidjāz railway. In order the better to coordinate the leasing and exploitation of the state mines and to increase their profits, a separate Department of Mines attached to the Ministry of Public Works (*Nafʿiyya*) was established in 1887.

The most significant development in the new period was the intensive exploitation of the empire's coal reserves with the participation of foreign capital. This sector of the mining industry has been thoroughly studied by Quataert (see *Bibl.*), so there is no need to enter into details here. Two points which should be stressed, however, are firstly that the marked rise in mineral output in the late 19th century was almost entirely used for export outside the empire and not to fuel internal industrial activity (according to Owen, 213, 80%-90% of all coal production was exported, according to Quataert somewhat less, whereas Solakian (10) provides statistics from the first decade of the 20th century showing that minerals alone usually accounted for between 60-70% of all exports), and secondly that of all the minerals, coal was far and away the most important, comprising nearly 80% of all mineral output (see statistics in *Iḥṣāʾiyyāt*, 100). The table below excludes coal production (for which, see Quataert and statistics on the Ereğli mine in *Iḥṣāʾiyyāt*, 262-3) so as to give a more balanced picture of developments in the 19th century as compared with the earlier period. With reference to this table, it should be noted that two quarried minerals which were also intensively exploited during the new period, once again primarily for export, were fuller's earth and meerschaum (for statistics on these, see *Iḥṣāʾiyyāt*, table 27, at pp. 102-3, which gives the mineral output of the empire by province according to two categories, mines (*maʿdin*) and quarries (*ṭash odjaḳlarī*).

Mining technology.

1. The earlier period. Some interesting details of the technological aspects of Ottoman mining are provided through the first hand observations of Meḥmed ʿĀshiḳ, who was in residence during a three-year period between 994/1586 and 997/1589 in the mining town of Sidrekapsı. According to his description, the mine shafts were typically dug to a depth of some 150 to 200 *dhirāʿ*s (one *dhirāʿ* = approx. 75 cm). A system of mechanically operated surface pumps linked to the subterranean water channels was installed to facilitate drainage. The process whereby the ore was smelted and purified in small forges is also described by him. As the by-product of the first smelting, the ore was divided into pure silver ingots and a quantity of litharge. The litharge could then either be sold in its raw state or else further refined to produce lead for roofing or ammunition. As described by Meḥmed ʿĀshiḳ, the forges at Sidrekapsı were rather small in size, with a central heating chamber connected to an exterior collecting chamber where the smelted ore was left to solidify. The major technical difficulty seems to have been overheating, particularly in the winter months when the water circulation needed for cooling was impeded by freezing temperatures, which gave rise periodically to the explosion and collapse of the small, clay-built forges. A document which further describes the operation of the smelting houses (*ḳal-khānes*) attached to the imperial mint and which specifies the percentage of metal lost during each stage of the assaying process, has been discovered in the Topkapu Sarayı archives (D. 9572) (see further, Beldiceanu 1964, 95-7). Ewliyā Čelebi's 11th/17th century description of the iron works in Samakov gives evidence of the use of hydraulic power to work the iron-stamping presses (*Seyāḥāt-nāme*, vi, 128).

2. The 19th century. We have already referred to the application of improved techniques in order to raise yields, a notable example being the construction of a centralised smelting plant at Tokat to process ore from mines throughout northeastern Anatolia (see above). Alongside improved technology, mechanisation in key areas such as the transport and loading of ore had a dramatic impact on mineral output at the turn of the 20th century. To take an example from the Ereğli coal fields, the building of a rail link and installing of cranes for rapid loading of the ships in the port are singled out by Quataert as the critical factors leading to a three-fold increase in production within a few years of the establishment of the French Company, the *Société d'Heraclée*, in 1896 (see Quataert; Owen, 213, taking a longer time frame, speaks of a better than ten-fold increase in coal output between 1855 and 1913). Proximity to existing railway lines also affected the decision to exploit known deposits in other sectors of the mining industry. The development of chrome mining in the province of Aydīn, and intensified exploitation of the beds of schist at Hendek for extraction of copper, became economically viable only by virtue of the proximity of these areas to existing railway lines. In the case of the Hendek operations, we are told by Edwards (196) that at the time of his report in 1914 there were as many as 26 separate concessionaires working in an area only 80 miles square. As a result of intensified mining activity and mechanisation in the industry, in a single decade at the turn of the 20th century overall mining production in all sectors of the industry doubled from about 600,000 tons to 1.15 million tons (Solakian, 9). This improvement in output was

achieved without a significant increase in the number of mines operated (Solakian, table at p. 9, shows that the number of mines operated fluctuated between 82 and 94 over the period 1901-10), and in the absence of new mineral finds of any significance.

Bibliography: I. Ottoman Mining. (a) *Archival sources*: London, Public Records Office, Calendar of State Papers and Manuscripts relating to English affairs existing in the archives and collections of Venice and other libraries of northern Italy (see index under "trade" where sub-headings for commodities include: iron, lead, tin, silver, etc.); Istanbul, Başbakanlık Arşivi, (BBA) Maliyeden müdevver (MM) 2067 = *Idjmāl-i muḥāsebe-yi wāridāt ve ikhrādjāt-i muhimmāt-i āhen der djānib-i Samakov fi sene 1025-6*; Kâmil Kepeci (KK) 5167 = First draft of a survey recording mining centres in Rumelia. This draft contains chancellery notations indicating where comparative statistics from other years are to be entered. As an example, on p. 9 of this register, a single figure for the valuation of the tax-farm of Skopje/Üsküb pertaining to the year 1003/1595 is given. Below this is inscribed the instruction *987, 990, 991, 992, 1015, 1024, 1025, ve 1043 senerleri dahī görüle*; MM 22, 148 = completed draft of the above survey containing data spanning the years 990-1041/1582-1631; State Treasury budgets from the KK series: KK 1919 = budget for 1036-7/1626-7 KK 1921 = budget for 1037-8/1627-8 KK 1927 = budget for 1039-40/1630-1. Istanbul, Topkapu Sarayı Arşivi, Defter 9572 = a document dealing with the administration of the mint at Sidrekapsı dated 944/1537. For a brief description on archival sources on mining, see M. Sertoğlu, *Muhteva bakımından Başvekalet Arşivi*, Ankara 1955, 78-81. In particular, see BBA, KK 5167, KK 5169, KK 5171, KK 5175, KK 5184, KK 5185, KK 5196 = registers dealing with the Rumelian mines, and BBa, KK 5190, KK 5191, KK 5192, KK 5195, KK 5204 = registers dealing with the Anatolian mines. In addition, see the Cevdet tasnif, Darbhane (Sertoğlu, *op. cit.*, 70), and the collection of documents mostly from the 18th and 19th centuries dealing with the state mines and imperial mint transferred to the archives from the Department of State Lands (*millī emlāk*), Sertoğlu, *op. cit.*, 81. The Ibn ul-Emin Tasnif, Me'adin (vol. xix) contains 248 documents dealing with various aspects of mining. These documents are particularly useful, since apart from statistical information, they give us an idea how the mines were physically operated. Particularly useful in this regard are *Ibn ul-Emin, Me'adin, no. 17* = a report sent by the *ḳāḍī* of Magnisa dated 996/1588 concerning mineral deposits in the vicinity, and *Ibn ul-Emin, Me'adin, no. 105* = a report by the *ḳāḍī* of Küre in Ḳasṭamonu province dated 1093/1682 concerning the state of the mining and smelting operations in the copper mines. (R. Murphey)

4. In Islamic art.

Materials and techniques.

In Muslim civilisation as in classical antiquity, precious metals and alloys of copper, tin, lead and iron were used for artistic purposes. We have only scanty information about the metals, and particularly about the alloys of which metalware was made. Our ignorance in this respect stems from a number of reasons. One is that most of the Islamic metal objects have never been properly analysed, and terms like "bronze" or "brass" are used indiscriminately in catalogues and other scholarly publications. Another reason is that the mediaeval Islamic terminology for metals and their alloys is often ambiguous and therefore difficult to evaluate (Aga Oğlu, *A brief note*, in *JAOS*, lxv [1945], 218-23). It would seem, however, that from the early Islamic period to at least A.D. 1200, materials conform with those used in classical antiquity and with those mentioned by al-Djazarī, namely: gold (*dhahab*); silver (*fiḍḍa*); with bronze (*isfādrūh*, from the Persian *sapīd rūy*, a bronze with heavy content of tin, antimony and lead); bronze (*ṣufr*); brass (*shabah*); copper (*nuḥās*), and tin (*raṣāṣ al-ḳalʿī*). In early Islamic times the use of iron (*ḥadīd*) seems to have been negligible. It became important, however, for the production of steel for weapons and tools, and may have also been used instead of bronze for the plating of doors and city gates.

Together with the unbroken tradition in the use of metals and their alloys, there was a technical conservatism in the fashioning of Islamic metal objects. Several methods of casting—one of the oldest arts in the world—were practised in Islam. One was the cire-perdue or lost wax process, applied in cases of closed shapes. An accurate, though somewhat sketchy description by al-Djazarī [*q.v.* in Suppl.], active in Diyārbakr in the second half of the 6th/12th century, testifies that in northern Mesopotamia the lost wax technique was well-established. Dated mid-6th/12th century objects indicate its use in Iran too (L. T. Giuzalian, *A bronze qalamdān*, 97). Another method described by al-Djazarī was casting with green sand. This method, which is of obscure origin, is mentioned also in Chinese sources contemporary to al-Djazarī. (For the first description in Europe, see Biringuccio, *De la pirotechnia*, 1540.)

Casting in open or piece moulds was used for works in the round or for more composite shapes, and required soldering. Hollow, primarily circular vessels, were often produced from disks or sheet metal, such as brass or white bronze, by burnishing the shape on a lathe. This technique, discovered by Roman artisans and known today as spinning, presumably passed to Islam from late Roman and Byzantine sources. No written documents on this technique, comparable to al-Djazarī's book on automata [see ḤIYAL in Suppl.] have so far come to light. The same applies to the widely employed method of raising—or sinking—in which comparatively thin metal sheets were transformed by hammering into jointless, hollow vessels of almost any shape. Among the objects fashioned in this technique are jugs, bottles, cups and bowls raised in precious metal or white bronze, covered brass vessels with fluted bodies and lids, and the like.

The most common method employed for decoration were punching, chasing and bossing, tracing, engraving and inlay. None of these techniques was

entirely new. Their originality lies in the application of these conventional methods to create surface decorations of unprecedented Islamic character and artistic feeling.

(1) Punching: This method, known also as ring-matting and executed by stamps which terminate in a small ring or hole, is particularly appropriate for soft metals. It was employed by Chinese and Soghdian gold- and silversmiths primarily as background pattern, while in Islamic metalwork punched circles were also applied to objects made of bronze and its alloys. The most common use of ring-matting was to set off the main decoration or an inscription from the ground. Yet particularly on early metalware, punched circles also formed the principal decoration. On bronzes, ring matting appears to have gone out of fashion by the early 7th/13th century. The latest dated example of ring-matting on bronze known to the writer occurs on an inlaid penbox, which was made in 607/1210-11 by Shādhī for Madjd al-Mulk al-Muẓaffar, one of the viziers of ʿAlāʾ al-Dīn Muḥammad Khwārazm Shāh.

(2) Chasing and bossing (*tandjīr*): Repoussé, or ornamental relief work, is produced by hammering metal sheet, and like punching it is closely linked to the work of the gold- and silversmith. We still possess a relatively fair number of chased and bossed gold and silver objects. The bulk of the surviving objects comes from Iran and antedates the 7th/13th century. Reports of later Muslim travellers like Ibn Baṭṭūṭa imply, however, that such vessels continued to be manufactured also outside Iran and in larger quantities than the surviving examples suggest. The application of repoussé to bronze in order to create an over-all decoration, which was practised in the Near East since remote antiquity, was relatively rare in Islam. It is known foremost from a group of late 6th/12th to early 7th/13th century candlesticks and some stylistically closely-related rectangular tray-like objects (see also Rice, *A Seljuq lamp from Konya, SIMW. V*). In modern times, chasing and bossing of brass and copper is practiced all over the Islamic world.

(3) Tracing and engraving (*ḥafr*): The decoration of the majority of Islamic metal objects was done either with chisels to produce grooves, or with gravers in order to remove the metal which once filled these grooves. Both techniques are not related to any specific material, and were employed singly and in conjunction with other techniques. They were used for unpretentious decorations of household utensils; for tracing intricate arabesque patterns; for preparing the grooves for copper and silver inlay, or to enrich repoussé or other decorations. Both tracing and engraving are still practiced in almost any bazaar workshop.

(4) Inlay: Inlay in metal (*takfīt* or *tarṣīʿ*) is a technique by which the artist enriches a metal object by overlaying parts of its surface with patterns formed from wires or sheets of a different metal. Although this craft too is of considerable antiquity, it was not popular before the mid-6th/12th century. On early bronzes, as for instance a pear-shaped ewer in the Victoria and Albert Museum (434-1906), an often-discussed ewer in the Hermitage, or a ewer in the Metropolitan Museum of Art (47.100.90), a thin piece of red copper was hammered into a small cavity in order to mark the eyes or feathers of a bird or to indicate a fruit or floral motif. Silver wire, which in later centuries had become a common medium for inlay, was only rarely used with these early examples. The wider use of inlay with copper and silver is documented only from the mid-6th/12th century onwards. According to al-Djazarī, the inlaying of the doors at Diyārbakr in the last third of the 6th/12th century was done by cutting the pattern for the inlay from metal sheets, casting the grooves in the lost wax technique, and finally fitting both parts together. Although this method was known in ancient times, inlaid Islamic metal objects from the 6th/12th and 7th/13th centuries point to two different techniques. In the first, the so-called dove-tailing employed for red copper and silver inlay, the design was traced into the bronze or brass with a blunt tracer. The channels, or spaces to receive the copper or silver wire, were roughened and undercut, and the silver hammered into these "dove-tailed" grooves. Where the space to be inlaid was greater than a wire would fill, a piece of sheet metal instead of wire was beaten down into the undercut spaces and subsequently engraved. No undercutting took place in the second method of inlay. In this method, which was employed for gold and is documented since the mid-7th/13th century, shallow grooves following the contours of the design were traced, and the thin gold leaf was secured by hammering it into the grooves. When larger panels were prepared to receive the gold, the bottom of the respective ornament was thoroughly roughened with a punching tool.

On the majority of mediaeval bronze and brass objects, chased lines or background scrolls are filled with a black, bituminous substance the composition of which has so far not been analysed. Similarly, the composition of the niello powder used in Islamic times on gold and silver ware is still unknown.

Types of metalware.

Broadly speaking, Islamic metalwork falls into five categories. The first and largest are objects made for domestic and religious use. They are well represented in museums and private collections and therefore better known than the rest. The second group are doors and windows and their accessories. It includes knockers, locks, keys and window grills. Scientific and medical instruments, astrolabes, globes, knifes and scissors form the third group of metalwork. The interest in these instruments lies primarily in the history of science and technology. Yet in their excellent craftsmanship and beautiful decoration they are often real works of art. The fourth group are arms and armoury. They too are often of excellent craftsmanship, though for evident reasons they differ in design and workmanship from the former categories. The same applies to jewellery, which for technical and other reasons deserves a separate study [see DJAWHAR, ii, in Suppl.]. The last three categories are therefore not included in this section. Artistically-outstanding examples will be mentioned below.

Objects made for domestic and religious use.

(1) Lighting implements. Islamic lampstands basically follow Byzantine, Mediterranean models. Two types, both common in pre-Islamic Iran, Syria and Egypt, had particular influence on the formation of the Islamic stands. The first is characterised by a post made up of baluster-shaped links, and is topped by a pan and a faceted spike to hold the lamp. The second type has a plain shaft which is bordered above and below by either disks, rings or a squat knob. Both kinds rest on three pawed or hoofed animal feet. The base is formed by three curving trefoils with a raised sharp edge along the centre,

or, more rarely, rises in the shape of a shallow dome. The artistic changes brought about by Islam did not so much affect the main elements of the Roman-Byzantine models than their stylistic transformation. This is expressed in the preference for segmental shapes, faceted shafts, or geometric, flattened renderings of the zoomorphic feet or trefoil bases (Barrett, *Islamic metalwork*, Pls. 3, 4a). Another Roman variation, the pricket-type lamp stand, recurs primarily among early Mamlūk specimens (cf. Louvre, no. 6030; Berlin, Museum für Islamische Kunst, no. I 655, repr. H. Glück and E. Diez, *Die Kunst des Islam*, Berlin 1925, Pl. 441). In later centuries, lampstands of the above-mentioned types became less adequate as lighting utensils and are therefore rare.

Mediaeval Islamic oil lamps also follow the Roman-Byzantine tradition. Their oval, or occasionally bulbous body has one or several nozzles for the wick, a hinged lid to cover the central filling hole, and is often applied with a handle at one end of the longitudinal axis. In contrast to the Roman specimen, the Islamic oil lamps were not made for a pricket stand, and are either footless or rest on a splayed, often faceted foot. This last form is generally regarded as an Iranian, particularly East Iranian feature and associated with 6th/12th to 7th/13th century Khurāsānian workshops. Many of them had animal or bird-shaped finials.

Zoomorphic oil lamps, too, were created both by Christian and by Islamic artisans. Yet whereas the shapes of the Byzantine and Coptic lamps were restricted to birds of symbolic content, in mediaeval Islam no clear preference for one or the other animal shape seems to have existed. The species of birds or quadrupeds became more and more differentiated and imaginative, and many are provided with burners attached to the breast or head of a fabulous creature.

In contrast to the lighting implements mentioned so far, the models for the mediaeval types of Islamic candlesticks are as yet obscure. Since about the end of the 6th/12th century the dominant type of these objects consisted of three clearly-marked elements: a truncated base, a socket which on a smaller scale repeated the form of the base, and a tubular neck serving as a link between the two. Aside from different proportions and sizes—candlesticks manufactured for mosques or public institutions may have reached a height of more than 50 cm.—base and socket took on a variety of shapes. There were two basic trends. In the first, the truncated cone of these elements had straight sides. The general appearance of those candlesticks was therefore heavy and somewhat sturdy. In the second, and more elegant variety, the flanks were contracted. In addition, the surface was often faceted, subdivided into straight vertical flanges, into raised ogee-shaped arches or two registers of pentagonal compartments. In a "transitional" type between the faceted and truncated forms, body and socket projected strongly towards their base, and the body rested on a slanting foot. This strong projection is counterbalanced by a protruding, flat shoulder (Ferhérvári, nos. 159-60; A. S. Melikian-Chirvani, *Le bronze iranien*, 52-3). In a special category of Iranian 10th/16th to 11th/17th century candlesticks, base, neck and socket were unified and turned into a cylindrical, and occasionally faceted stand with a slanting foot (Melikian Chirvani, *op. cit.*, 116-17). In most of these so-called pillar candlesticks, some traces of the basic three sections in the form of low mouldings or rings have been retained.

Mosque lamps, polycandelons and chandeliers belong to a variegated group of suspended float-wick lamps, of which relatively few examples have survived. To judge by the few complete and the numerous fragmentary metal mosque lamps so far known, they closely resembled glass lamps. They were either fashioned of sheet metal or cast in bronze, had a bulbous perforated body, a flaring neck and low foot, and three suspension rings were attached to the middle of their body. Suspension arms, also made of sheet metal, were hooked to these rings. The few specimens which have survived do not allow a closer typological classification. By the late 7th/13th century, their place appears to have gradually been taken by glass or ceramic lamps.

The number of polycandelons—a suspended lamp consisting of several glass containers fitted into a metal frame—is even smaller. This type, which stems from the Roman-Byzantine tradition, was developed in western Islamic countries rather than in the east, and was transformed in Mamlūk Egypt into huge prismatic, many-tiered or pyramidically-shaped chandeliers.

(2) Perfume vessels. The most common type of incense burner (*mibkhara* or *mabkhara*) had a cylindrical body with an inner shallow bowl for the incense, a domed cover, straight handle soldered horizontally to the body, and three, often zoomorphic feet. The cover, and in many cases also the body, were pierced for the emission of the smoke. The shape of these incense burners stems ultimately from Byzantine of Coptic thurification vessels, and also the feet in the form of animal paws in different degrees of stylisation correspond to the feet of Byzantine and Islamic lampstands mentioned previously. Between the early 7th/13th and the end of the 8th/14th century this traditional Byzantine type dominated in Syria and Egypt, while in Iran it seems to have been less abundant. Another kind of Mamlūk incense burner common in Syria and Egypt consisted of two, partly perforated hemispheres held together by clasps, which had no feet and were either suspended or rolled on the floor. To hold the charcoal they enclosed a small iron bowl which was set in gimbles to move freely when the incense burner was rolled or swung. In the 9th/15th and 10th/16th centuries, such vessels were widely exported to Italy and then produced by Mamlūk artists who resided in Venice. Similarly-shaped incense burners occur already among Chinese silver vessels which are generally attributed to the T'ang period. The Chinese specimens are, however, much smaller, and their relation to the Islamic incense burners is so far obscure. Some early 4th/10th to early 7th/13th century East Iranian incense burners with a square or cylindrical body seem to relate to a Buddhist, Central Asian tradition. They rested on low feet of a type also common in other East Iranian bronzes, and certain details in their decoration, such as lotus petals and blossoms are reminiscent of pinnacles on Buddhist stupas or votive vessels. A variant of these East Iranian incense burners, which was also popular in East Iranian households between the late 4th/10th and the 7th/13th centuries, was fashioned in the form of a cylindrical, hooded receptacle. It also rested on three zoomorphic, generally faceted feet; its low body had a niche-like upper aperture with an arch-shaped opening, and the front of the semi-dome was flanked by a pair of flat, projecting bird heads.

Another type of incense burner was fashioned in the form of highly-stylised felines or birds. These

vessels, which are generally assigned to North-East Iranian workshops, seem to have been in vogue throughout the 6th/12th century. Their body was hollow-cast and perforated. In the feline-shaped incense burners, the animal-head was removable to permit placing the incense in the body, while the bird-shaped examples had a drawer for the charcoal in the bird's breast. There is still much uncertainty about zoomorphic incense burners in Fāṭimid Egypt. Although a considerable number of animal-shaped, presumably Fāṭimid objects have been preserved, their function is not always clear, and the group comprises fountain heads and objects which may have served various decorative purposes.

The identification of mediaeval Islamic bottles as perfume flasks (*ḳumḳum*) is often ambiguous. Among the extant flasks and bottles the following types almost certainly served this purpose. One is a group of Persian, 15-21 cm. high silver or parcel gilt bottles attributable to between the late 5th/11th and the mid-6th/12th century. They have a globular body resting on a low, splayed footring and a narrow, tubular neck. A small fluted cover with a ring, which probably once held a chain by which it was attached to the neck, has been preserved in some of these specimens. To prevent the evaporation of the perfume they would have required an additional stopper (*Survey*, Pl. 1350). A second group of Persian 12th century bottles is characterised by a funnel-shaped neck, a bell-shaped, longitudinally-fluted body, and a flat horizontal link between collar and neck (*Survey*, Pl. 1311 B.E.). Other bottles of this type have oblique or softly-rounded shoulders. Their bodies are cylindrical or facetted, and occasionally the mouth of the neck is sealed with a small filter. Similarly-shaped pottery and glass vessels with a pierced filter and a filling hole at the bottom make an interpretation of these bottles as perfume-sprinklers even more likely. Small, 8-9 cm. long bronze perfume flasks with a facetted, slightly flaring neck, a rectangular body and four tooth-shaped feet, which evidently were fashioned after a widely-used type of glass and rock crystal flasks, bear further witness to the affinities between bronze and glass flasks of that kind (C. J. Lamm, *Mittelalterliche Gläser und Steinschnittarbeiten aus dem Nahen Osten*, Berlin 1929-30, i, 160-2; ii, Pl. 59; cf. idem, *Das Glas von Samarra*, Berlin 1928, Pl. VII).

Mamlūk perfume bottles were particularly appropriate for sprinkling odoriferous oils. Fashioned in an ovoid shape, these bottles had a long tapering neck that terminated in a pointed end and a base that was fitted with a plug, resembling the filling holes of the Persian perfume flasks, (Cairo, *Cat.*, 1969, no. 79, Pl. 15).

(3) Mirrors. Islamic mirrors fall into two categories. The first and larger category consists of mirrors with a central perforated boss for fitting a cord and is based upon Chinese prototypes. They are relatively small—the average diameter varies between 10 to 20 cm.—the face of the mirror is cast in relief decoration, and the reverse is smoothly polished. In the second and smaller group the mirror was furnished with a handle, which was cast either separately or in one piece with it. This second category stems from a Mediterranean tradition, and dates back to classical antiquity. Mirrors of this type appear to have served primarily as toilet accessories, while the originally Chinese type presumably had a magical or talismanic purpose. In spite of the considerable number of extant mirrors, which include inscribed and even dated specimen, these objects have never been properly studied, and both categories need further investigation.

(4) Inkwells and penboxes. The most common type of inkwell (*dawāt* or *miḥbara*) had the shape of a cylindrical pot and was covered with a separate domed lid. It was used in Iran since Sāmānid times, and only the proportions, the profile of the cover and the decoration changed in the course of the centuries. The extant specimens fall chronologically into three groups. The first consists of Persian inkpots from the second half of the 6th/12th century. They are relatively small, 7 to 13 cm high. The base is either flat or has three low, almond-shaped feet cast together with the vessel. The cover has a fluted, dome-shaped centre, and lid and body are furnished with loops or tubular appendages for fastening the pot to the hand of the scribe. In the second group, which appears to have been used also in Syria in the 7th/13th century, the dome is hemispherical and rests directly on the level surface of the lid. In the last group, represented by Persian inkpots of the 10th/16th to 12th/18th centuries, the body is slender, and its width hardly exceeds the width of the domed cover.

Penboxes (*ḳalamdān*) fall into several categories. The most common are rectangular boxes with a separate hinged cover and differently-shaped compartments for the ink and other writing implements. The shorter ends of the Iranian specimens were generally rounded. The rectangular shape was more characteristic for Mamlūk Syria and Egypt and for Ottoman Turkey. Pencases which were placed in the belt were more delicately shaped. The first and earlier type was wedge-shaped. It was made of two parts, and the inner, compartmented box could be entirely removed. Most of the extant specimens of this kind are Iranian in style and attributable to the 7th/13th century. The second type, known from 10th/16th to the 12th/18th centuries, apparently West Persian examples, consisted of a flat, either tubular or rectangular pencase and a cylindrical inkpot attached to it (*Survey*, Pl. 1387 A). A similar type was used by Ottoman officials.

(5) Caskets and boxes. The earliest preserved metal caskets come from 4th/10th century Spain. They are made of silver, mostly gilt and inlaid with niello, and their shape and proportions closely follow contemporary Spanish-Islamic rectangular ivory caskets with gabled lids (Migeon, *Manuel*, ii, 16-17, fig. 220). In the Eastern Islamic lands, silver caskets of this type are rare, and not known before the Saldjūḳ invasions. Two particularly fine examples are said to come from a Persian hoard and are kept in the L. A. Mayer Memorial Museum in Jerusalem (*Survey*, Pl. 1352 A, B). Brass and bronze caskets made between the late 6th/12th and later 8th/14th centuries are more numerous. The earlier specimen (Rice, *SIMW. VI*, Pl. VI) have a flat base and closely follow in their proportions the silver caskets. Later 7th/13th and 8th/14th century examples become higher, relatively shorter and wider, rest on low feet and generally have slightly slanting sides (Barrett, Pl. 37; *Survey*, Pls. 1359, 1360 B). A derivative of the former caskets has a flat top and a partial lid which is secured to the fixed portion of the roof by hinges. Their form, too, is paralleled in ivory and ceramics (Rice, *SIMW. VI*, Pls. I-III; *Survey*, Pl. 1303, dated 593/1197).

Ḳurʾān boxes are square and of larger dimensions. They are generally plated and not cast. The Mamlūk specimens have a bevelled lid (Berlin, *Cat.* 1971, no. 19, Pl. 69), while Iranian Ḳurʾān boxes

have often flat covers. Along with angular, round and cylindrical boxes occur caskets of less conventional shape or exceptionally small size. To the last category belongs an oblong miniature box of remarkable artistic quality by Ismāʿīl b. Ward al-Mawṣilī, dated 617/1220 (Rice, *SIMW, II*, Pl. IX), or a kidney-shaped box in the British Museum which is attributable to an Egyptian or Syrian workshop of the middle to second half of the 7th/13th century. Similarly unusual in shape are a shallow, but relatively large, hemicircular box in the Harari Collection (*Survey*, Pl. 1305 C) or a "casket" in the Louvre. The last follows the shape of cylindrical, late 7th/13th century candlesticks with narrow, contracted waists, and has a low convex lid which is fastened to the container by hinges.

In the 8th/14th century, Persian metalworkers produced also a variety of polygonal caskets of various sizes. Among the preserved specimens are a small octagonal box (*Survey*, Pl. 1360 A) and four larger dodecagonal caskets, all of which have been assigned to a workshop in Fars (Melikian-Chirvani, *Le bronze iranien*, 80-2). Mamlūk, usually oval-shaped lunch boxes form a category by itself. They consisted of one to three separate units which were placed one on top of the other, and had a lid with a handle that could also be used as a foot. To prevent food poisoning, they were made of tinned bronze (J. Allen, *Later Mamluk metalwork, II*, in *Oriental Art*, N.S. xvii/2 [1971], 156-64; Barrett, Pl. 31).

(6) Ewers and jugs. In spite of the relatively large number of preserved ewers (*ibrīḳ* [*q.v.* in Suppl.]) and their importance as art historical documents, they have not yet been sufficiently studied. The suggested typological evolution, and most of the chronological or geographical attributions, are therefore tentative. Particularly difficult is the classification of ewers from the first four to five centuries A.H., where one finds an exceedingly large number of shapes and combination of forms for which so far no models have been traced. Among these ewers are vessels with slender, oval and heavily bulging-out bodies; with and without shoulders; with elegantly contracted and long tubular necks; with tubular or bird shaped spouts and a large variety of straight, gently curved and zoomorphic handles. Between the end of the 4th/10th and the 6th/12th centuries new forms appear to have been introduced from the Eastern Islamic world, which include types of ewers with an oil-lamp like spout. Signed specimens of that kind have been found in ancient Farg̲h̲ānā and Us̲h̲rūsana by Russian scholars who dated them to the mid-5th/11th century. While these early examples were either plain or only little decorated, later 6th/12th to early 7th/13th century K̲h̲urāsānian ewers of that type were inlaid with silver and copper, and attest to the new artistic trends of that time (*Survey*, Pl. 1309A). After about the first half of the 7th/13th century, more emphasis was put on decoration, while shapes became more standardised. The Mesopotamian standard type of ewer with a pear-shaped body, a low, splayed foot and a straight, tubular spout was retained as a model for Iranian and Mamlūk ewers, which in Egypt and Syria developed more strongly swelling bodies, high splayed feet and top-heavy necks (for an ewer of Ḳāʾit Bāy, see Rice, *SIMW. IV*, Pl. VI). The development of Ṣafawid and Ottoman ewers is known from a small number of examples only. Among their typical elements one can tentatively single out curving spouts and handles, waisted necks with a bulging ring and boat-shaped openings, which presumably stem from the lamp-shaped openings of the earlier mediaeval tradition.

Jugs and pitchers (*kūz*, pl. *akwāz*), on the other hand, were fashioned in simple conventional shapes —a squat globular body and low foot, a short neck and a curved handle. The earliest extant models of gold and gilt silver date from the second half of the 4th/10th to the 6th/12th centuries (*Survey*, Pl. 1345; 1349, now in Jerusalem, L. A. Mayer Memorial Museum. For a jug made for Ṣamṣām al-Dawla, now in the Cleveland Museum of Art, see Kühnel, *Die Kunst Persiens unter den Buyiden*, in *ZDMG*, cvi [1956], fig. 6). Ṣafawid and Ottoman specimens basically conform to the Būyid prototypes. In addition to the conventional type of jug, there occur zoomophic hollow-cast vessels which resemble the European aquamanile. The purpose of these objects is often ambiguous. Some may have served for pouring water (bird in the Hermitage by Sulaymān, dated 180/796; bird in Berlin, *Cat.* 1971, fig. 37; bird in the Monastery on Mount Sinai). Others were presumably fountain heads. Several specimens of the last category, such as "hares", "lions" or "horses" were either of Fāṭimid or Spanish origin.

(7) Bowls, cups and goblets. Mediaeval Islamic cups and bowls reflect a particularly long-lasting affinity to Iranian and Soghdian gold and silver models. Of particular interest in this respect is the continuity of hemispherical, either plain or fluted bowls, like the early 7th/13th century "Vaso Vescovali" (Rice, *Wade Cup*, Pl. 16), the "Wade Cup" (*ibid.*, Pl. 2) or a parcel gilt silver bowl in the Keir Collection (Fehérvári, Pl. G). In a more restricted sense this also applies to the continued use of ring handles with projecting thumb knobs. Although ultimately such handles appear to derive from Roman drinking cups, they too were introduced into Islamic civilisation via Soghdian silver vessels and persisted in metal cups until at least the early 5th/11th century (Melikian Chirvani, *White bronze* fig. 15), while with ceramic cups this feature lasted even much longer. By the later 7th/13th century, bowls with strongly-projecting walls, similar in profile to contemporary ewers, as well as new types of cups, bowls and goblets, began to appear simultaneously in Syria, Egypt and Western Iran. Among the new shapes were cups with a strongly contracted base and a high, funnel-shaped foot turned upside down (Barrett, Pl. 34); footless bowls with walls that project strongly up to about one-third to one-half of their height, and bowls that have a nearly angular profile (Rice, *Two unusual Mamluk metal works*, Pl. I; VII; Barrett, Pl. 36 for a late 8th/14th century Iranian example). Bowls with strongly curving-out profiles continued to be made in Ṣafawid Iran. However, many of the 10th/16th to 11th/17th century bowls hark back to the more gently-rounded 7th/13th century models, which seem to have more agreed with the taste of the time.

Doors and windows and their accessories.

(1) Doors. Although plating of doors was practiced since early times (Nāṣir-i K̲h̲usraw, *Safar-nāma*, ed. and tr. Ch. Schefer, Paris 1881, 81, for door bearing the name of the ʿAbbasid caliph al-Maʾmūn at the Aḳṣā Mosque, and p. 28 for iron-plated door in Diyārbakr; D̲j̲azarī-Hill, 191-5, 267-8 for description of later 6th/12th century door), no specimen made before the beginning of the 7th/13th century is as yet known. The earliest preserved door at the mosque of Cizre or D̲j̲azīrat ibn ʿUmar (C. Preusser,

Nordmesopotamische Baudenkmäler, Leipzig 1911, Pl. 36 and p. 25) is inscribed with the name of Abu 'l-Ḳāsim Maḥmūd b. Sandjar Shāh (605/1208?). Nearly contemporary are three iron-plated doors from the constructions of the Ayyūbid al-Ẓāhir Ghāzī (606-7/1209-10) at the citadel gates of Aleppo. Bronze or iron-faced wooden doors were particularly widespread in Mamlūk Egypt (for elements from door platings of Baybars, now in the Victoria and Albert Museum, see M. S. Briggs, *Muhammadan architecture*, Oxford 1924, fig. 232). Plaques from Mamlūk doors as well as complete door wings are preserved in the Islamic Museum in Cairo). The 8th/14th century doors of the Mosque of Sulṭān Hasan, re-employed at the Mosque of al-Muʾayyad in Cairo, are a very good example of its kind (Migeon, *Manuel*, ii, 82-4, fig. 259). While the majority of extant doors were plated with iron or alloys of bronze, some 10th/16th to 12th/18th century silver, or silver-plated, doors have also remained (Mayer, *Metalworkers*, "Ilyās"; "Yahūda"). It may be safely assumed that earlier silver doors have been melted down and that their material has been re-used for other purposes.

(2) Doorknockers. In contrast to the plating, which was generally made up of flat bronze straps and polygonal lattice work panels, doorknockers were cast in heavy bronze. Aside from polylobed rings which were filled with arabesques in openwork (Sevilla, Puerta de Pardón; Cairo, Sulṭān Ḥasan *madrasa*), numerous zoomorphic doorknockers are known. Earlier specimen, like the doorknockers of the Ulu Cami in Cizre (Djazīrat ibn ʿUmar) are formed by a pair of confronted dragons which are suspended from hinges attached to a lion mask (Ülker Erginsoy, in Gönül Öney, *Anadolu Selçuklu mimarisinde süsleme ve el sanatları*, Ankara 1978, 168, fig. 141; The David Collection, *Islamic art*, Cat. Copenhagen 1975, 69. An identical knocker of unknown provenance is in the Berlin Museum). In later renderings, as for instance in a Mamlūk example with the name of Muḥammad b. Ḳalāwūn in Hebron, the ring is formed by a pair of facing dragon heads (a similar example is in the Louvre. See also knocker on door of the Mosque of Ḳadjmās al-Iṣḥāḳī in Cairo, 885-6/1480-1).

(3) Window grills. Aside from a few silver and gold inlaid brass balls from monumental window gratings, no window accessories have been preserved. (The number of wooden accessories preserved *in situ* and in museum collections is however considerable.) Three of these balls bear the name of the Īlkhānid Sulṭān Muḥammad Öldjeytü Khudābanda Shāh (703-16/1304-16). The rest cannot be precisely dated, although their resemblance to the inscribed specimen places them in the same category.

(4) Locks and keys. On the whole, little attention has been devoted by art historians to locks and keys. They are poorly represented in museum and other collections, are seldom signed or dated, and once removed from the area in which they were made are difficult to identify. For stylistic and other reasons, most of the preserved pieces are said to be Iranian, though for lack of information this cannot be verified. Most of these locks are padlocks and were intended for chests, boxes, trunks or similar containers. They are generally very small—the average proportions are 5 cm width and 3.5 cm height—and fashioned in a variety of shapes. Yet a typical Iranian preference for animal shapes, inherited from ancient times, has been retained until today. Judging from the recently- catalogued locks in the P. Tanavoli Collection (Parviz Tanavoli and John T. Wertime, *Locks from Iran*, the Smithsonian Institution and P. Tanavoli, 1976), certain animal forms were in vogue at particular times only, while others were favoured throughout the centuries. A special category of padlocks was used as amulets and bear inscriptions of protective character.

Keys of the Kaʿba form a class by itself (J. Sourdel-Thomine, *Clefs et serrures de la Kaʿba*, Paris 1971). Many carry names and titles of the sultan for whom they were made and are therefore dated or datable. On the whole, they are historical documents rather than works of art.

The decoration.

Although Islamic decoration follows some general, ubiquitous principles by which designs were interchangeable between various media, one can nearly always detect certain strains which characterise any specific form of art. This applies also to metalwork, which seems to have developed certain preferences with regard to ornaments or decorative schemes as well as to iconographic themes.

(1) Geometric patterns. In addition to primary geometric grids by which the surface of every object was subdivided and its decorative elements organised, metal workers employed all the geometric forms used by artisans working in other media. Designs obtained by means of intersecting parallel bands to form an overall surface pattern of squares or lozenges, which could also easily be perforated, were often adopted for incense burners or mosque lamps (Rice, *SIMW. V*). To avoid the monotony of these patterns, artisans used to fill the empty spaces by adding a punching mark or circular cavity at the points of intersection, matting the interior of the lozenges or filling them with a floral design. Small circles were employed also to create continuous lines and geometric patterns. Particularly on early metal objects, artisans succeeded in producing a variety of patterns of tangent or overlapping circles and ring-matted geometric forms set into the interspaces (see for instance, Melikian-Chirvani, *The white bronzes*, 136 ff.). As a rule, the artists omitted certain portions of the circles in order to create new variants of interlacings. Patterns of this kind, which were often imbued with a remarkable inner tension (Barrett, Pl. 2a), were employed up to at least the 8th/14th century for single and repeat patterns alike. Between the second half of the 7th/13th to about the middle of the 8th/14th century, circles inscribing six or eight interlaced roundels became a favourite design of Syrian, Egyptian and Persian metal workers. In these later examples, many of these patterns have lost their former inner tension (Baer, *Nisan tası*; cf. 8th/14th century Persian penbox, *Hayward cat.*, no. 206).

As in architectural decoration, hexagons formed also the base for surface and star patterns. Six-armed clockwise or anti-clockwise wheel patterns (erroneously called swastika), which were common in brick architecture as early as the 5th/11th century, were not employed in metalwork before the first third of the 7th/13th century, and until the second half of the 8th/14th century they remained a favoured design for filling petals or circles. Hexagonal star patterns were particularly popular in East Iranian and Afghanistan workshops, which in the 6th/12th and 7th/13th centuries developed them into intricate designs or into notched or looped motifs interwoven with a variety of geometric forms. By the second half of the 7th/13th century, this type of pattern disappeared from the répertoire of Persian and Meso-

potamian metalworkers, and its place was taken by medallions formed by overlapping circles.

In spite of the common geometric language which metal objects share with other fields of Islamic art, there is a clearly noticeable difference in emphasis. In contrast to architectural ornament, in metal the geometric patterns are confined to close borders; they are generally combined with other designs, and only rarely form the main decorative feature. They either form a grid or a network into which other motifs are set, or function—like "swastika" or basket-weaving—as background pattern. In Ṣafawid and Ottoman metalwork, certain geometric interlacings continue to fill medallions or other inscribed spaces (*Survey*, Pl. 1385). On the whole, these objects bear however floral and epigraphic decorations.

(2) The floral répertoire. As in other artistic media, vegetal ornaments on metalware fall into three main types: motifs derived from Hellenistic Mediterranean and non-Hellenistic Iranian models; infinitely curling scrolls and arabesques; and blossoms and foliations that stem from Far-Eastern prototypes. Motifs of the first type—acanthus leaves, palmettes, vine scrolls or stalks bearing grapes or pomegranates—continue to figure in traditional and new compositions. One some early bronze and silver objects these motifs appear in sophisticated combinations (Dimand, *Some early Islamic bronzes from Iran in American collections*, in *Akten 24. Intern. Orientalisten Kongress*, 1957, Munich 1959, 347-9). On less ambitious objects, undulating stalks and branching-off shoots carrying vine and palmette leaves constitute the only decoration.

Fully-developed arabesques do not appear before the 4th/10th century. From this time onwards, two types of arabesques—a flowing, constantly changing design, and an arabesque based on axial symmetry—recur on metalwork of all periods. Another form of arabesque which gained much popularity on metalwork consists of pairs of knotted, bifurcated palmettes which blossom out from a crescent-shaped loop (Rice, *The brasses of Badr al-Din Luʾluʾ*, fig. 8). Modifications of such floral interlacings, in which a crescent-shaped loop is either substituted by a bar, or transformed into lotus blossoms, or even completely omitted, remain a favourite motif in 7th/13th and 8th/14th century brasses in the east and west alike.

Winding, often hooked stalks, whose foliage is reduced to small buds and split palmettes, serve as background pattern and filling device alike. On Iranian, 7th/13th to 8th/14th century metal objects the background scrolls tend to be light and airy and wind regularly, while the Syrian types are heavily loaded with buds. On early Mamlūk brasses, the heraldically-composed arabesque never reached the popularity it had gained in Iran. Background patterns on Egyptian metalwork of the first half of the 8th/14th century are formed by continuously winding and freely intersecting scrolls. Most delicately drawn arabesques, carrying tiny buds and flowers occur on 10th/16th to 11th/17th century steel helmets, daggers, steel or iron belts, pierced plaques and surgical instruments.

As in other artistic media, varieties of lotus blossoms, peonies and morning glories are encountered on both Mamlūk and Persian metal objects. Persian artists made, however, a somewhat wider use of these motifs than their Mamlūk contemporaries. On later 7th/13th to early 8th/14th century West Iranian metalware, the flowers grow "naturally" from the ground. Sprouting between and behind the figures, they form the background for figurative motifs or cover the entire surface of an object. A tendency towards more symmetric composition can be detected on Mamlūk metal objects (Rice, *Two unusual Mamluk metal works*, Pl. V), while the individual, carefully engraved petals have generally retained a naturalistic flavour.

(3) Animals and imaginary creatures. On mediaeval metalwork, animals and imaginary creatures were one of the most conspicuous themes. The frequency in which these motifs were employed, as well as the species depicted, were determined by different factors. Yet even at times when animal decorations did not constitute a major theme, they did not disappear from the répertoire. Because of their abundance, and often intricate iconographic implications, the present survey includes only the most current animal motifs and compositions.

Many of the animal motifs were carried on in Islamic metalware from Sāsānid and Soghdian silver (Barrett, Pls. 1, 4b). The same is true for compositions, such as a single bird or quadruped inscribed within a round or polylobed medallion. The preference for heraldic compositions, inherent in Near Eastern and Iranian art, applies also to animal designs, even if the prominence given to these compositions varied. Broadly speaking, in earlier metalwork they are more monumental in size and style, while on later objects they are integrated in a larger decorative scheme. In many of these heraldic compositions the central axis is taken by a plant design or a curtailed "tree of life", a knotted motif or other derivative of the "tree of life". Pairs of ducks flanking a crescent-shaped motif are characteristic for North Mesopotamian, Mamlūk and Persian metalware from the mid-7th/13th to the second half of the 8th/14th century. Physically-linked pairs of animals or imaginary creatures do not occur on metalware after the early 8th/14th century, while the motif of heraldic birds or quadrupeds, set into cartouches or pendants, was carried on in Ṣafawid and later metalwork. Other ancient Near Eastern animal motifs employed in metalwork are animal friezes, animals in combat (Baer, *Inkwell*, particularly 206-8), and real and imaginary creatures revolving around a central axis. In 6th/12th and early 7th/13th century examples from Eastern Iran, Afghanistan and Northern Mesopotamia, the ears, wings or necks of the centrifugally-rotating creatures meet—or intersect—in the centre (Rice, *The brasses of Badr al-Dīn Luʾluʾ*, figs. 1-3; Ettinghausen, *Wade Cup*, figs. L, P, 21, 34). In later 7th/13th to 8th/14th century examples, the rotating creatures are no longer physically linked. In the last phase in the development of this pattern, the real or imaginary creatures are substituted by flying birds, and the rotating movement is no longer consistently adhered to (for a typical Mamlūk example, see *Cairo cat.* 1969, no. 58, Pl. 8).

Another motif is that of animal (or *wāḳ-wāḳ*) scrolls, in which animal bodies or busts are attached to, or amalgamated with a vegetal design. Spreading from Syro-Mesopotamian and Persian to Egyptian metalware, it appeared in the first half of the 7th/13th century (*Hayward cat.*, no. 200) as abruptly as it disappeared in the last quarter of the 8th/14th century (for a late example, see E. Combe, *Cinq cuivres musulmans datés des XIII, XIV et XV siècles de la Collection Benaki*, in *BIFAO*, xxx [1931], 56-7. On textiles and carpets, the motif survived, however,

in various related forms. See for instance, *Survey*, Pls. 1172, 1212B).

The animal decoration in later metalwork closely follows the mediaeval répertoire. Conventional themes, such as combatant or chasing animals, friezes, flying birds, peacocks or animals of prey were carried on, and are re-employed in modern metalwork (*Survey*, Pls. 1380, 1383, 1386B. For armoury see also Pls. 1408 D, E, 1418, 1430-31 D).

(4) Epigraphy. Stylistic peculiarities. In metalware, the first epigraphic bands which carry not only a message but have a clear decorative function occur on 3rd/9th to 4th/10th century mosque lamps (Rice, *SIMW*. *V*; for earlier inscriptions, cf. a 2nd/8th century bronze ewer in the Tbilisi Museum, or bird-shaped vessel in the Hermitage, dated 180/796-7, and on 4th/10th to 5th/11th century bronze and silver objects (*Survey*, Pls. 1343, 1345-6). From this time onwards, particularly since the mid-6th/12th century, epigraphy remained a constant factor in the decoration of metalware. The formal integration of the script, being set into continuous or compartmentalised bands, cartouches or medallions, complies with the general stylistic tendencies of the time. On Mamlûk metalware, inscriptions appear not only in continuous and intersecting bands which may occupy a considerable part of an object, but also in a circular arrangement in which the hastae of the letters point towards the centre. Starting from the mid-8th/14th century, such radiant inscriptions are most prominent.

The stylistic development of script on metalware, and the possible divergencies from other artistic media, still remain to be studied. In the present state of our knowledge, there appears to be only one type of script which at least in its later stages of development is unique to metalware. This is a script in which either the whole letter or part of it are made to assume human or animal forms. According to the figural features which dominate in each of its variations, it falls into four types: ornithomorphic, human-headed, zoomorphic and anthropomorphic (Rice, *Wade Cup*; Baer, *Metalwork*). Out of these, only the first is known from objects other than metalware, occurring on Sāmānid ceramics about 150 years prior to the first dated evidence of figural script on metal, the "Bobrinski Bucket", which was made in Harāt in 550/1163 (Ettinghausen, *Wade Cup*). The figural script had disappeared almost completely by the end of the 7th/13th century.

The integration of the script into the overall composition of a decoration, like its artistic development, is however only one aspect of these inscriptions. Aside from their artistic value, these examples are texts which, if properly read and interpreted, may provide valuable information which is not available from other sources. Although the general categories —eulogies, and dedications, religious inscriptions, moral dicta, inscriptions connected with the usage or quality of the object and verses from Persian literature—are known, only a very limited number of inscriptions have actually been read. A proper investigation and evaluation of each of these categories has therefore been postponed until we possess a comprehensive corpus of inscriptions on metalwork (for some ideas, see Baer, *Metalwork*).

(5) The thematic répertoire. The thematic répertoire of mediaeval Islamic metalwork falls into three main groups. The first and by far the largest are representations of pleasure and pastime. They include, aside from banqueting scenes, dancers and musicians, a rich selection of hunting methods, falconry, hunting with the cheetah and phases of the animal's training and fowling. Visual renderings of this last game are rare in other artistic media. Other pastimes, like polo games and travelling in a howdah on camel-back, have parallels in ceramics or miniature paintings. Sailing in a pleasure boat, a princely pastime which could be practiced only in Mesopotamia and Egypt, seems to have no analogues in ceramics, textiles and the like (Baer, *A brass vessel*, 299-325). Representations of outdoor activities in a rural environment appear to be characteristic of a small group of early 7th/13th century Mesopotamian-style metal objects, while tournaments or battle scenes seem to have been a favoured theme in the later 7th/13th to 8th/14th century in Syrian, Egyptian and West Iranian metalwork alike. On the whole, these scenes were less popular on Iranian brasses than on contemporary Mamlûk objects (Rice, *Baptistère*), The second category are cosmic and terrestrial cycles. It comprises representations of the Labours of the Months, the planets and the zodiac, and scenes in which a princely image is shown in a cosmic setting. The first and the third theme are as yet known from metal objects only (for Labours of the Months, see Rice, *The seasons and labors*, 1-40; E. Atil, *Two Il-khanid candlesticks*, 1-33). Astrological signs, on the other hand, are not limited to metalwork. It would seem, however, that on metalwork the iconographic programme of this theme is particularly rich and has no known analogues in other artistic media (Hartner, *The Vaso Vescovali*; Baer, *An Islamic inkwell*. For the princely image in cosmic setting, see Baer, *Metalwork*).

Epics, legends and religious themes serve as an inspiration for the third group. It comprises illustrations of certain episodes of the *Shāh-nāma*, and ornamental designs based upon popular belief and folklore. Both relate to pottery and the art of the book. Their iconographic meaning is allusive (Baer, *Fishpond ornaments*).

In a group of mid-7th/13th century North Syrian and North Mesopotamian metalware, Christian religious themes are combined with traditional Islamic decorations. In addition to saints or high church officials, they depict cycles of the life of Christ. Themes so far identified are "The Entry into Jerusalem", "The Nativity", "Baptism", "The Presentation in the Temple" and "The Virgin and the Child enthroned". However, the problem of Christian subjects on Islamic metalwork needs further research.

Workshop centres.

Our information on centres of manufacture of metalwork stems from two main sources. One is written evidence provided by mediaeval geographers and historians. It is generally reliable, but often exceedingly brief, and even when the author reports on his native town (cf. Ibn al-Faḳīh, *K. al-Buldān*, 253, ll. 19-20, for Hamadān), the products are often only listed but not described (for an exception see al-Maḳrīzī, below). The second source of information is inscriptions which figure on the objects themselves. Two types are particularly suggestive. One are inscriptions referring to the place of manufacture. So far only a relatively small number of places have been deciphered. Future systematic collection of these inscriptions may provide new evidence (the following place names appear so far on one object only: Baṣra, ewer by Ibn Yazīd, dated 67 or 69/688-7 or 688-9, Mayer, *Metalworkers*, 48; Ḳashan or Ḳasan

(?), bird-shaped vessel by Sulaymān, dated 180/796-7, Melikian-Chirvani, in *Propyläen Kunstgeschichte. Islam*, ed. J. Sourdel-Thomine and B. Spuler, 1973, no. XVI; Mosul, "Blacas Ewer", decorated by Shudjāʿ b. Manʿa in 629/1232, *Hayward cat.*, no. 196; Miṣr, candlestick by Muḥammad b. Ḥasan, dated 668/1270, Wiet, *Objets en cuivre*, Pl. 27).

The other type of inscription on metalware is that of signatures giving not only the name of the artist but also his *nisba*. An often-made assumption that intrinsically the *nisba* means that the artisan was active in this centre has to be discarded. It may have been carried by an artist who had left his native town many years ago and was working hundred of miles away. It can therefore be considered significant only if taken in conjunction with other elements. One of the most striking examples for the continuous use of a *nisba* by artists who were active in another centre is the *nisba* al-Mawṣilī, found on at least 30 objects made throughout the 7th/13th and the first quarter of the 8th/14th century, out of which only one single specimen stems unequivocally from Mosul (Rice, *Inlaid brasses*. To Rice's list add a candlestick by ʿAlī b. Kusayrāt, working in Damascus, and a Ḳurʾān box by Aḥmad b. Bāra, *Cairo cat.* 1969, nos. 56, 60).

On the basis of the above mentioned criteria, only three larger centres can so far be singled out. One is Damascus, which at least since the 4th/10th century and throughout Mamlūk times exported metalware to all parts of the Islamic world, including Cairo (al-Muḳaddasī, 181, l. 1; Nāṣir-i Khusraw, *Safar-nāma*, ed. Schefer, 52, l. 13; al-Maḳrīzī, *Khiṭaṭ*, ii, 112. For metal objects inscribed with this provenance, see Rice, *Inlaid brasses*, 326, no. 16; *Cairo cat.* 1969, no. 56).

The second centre which, like Damascus, had flourishing workshops during the Mamlūk period is Cairo (for a detailed description of the Market of metal Inlayers—*sūḳ al-kuftiyyīn*— in which bronze vessels were inlaid with gold and silver, see al-Maḳrīzī, *Khiṭaṭ*, ii, 105. For metal objects inscribed with this provenance, see Rice, *Inlaid brasses*, nos. 23, 24, 26). At the time of al-Maḳrīzī's account, i.e. after 820/1417, this industry had already declined.

The third reasonably-documented centre, famous for its richly-inlaid bronze objects, is Harāt (Ḳazwīnī, *Athār al-bilād*, ed. Wüstenfeld, 322, l. 30-323, l. 1). Two objects, the "Bobrinski Bucket" dated 559/1163, and an ewer in the State Museum of Georgia in Tbilisi, dated 557/1181, carry an inscription stating that they were made in Harāt (the exact text of the Tiflis ewer has, however, never been published. See Mayer, *Metalworkers*, 59, Maḥmūd b. Muḥammad; Ettinghausen, *Bobrinski "Kettle"*, in *Gazette des Beaux Arts*, 1943, 196). Four other 6th/12th century inlaid pieces of metalworks, worked in similar style and technique, and signed by artists using the *nisba* al-Harawī, suggest that these artists had already left Harāt and were active in another centre. Information on other centres of manufacture is even more scanty. Places put forward by art historians should therefore be used with caution.

Arabia and other parts of the Orient (see Yāḳūt, s.v.), and is also found in the toponomy of the Iberian peninsula. Under the form Almaden, this term refers to the locality in the province of Ciudad Real, 125 km. to the north of Cordova, in the Sierra de Almadén (A. Djibāl al-Maʿdin), which has one of the richest deposits in the world of mercury (A. *ziʾbaḳ* and variants, whence Spanish *azogue* and the fullest form of the place name Almadén de Azogue). According to Garciá Bellido (*España y los españoles hace dos mil años segun la Geografia de Strabón*, Madrid 1945, 79-81), these deposits were already being exploited in the 4th century B.C., since the Greek philosopher Theophrastes (*ca.* 372-287) mentions the cinnabar of Iberia. At the present time, they still produce each year about 1,800 tonnes of mercury.

The Portuguese town of Almada, situated opposite to Lisbon on the southern bank of the Tagus, owes its name (A. Ḥiṣn al-Maʿdin) to the grains of gold dust thrown up by the sea on to this bank (al-Idrīsī, *Description de l'Afrique et de l'Espagne*, text 184, tr. 223 = *Opus geographicum*, Naples-Rome 1975, v, 547).

MADĪNA, urbanism. [See Supplement].

AL-MADĪNA (usually Medina in English, Médine in French), residence of the Prophet Muḥammad after the *hidjra* and one of the sacred cities of Islam.

Medina is situated in the Ḥidjāz province of Saʿūdī Arabia in latitude 24° 28′ N, longitude 39° 36′ E, about 160 km. from the Red Sea and about 350 km. north of Mecca. It has developed from an oasis on relatively level ground between the hill of Uḥud on the north and that of ʿAyr on the south. East and west are lava flows (in Arabic *ḥarra* [*q.v.*] or *lāba*). There are several *wādī*s or watercourses which cross the oasis from south to north. Though these normally contain water only after rain, they maintain a fairly high water table, so that there are many wells and springs. After heavy rains the central area of al-Munākha used to form a lake, and a number of serious floods are recorded which threatened the stability of some of the buildings. On one occasion the caliph ʿUthmān erected a dam as a protection against flood-waters (al-Balādhurī, *Futūḥ*, 11). Serious floods are also recorded in 660/40, 734/116 and 772/156. The water is in places salt and unpalatable, and in the past various governors of the town built aqueducts to bring good water from wells further south. The soil consists of salty sand, lime and loamy clay, and is everywhere very fertile, especially in the more southerly part. Date-palms were numerous before the time of Muḥammad, and cereals were also grown. At a later date oranges, lemons, pomegranates, bananas, peaches, apricots, figs and grapes were introduced. The winters are cool with a slight rainfall, and the summers hot but rarely sultry. In former times, the air was reckoned pleasant but conducive to fevers (al-Balādhurī, 11 f.; Wensinck, *Mohammed en de Joden*, 31; Goldziher, *Muh. Stud.*, ii, 243). The Umayyads called the town *al-khabitha*, "the dirty", in contrast to the honorific name of *Ṭayba*, "the sweet-smelling", given to it by Muḥammad (Goldziher, *op. cit.*, ii, 37; al-Balādhurī, 11).

(i) History to 1926

1. *The pre-Islamic settlements*

In pre-Islamic times the common name was Yathrib, though this is said to have been applied originally to only part of the oasis (al-Samhūdī, i, 8-10). This name occurs once in the Ḳurʾān (XXXIII, 13). Iathrippa is found in Ptolemy and Stephanus Byzantinus, and Ythrb in Minaean inscriptions. *Al-Madīna* is properly "the town" or "the place of jurisdiction", corresponding to Aramaic *medīnta*. The word *madīna* as a common noun occurs ten times in the Ḳurʾān and the plural *madāʾin* three times, all in stories of former prophets. In four relatively late verses (IX, 101/2, 120/1; XXXIII, 60; LXIII, 8) *al-madīna* appears, referring to the oasis now inhabited mainly by Muslims, but it is possible that it has not yet become a proper name. The same holds of its occurrence in the last clause of the Constitution of Medina (Ibn Hishām, ed. Wüstenfeld, 341-4), since in the preamble and other two clauses of this document the name Yathrib appears by itself. It is often suggested that the name is a shortened form of *madīnat al-nabī*, "the city of the Prophet", but this is unlikely in view of its use in the Ḳurʾān, especially in LXIII, 8, where it is spoken by Hypocrites. Of the poets of the oasis, the pre-Islamic Ḳays b. al-Khaṭīm [*q.v.*] speaks only of Yathrib, whereas Muḥammad's contemporaries Ḥassān b. Thābit and Kaʿb b. Mālik [*q.vv.*] use both names.

Medina was at first not a compact town, but a collection of scattered settlements, surrounded by groves of date-palms and cultivated fields. For defence, therefore, a large number of forts or strongholds (*āṭām*, sing. *uṭum*; also *ādjām*, sing. *udjum*) had been constructed, perhaps about 200 in all. In these the local inhabitants took refuge in times of danger. The idea of the *uṭum* probably came from the Yemen (cf. H. Lammens, *Ṭāʾif*, 72 = *MFOB*, viii [1922], 184).

The later Muslim historians (cf. al-Samhūdī, i, 156-65; *bāb* 3, *faṣl* 1) had no reliable information about the earliest history of Medina, and the views expressed appear to be conjectural; e.g. that the first cultivators were ʿAmālīḳ [*q.v.*]. It seems probable that before the arrival of any Jews there were some Arabs at Medina, doubtless the ancestors of those found subordinate to the Jews at the time of the settlement of al-Aws and al-Khazradj. It was probable because of this close relation to the Jews that certain small Arab clans (Khaṭma, Wāʾil, Wāḳif, Umayya b. Zayd, sections of ʿAmr b. ʿAwf) did not at first accept Muḥammad as prophet.

There is also obscurity about the earlier history of the Jews of Medina. It seems probable that some were refugees from Palestine, perhaps men who left after the defeat of Bar Kokhba; but others may have been Arabs who had adopted Judaism as a religion. Certainly, the Jews of Medina intermarried with Arabs and had many customs similar to those of their Arab neighbours. It is clear from the Ḳurʾān, however (e.g. II, 47/4 ff.), that they claimed to be of Hebrew descent, despite the fact that the names of the clans and most of the names of individuals are Arabic. Early Arabic poems ascribed to Jews are indistinguishable in literary form and in content from those of desert Arabs (Th. Nöldeke, *Beiträge zur Kenntnis der Poesie der alten Araber*, 52 ff.). While there may have been some simple agriculture before the coming of the Jews, they almost certainly developed the cultivation of dates and cereals here as in other oases such as Khaybar (cf. W. Caskel in G. E. von Grunebaum, ed., *Studies in Islamic cultural history*, Menasha 1954, 43; = *American Anthropologist*, lxvi/2, Memoir no. 76).

There were three main Jewish groups in Medina at the Hidjra, the clans or tribes of Ḳurayẓa, al-

Naḍīr and Ḳaynuḳāʿ. Of these, the first two had some of the most fertile land in the oasis, while the third had no land but were armourers and goldsmiths, besides conducting a market. In addition, al-Samhūdī lists about a dozen other purely Jewish groups, of whom the most important was the Banū Hadl, which was closely associated with Ḳurayẓa. He further mentions among the Jewish groups a few which are sometimes given Arab genealogies, such as Unayf and Mart͟had (parts of Balī), Muʿāwiya b. al-Ḥārit͟h (of Sulaym), and D͟jad͟hmāʾ and Nāg͟hiṣa (of al-Yaman).

The Jewish domination of Medina came to an end some time after the settlement of two large Arab groups, al-Aws and al-K͟hazrad͟j [*q.vv.*], sometimes called together the Banū Ḳayla, but mostly referred to as the Anṣār or "helpers" of Muḥammad. They are among the Arabs said to have left South Arabia after the breaking of the dam of Maʾrib [*q.v.*]. At first these Arabs were under the protection of some Jewish tribes, and a sign of their inferiority was that Fiṭyawn, the leader of the Jewish-Arab group of T͟haʿlaba, exercised a *ius primae noctis* over their women. This was resented by Mālik b. al-ʿAd͟jlān (of the clan of ʿAwf of al-K͟hazrad͟j), and he revolted successfully and became independent. Subsequently, with help from either a G͟hassānid or a South Arabian ruler (according to somewhat legendary accounts), he enabled the other clans of al-Aws and al-K͟hazrad͟j to become independent of the Jews. It is sometimes said that the Jews now became subject to these Arabs. This is not borne out, however, by the historical accounts of the period up to 5/627. The main Jewish groups, though doubtless now weaker than the Arabs, retained a measure of independence and continued to occupy some of the best lands. They were not politically united by their religion, but different groups were in alliance (*ḥilf*) with different Arab clans, and were sometimes involved on opposite sides in the fighting between Arab clans. Some of the groups of judaised Arabs seem to have gradually become merged with Arab clans (as the Banū Zaʿūrāʾ with ʿAbd al-As͟hhal).

The historical accounts make it clear that the effective political units in the pre-Islamic period were not the tribes of al-Aws and al-K͟hazrad͟j, but smaller units, which may be called clans. Those mentioned in the Constitution of Medina (see below) were al-Nabīt, ʿAmr b. ʿAwf and Aws Manāt (later Aws Allāh) among al-Aws, and al-Nad͟jd͟jār, al-Ḥārit͟h, ʿAwf, Sāʿida and D͟jus͟ham among al-K͟hazrad͟j; but even smaller groupings were also important. From at least fifty years before the Hid͟jra there had been a series of blood-feuds between Arab groups, behind which, at least latterly, there may have been an economic factor, namely, desire for better lands. These feuds led to fighting described as "wars". The earliest recorded was between Mālik b. al-ʿAd͟jlān of ʿAmr b. ʿAwf and Uḥayḥa b. al-D͟julāḥ of Sālim (Ḳawāḳila). Four small "wars" occurred between this and the "war of Ḥāṭib", which was the bloodiest and culminated after several fights in the battle of Buʿāt͟h [*q.v.*] in about 617 A.D. Most of the clans of al-Aws took part under the leadership of Ḥuḍayr b. Simāk, and most of the clans of al-K͟hazrad͟j under ʿAmr b. al-Nuʿmān of Bayāḍa. The Jewish clans of Ḳurayẓa and al-Naḍīr on this occasion supported Ḥuḍayr because ʿAmr b. al-Nuʿmān had killed hostages they had given him. One or two Arab clans and some prominent leaders, notably ʿAbd Allāh b. Ubayy, did not take part in the battle. The fighting was severe and both leaders were killed, but neither side had a decisive advantage and no formal peace was made. This unresolved conflict was doubtless one factor leading the Arabs of Medina to invite Muḥammad to go there.

Al-Aws and al-K͟hazrad͟j were noted for their devotion to the deity Manāt, whose shrine was at al-Mus͟hallal between Medina and Mecca (Wellhausen, *Reste arabischen Heidentums*[2], 26; T. Fahd, *Panthéon*, 123). The Medinan poet Ḳays b. al-K͟haṭīm has references to *Allāh* (*Dīwān*, ed. Kowalski, Leipzig 1914, 5.6; 6.22; 11.8; 13.12), but these may reflect not so much Jewish or Christian influence as the widespread belief in a supreme god or "high god" often called Allāh (cf. J. Teixidor, *The pagan God*, Princeton 1977, 17, 162, etc.). There seems, however, to have been some movement towards monotheism before the contact with Muḥammad; e.g. Asʿad b. Zurāra and Abu 'l-Hayt͟ham (Ibn Saʿd, iii/2, 139, 22), and Abū Ḳays Ṣirma b. Abī Anas (Ibn His͟hām, 348). Another man, known as Abū ʿĀmir al-Rāhib, though a monotheist and ascetic previously, became an opponent of Muḥammad (Ibn His͟hām, 411 f., 561; etc.).

2. *From the Hid͟jra to the caliphate of ʿAlī*

There was probably some knowledge in Medina of Muḥammad's mission from an early date. Suwayd b. al-Ṣāmit, who died before the battle of Buʿāt͟h, is said to have accepted the Ḳurʾān (Ibn His͟hām, 283-5). The first definite converts were six men of al-K͟hazrad͟j who came to Muḥammad probably in 620. At the pilgrimage of 621 they brought a party of twelve men (including two from al-Aws), and the party formally accepted Islam and made certain promises. This was the Pledge of the Women, or first Pledge of al-ʿAḳaba. In 622 seventy-three men and two women from Medina, who had become Muslims, made the pilgrimage to Mecca, and promised to protect Muḥammad and his followers as they would their own nearest kinsmen. This was the second Pledge of al-ʿAḳaba or the Pledge of War (*bayʿat al-ḥarb*). On the basis of this agreement, some seventy of Muḥammad's Meccan followers with their dependants emigrated, or made the *hid͟jra*, to Medina in small groups. Muḥammad and Abū Bakr came last, and reached Ḳubāʾ in the south of the oasis on 12 Rabīʿ al-Awwal (= 24 September 622). The Emigrants (*muhād͟jirūn*) from Mecca were given hospitality by the Muslims of Medina. Muḥammad himself did not accept any of the many offers of hospitality, but ostensibly allowed his camel to make the choice for him. It halted on a piece of land belonging to two orphans, and Muḥammad bought the land and used it for his mosque and for his own house. It was probably because of the same desire not to have a special relationship with any of the rival clans in Medina that none of Muḥammad's marriages was with a woman of either al-Aws or al-K͟hazrad͟j.

At al-ʿAḳaba in 622 Muḥammad had asked for the appointment of twelve "representatives" (*nuḳabāʾ*). The number twelve was probably suggested by the tribes of Israel and the disciples of Jesus; but the fact that when the first representative of the clan of al-Nad͟jd͟jār died Muḥammad took his place (one of his great-grandmothers had been a woman of al-Nad͟jd͟jār) suggests that the *nuḳabāʾ* were part of a political structure for Medina which fell into disuse. The effective structure of the community is doubtless that indicated in the document often known as "the Constitution of Medina" (Ibn His͟hām, 341-4; discussed by Wellhausen, *Skizzen und Vorarbeiten*, iv, 65-83; Wensinck, *Mohammed en de Joden*, 74-81;

Caetani, *Annali*, i, 391-408; Watt, *Muhammad at Medina*, 221-8; R. B. Serjeant, *The "Constitution of Medina"*, in *IQ*, viii (1964), 3-16; idem, *The Sunnah Jāmiʿah, pacts with the Yat͟hrib Jews, and the taḥrīm of Yat͟hrib*, in *BSOAS*, xli [1978], 1-42). The document is composite, as is shown by repetitions. In its present form it would seem to belong to a date after the Ḳurayẓa affair in 5/627, but some of its articles may go back to the Pledge of War at al-ʿAḳaba. By this document all the people living in Medina are constituted a single *umma* or community in accordance with traditional Arab ideas of confederacy. There are nine primary members of the confederacy, eight local "clans" (three of al-Aws and five of al-K͟hazrad͟j) and the group of Emigrants from Mecca. Although the underlying political conceptions were pre-Islamic Arab, the confederacy was one of Muslims, since at least the leading men in each of the eight clans had accepted Muḥammad as prophet. Many of the articles speak of "the believers", and there are several references to God. About ten distinct groups of Jews are mentioned in separate articles, and are confirmed in the practice of their own religion, as well as having certain rights and obligations. Even unbelievers or idolaters in the Arab clans appear to have been accepted as members of the community, though with restricted rights. There are some two dozen general articles dealing with various matters conductive to the smooth running of the community. Muḥammad is given no special powers, but is recognised as prophet and is to have disputes referred to him. At least until 5/627 he could not issue commands but had to consult the clan leaders and get them to agree to what he proposed. After the conquest of Mecca in 8/630, however, his authority was unchallenged as a result of Muslim successes. When Arab tribes accepted Islam and became allies of Muḥammad they were presumably included in the confederacy, and the Muslim community ceased to consist solely of the inhabitants of Medina. Al-Aws and al-K͟hazrad͟j, as Muḥammad's earliest allies, were called the Anṣār or "helpers".

The period from the Hid͟jra to Muḥammad's death was characterised by a series of over 70 expeditions or razzias (*mag͟hāzī* [*q.v.*]), in which the number of participants varied from a handful to 30,000. In the first few small expeditions, only Emigrants from Mecca took part, but in the expedition of 2/624 which culminated in the battle of Badr the Muslims of Medina constituted about three-quarters of Muḥammad's force. After the victory at Badr most of the Muslims of Medina were committed to Muḥammad's general policies, though a few, the Hypocrites (*munāfiḳūn* [*q.v.*]), opposed them. This opposition within Medina was dangerous for Muḥammad when the Meccans invaded the oasis in 3/625 and the Muslims of Medina suffered many casualties, and again in 5/627 when the Meccans with many allies attempted to besiege Medina. There was also opposition from some of the Jews, and this led to the expulsion of the clans of Ḳaynuḳāʿ and al-Naḍīr (in 2/624 and 3/625) and the execution of the men of Ḳurayẓa and selling into slavery of its women and children (in 5/627). Jewish verbal criticisms of the Ḳurʾān had been felt to threaten the acceptance of Muḥammad as prophet, while Ḳurayẓa had apparently been intriguing with the Meccans during the siege. After 5/627 the remaining Jews of Medina gave no further trouble. In succeeding years, many Arab nomads on accepting Islam came to settle in Medina and were attached to the group of Emigrants; and this further strengthened Muḥammad against the Anṣār. On the whole, he managed to keep the peace between the rival groups in Medina, though at times he was able to use the hostility of al-Aws and al-K͟hazrad͟j to further his own ends. After the conquest of Mecca and the acceptance of Islam by many of the leading Meccans, both sections of the Anṣār felt threatened by these last (cf. Ibn His͟hām, 824, 855 f.), and this division in the Anṣār gradually ceased to be of political importance. The opposition to Muḥammad from ʿAbd Allāh b. Ubayy [*q.v.*] and his supporters, known as the *munāfiḳūn*, seems to have faded out at the time of the siege of Medina, for ʿAbd Allāh b. Ubayy participated in the expedition to al-Ḥudaybiya. About 9/630, however, another group of *munāfiḳūn* appeared. During the expedition to Tabūk an attempt on Muḥammad's life was planned, but was foiled. About the same time a mosque had been completed in the southern part of the oasis, the Masd͟jid al-Ḍirār or "Mosque of Dissension", but instead of honouring it by his presence Muḥammad sent men to demolish it, having realised that it was designed to be a focus of intrigue against himself. (For the details of all these events, see MUḤAMMAD.)

After the great expedition to Tabūk, Muḥammad did not leave Medina except to make the Pilgrimage of Farewell to Mecca in D͟hu 'l-Ḥid͟jd͟ja 10/March 632. About two months later he fell ill, and asked permission of his wives to remain in ʿĀʾis͟ha's apartment (instead of spending one night with each in turn). He died on 13 Rabīʿ I 11/8 June 632 and was buried in this apartment. He had made no arrangements for succession to his political authority, except that he had appointed Abū Bakr to lead the public prayers. The Anṣār met in the hall (*saḳīfa*) of the clan of Sāʿida and appointed the leading K͟hazrad͟jī, Saʿd b. ʿUbāda, as their ruler. ʿUmar and Abū Bakr, however, heard of what was happening, hurried to the hall, and persuaded the Anṣār that only a man of Ḳuray͟sh could be accepted by everyone as head of the community. They then appointed Abū Bakr who took the title of "caliph (*k͟halīfa*) of the Messenger of God".

Abū Bakr continued to reside in Medina and to follow a policy of expansion by sending expeditions northwards. Most of his brief reign (11-13/632-4), however, was occupied in subduing revolts among various Arab tribes (the wars of the Ridda). His successors ʿUmar (13-23/634-44) and ʿUt͟hmān (23-35/644-56) also resided in Medina, apart from brief visits to recently conquered provinces. Medina was thus briefly the capital of an empire, but had little of the dignity associated with such a role. The caliph lived in his private house, and had no guards. Thus when insurgents from the provinces attacked ʿUt͟hmān in his house, his only support was from the sons of some of the leading men of Medina who had been sent as a token force. When the insurgents attacked seriously, there was virtually no resistance and ʿUt͟hmān was killed. Upon this, the Muslims in Medina accepted ʿAlī as caliph, but they were now only a small proportion of the whole Muslim community, and their choice of caliph was not accepted in all the provinces. The Muslims of Syria favoured their governor Muʿāwiya, while Ṭalḥa and al-Zubayr opposed ʿAlī, first from Mecca and then from Baṣra. ʿAlī, feeling constrained to counter the moves of these two, left Medina for ʿIrāḳ in October 656 and never returned. In effect, Medina was replaced as capital by Kūfa, and, after the acknowledgement of Muʿāwiya as caliph in 661, by Damascus.

3. *From 661 to 1926*

After it ceased to be the centre of the caliphate, Medina became something of a backwater politically. For a brief moment in 63/683 it came into the historical limelight. Many of the leading men of Medina disliked Yazīd's succession to his father Muʿāwiya in 60/680. Some may have been moved by the hope of regaining for Medina some of its former influence. Others seem to have sympathised with ʿAbd Allāh b. al-Zubayr [*q.v.*] who was organising opposition to the Umayyads from Mecca. A large body of the Muslims of Medina, led by ʿAbd Allāh b. Ḥanẓala, formally renounced allegiance to Yazīd, and forced a thousand members of the Umayyad family and its supporters to take refuge in the quarter of Marwān b. al-Ḥakam [*q.v.*], the head of the family in Medina, though of a different branch from Muʿāwiya. Yazīd sent an army of from 4,000 to 12,000 Syrian troops under Muslim b. ʿUḳba, but before they arrived the rebels had allowed the Umayyad party to leave Medina for Syria. Muslim's army encamped on the Ḥarra to the north-east of Medina and invited the rebels to submit. Instead they marched against him and were severely defeated, and Medina is alleged to have been pillaged for three days by the Syrians. There seems to be some anti-Umayyad exaggeration in the accounts of this battle of the Ḥarra [*q.v.*] and its aftermath. These events did not greatly alter the position of Medina, except perhaps to reduce its political importance still further.

In 130/747 a group of Ibāḍiyya [*q.v.*] who had established themselves in the Yemen sent an army into the Ḥidjāz and, after defeating the governor of Medina and a locally raised force, occupied Medina for three months until defeated by an army from Syria (Wellhausen, *Die Oppositionsparteien*, ch. xii; Eng. tr. *The religio-political factions*). After the establishment of ʿAbbāsid rule, Medina was the centre of two short-lived and unsuccessful Ḥasanid revolts, that of Muḥammad b. ʿAbd Allāh, the "pure soul" (*al-nafs al-zakiyya* [*q.v.*]) in 145/762 and that of Ḥusayn b. ʿAlī, the *ṣāḥib Fakhkh* [*q.v.*], in 169/786. Another incident that has been recorded was the defeat in 230/845 by the Turkish general Bughā al-Kabīr of the nomadic tribes of Sulaym and Hilāl who had been making depredations in the region of Medina. About two years later they escaped from prison, but were put to death by the people of Medina (Ṭabarī, iii, 551 ff.; Ibn al-Athīr, *sub annis* 230, 232). For the first three centuries of Islam these are the main events involving Medina.

Even in the reign of Muʿāwiya, Medina was becoming remote from the caliph and his government, and was beginning to attract those who wanted to keep aloof from political turmoil and maintain an attitude of neutrality between the opposing groups. Prominent among the neutrals was ʿAbd Allāh b. ʿUmar b. al-Khaṭṭāb [*q.v.*]. To Medina also came al-Ḥasan b. ʿAlī [*q.v.*] after renouncing his claim to the caliphate in 41/661, and to Medina were brought al-Ḥusayn's wives and son after his death at Karbalāʾ. Another son of ʿAlī, Muḥammad b. al-Ḥanafiyya [*q.v.*], also lived quietly in Medina. As already noted, too, an important section of the Umayyad family, not closely involved in the government of Muʿāwiya and Yazīd, resided in Medina. Many others of the Ḳuraysh of Mecca also settled there. Such people were able to enjoy the wealth brought to them by the wars of conquests, and life in Medina became notorious for its luxury. The caliph Marwān II expressed surprised that one of the participants in the rising of 127/745 had not been held back by the wine and singing-girls of Medina (Ṭabarī, ii, 1910).

At the same time, however, Medina became an important centre of Islamic intellectual life. From the beginnings of Islam, it would seem, men had met in mosques to discuss matters of religious interest. In Medina in the Umayyad period such discussions led to criticisms of current legal and administrative practice on the ground that these were not in accordance with Islamic principles. As these discussions and criticisms became more systematic, Islamic jurisprudence began to take shape. The early school of Medina seems to have been important (though J. Schacht, *Origins of Muhammadan jurisprudence*, Oxford 1950, 223, etc., thinks it was subordinate to the ʿIrāḳī schools). There are many references to "the seven lawyers of Medina", a group of men who died a little before or shortly after 106/718; the lists of the seven vary somewhat [see FUḲAHĀʾ AL-MADĪNA AL-SABʿA in Suppl.]. One of the most prominent was ʿUrwa b. al-Zubayr [*q.v.*], who was also a collector of *ḥadīth* and of historical information about the life of the Prophet. Among his pupils were his son Hishām and (Muḥammad b. Shihāb) al-Zuhrī (d. 124/742 [*q.v.*]), one of the greatest scholars of the time in several fields. The real flowering of the legal school of Medina, however, came through the work of Mālik b. Anas (d. 179/795) [*q.v.*], who was the founder of one of the four Sunnī legal rites. The textual study of the Ḳurʾān was represented in Medina by Nāfiʿ al-Laythī (d. 169/785), the authority for one of the seven canonical sets of readings. Ibn al-Ḳaʿḳāʿ al-Makhzūmī (d. 130/747) from Medina was also highly thought of for his textual studies. In the exegesis of the Ḳurʾān an important place was held by ʿAbd al-Raḥmān b. Zayd b. Aslam (d. 182/798), whose father had been noted as a lawyer. A pupil of Mālik's, Ibn Zabāla, wrote one of the first histories of Medina (Sezgin, *GAS*, i, 343); it has not survived, but is occasionally quoted by al-Samhūdī.

No wall was built round Medina until it was felt to be threatened by the Fāṭimid conquest of Egypt. In 364/974 the Buwayhid ʿAḍud al-Dawla built a wall enclosing the central part of the town. This was restored in 540/1145 by a Zangid vizier, but a few years later in 557/1162 the Zangid Atābeg of Syria, Nūr al-Dīn Maḥmūd, built a second wall of greater extent with towers and gateways. After the Ottoman conquest, Sultan Sulaymān Ḳānūnī (1520-66) built walls about 12 m. high of basalt and granite, with a trench in front. He also built a covered aqueduct to bring water from the south. These walls were raised to 25 m. by Sultan ʿAbd al-ʿAzīz (1861-76).

In 601/1203 the people of Medina were involved in a quarrel between the governors of Mecca and Medina, but, though there was some fighting, an agreement was eventually reached. Half-a-century later, in 654/1256, Medina was threatened by a volcanic eruption. After a series of earthquakes, a stream of lava appeared, but fortunately flowed to the east of the town and then northwards. After this, little is recorded of Medina until the 19th century. In 1804 the Wahhābīs [*q.v.*] took the town, plundered the jewels, pearls and other treasures of the Prophet's Mosque and prevented pious "visits" to his tomb there. In 1813 it was recaptured for the Ottomans by Ṭūsūn, a son of Muḥammad ʿAlī of Egypt, and in 1815 the Wahhābī *amīr*, ʿAbd Allāh b. Suʿūd, recognised Ottoman sovereignty over the holy places in the Ḥidjāz, and there was no change in this respect until the First World War. Shortly before that, in

1908, the Ottoman government built the Ḥidjāz railway from Damascus to Medina. Though primarily intended for pilgrims, this had some military importance, and was the object of attacks after November 1916 when the Grand Sharīf of Mecca, Ḥusayn b. ʿAlī [*q.v.*], revolted against the Ottomans. A contingent of Ottoman troops, under Fakhrī Pasha, however, maintained themselves in Medina until after the peace in 1918, not surrendering until 10 January 1919 with his 9,800 men (see A. L. Tibawi, *The last knight of the last caliphs*, in *IQ*, xv [1971], 159-63). In 1924 after the abolition of the caliphate by the Turkish republic the Grand Sharīf (now King) Ḥusayn assumed the title of caliph, but met with much opposition from Arabs and other Muslims. In particular, Ibn Suʿūd invaded the Ḥidjāz in August 1924; Ḥusayn abdicated in favour of his son ʿAlī, but the latter too had to leave the Ḥidjāz, and in January 1926 Ibn Suʿūd became "King of the Ḥidjāz" as well as of Nadjd. Medina was thus incorporated into the Suʿūdī kingdom.

(ii) THE MODERN CITY

As early as 1923, growing hostility between the Hāshimite king, Ḥusayn b. ʿAlī, and the Suʿūdī sultan, ʿAbd al-ʿAzīz b. ʿAbd al-Raḥmān, led to fears that ʿAbd al-ʿAzīz's Ikhwān [*q.v.*] might capture al-Madīna. In fact, the redoubtable Fayṣal al-Dawīsh, Ikhwānī leader and chief of al-Muṭayr tribe, had raided into al-Ḥidjāz, where he destroyed track of the already defunct Ḥidjāz Railway and generally frightened the population. By late 1342/June 1924, al-Madīna had been largely cut off from outside supplies; nevertheless, at the time of the Suʿūdī/Ikhwān capture of al-Ṭāʾif (4 Ṣafar 1342/5 September 1924) and the subsequent fall of Makka, an exodus began from the latter which brought a surge of refugees into al-Madīna. During 1343-4/1925, occasional loads of supplies reached the beleaguered city, but by September when the Ḥarb [*q.v.*] tribe defected to the Suʿūdīs, al-Madīna was completely isolated. By the beginning of October, the garrison commander, ʿAbd al-Madjīd al-"Mifa'ie", was down to a 20-day supply of necessities, and the population began to slip away. By November, the citizens who remained approached ʿAbd al-Madjīd and one ʿIzzat Effendi, controller of the railroad, and asked them to negotiate the city's surrender. The terms were to open the gates if a general amnesty were to be declared and if the Ikhwān would guarantee the safety of the defenders and of the populace. From the Suʿūdī point of view, the city could have been captured soon after the capture of al-Ṭāʾif and Makka, but ʿAbd al-ʿAzīz apparently preferred to wait until Muslim opinion had digested the new régime's control of Makka. Indeed, false, but not implausible reports that Suʿūdī artillery had damaged the famous green dome over the Prophet's tomb had already in October 1925 brought an Iranian mission of investigation as well as protests from foreign consuls in Djudda [*q.v.*] and from all over the world. Not long before the city's fall, Philby, en route to Rābigh, reports that he saw a detachment of the Suʿūdī army under the sultan's third son, Muḥammad, marching on al-Madīna. According to Philby, in the last weeks of the siege Medinese fear of the Ikhwān led ʿAbd al-ʿAzīz to have food smuggled into the city in order to prevent Fayṣal al-Dawīsh from effecting the capture. In any case, the surrender took place on 19 Djumādā I 1344/5 December 1925 and was accepted by Amīr Nāṣir b. Suʿūd and Shaykh ʿAbd Allāh b. Faḍl. The Ikhwān soon entered the exterior fortress of al-Salaʿ but not the city. Amīr Muḥammad b. ʿAbd al-ʿAzīz entered on 6 December, prayed in the Prophet's mosque, and then ordered his troops to distribute 1,000 bags of rice and 2,000 of flour to the hungry citizenry. Fayṣal al-Dawīsh aspired to the post of governor of al-Madīna (which is a town on the Nadjd plateau unlike Makka, a city of the coastal plain) and its dependent villages. His failure to receive it may have been one cause of his participation in the subsequent Ikhwān revolt. But from ʿAbd al-ʿAzīz's point of view, since the Muṭayr *dīra* already reached from the confines of al-Aḥsāʾ [*q.v.*] almost to al-Madīna, a further extension of his power would have given him a possibly preponderant influence from the Red Sea to the Gulf. The first governor appointed was Ibrāhīm b. Sālim b. Subḥān, a relatively liberal-minded native of Ḥāʾil [*q.v.*].

The Wahhābī [*q.v.*] zealots were in the end served following the arrival of ʿAbd Allāh b. Bulayhid, the chief Wahhābī *ḳāḍī*. He soon assembled the local *ʿulamāʾ* and asked them to give him, after due deliberation, an opinion on the legality of the elaborate tombs erected over the years in al-Baḳīʿ cemetery. After some two weeks of discussion, a *fatwā* [*q.v.*], motivated partly by fear, was issued by Shaykh Muḥammad al-Ṭayyib al-Anṣārī, with reluctant approval from his colleagues, which sanctioned the Wahhābī view that the tombs, cupolas, etc., should be destroyed. Shaykh Muḥammad was for the rest of his days referred to with opprobrium as "the Wahhābī". Ibn Bulayhid now had legal justification to implement the Wahhābī view. He had, however, a problem: there were almost no Wahhābīs in al-Madīna, and the regular population was reluctant to implement the *fatwā*. In the end, he had to hire the Shīʿī pariah class al-Nakhāwila (see below) to perform the task, When Eldon Rutter visited the city just after these events, he found that al-Baḳīʿ looked like a razed town. It was strewn with a rubble of earth, timber, iron bars, bricks, cement, etc., through which paths had been cleared. It was said that 10,000 of the Companions of the Prophet had been buried there, but all graves, from those of the Prophet's family, of ʿUthmān, Mālik b. Anas and other well-known Muslims, to the palm-frond graves of the poor, were systematically destroyed. Some of the Nakhāwila, who had never been allowed to bury their own dead in al-Baḳīʿ cemetery, were still raking over the rubble when Rutter visited the site. Also, outlying religious buildings such as the mosque of the tomb of Ḥamza were destroyed.

Ibrāhīm b. Sālim b. Subhān was soon replaced, but there was one saving grace amidst the carnage. Full public security throughout the peninsula, unknown for long years, provided the basis for a future of far greater hope.

In 1926 King ʿAbd al-ʿAzīz, to use his new title, visited the Prophet's city and conducted diplomatic negotiations with the British Agent and Consul, Mr. S. R. Jordan, but little came of them. ʿAbd al-ʿAzīz, who had been absent from Nadjd for two years, had to return to affairs there. The only other high-level meetings which modern al-Madīna has known was in early 1945 when King Farūḳ b. Fuʾād [*q.v.* in Suppl.] of Egypt visited King ʿAbd al-ʿAzīz and invited him to visit Cairo, which he did in January 1946.

The population of the captured city was much depleted, but there are no exact figures. Estimates with source for the 19th and 20th centuries are as follows:

1814	16-18,000	Burckhardt
1853	16-20,000	Burton
1877	20,000	Keane
1908	30,000	Wavell
1910	60,000	al-Batanūnī
eve of World War I	80,000	Philby
1925	6,000	Rutter
early 1930s	15,000	Philby
early 1940s	20,000	*Western Arabia and the Red Sea*
1950s	40,000	Lipsky
1962	71,998	census
1968	90,000	Sogreah Co.
1970	112,000	Doxiades
1972	137,000	Robert Matthews Co.
1974	198,186	census
1976	150,000	*Area handbook*
2000	250-400,000	Makki

One could assume that by 1983 the population was approaching 200,000. Current estimates for the province of al-Madīna are approximately 500,000, but it should be emphasised that the estimates are only estimates. The compulsory recording of births dates only from 1965. In 1972 it was estimated that average population density was 2332/km² with a centre-city density of 30-40,000/km². The Robert Matthews Co. survey of 1972 showed that 36% of heads of families were born in al-Madīna; 28%, elsewhere in Suʿūdī Arabia; and 36%, outside the kingdom. As to age distribution, the 1974 estimate was that 50% of the population was below age 15, and in addition that the economically active age group was only 23% of the total. A curious phenomenon in al-Madīna is that the age group over 65 is larger than the 60-64 group which in turn is larger than the 55-59 age group. This is explained by what might be called "religious retirees"—those who wish to retire and spend their last days in the Prophet's city. Oil-stimulated immigration consisted on the one hand of professionals (teachers, doctors, engineers) who came largely from Egypt, Lebanon, and Syria, and labourers who were primarily but not exclusively from Yemen. Yemenis constituted some 75% of all foreigners. It should be noted that the economic activity rate of migrants was higher than that of Saudis, whereas family size was smaller.

The population of the somewhat dazed or even partially ruined city that the Suʿūdīs took over in 1925 spoke a Medinese dialect distinct from that of other Ḥidjāz localities. It has affinities both to Syrian and Egyptian Arabic, and Turkish words and phrases are still heard in the last quarter of the 20th century. There were considerable areas of the city that were abandoned and semi-ruined, especially those outside the northern and western walls where wealthy Turks and others had built homes, especially after the coming of the railroad. Traditionally, the population lived in clearly compartmented quarters (*ḥawsh*, pl. *aḥwāsh*) and, in addition to native Medinese, included North Africans (attracted by the tomb of Mālik b. Anas), Indians, black Africans (Takārina), Mauritanians (Shanāḳiṭa) and Central Asians. A newer "immigrant" group are tribesmen: those of Ḥarb are concentrated in the eastern *ḥarra*; those of Djuhayna in the western. In addition, there was Ḥārat al-Āghāwāt, which was the home of the eunuch and other servants of the mosque (*al-Ḥaram al-Nabawī*). These included *imāms*, *muʾadhdhins*, caretakers, etc.

Religiously, the population is mostly Sunnī, of whom the large majority is Ḥanafī with a few Shāfiʿīs. There are also several groups of Shīʿīs. One of the most interesting of these is the Nakhāwila (sing. Nakhwalī). This is a twelver Shīʿī pariah class who formerly had their own *ḥawsh*, which was, however, broken up by the Suʿūdī régime first, apparently, in the 1920s and, definitively, following serious communal disturbances in the mid-1970s when a large highway was run through it. The origin of the Nakhāwila, who are currently roughly estimated to number between five and ten thousand, is obscure. They themselves claim to be descendants of the Anṣār; others believe they are descendants of African slaves, that they came from eastern Arabia or from Iran, etc. Some date their ostracisation from the time of the caliph Yazīd I. The name derives from their specialisation in cultivating palm trees. They also perform other menial services. Rutter reports that they were not allowed to live within the city walls, although they came in during the day to sell vegetables near Bāb al-Salām. In addition, the Nakhāwila were not allowed to pray in the Prophet's mosque, nor do they bury their dead in al-Baḳīʿ, but rather in their own cemetery east of Ḳubāʾ. Popular Sunnī feeling, according to Rutter, was that they would pollute these localities. They practice *mutʿa* [*q.v.*], and it was said they rent their houses to Iranian pilgrims during the *ḥadjdj* season. It may also be noted that the late Ottomans effectively prevented them from participating in elections, and King ʿAbd al-ʿAzīz, following a general protest against their participation in voting for the *madjlis al-shūrā* in 1937, followed the Ottoman precedent. There are also a few Shīʿīs of the Banū ʿAlī section of Ḥarb and the Banū Ḥusayn of al-Sādāt. It may also be noted that there is a small upper class group of Shīʿīs in al-Madīna. These, originally from ʿIrāḳ, are to a considerable degree integrated with the Sunnī upper class and basically come from two families, ʿUmrān and Mashhadī.

Among the well-known Sunnī families are the Khuraydjīs, of Nadjdī origin but long connected with trade in al-Madīna, who in the mid-1930s had the finest residence in the city; the Saḳḳāfs, whose scion ʿUmar was for some years Suʿūdī Foreign Minister, and newer rich families such as the Asʿads and the Kurdīs who made fortunes in land speculation in the 1970s.

The febrile modernisation of the 1960s, 1970s and 1980s, has largely destroyed all of the old *aḥwash* and has promoted a considerable homogenisation of the people, but slums remain in certain parts of

the old city, and these continue to have ethnic settlement patterns. On balance, Philby's judgment continues to be sound, that the people of al-Madīna, favoured as they are by location, water supplies, and relatively abundant agriculture, "lead more spacious lives" with something of the patrician and the patriarchal about them, in contrast to their neighbours in Makka.

The physical appearance of al-Madīna has changed dramatically in the six decades since the Wahhābīs first took it over. Rutter was told that the houses in the oldest sections of the city around the mosque, but especially between the *ḥaram* and al-Baḳīʿ, were built so incredibly close together in order to prevent the *samūm* from penetrating them. These houses, which were built of granite or basalt blocks and some of which had pillared halls opening on bathing pools, were typically three or four stories tall. Almost every house had a well with a hole directly above it on each floor. The hole itself had a small room (*bayt al-biʾr*) built around it which served as a bathing and siesta room for the people on that floor. The bucket was on a rope which operated from a pulley in the ceiling, and thus people on each floor could get water as needed. The water, which was not in short supply, was normally about five metres below the surface of the ground. The whole city was enclosed by a substantial wall with various gates, and there was also an outer wall extending from southeast of the old city westward and then north to tie into the main citadel at al-Bāb al-Shāmī on the northwest of the inner city. Finally, the Hāshimite King Ḥusayn built another wall from the northeast section of the old city north and then westward, but the Hāshimite kingdom ceased to exist before the new wall reached the existing outer wall on the west. With the coming of the *pax Suʿūdiana*, the whole system became obsolete, and gradually the walls disappeared before bulldozers. Philby reported in 1957 that they were gone, but some fragments still exist.

Modernisation has brought completely different

architectural approaches and materials, and much of the old has been swept away. Courtyards have been replaced by balconies, and cement and bricks are now standard. Sometimes old and new are combined, with traditional materials used on the ground floor and concrete blocks above. The latter, being lighter, allow larger rooms than would stone. The new construction is less insulating than the old, but air conditioning offsets this loss. Much of the growth of the city has been uncontrolled. Immigrants have settled on the eastern and western *ḥarra*s and bidonvilles have emerged. Some of the more prosperous immigrants have replaced their shanties with substantial structures, but growth in these areas has been chaotic. Running water did not exist as late as about 1980; electricity reached the *ḥarrāt* only about 1978.

By the 1960s, a city plan emerged. It features wide streets, street lighting, plantings, pavements for pedestrians and parks. Various new streets were cut, others were widened. The castle at al-Bāb al-Shāmī was demolished and replaced by apartment houses, and certain streets formerly connected by stairs were placed on the same level. The *aḥwāsh* disappeared; buildings were built across the water course that cut through the southern part of the city on a northwest-southeast axis.

In general, the central business district near the Prophet's mosque has not shifted, but there are satellite suburbs which have grown rapidly. These include al-ʿAwālī to the southeast, Ḳubāʾ to the south (which with its orchards and cafés is a suburb of the affluent), and Sayyid al-Shuhadāʾ to the north-east.

The old layout of the city continued to impose itself on some developments. The Ḥidjāz railway station and the Ottoman barracks were both located in the southwest just inside the outer wall. The straight road, Shāriʿ al-ʿAnbariyya, which led to the centre of town at al-Bāb al-Miṣrī, had also by 1925 attracted the public or Egyptian kitchen, the governor's residence, and other private mansions. In the late 60s, the barracks were demolished and replaced by a large government building. Other

multi-story buildings soon followed. The location of the residence of the *amīr* exerted a pull on the location of upper-class housing. As long as the governor's house was in the south, the well-to-do lived there, but when in the 60s the *amīr*'s palace moved to the north of the city, Sulṭāna Street, which led northwest towards the old (Sultana) airport, and the community of al-ʿUyūn (7 km. away) began to attract affluent villas. The new airport located about 14 km. northeast of the city has also been an attraction northwards, and in general the area between Shāriʿ al-Maṭār (airport road) and Sulṭāna Street has filled in. West of Sulṭāna Street, Djabal Salaʿ, a difficult and substantial rocky outcrop, impeded development, but by the 80s villas were appearing north of it as well. To exemplify the overheated inflation in land prices, one can cite a garbage area north of the outer (Ḥusayn's) wall where no one would build. Cleaned up in the 60s, land was selling there for $ 2,500/m² by the mid-70s.

Other points of interest are that industry has generally moved outside the city where land was cheaper and there was room to expand. Public open spaces in al-Madīna are below international standards (totalling, in about 1980, 2,321 m²), but this inadequacy is partially compensated for by recreational use of the green areas, which are themselves diminishing, north and south of the city.

Traffic has always been a problem in al-Madīna. Rutter reports that streets in the old sections in 1926 were so narrow that on occasion a person had to walk sideways to pass. During the restoration of the mosque under Sultan ʿAbd al-Madjīd (1848-60), a breach (al-ʿAyniyya) was made in the inner wall, and a straight street driven through to near the southwest gate of the mosque (Bāb al-Salām) so that columns and stone blocks could be brought in from Wādī al-ʿAḳīḳ. As long as camels discharged their loads in the area (al-Manākha) west of the inner wall reserved for that purpose and goods were then taken in by donkey or porter, the narrow streets could also be used by pedestrians, but with the coming of motor vehicles the situation became acute, especially as there was a severe shortage of parking space. One major parking lot does, however, exist in a portion of the old railroad yards.

Streets were added and widened in two stages: (1) 1950-5, when by private contract the *aḥwāsh* and *aziḳḳa* were greatly altered, by building new roads, especially Shāriʿ al-Maṭār and Shāriʿ Abī Zār which runs north and south to the east of the old city, by widening others, and by asphalting others; (2) 1961-5, when the municipality itself carried the process a stage further, installing *inter alia* a one-way traffic system in some sections and traffic lights. There continued in the early 1980s to be some unasphalted streets. The increase in vehicles can be gauged by the fact that in the period 1948-72, 6,511 vehicles were licensed, whereas in 1973-4 along 6,158 were licensed. In addition, at *ḥadjdj* time many outside vehicles appear. One may also note Shāriʿ al-Khawādjāt, which links, north of the city, the airport with Abyār ʿAlī some 8 km. southwest of the city, where there are TV and power stations. Designed as a road which non-Muslim technicians would be allowed to use (hence its name), it has become the main truck route because it bypasses the heavy city traffic. The city boasts two bus stations and taxi companies (cabs can be ordered by phone). Traffic, however, apparently remains a serious problem. Makki reports that accidents and ensuing violence between drivers are common, that parking fines are not levied, and that roads are hazardous for pedestrians.

The economy of al-Madīna may be conveniently considered under three headings: agriculture, commerce and industry, and the pilgrimage. Agriculture and agricultural self-sufficiency have constituted one of the glories of Islam's second city. Palms ripened early in June, and the main harvest was about a month later. The grapes, of which the best were a long white variety called Sharīfī, were also well known. Modernisation, however, has come disastrously close to ending the city's agricultural sector for three reasons. One is that urban sprawl in the 1950s overtook those farms which immediately surrounded the city. A second reason is the economic opportunity which the oil-driven economy of the country presented in other economic sectors; and the third cause is the fall in the water table because of unprecedented demands for water. By the 1950s, the formerly planted banks of Wādī al-ʿAḳīḳ had become barren and the desolation of the natural acacia forest, al-Ghāba, the traditional outdoor recreational area of the Medinese, and a source of wood, located some 7.5 km. north of the city, was well under way. This process was accelerated by the successive construction of small dams (ʿAḳūl, 1956; al-ʿAḳīḳ, 1958; and Buṭḥān, 1966) which prevented destructive flash floods in al-Madīna, but also prevented water from reaching al-Ghāba. Makki believes (1982) that the process might still be reversed, but notes no sign of the required effort. The agricultural areas south of the city have held up more successfully, though some decline is noted there as well. The decade 1962-72 showed a total reduction in agricultural land of 16.8% from 8.14 to 6.77 km². Over 40% of the total is in al-ʿAwālī and Ḳubāʾ south of the city. According to the Ministry of Agriculture, crop distribution in 1962 was as follows: 64% palm trees, 21% fruit trees, 14% alfalfa, and 1% garden vegetables, including tomatoes, eggplant, carrots, potatoes, squash, peppers, cucumbers, watermelons, cabbage, and cauliflower. It may be noted that the date trade was especially important as an export (to Syria, Egypt and the Indian subcontinent) crop. The dates in fact had a religious aura as a kind of blessing for the eater. There are many varieties, of which Rutter says the best three are al-ʿAnbarī, al-Shalabī and al-Ḥalwa.

The estimated percentage distribution of the non-agricultural and non-religious work force is, after Makki, as follows:

Activity	1972	1974
delivery services	22.01	24.23
scientific and vocational services	10.84	20.00
governmental services	24.50	12.72
primary industries	1.61	11.20
construction and maintenance	4.90	10.12
transport	6.67	7.73
other	17.75	6.71
education	7.78	4.84
handicrafts	1.20	2.21
electricity and water supply	2.65	.83

Highlights of the local economy are as follows. Industrial activities are principally date packing and vehicle repair. These are located on the periphery of the city on a totally unplanned basis. In 1971 manufacturing firms numbered 107, most of which employed 10 or less workers. Of the total, 35 were in car repair, 17 in building tile manufacture, 15

in bricks, 4 dairies, and 2 large date-packing factories. Estimates are, for 1971 and 1974 respectively, that there were 1,452 and 3,517 industrial workers and 3,105 and 6,207 commercial workers. Hotels and hospices, including a Sheraton, numbered 8 in 1971 and employed some 1,225 workers in 1974. In 1971 there were 2,208 retail and 28 wholesale stores and the *sūḳ* system received its first challenge in that same year with the establishment of two supermarkets, one in the city and one on Ḳubā' Street. The social importance of the *sūḳ* has also declined with changing life-styles, because accompanying traditional social activities such as public baths and coffee shops have almost disappeared. According to Makki, men's barbers, often Indian or African, are still conspicuous as they work outside on the sidewalk attending to the needs of, especially, Yemenis and other unurbanised immigrants. At the same time the new life-style has given rise to ladies' coiffeuses who use modern equipment but operate from their private homes. Of the three known to Makki (two in Ḳubā' and one in al-Bāb al-Madjīdī), two were run by foreign teachers and one by a Medinese lady.

It is difficult to get a clear picture of the impact of the *ḥadjdj* on the economy of al-Madīna. Rutter estimated in 1926 that the number of those who served the *ḥaram* was about 1,000. This number included, in addition to the *shaykh al-ḥaram*, his deputy, and the treasurer, *imāms*, preachers, lecturers, *mu'adhdhins*, overseers, doorkeepers, sweepers, lamp cleaners, water carriers, etc. Most were supported at least in part by *waḳfs*, many originating in Egypt. He reports that King ʿAbd al-ʿAzīz initially reduced the number to 200. The corps of eunuchs numbered about 50. They were popularly believed to be wealthy, and they had *inter alia* black boys in training to enter the mosque service. In more recent times, Long has estimated that the guild of guides alone received some $ 800,000 in fees (gratuities are also important) in 1972 when pilgrims numbered about 480,000. His estimate of gross *ḥadjdj* income, including public sector expenditures, in that year was $ 213 million. Of this, one could guess that al-Madīna might be allocated one-third. Other estimates are higher. Robert Matthew Co. estimated for the same year that *external* pilgrims spent just under $ 100 million, of which two-thirds was for gifts. Makki's fieldwork in the same year indicates that average pilgrim expenditures were 583 Suʿūdī *riyāls* (SR; $ 1.00 = SR 4.15 in 1972) broken down as follows:

gifts	SR 331
other	99
lodging	71
food	52
transport	17
religious donations	13
	SR 583

He estimates total revenue from *external* pilgrims at SR 381.4 million (= $ 91.9 million). Total pilgrims on Makki's projection produced a revenue of SR 558.5 million (= $ 134.5 million).

The *Ḥaram al-Nabawī* of course is the central focus of al-Madīna, although other buildings and localities have high religious significance. The exact area of the sacred territory (*ḥaram*) from which non-Muslims are excluded is unclear. There is indeed a certain ambiguousness about the *ḥaram* quality of al-Madīna. Abū Ḥanīfa said it was not a *ḥaram*. Rutter reports that "common opinion" held that the area is bounded by the lava fields on the east and west, by Djabal ʿAyr on the south and Djabal Thawr ("behind Ohod") on the north, an area about 16 by 3 km. Philby wrote in the early 1930s that the whole district from Ḳubā' to Djabal Uḥud was *ḥarām*. Nallino reports that, according to the Saudi Arabian Mining Syndicate convention, it was defined as a radius of 30 km. around the walls of the city—a significantly smaller area. Non-Muslims now regularly travel the *Shāriʿ al-Khawādjāt* and stay in such hotels as the Sheraton.

When the Wahhābīs first arrived, they discouraged the visit (*ziyāra*) to al-Madīna as constituting idolatrous tomb worship, but King ʿAbd al-ʿAzīz, for whom the revenues had some interest, justified it on the ground that he permitted pilgrims to pray in the mosque but not to visit the Prophet's tomb. For Rutter, the mosque with its green dome and golden apex ornament rising high above the walls to one-half the height of white minarets was "a picture of the most striking beauty and magnificence." Philby opined that it was the "chief architectural feature not only of Medina but of all Arabia." Rutter noted that many of the religious students had fled, but others were still studying at the feet of teachers such as Aḥmad al-Ṭanṭāwī and Ibn Turkī. Philby, who visited the city in 1931, found that all the tombs (other than those in the *Ḥaram*) were in ruinous condition. He also reports that the Shīʿīs of India had offered King ʿAbd al-ʿAzīz £ 50,000 to spare the tomb of Fāṭima, but that it, like others in al-Baḳīʿ, was then almost gone. In 1934 when Shaykh ʿAbd Allāh Sulaymān visited the city, many of the historic tombs were tidied up, and basalt borders and simple headstones set in place.

As to the Prophet's mosque itself, it has undergone substantial changes under Suʿūdī rule. The first known attention to it took place during 1934-8 when, largely through the generous efforts of Ṭalʿat Ḥarb of Egypt, badly needed repairs were carried out. These included installation of a new marble floor, and a new wooden screen to separate the women's section from the much larger men's part. Major enlargements followed. On 12 Shaʿbān 1368/9 June 1948 King ʿAbd al-ʿAzīz wrote an open letter to the Muslims of the world (published in *al-Madīna al-Munawwara*, no. 301, 5 Ramaḍān 1368[/1 July 1948]) indicating his intention to enlarge the mosque. A committee of notables to assess the value of those properties that were condemned and an office with some 50 officials was established in Shaʿbān 1370/May-June 1951. For actual building, a team of 14 architects, 200 artisans and 1,500 labourers was assembled. A workshop area was established at Abyār ʿAlī both for the repair of equipment and also for making mosaics. Equipment and supplies were brought in from Yanbuʿ and included cement, iron and 30,000 tons of timber. The foundation stone was laid on 13 Rabīʿ I 1373/20 November 1953 before 2,000 dignitaries, and the inauguration of the new structure took place on 5 Rabīʿ I 1375/22 October 1955 with King Suʿūd, who had succeeded to the throne, officiating. The total cost was $ 11 million. The total new area added to the mosque was 6,024 m². Other new features included 474 square and 232 round pillars. The lengthening of the building to the north was 128 m. and the new northern wall is 91 m. long. Essentially, what the builders did was to double the size of the mosque by integrating a whole new building on to the northern end of the original one. The new section has its own courtyard plus minarets at the new northern corners. (The old Ottoman style minarets at the former

northern corners as well as the minaret just north of Bāb al-Raḥma were torn down.) The building itself is in neo-Moorish style; the minarets, neo-Mamlūk. In addition, as the accompanying Figs. 1 and 2 indicate, the Suʿūdī builders straightened out the asymmetrical shape of the exterior of the earlier structure and rebuilt the east, west, and north structures surrounding the original courtyard. West of the reconstructed mosque a large permanently canopied area was built in 1974-8 to provide shade for the vehicles and bodies of the hundreds of thousands who visit annually, although many old residences in the *aḥwāsh* were thereby destroyed. Finally, in Radjab 1403/May 1983 King Fahd b. ʿAbd al-ʿAzīz ordered a further expansion of the mosque—basically on the east and west—from the present 16,000 m² to a staggering total of 82,000 m² with 90 m. minarets, the whole to be air conditioned. Little will remain of the old city.

There are of course other religious buildings and sites in al-Madīna, and in 1980 they constituted about 1 % of the total city area (down from 6.4 % in 1950). The most important is al-Baḳīʿ, the cemetery lying to the east of the mosque. This tract, which has been used by all Medinese except the Nakhāwila since the Prophet's time, was expanded in 1953 to an area of 52,741 m². It cannot in practice be moved because it holds the graves of many famous people. Makki estimates that bodies decompose in al-Baḳīʿ within six months, after which a grave can be re-used. Sometimes at the height of the *ḥadjdj*, 2 bodies are put in one grave.

Other well-known sites include the mosque of al-Ḳiblatayn, the so-called al-Masādjid al-Khamsa and the mosque of Ḳubāʾ. In the city proper are also the al-Ghanāma, Abū Bakr and ʿAlī mosques near al-Manākha street. A common characteristic of mosques in al-Madīna is that they have a courtyard surrounded by roofed columns. In addition to the cemetery and mosques, there are a number of so-called *zāwiya*s or chapels in private homes. These often have a door opening directly on the street, but by 1980 many had been abandoned. In Ottoman, Sharīfī and early Suʿūdī days, the Ramaḍān cannon was fired from the Ottoman fort on Djabal Salaʿ, but with the modern growth of the city it could not be heard; other cannons were set up in various locations.

The logistics and management of pilgrims in al-Madīna differs from that in Makka, but still constitute an annual event of massive proportions. The differences are that only about three-fourths of the *ḥādjdjī*s make the visit (*ziyāra*) to al-Madīna and that they may come either before or after the *ḥadjdj* proper. As in Makka, however, guilds have arisen to service the visitors (*zāʾir*, pl. *zuwwār*): the *muzawwirūn* (sing. *muzawwir* "he who conducts a visit") and the *adillāʾ* (sing. *dalīl* "guide"). The former are those who conduct the visitor through the religious customs, such as reciting the proper formulas; the latter are responsible for the physical needs of the *zuwwār*, such as food, lodging and local transport. This dual system constrasts with that of Makka, where the *muṭawwifūn* (sing. *muṭawwif*, he who conducts the *ṭawāf* [*q.v.*]) are responsible for both spiritual and physical needs. The *adillāʾ*, like the *muṭawwifūn*, are divided into subguilds by nationality, and since the issuance of a decree in 1356-7/1938, there has been a government-appointed *shaykh al-adillāʾ*. Governmental control evolved because by the late 1930s, internal transport had improved to the point where the visit to al-Madīna could be made from Makka or Djudda in a matter of hours and the number of visitors steeply increased. Usually the *adillāʾ* are also *muzawwirūn*, but not every *muzawwir* is a *dalīl*. Traditionally, almost every native Medinese served at one time or another as a *muzawwir*. As spelled out in the regulations, the responsibility of a *dalīl* is: (a) to receive the *ḥadjdjī*s on their arrival at the official reception centre; (b) to assist them to find lodgings and to move in; (c) to guide them to the principal shrines and to assist in devotions; and (d) to assist them in arranging onward travel (which is usually to Makka, Djudda, or Yanbuʿ). The 1972 regulations, as cited by Long, specify the shrines as: *al-Ḥaram al-Nabawī al-Sharīf*, al-Baḳīʿ cemetery and "other shrines." Offices of the Directorate of Ḥadjdj Affairs of the Ministry of Ḥadjdj and Waḳfs are located at the main sites to hear complaints.

Like pilgrims proper to Makka, visitors to al-Madīna have come by every form of transport, certainly not excluding walking and, before World War I, including the railroad. However, since the Suʿūdī takeover, the railroad from Damascus has remained derelict and walking has practically ceased. As early as 1929 the number of visitors who came by camel caravan had declined to about half, while most of the other half came by motorcar. The first visitors to arrive by air came in January 1936 as the result of a contract made by the Suʿūdī government with the Egyptian Misr Airlines (now Egypt Air). In 1937 the aircraft made two flights per day from Djudda to the old Sulṭāna airport with five passengers per flight. In all, 105 visitors came at a cost of £E 30,500, of which half was tax. In 1939 the aircraft developed engine trouble, and the service was discontinued. By 1950, according to Long, the camel had practically disappeared as a means of transporting pilgrims. Roads to the holy cities received very high priority immediately after World War II, and the Djudda-al-Madīna sector was paved by 1958. Exact figures for mode of travel to al-Madīna in more recent years are not available, but a rough idea may be obtained from the following. In 1972 there was a total of 1,042,007 pilgrims to Makka, of which 479,339 came from abroad and 562,668 from within Suʿūdī Arabia (of these 178,378 were from Makka itself and presumably did not visit al-Madīna). Of those who came from abroad, 20 % came by sea, 30 % by land and 50 % by air. One could assume by 1980 that motor vehicles and aircraft brought all but the smallest handful of *zuwwār* to al-Madīna.

Some idea of various charges paid by *zuwwār* in modern times can be garnered. In the late 1920s, the round trip automobile fare from Makka to al-Madīna was taxed £ 7.50 ($ 36.00), but this impost was lowered by 1931 to £ 6 ($ 28.80). Transportation fees, round trip (? from Djudda), were listed in 1948 as follows: first class (car), £ 24; second class (bus), £ 12; third class (truck), £ 8. In 1972 the fees are more exact:

Single person fare	SR	$
Bus from Djudda or Yanbuʿ to al-Madīna and back to Djudda or Yanbuʿ	90.	21.69
Car from Djudda or Yanbuʿ to al-Madīna and back to Djudda or Yanbuʿ	144.	34.70
Car from Djudda or Yanbuʿ and thence to Makka	160.	38.55
Bus from Makka al-Madīna and thence to Djudda or Yanbuʿ	101.25	24.40

By royal decree of 1384-5/1965, the fee for a *dalīl* was fixed at SR 10 (= $ 2.22; from 1378-9/1959 to 1390-1/1971 the exchange rate was $ 1 = SR 4.5). Accommodation is a private sector matter, but there are government-suggested prices. According to the 1391/1972 regulations, SR 20 ($ 4.82) was the suggested daily rent for a "house." The Ḥadjdj Accommodation Control Committee of the Ministry of Ḥadjdj and Waḳfs is charged with regulating abuse. In all, it has been estimated by Long that in 1972 *adillā'* were paid SR 3.6 million ($ 867,470), assuming that 360,000 visited al-Madīna.

Al-Madīna had been famous for libraries and learning from early Islamic times, but Rutter found a mixed situation in regard to both. The library of ʿĀrif Ḥikmet Bey [*q.v.*], a former Ottoman *shaykh al-Islām* who had also served as *mullā* of al-Madīna in 1239/1823 and following, was one of the richest in al-Ḥidjāz, with estimated holdings of 17,000 volumes. Although Fu'ād Ḥamza opines that "in the Ottoman period" a considerable part of the collection had been removed, others do not corroborate his contention. Located just off the southeast corner of the *Ḥaram*, the library was open to the public but non-circulating. Rutter describes it as a building composed of two domed rooms set in a walled garden. Access was through a large ornamental iron gate. Within, Rutter remarks on the cleanliness and high level of upkeep. The principal attendant and his assistant were both highly competent Turks, and several people were reading. Philby indicates that the library contained unique manuscripts. In regard to the very recent siege and Suʿūdī accession to power, the assistant told Rutter that "we do not eat of the hand of the king, neither from the hand of El Husayn, nor from the hand of Ibn Saʿūd. Our provision comes from the waqf bequeathed by the Shaykh [ʿĀrif Ḥikmet]. Therefore, it is of no account to us who is king or who is sultan; we render praise to God, Who is Lord of All." Although it had presumably withstood the siege intact, the Sulṭān Maḥmūd library (4,569 volumes), adjoining Bāb al-Salām, could not be examined by Rutter because the key could not be found. Other libraries (Bashīr Āghā [2,063 volumes], the al-Shifā' school, ʿUmar Effendi and Sultan ʿAbd al-Ḥamīd [1,659 volumes]) were simply gone. Various explanations were offered: the books had been stolen when the inhabitants fled; they had been sold by their caretakers; the Wahhābīs had burnt them. The *Ḥaram* itself contained approximately 100 large Ḳur'āns.

At the time of the Suʿūdī conquest, Nallino counted public schools as one elementary (*ibtidā'iyya*) and two preparatory (*taḥḍīriyya*). By 1937 this had increased modestly to one elementary, three preparatory and one school for adult illiterates. But there were also some eight private schools, including Dār al-Ḥadīth, which had 49 students, as well as Madrasat al-ʿUlūm al-Sharʿiyya with 394 students. In all, the private schools enrolled 873 students. By 1938 these institutions had been increased by the addition of an Italian orphanage. A different type of educational institution also appeared in 1354-5/1936—namely, the four-page weekly *al-Madīna al-Munawwara*, which was owned by ʿAlī and ʿUthmān Ḥāfiẓ and managed by the latter.

Nallino signals six Medinese writers of prominence in the 1930s: (1) Aḥmad al-ʿArabī (b. *ca.* 1327-8/1910), who was sent by King ʿAbd al-ʿAzīz on a mission to Dar al-ʿUlūm in Cairo and graduated from al-Azhar. On his return, he taught at Madrasat al-ʿUlūm al-Sharʿiyya and became in 1935 the director of the prestigious Madrasat al-Umarā' (school for princes) in al-Riyāḍ. (2) ʿAbd al-Ḳuddūs al-Anṣārī (1324-1403/1906-83). A prolific writer, al-Anṣārī received his diploma in 1346/1927-8 from al-ʿUlūm al-Sharʿiyya, worked in the *dīwān* of the amīrate of al-Madīna and taught Arabic literature at his *alma mater*. His important prose works include *Āthār al-Madīna al-Munawwara* (Damascus 1935) and *Bayn al-ta'rīkh wa 'l-āthār* (Beirut 1969). (3) ʿAbd al-Haḳḳ al-Naḳshabandī (b. 1322/1904-5), a poet, who after primary studies in al-Madīna, accompanied his father during World War I to Syria. After returning to al-Madīna for further study, he went to India, where he earned a teaching certificate, after which he taught at al-ʿUlūm al-Sharʿiyya. (4) ʿAlī Ḥāfiẓ (b. 1321/1903-4), a poet, studied in *al-Ḥaram*, became *kātib ḍabṭ* (secretary) of the higher court in al-Madīna and then head secretary. He was a founder of *al-Madīna al-Munawwara*. (5) ʿAzīz Ḍiyā' al-Dīn b. Zāhid (b. 1332/1913-4), a poet and prose writer, who, following primary studies in al-Madīna, studied in the "health school" of Makka (closed in 1347/1928-9). He became secretary to the Directorate General of Health and then went to the Directorate of Police. (6) ʿAbd al-Ḥamīd ʿAnbar (b. 1326/1908-9), a prose writer who both studied and taught at Madrasat al-ʿUlūm al-Sharʿiyya.

In more recent years, the Islamic University of al-Madīna has been the institution of highest learning in al-Madīna. This institution was founded in the early 1960s, with encouragement from members of al-Ikhwān al-Muslimūn driven into exile by President Djamāl ʿAbd al-Nāṣir of Egypt, as an international seminary modelled at least in part on al-Azhar and designed to propagate Islām. It contains both a secondary (*thanawiyya*) curriculum and a university-level programme. The secondary section schedules 34 classes per week for three years, and the total hours per week per subject for the three-year curriculum are as follows: *sharīʿa* 12, *tafsīr*, 12, Arabic language 12, *ḥadīth* 10, *tadjwīd* 9, *tawḥīd* 9, history of Islam 6, *uṣūl al-fiḳh* 4, *furūḍ* 4, semantics 4, principles of *tafsīr* 3, principles of *ḥadīth* 3, speech and composition 3, Arabic reading and literature 3, literary techniques 3, Ḳur'ān 2, handwriting 2, Islamic morals 1.

The university-level programme lasts four years. Students take 25 classes per week in the first two years and 24 in the last two. The total hours per week devoted to each subject are as follows: *sharīʿa* 16, Ḳur'ān 14, *tawḥīd* 12, *ḥadīth* 12, Arabic language and grammar 12, *uṣūl al-fiḳh* 8, vocabulary of *ḥadīth* 4, semantics 4, Islamic morals 3, speech and composition 2, literary techniques 2, and one hour each for each of the following: *sīra*, history of the caliphs, Islamic history, contemporary Islamic world, social doctrines of Islām, al-Bukhārī, Muslim, Abū Dāwūd and al-Tirmidhī, al-Nasā'ī and Ibn Mādja.

The university, led for many years by the well-known ultra-conservative ʿAbd al-ʿAzīz b. Bāz (and more recently by ʿAbd Allāh Ṣāliḥ al-ʿUbayd) is academically under a Higher Consultative Council, which in 1974 was almost equally composed of well-known foreign and Suʿūdī educators, *ʿulamā'*, or religious administrators. At that time these included, e.g., Ḥasanayn Muḥammad Makhlūf, former *muftī al-diyār al-Miṣriyya*; Muḥammad Amīn al-Ḥusaynī of Palestine; and ʿAbu 'l-ʿAlā' al-Mawdūdī, former president of al-Djāmiʿa al-Islāmiyya of Pakistan. In 1975 the journal published by the university (*Madjallat al-Djāmiʿa al-Islāmiyya*) indicated that, at the university level, there were three faculties:

Kulliyyat al-Sharīʿa, Kulliyyat al-Daʿwa and Kulliyyat Uṣūl al-Fiḳh, and that these faculties grant the "higher *idjāza*" which bestows on its holder the same rights as equivalent degrees granted by the secular universities of the kingdom.

Despite the great increase in educational facilities illiteracy continues to be a major problem. According to Makki's analysis of the 1974 census, about 74% of the Suʿūdī labour force in al-Madīna was illiterate, and 51% of the foreign labour force was illiterate. A major explanation of continuing high illiteracy rates is the influx of illiterate people from desert and rural areas into the city.

Medical facilities have also burgeoned in al-Madīna since 1925—not least because of the pilgrimage, its medical problems and the public relations aspects thereof. One early milestone in this development was the establishment in 1356/1937 of an Italian-Muslim hospital under the auspices of the king of Italy. The hospital was under local control and was financed by a *waḳf* from Tripoli, Libya. By the mid-1960s, a 50-bed hospital of tropical medicine as well as enlargement of the main general hospital were both under construction, and by 1975 a control station for schistosomiasis (bilharzia) had been opened. Patients treated in Medinese hospitals reached 903,635 in 1969, but declined in the subsequent year. Death rates have also generally declined, and the death rate of *zuwwār* dropped from 1.6% in 1942 to 0.31% in 1974. It might also be noted that the city gave its name to the parasitic Guinea Worm, as in *Dracunculus medinensis*, *Vena medinensis* or *Filaria medinensis*.

Modern communications in al-Madīna cover the following: roads, facilities for air travel, telecommunications and rail service. Revival of the Hidjāz railroad from Damascus to al-Madīna has been discussed by the Syrian, Jordanian and Suʿūdī governments throughout the post-World War II period. Periodical announcement of positive decisions have been made, but nothing has been done up to 1405-6/1985. The evolution of the telephone service has been steady since 1313/1896, when a line connecting the city with al-ʿUlā, Tabūk, ʿAmmān and Damascus was installed. In 1323-4/1906 a second line was put in place, and by 1333-4/1915 there was a 50-line exchange located outside al-Bāb al-Shāmī and reserved for military use. Philby reports that a wireless service to Djudda began under the Ottomans. The Hāshimites spread the telephone service to other government offices. The Suʿūdīs installed, in 1932, new Marconi (British) equipment with 21 exchanges of 100 lines each. In this period there were some 1,890 lines in all, of which 1,458 were private and the remainder official. A new radio telephone was installed in 1395-6/1956, and automatic service arrived in 1391-2/1972, as well as a co-axial cable to Yanbuʿ, Djudda, and al-Ṭāʾif. In that year there were 3,737 telephones in use, with long waiting lists. A local television station arrived in 1388-9/1969. The first airport was located near Sulṭāna, northwest of al-Madīna, and was derelict from World War I until 1936, when Bank Misr opened, briefly, its *ḥadjdj* service, but the modern airport, in use by the mid-1960s, is located 15 km. northeast of the city on the road to al-Ḥanakiyya. By the early 1980s, al-Madīna was linked with neighbouring population centres in all directions by a completely modern highway network. Al-Madīna again benefited from its religious importance and was given early priority in the development of roads for that reason. The Djudda-al-Madīna sector was completed as early as 1392-3/1953. Finally, it may be noted that although the Suʿūdī government joined the International Postal Union in 1345-6/1927, in 1357-8/1939 al-Madīna's post office was one of only four (the others: Makka, Djudda and Yanbuʿ) in the country that could handle all operations specified by the international conventions. In 1357-8/1939, the al-Madīna postal service was twice per week.

It is difficult to get a clear picture of the administration of al-Madīna. The Hāshimite surrender was taken by Muḥammad b. ʿAbd al-ʿAzīz, and the following is a quite incomplete list of *amīr*s (with known dates of incumbency) compiled from various sources:

Ibrāhīm b. Sālim b. Subḥān	1926
ʿAbd al-ʿAzīz b. Ibrāhīm	1932
ʿAbd Allāh al-Sudayrī	1936, 1937
H.R.H. Muḥammad b. ʿAbd al-ʿAzīz	1952
H.R.H. ʿAbd al-Muḥsin b. ʿAbd al-ʿAzīz	1981

The main function of the *amīr* is the maintenance of public security. The city was one of five in the Ḥidjāz that had had a municipality in Ottoman and Hāshimite times. The highest body was composed of a president and four members. In Ṣafar 1345/August 1926 "fundamental instructions" on rule were issued by the still juridically separate Kingdom of the Ḥidjāz. According to article 34, an administrative council (*madjlis idārī*) was established for al-Madīna. It was to be composed of the *ḳāʾim maḳām* (head of the amīral secretariat), his assistant, the heads of the various departments and four people nominated by the king. Al-Madīna was one of only three cities in al-Ḥidjāz that had police at the time of the Suʿūdī takeover; overwhelmingly, members of the police force were, all over the Suʿūdī realm, from ʿAsīr and Nadjd. Other administrative aspects may be mentioned. In 1347/1928-9, notaries (sing. *kātib al-ʿadl*) were instituted in al-Madīna as well as in Makka and Djudda. (Elsewhere, *ḳāḍī*s performed this function.) Justice was, in the period till World War II at least, administered by a summary (*mustaʿdjila*) court under a single *ḳāḍī* and had jurisdiction over petty civil cases and criminal cases not involving execution or loss of limb. The higher court (*al-maḥkama al-kubrā*) has a *ḳāḍī* as president and two "substitutes." In cases involving capital punishment or loss of limb, the decision had to be pronounced by the full court. Al-Madīna also had a customs office which was a branch of the Djudda office. Originally, *waḳf* administration in al-Madīna was independent and reported to the local *amīr*; however, by a royal decree 1354/1936 the *waḳf* administration in Makka was upgraded to a directorate-general with the Medinese director to report thereto. Finally, because of the importance of water and its interrelation with various properties in and outside the city, a special authority, Hayʾat ʿAyn al-Zarḳāʾ, composed of five members, was established. It was in part financed by special *waḳf*s, but was also written into the state budget as early as 1926. The name of the authority was changed in 1978 to the Water and Drainage Department. Writing in 1936, Fuʾād Ḥamza (*al-Bilād*, 184, 186, 193, 236) gives the names of most of the then incumbents of the various posts.

By the 1980s, water was for most Medinese piped into houses, offices and apartments from desalinisation plants on the Red Sea coast, but when the Suʿūdīs took the city over the situation was very different. Al-Madīna's not unplentiful natural water

supply came from three main interrelated sources, but basically from the south: (1) south of the city in and around Ḳubā'; (2) ground water throughout the area of al-Madīna; and (3) north of the city in and around al-ʿUyūn. In addition, several *wādīs* intersect more or less in al-Madīna and often generated destructive flash floods. These wādīs have gradually been dammed, starting with a dam built in the 1940s to the northeast of the city and including the 1966 dam across the upper course of Wādī Buṭhān which used to flood the city frequently. However, the dams reduce the water available in the northern agricultural areas and thus lead to a decrease in cultivation. Actual rainfall in al-Madīna fluctuates greatly. From 1957 to 1978 it ranged annually from zero to almost 104 mm. and averaged 38.04 mm. Historically, the most important source of domestic water has been ʿAyn al-Zarḳā', which was actually a series of wells connected by covered conduits in the Ḳubā' area, where they joined into a single double-decker aqueduct. The upper channel carried drinking water to ten public watering places (*manhal*, pl. *manāhil*). The lower channel is a drain for the upper channel and for the *manāhil*. North of the city this aqueduct emerged above ground, and the water was used for irrigation. The *manāhil* were about 10 m. below ground and were reached by steps. The aqueduct passed under only two buildings: the former al-Bāb al-S̲h̲āmī and the mosque. There were also ordinary *sabīl*s up until the early 1960s. The first pipes and public taps were installed in 1909, and in 1957 there were 49 of these taps (*kabbās*, pl. *kabbāsāt*) from which water was often led to individual houses by hose. By 1965 there were 1,500 *kabbāsāt*, but by 1974 their number had declined to 600 because of the spread of indoor plumbing; those that remained were in outlying areas of the city beyond which water tankers delivered to the poorer population. Water meters began to be used in 1959. In addition, in the earlier period brackish water was readily available at depths of 4-10 m. and most houses had wells to tap this water. Recent use has now lowered the water table significantly, and the supply is inadequate. All have been abandoned, as well as the unusual *bayt al-bi'r* architectural feature (described above) which provided summer cooling for generations.

The situation with agricultural water is parallel. The natural springs in the al-ʿUyūn area which irrigated 500,000 palm trees in 1915 were by 1980 all dried up. Owners have compensated for the decline in the water table by pumping. Philby reported that around 1954 pumping was well established and expanding, and Makki (on whom most of this analysis of water is based) indicates that 672 diesel pumps were in use in 1962. Makki pleads eloquently for the ʿAyn al-Zarḳā' Authority to control well-digging and pumping. A further development has been the erection in 1968-71 of a large concrete tank on top of D̲j̲abal Salaʿ, whither water is pumped from the Ḳubā' pump station. Other tanks on high ground also ensure adequate water pressure.

There are two additional pressures on the natural water supply. The first is the recent increase in paved and asphalted areas which, with their run-off characteristics, reduce infiltration; and the second is sewage problems. There was no disposal system prior to the 1970s. Rather, each building had its own cesspool (*bayyāra*) which was cleaned (? by the Nak̲h̲āwila) periodically. This practice made for special difficulties in the *ḥarrāt* because it is difficult to dig to depth and impossible without dynamite. Most of the waste was dumped in an area east of the city called "al-Manasie" (Makki's spelling). Water pollution is a growing problem; at least one well has had to be closed. On the other hand, a full sewage treatment plant was initiated in 1970 and located behind D̲j̲abal Uḥud. By 1976 a considerable portion of the city had been tied into the system.

AL-MADĪNA AL-ZĀHIRA, a city founded in 366/978-9 to constitute a court by al-Manṣūr Ibn Abī ʿĀmir [*q.v.*] in a place called Ālas̲h̲, Ballas̲h̲ or Manzil Ibn Badr, on the right bank of the Guadalquivir to the east of and a short distance from Cordova. Al-Zāhira's existence was of short duration, since it was sacked and utterly destroyed in 399/1009, at the time when Muḥammad II al-Mahdī revolted against ʿAbd al-Raḥmān Sanchuelo, whom he had imprisoned and killed, and usurped the caliphate, dethroning His̲h̲ām II. The ploughshare subsequently caused the last traces of the city to disappear, whose site, some years later, was no longer known.

The Arab chroniclers do not supply as many details on al-Madīna al-Zāhira as on Madīnat al-Zahrā' [*q.v.*], but they mention in their texts some very precious evidence for determining the exact site of the dictator's city. They tell us, for example, of the general name of the area where al-Zāhira was built:

Shabulār or Ramla, i.e. "sandy terrain" (in Spanish *arenal*). This terrain is still called "Cortijo del Arenal", an important part of which, the "Pago de Tejavana", is easily identified with the main nucleus of the old city. Today the traces which remain are not very significant, but they show us that the buildings of al-Madīna al-Zāhira were made of materials of mediocre quality—bricks, quarries stones, clay wall etc.—and, consequently, without possible comparison with the riches and majestic edifices of its rival Madīnat al-Zahrā'. However, the palaces of al-Zāhira were notably endowed with fine, sculpted marble cisterns in the form of Roman sarcophagi and intended as fountains, of which the museums preserve marvellous examples which were executed—as their inscriptions testify—at al-Zāhira for the Banū ʿĀmir.

Finally, it is worth noting that, according to the historian al-Ḍabbī (*Bughya*, biogr. no. 1544), the famous Munyat al-ʿĀmiriyya was one of the palaces of al-Madīna al-Zāhira and, consequently, was not located alongside Madīnat al-Zahrā', as some contemporary authors presume, who confuse this *munya* with the Munyat Wādī 'l-Rummān given to the caliph al-Ḥakam II al-Mustanṣir by his great *fatā* Durrī al-Aṣghar in 362/973.

Bibliography: see principally ḲURṬUBA, and also L. Torres Balbás, *Al-Madīna al-Zāhira, la ciudad de Almanzor*, in *al-Andalus*, xxi (1956), 353-9 (with a very complete account of the historical notices concerning the city supplied by the Arab chroniclers and geographers).

(M. OCAÑA JIMÉNEZ)

MADĪNAT SĀLIM, the Arabic name, which has become MEDINACELI, of a small town in north-eastern Spain, on the railway from Madrid to Saragossa, and almost equidistant from these two cities; it lies at an altitude of more than 3,280 feet/1,000 m., on the left bank of the Jalón. It owes its name to a Berber from the Maṣmūda, Sālim, who repaired a Roman fortress which Ṭāriḳ [*q.v.*], according to Yāḳūt, iii, 13, had found in a ruinous state.

The Arab geographers give brief descriptions of Medinaceli. According to al-Idrīsī, it was a large town built in a hollow with many large buildings, gardens and orchards. Abu 'l-Fidā' says that this town was the capital of the Middle March (*al-thaghr al-awsaṭ*).

Through its geographical position, Madīnat Sālim was of considerable strategic importance for the Umayyads from the 4th/10th century onwards. It was on many occasions, as the last stronghold on Muslim territory, the point from which forces assembled at Cordova finally started for expeditions against the Christians of the north-east of the Peninsula and to which they retired. Though somewhat decayed down to the reign of ʿAbd al-Raḥmān III al-Nāṣir, it was rebuilt, if we may believe the detailed evidence of a chronicler quoted by Ibn ʿIdhārī, in 335/946: this ruler put the work in charge of his client, the general Ghālib, and all the garrisons of the country lent their aid in the work. This Ghālib remained governor of Medinaceli and all the Middle March until the power was seized by al-Manṣūr Ibn Abi ʿĀmir [*q.v.*]. It was in Medinaceli that this famous *ḥādjib* died on 27 Ramaḍān 392/10 August 1002, on returning from his last expedition against Castile. In the following century, Medinaceli was frequently taken by the Christians and retaken by the Muslims, before being finally incorporated in the Kingdom of Castile.

Madīnat Sālim should not be confused with Madīnal Ibn al-Sālim or Ibn Sālim, which was situated in the region of Seville, probably the modern Grazalema in the province of Cadiz (see Lévi-Provençal, *Hist. Esp. mus.*, i, 342).

MADĪNAT AL-ZAHRĀ', governmental city of the Umayyad caliphs of Cordova.

According to the texts which recount the construction of this *madīna*, it was the monumental work of ʿAbd al-Raḥmān III who had it built to satisfy the whim of a *djāriya* of his *ḥaram*, al-Zahrā'. The city was constructed 5 km. as the crow flies to the north-west of Cordova, on the southern flank of the Djabal al-ʿArūs ("the Bride's Mountain") of the mountain chain called today Sierra Morena. The work was begun at the beginning of the year 325/19 November 936, under the direction of the Crown Prince al-Ḥakam, with the technical collaboration of the architect Maslama b. ʿAbd Allāh. During the *fitna* or civil war which was to lead to the fall of the caliphate of Cordoba, the Berbers of Sulaymān al-Mustaʿīn occupied Madīnat al-Zahrā' by force and it was sacked and destroyed (401/1010). The ruined city later fell prey to pillage and systematic destruction, especially in the Almoravid and Almohad periods.

When Cordova was conquered by Ferdinand III in 1236, the old site of the royal *madīna* was a vast terrain, occupied by ruined walls, which someone called "Castillo de Cordoba la Vieja"; the monarch gave this terrain to the Cordoban Municipal Council, and hewn stones continued to be taken to build palaces, churches, convents and bridges in the capital. In 1408, the Council gave the ruins to the monks of St. Jerome who exploited them intensively to build in a nearby orchard a monastery called "Valparaiso", in which Ambrosio de Morales, the great Cordovan historian, stayed in *ca.* 1532; he sought to identify the neighbouring ruins, but, in his study published in 1575, he asserted that they were of Roman origin and that their site was that of the famous Colonia Patricia. In 1627, another Córdovan historian, Pedro Diaz de Rivas, demonstrated that they were not Roman but Arab and belonged, in a concrete manner, to a great palace erected by ʿAbd al-Raḥmān III; and this same thesis was upheld by P. Francisco Ruano in 1760 and Antonio Ponz in 1792. The painter and historian J. A. Ceán Bermùdez was the first researcher to identify "Córdoba la Vieja" with Madīnat al-Zahrā' (1832), and this identification was confirmed in later years, when European Arabists began to publish the Arabic sources for the history of Muslim Spain, so that, in 1854, Pedro de Madrazo and Pascual de Gayangos were charged by the Spanish state with carrying out an archaeological exploration at "Córdoba la Vieja", but their work was not crowned with success.

Meanwhile, the architect Ricardo Velázquez was to inaugurate, in 1911, a new period of exploration which he continued until his death in 1923, with excellent results: the discovery of a sector of the

northern part of the city, where the principal drawing-room of the caliph was excavated, richly decorated —which Ricardo Velázquez called the "Salón Occidental"—and, on the other hand, a large *madjlis*—for its discoverer, the "Salón Oriental"—clearly marked by its austere decoration which proclaims a military purpose. The excavations carried out by Ricardo Velázquez were not conducted following a preconceived programme, and it was at his death that a local commission was named in Cordova (Rafael Jiménez, Rafael Castejon, Ezequiel Ruiz, Félix Hernández and Joaquin Ma de Navascués) which had as its aim the delimiting of the extent of Madīnat al-Zahrāʾ and the establishing of a plan of work to follow in future excavations. The survey of the ruins which flourished under the covering of vegetation allowed Hernández, the architect of the commission, to draw up, in 1924, the topographical plan on a scale of 1:800 of the terrain where the city was located. Later the same architect drew up, in 1926, a plan on a scale of 1:200 of the part explored by Velázquez, of which the drawing-rooms, courts, vaulted passages, etc., were enumerated following the chronological order of their discovery, and this order has prevailed until the present. Quite soon after, excavations were pursued and the two principal sectors discovered by Velázquez were gradually enlarged until they constituted a good cohesive group. At the beginning of the year 1930, the commission having been reduced to only two members, Castejòn and Hernández, the reconstruction was begun, up to a prudent height, of the northern wall encircling the city. The same system was followed during the following years, with all the walls separating the terraces which had been discovered, before the re-establishment of the masonry in its broad outline. The civil war of 1936 paralysed the work until 1941, when it was pursued according to the system presented above. Simultaneously, excavations were undertaken in some then unexplored sectors belonging to the southern part of the Alcazar of the city, where in 1944, a magnificent reception *madjlis* was discovered, whose architectural work was a dreadful ruin, while its revetments of sculpted stone, although very fragmented, remained almost complete. This important discovery proved in an indisputable manner that the plunderers had pillaged everything that could be utilised for future constructions—hewn stones from the walls, capitals, shafts and bases of columns, etc.—and had disdained the surface decoration of the halls, generally composed of thin stone plaques which would be useless to dislodge and place in pieces in another construction. The year 1944 signals, in the excavations of Madīnat al-Zahrāʾ, the beginning of a new age characterised by the reconstruction of halls by means of the preliminary recomposition of the decorative plaques and the restoring of these plaques on the walls and rebuilt arches. While the structure of the reception *madjlis* was rebuilt, excavations were pursued in the same sector and there was discovered, in the course of the following years, the whole architectonic entirety of which the *madjlis* was the heart: a vast terrace, delimited on the east, south and west by a very thick wall fortified with towers; a small *ḳaṣr* or pavilion placed opposite the *madjlis* and separated from it by a large pool; a *ḥammām* or steam bath, and some drawing-rooms with courts, staircases and public conveniences. According to the epigraphy placed at the time in this sector, the *madjlis* was built by ʿAbd al-Raḥmān III al-Nāṣir during the years 342-5/953-6, under the direction of his *fatā* Shunayf, as was the pavilion, but under the direction of the *fatā* Djaʿfar (the Djaʿfar b. ʿAbd al-Raḥmān, who was to be the *ḥādjib* of al-Ḥakam II). In 1964, Basilio Pavón explored, with the assistance of Hernández, the sector corresponding to the site of the *djāmiʿ* of the city, perfectly illustrated in the topographical plan of 1924; this building had been totally destroyed by the plunderers, but all the principal elements of its structure have been identified and they will shortly allow for the reconstruction of the mosque. At the end of 1969 Hernández remained the sole director of excavations, which were then concentrated in a new sector located in the Western wing of the great Alcazar of al-Zahrāʾ and probably belonging to the house of Djaʿfar, the *ḥadjib* mentioned above. Finally, in 1975, on the death of the great master of Hispano-Moorish art Félix Hernández, the direction of the works fell to the architect Rafael Manzano, who has continued the enormous task of restoration begun by his predecessor.

The Arab chroniclers and geographers have supplied us with excellent descriptions of Madīnat al-Zahrāʾ and plenty of accounts and pieces of information acquaint us with the motive for its foundation; the choice of its site; the duration of its construction; the number of the workmen there, camels, mules and the materials and large sums spent on it; the palaces, reception halls, outbuildings, baths, pools, gardens, barracks, etc., built in its enclosure; the principal wonders contained in its buildings; the people who lived there; the bureaucratic services of the state which moved from Cordova to the new court; the memorable feasts celebrated in honour of the great dignitaries and ambassadors or to recall the memory of important events; the twilight of the city; and, finally, its destruction and ruin. Furthermore, excavations have confirmed for us that the foundation of al-Nāṣir was a dazzling city built within a rectangular rampart which measured 750 m. from north to south and 1,500 m. from east to west, flanked by towers regularly spaced. This rampart was formed by two walls separated by a corridor, except in the central tier of its northern flank, where a single wall was defended, it seems, by another rampart placed in from of it up to the ridges of the neighbouring hills and attached to the general enclosure. The buildings constituting the Alcazar of the city—Royal Palace, Civil Headquarters, Military Headquarters and prodigious reception halls with their secondary annexes—were laid out on stepped terraces and adapted to the relief of the lower slopes of the mountain and supported by solid reinforcing walls. The area occupied by the Alcazar, the whole northern sector of the city, was approximately 45 hectares, of which only 12 hectares have been explored at present, although corresponding to the central part of this supreme architectural complex. Owing to the fact that the unexplored parts are, for the moment, greater (33 hectares) than those which have been explored, it is still not possible to identify the buildings discovered in terms of the documentation supplied by the texts; consequently, the Arabic names which have been given to these buildings are also gratuitous rather than definitive. For the moment we must be satisfied with contemplating the exceptional spectacle which, following the most recent work, Madīnat al-Zahrāʾ offers to the visitor to the ruins: a reception *madjlis* of the 4th/10th century reconstructed with its origin-

al decoration, whose themes sculpted in stone and marble reveal the high degree of experience and exquisite artistic sensibility of all the artisans who worked for the great Cordovan caliph ʿAbd al-Raḥmān III al-Nāṣir.

García Gómez, *Algunas precisiones sobre la ruina de la Córdoba omeya*, in *al-And.*, xii (1947), 267-93; idem, *Anales palatinos del califa de Córdoba al-Hakam II, por ʿĪsā ibn Aḥmad al-Rāzī*, Madrid 1967, and H. Terrasse, *Islam d'Espagne*, Paris 1958.

(M. OCAÑA JIMÉNEZ)

MAḌĪRA (A.), a dish of meat cooked in sour milk, sometimes with fresh milk added, and with spices thrown in to enhance the flavour. This dish, which Abū Hurayra [*q.v.*] is said to have particularly appreciated (see al-Masʿūdī, *Murūdj*, viii, 403 = § 3562, where a piece of poetry in praise of *maḍīra* is cited), must have been quite well sought-after in mediaeval times (al-Djāḥiẓ, however, does not cite it in his *K. al-Bukhalāʾ*; see nevertheless al-Thaʿālibī, *Laṭāʾif*, 12, tr. C. E. Bosworth, 46). Its principal claim to fame comes from al-Hamadhānī's *al-Maḳāma al-maḍīriyya* (no. 22 in Muḥammad ʿAbduh's edition), in which ʿĪsā b. Hishām records solely at the beginning of the *maḳāma* an occurrence which he witnessed and then tells the story, it goes without saying, in the mouth of Abu 'l-Fatḥ al-Iskandarī, of an adventure which had happened previously to this last. In effect, this story is the satirical portrait of a nouveau riche who invites Abu 'l-Fatḥ to his house in order to try some *maḍīra*, but goes on at such length about his skill in acquiring the house and other objects, whose praises he sings with such a wealth of details that the invited person, overwhelmed, takes to flight. Pursued by street urchins, he hurls a stone which wounds one of these last grievously, and spends two years in prison. Hence he has vowed never more to eat *maḍīra*, thus explaining why, at the beginning of the *maḳāma*, he refused a dish of it.

The *maḳāma* has been translated into German by O. Rescher, in *Beiträge zur Maqāmen-Litteratur*, v, Leonberg 1913; into English, by W. J. Prendergast, *The Maqámát of Badíʿ al-Zamán al-Hamadhání*, Madras 1915 (2nd ed. with Preface by C. E. Bosworth, London-Dublin 1973); into Italian, by F. Gabrieli, *La maqāma maḍīriyya di al-Hamadhani*, in *Rend. Lincei*, 8th Ser., iv/11-12 (1949), 509-15; and into French by R. Blachère and P. Masnou, *Al-Hamadānī, choix de Maqāmāt*, Paris 1957 (with the title: *La séance de la maḍīra ou Le parvenu*) and by R. Dagorn, in *IBLA*, 153 (1984/1), 113-23. (ED.)

AL-**MADIYYA**, AL-MADYA, LEMDIYA, in French MÉDÉA, a town of Algeria situated about 100 km./60 miles to the south of Algiers (in lat. 36° 15′ 50″ N., long. 2° 45′ E.), at an altitude of 920 m./3,018 ft. and on the northern border of the mountainous massif which divides the high plateau from the Mittīdja. Down to the French occupation, it could only be reached by a bridle-path over the Muzāya pass (979 m./3,270 ft.). The building of a road through the gorges of the Chiffa, alongside of which a railway runs, has made access to it easier. The town itself is built at the foot of slopes covered with vineyards which yield wines of superior quality and orchards in which, as a result of the temperate climate, fruit trees grow very well. In the neighbourhood, a number of villages have grown up in which the cultivation of cereals is combined with that of the vine. There is also a fairly busy market, but it is losing in importance since the railway has been extended to Djelfa at the southern end of the high plateaux. The population, which, in 1926, was 13,816, of whom 2,225 were Europeans, has today increased considerably.

Médéa occupies the site of a Roman settlement, Lambdia, which A. Pellegrin, *Essai sur les noms de lieux d'Algérie et de Tunisie*, Tunis 1949, 98, proposes to connect with the Berber root *b.d.* "to rise, stand up". According to Ibn Khaldūn, *ʿIbar*, vi, 154, tr. ii, 6, this region was inhabited by the Ṣanhādja tribe of the Lamdiyya, whose name survives in the ethnic name Lemdānī which people originally from Médéa bear. In 349/960, Buluggīn b. Zīrī [*q.v.*] restored and enlarged (but did not "found", as the sources say) the urban complex (see Ibn Khaldūn, *loc. cit.*; al-Bakrī, *Description*, 65-6, tr. 136; Yāḳūt, iv, 413, s.v. Mattīdja; H. R. Idris, *Zirides*, 28 and index). We know virtually nothing about the town's history. Leo Africanus (tr. Épaulard, 351-2), who, having stayed there two months, apparently wanted to stay there, and, following him, Marmol, *Africa*, ii, 394, merely tell us that after having belonged to the sultans of Tlemcen who kept a garrison there, it passed into the hands of the sultans of Tenès, and then of the Turks when the Barbarossas [see ʿARŪDJ] established themselves in Algiers. Under Ḥasan Khayr al-Dīn, Médéa became the capital of one of the three provinces (*beyliks*) of the Regency, the *beylik* of the south or of Titteri, to which at a later date was added the lower valley of the Sébaou in Kabylia. Down to about 1770 we therefore find the bey of this province alternately at Médéa and Bordj-Sébaou. It was not until this date that, the region of Sébaou having been incorporated in the *Dār al-Sulṭān* governed by the dey, the bey of Titteri settled permanently at Médéa, where he was in a better position to control the nomadic tribes of the plateaux. He had, however, no authority over the inhabitants of the town itself, who were under the authority of a *ḥākim* appointed by the *agha* of Algiers. The population, which did not exceed 4,000-5,000, among whom were many Kulughlis [see ḲUL-OGHLU] and Turks retired from the service, became wealthy through its trade with the south. Caravans brought thither the produce of the Sahara and also negro slaves, who were sold to the citizens of Algiers.

During the years which followed the capture of Algiers, the French on several occasions (Nov. 1830, May 1831, April 1836) occupied Médéa, without taking permanent possession. ʿAbd al-Ḳādir [*q.v.*] however placed a bey in it and had his ownership of it recognised by the treaty of the Tafna. The outbreak of hostilities again between the *amīr* and the French led to the final occupation of Médéa by the latter on 17 May 1840. It was in Médéa that, shortly afterwards, the future poet Jean Richepin was to be born.

Bibliography: In addition to the references given in the article, see F. Pharaon, *Notes sur les tribus de la subdivision de Médéa*, in *R. Afr.* (1857); Federmann and Aucapitaine, *Notice sur l'administration du beylik de Titteri*, in *ibid.* (1869).

MADJALLA [see MEDJELLE]

MADJAR, MADJARISTĀN, name given to the Hungarians or Magyars and to Hungary in the Ottoman period.

1. IN PRE-OTTOMAN PERIOD

(1) The names for the Hungarians and Hungary in the Arabic and Persian authors of the 3rd-8th/9th-14th centuries. The earliest mention of the Hungarians (Magyars) occurs in

the *Kitāb al-Aʿlāḳ al-nafīsa* of Ibn Rusta (Ibn Rosteh), written between the years 290-300/903-12-13 on the basis of the geographical treatise of al-Djayhānī (*ca.* 300 A.H.) who used, in the composition of this work, an anonymous historical account dealing with Central Asia and Eastern Europe and dating from the second half of the 3rd/9th century. In this source the Hungarians appear with the name of *al-Madjghariyya*, i.e. the Magyars. In this period they inhabited the plains adjacent to the Black Sea, between the Don and the Lower Danube, their eastern neighbours being the powerful Turkish tribe of Badjanāk (Pechenegs). It was under pressure from this tribe that they were compelled to withdraw, in *ca.* 889-92 A.D., into the basin of the Carpathians, where they founded a state which survived, within its 9th-10th century frontiers, until the end of the First World War.

It seems that the same *Anonymous account* of the 3rd/9th century is also the basis for the description of the country al-Madjghariyya (Ar. *bilād al-Madjghariyya*) contained in the *Kitāb al-Masālik wa l-mamālik* of al-Bakrī (*ca.* 460/1068). In fact, the Hungarians mentioned in this account led a nomadic existence, and their territories, situated on the Black Sea, bordered on the provinces of the Byzantine Empire (Ar. *bilād al-Rūm*).

A description of the al-Madjghariyya people is also found in the *Ṭabāʾiʿ al-ḥayawān* of Sharaf al-Zaman Ṭāhir al-Marwazī [*q.v.*] composed in *ca.* 514/1120. Analysis of this description reveals that the period in question is prior to the years 889-92, a period during which the Hungarians were still a nomadic people inhabiting the plains of Southern Russia, between the rivers *Dūnā (Danube, erroneously in the Arabic text Rūtā), and Atil or Etul (Don). The description of al-Madjghariyya contained in the work of al-Marwazī is also based on the treatise of al-Djayhānī.

The anonymous Persian geographical treatise entitled *Ḥudūd al-ʿālam* written in 982 A.D. mentions the Hungarians with the name of *Madjghari*. According to the author of the *Ḥudūd al-ʿālam*, the country of the *Madjghari* was situated to the west of a range of mountains which corresponds to the Carpathians and to the north of a Christian people called Wanandar. This latter people must be identified as the Bulgar tribe of the Onugundurs who, in the 6th-7th centuries A.D., occupied the north-western Caucasus, in the region of the Kuban. It is known from Byzantine sources that, under the command of Asparukh, part of this tribe left the region of Kuban and travelled towards the Lower Danube which it crossed over in 679 A.D., founding to the south of this river the Turko-Slavic state of the Bulgars. The new arrivals were baptised in 864. The information given by the *Ḥudūd al-ʿālam* concerning the frontiers of the territory of the Hungarians is therefore not derived from the *Anonymous account* of the 3rd/9th century, but from another anonymous source composed later, in the 4th/10th century, after the conquest by the Hungarians of the Carpathian basin in 889-92 A.D.

The name *Madjghari* or rather *Madjghariyān* (the plural in Persian of *Madjgharī*) is also found in the *Zayn al-akhbār*, a Persian historical treatise composed in the years 441-4/1048-52 by Gardīzī (or Gurdēzī). Gardīzī considers this people to be Turkish. In the paragraph of the *Zayn al-akhbār* devoted to the Madjghariyān, Gardīzī has used two different sources, these being the *Anonymous account* of the 3rd/9th century compiled by al-Djayhānī and an anonymous source of the 4th/10th century, the same one that was used by the author of the *Ḥudūd al-ʿālam*. The Bulgars of the Danube are here called Nandar.

In his *Ṭabāʾiʿ al-ḥayawān* al-Marwazī also calls the Hungarians (whom he knew still in their ancient homeland to the north of the Black Sea, between two rivers which may be identified as the Don and the Danube) *al-Madjghariyya*. He considers this people as being of Turkish origin. Like Ibn Rusta, he too has taken his account concerning the Hungarians from the *Anonymous account*, the work dealing with Central Asia and Eastern Europe compiled by al-Djayhānī.

The name *al-Madjghariyya* is also found in the *Taḳwīm al-buldān*, a geographical work by Abu 'l-Fidā' (d. 732/1331), in a passage probably derived from the *Kitāb al-Masālik wa l-mamālik* of al-Bakrī. For this reason this author calls the capital of the said people Madjgharī.

In another passage of his *Taḳwīm al-buldān*, Abu 'l-Fidāʾ also mentions the Magyars under another form of this name, sc. *Mādjār*. According to this passage, the people in question lived, alongside the Serbs (Ar. *al-Sarb*), the Vlachs (Ar. pl. *al-Awlāḳ*) and other "infidel" (Christian) peoples in mountains called Ḳashḳā Ṭāgh (Kashka-Dagh), where the Danube (Ar. Ṭunā) has its source and which may be identified with the Carpathians, linked to the Alps on one side and to the mountains of the Balkan Peninsula on the other.

In his cosmographical treatise entitled *Kitāb Nukhbat al-dahr fī ʿadjāʾib al-barr wa 'l-baḥr*, al-Dimashḳī (d. 727/1327) also mentions the Mādjār or Hungarian people among the tribes inhabiting the territories situated on the tributaries of *Nahr al-Ṣaḳāliba wa 'l-Rūs* (here, the Danube and the Tisza, wrongly considered as tributaries of the Dnieper). Besides the Mādjār, al-Dimashḳī also mentions among these tribes the *Bashkird*, which he takes to be a separate people but which was, as will be demonstrated below, simply another name given to the Hungarians by the mediaeval Arab geographers.

The Arabic and Persian names *al-Madjghariyya*, *Madjghari*, *Madjghariyān* and *Mādjār* produce the Finno-Ugrian ethnonym *Magyar* which is also known from mediaeval European sources. Thus for example, the Byzantine author Constantine Porphyrogenitus (writing in 949-52) mentions among the Hungarians who were settled in the basin of the Middle Danube, a clan called Μεγερη (Hungarian Megyer). The Hungarian chronicler Simon of Kéza (writing in 1282-5) states in his *Gesta Hungarorum* that the ancestor of the Hungarians bore the name of Mogor. It may further be noted that in the *Gesta Hungarorum* of the Hungarian author called Belae regis Notarius (*ca.* 1200), the territory occupied by the Hungarians before their arrival in the Carpathian basin (889-92) bore the name of Dentumogor (Hungarian *Dontö magyar*). The second part of this name, i.e. *-mogor*, corresponds to the name of the ancestor of the Hungarians according to Simon of Kéza, while the first part, i.e. *Dentu-*, seems to be the origin of the name of Dāna, known from the *Kitāb al-Buldān* of Ibn al-Faḳīh (290/902) as being that of the territory situated on the Lower Don, and also the name of Tanat, mentioned in a letter of the Khazar king Joseph in the 10th century A.D. The Italian geographical charts of the 13th-14th centuries call this region Thanatia.

The second name by which the Arab geographers

of the 4th-8th/10th-14th centuries designated the Hungarians was that of Bashkirs. The latter were in fact a Turkish tribe which had lived, since the 3rd/9th century if not earlier, in the territory corresponding to the old Russian provinces of Penza and Orenburg; they had nothing in common with the Hungarians, who spoke and still speak a Finno-Ugrian language. Thus the use of the name Bashkirs to denote the Hungarians (in addition to the correctly-named Turkish Bashkirs) is an enigma which has yet to be solved, despite the efforts of numerous historians and linguists, Hungarian and others. The Turkish Bashkirs were called Bashkird by the mediaeval Arab authors (thus for example in the work of Ibn Faḍlān [*q.v.*], *ca.* 310/922). The same, or analogous, names were also used by the Arab geographers to denote the Hungarians.

The first Arab author to give the Hungarians the name of Bashkirs was al-Masʿūdī (d. 345/956). Describing in his *Murūdj al-dhahab* the war fought by the Hungarians and their allies the Pechenegs against the Byzantines in the years 320-32/932 to 43-4, this author denotes the Hungarians by two different but related names, these being *Badjghird* and **Bazkirda*, making of them two different, though kindred, peoples.

In his *Kitāb Masālik al-mamālik*, al-Iṣṭakhrī also uses the name *Basdjirt* to denote both the true Bashkirs and the Hungarians. The Basdjirt/[true] Bashkirs lived, according to this geographer, between the Oghuz-Turks (al-Ghuziyya) and the Bulgars of the Kama (Bulghār), under the domination of the latter, while the Basdjirt/Hungarians were based in the vicinity of al-Rūm, i.e. of the Byzantine empire. They were neighbours to the Badjanāk or Pechenegs who lived at this time between the Don and the Lower Danube. The work of al-Iṣṭakhrī was the principal source for the geographical treatise of Ibn Ḥawḳal entitled *Kitāb al-Masālik wa 'l-mamālik* or *Kitāb Ṣūrat al-arḍ* (first edition prior to 356/967, second edition in *ca.* 367/977, definitive version in *ca.* 378/988), which likewise mentions the Hungarians under the name of Basdjirt.

The name of Bashkirs (written *Bāshghird*) as that of the inhabitants of the country called *Unḳūriyya* (Hungary) is also encountered in the work of the Arab traveller and writer Abū Ḥāmid al-Andalusī al-Gharnāṭī (d. 565/1169-70) called *al-Muʿrib ʿan baʿḍ ʿadjaʾib al-Maghrib*. He arrived in Unḳūriyya in 545/1150-1, stayed three years and left the country in 547/1153, leaving behind his eldest son who had married the daughters of local Muslims. This same author provides another description of Hungary in his second work, the *Tuḥfat al-albāb*. In this latter book, the Hungarians bear the name of *Bāshghūrd*.

In his *Muʿdjam al-buldān*, Yāḳūt (d. 626/1229) likewise calls the Hungarians and their country *Bashghirdiyya* or Bashkirs. This writer met a group of Bashghirdiyya at Ḥalab (Aleppo) in Syria. Yāḳūt also mentions, in this account, the European name of Hungary as *al-Hunkar* (*al-Hungar*).

Ibn Saʿīd al-Maghribī (d. 685/1286) divides the Hungarians into two different nations: *al-Bashḳird* (Bashkirs) who are, according to him, Muslim Turks and who live to the south of the river Dūma (correctly *Dūna*, in Hungarian *Duna*—Danube) and *al-Hunḳar* who are Christians. He does not appreciate that the Bashghird and al-Ḥunḳar are one people which is divided only by religion. Ibn Saʿīd's great geographical work in which these ideas are contained was used by Abu 'l-Fidāʾ in his *Taḳwīm al-buldān*.

The Arab cosmographer Abū Shams Abū ʿAbd Allāh al-Dimashḳī (d. 727/1327) also mentions, in his *Nukhbat al-dahr fī ʿadjāʾib al-barr wa 'l-baḥr*, the Bashghird people which he locates in south-eastern Europe alongside the Mādjār or Hungarians. He does not appreciate that they are in fact the same people. Possibly al-Dimashḳī intended in this fashion to distinguish the Muslim Hungarians from the Christian Hungarians, as Ibn Saʿīd al-Maghribī had done.

In his *Āthār al-bilād*, the Arab cosmographer al-Ḳazwīnī (d. 683/1283) also mentions the Muslim Hungarians whom he calls Bāshghirt.

The Persian writers of the Mongol period also use the name of Bashkirs to denote Hungary and the Hungarians. Thus for example, in the *Djāmiʿ al-tawārīkh* of Rashīd al-Dīn (d. 718/1318) these Bashkirs are mentioned, alongside the Ās (Yasī Alans of the Russian chronicles) the Urūs (Russians), the Čerkes, the Ḳîpčaḳ and the Kelar (in other words, Christian Hungarians, see below) among the subjects of these descendants of Čingiz Khān who dominated the western portion of his empire.

It has been stated above that al-Bakrī uses the term *al-Madjghariyya* in his *Kitāb al-Masālik wa 'l-mamālik* to denote the Hungarians at the time when they were still leading a nomadic existence on the shores of the Black Sea (before 889-92). However, to describe the Hungarians as established, after the year 892 A.D., in the Carpathian basin, he employs two other terms which he has taken from the account of the Jewish merchant and traveller from Tortosa in Spain Ibrāhīm b. Yaʿḳūb al-Ṭurṭūshī (355/965-6) [*q.v.*], these being *al-Unḳali* (gen. pl. *al-Unḳaliyyīn*) and *al-Turk* (pl. *al-Atrāk*). Leaving aside, for the moment, this last-mentioned name, which will be discussed below, the ethnonym *al-Unḳalī/al-Unḳaliyyīn* deserves attention. Now, Ibrāhīm b. Yaʿḳūb mentions this tribe in a brief list of the peoples of Central and Eastern Europe, between the **Ṭudushkiyyīn* (Germans) on the one side and the *Badjānākiyya* (Pechenegs), *al-Rūs* (Russians) and Khazars on the other, and stresses that all these peoples speak Slavic, in view of their close connections with the Slavs. Kunik, the first commentator on that part of the geographical work of al-Bakrī which deals with Central Asia and with Eastern and Central Europe, had already identified the *Unḳaliyyīn* with the Hungarians, a conclusion also admitted by F. Westberg and T. Kowalski. The reason for this identification has been confirmed by the information concerning *al-Unḳaliyyīn* found in the chapters of al-Bakrī's *Kitāb al-Masālik wa-'l-mamālik* which were unknown until edited, very recently, by Abdurrahman Ali El-Hajji (Beirut 1387/1968). One such mention is contained in the paragraph intitled *Dhikr balad al-Unḳaliyyīn* which also seems to belong to the account by Ibrāhīm b. Yaʿḳūb. Now, according to the paragraph in question, we are dealing here with a Turkish tribe (*djins*) settled in proximity to the Slavs, between the land of Buwayra (Bavaria) and the kingdom of Būyaṣlāw, i.e. Boleslas I of Bohemia (935-67 A.D.). According to the same passage, the Russians were the neighbours of *al-Unḳaliyyīn* to the north, the Pechenegs to the east and the Bulgars to the south. There is no doubt that this localisation favours the identification of *al-Unḳaliyyīn* with the Hungarians. Al-Bakrī also mentions another ethnonym written in a similar fashion, *al-Inḳilish*. It is cited in a paragraph of the *Kitāb al-Masālik wa'l-mamālik* intitled *Bilād Ifrandja* ("Land of

the Franks"). According to al-Bakrī, these *al-Inkilish* belonged to the *al-Madjūs* [*q.v.*] (in this case Danes and Norwegians) who were neighbours of the Slavs (in fact, the Slavic tribe of the Obodrites who formerly lived in what is now Mecklenburg were neighbours of the Danes on the south-eastern side). Now, these *al-Inkilish* had nothing to do with the Hungarians; it is more likely that they were the English who, shortly before the time of al-Bakrī, lived under Danish domination (1012-42). The name *al-Unkaliyyīn* belongs to the same group of names for the Hungarians as the Old Slavic *Ugri* (*Ųngri*), the Byzantine *Ungroi*, the Latin *Hungari*, *Ungari*, *Ungare*, *Hungaria* and *Ungaria* and the Polish *Węgry* (pronounced *Wengry*). All these names derive from that of *Onogur*, a nomadic Turkish people known from Latin and Byzantine sources of the 6th century A.D. As for the transformation of the phoneme *r* to *l* in the names *Unkalī* < *Ungari*, this is not an isolated phenomenon in the Hungarian language. In fact, the Germano-Latin proper name Gerard became Gellert in Old Hungarian (11th century).

In the *Kitāb Nuzhat al-mushtāk*, al-Idrīsī's geographical treatise composed in Sicily in 548/1154, Hungary bears the name *Unkariyya*, which probably represents the Latin *Ungaria* or even the Italian *Ungheria*.

Belonging to the same groups of names is also *Unkūriyya* (for **Unguria* or **Onoguria*), the name for Hungary employed by Abū Ḥāmid al-Andalusī al-Gharnāṭī in his *al-Muʿrib*. The name of the inhabitants of Hungary was, in this treatise, as has been observed *above*, *Bāshghird*.

One of the names for the Hungarians employed by Yāķūt is *al-Hunkar* (for *Hungar*), a name derived from the Latin **Hungar*(*i*). Another orthography of this ethnonym is *al-Hunkar* (**Hungar*(*i*)); it is employed by Ibn Saʿīd al-Maghribī (d. 685/1286) in the extract from his great geographical treatise used by Abu 'l-Fidā'.

Besides *al-Unkalī*/*al-Unkaliyyīn*, Ibrāhīm b. Yaʿķūb also uses, to denote the Hungarians, another name, *al-Turk* (pl. *al-Atrāk*) "the Turks". It seems that the term was borrowed by this author from the Byzantines. In fact, Constantine Porphyrogenitus, who was writing some fifteen years before Ibrāhīm b. Yaʿķūb, calls the Hungarians *Turkoi* and their country situated in the Carpathian basin *Turkia*.

To be mentioned finally is a wholly isolated nomenclature, this being *Kelar* or *Kilar*, which concludes the list of names for the Hungarians and Hungary used by the Muslim geographers, historians and travellers of the 3rd-8th/9th-14th centuries. This nomenclature is mentioned several times in Rashīd al-Dīn's *Djāmiʿ al-tawārīkh* as the name of a people mentioned with the Bashkirs, the Ās (Alans, Russian Yasī), the Urūs (Russians), the Čerkes and the Ķîpčaķ among the subjects of the descendants of Čingiz Khān. In all probability, these *Kelar* or *Kilar* are nothing other than the subjects of the *király* (Hungarian, "king") of Hungary. This Hungarian word was already known to al-Gharnāṭī, who had heard it during his stay in Hungary in 1151-3 and who wrote it in his *Muʿrib* as *k.zālī* instead of **k. rālī*. It is possible that by the name *Kelar*/*Kilar*, Rashīd al-Dīn understands the Christian Hungarians, while he denotes the Muslim Hungarians with the term *Bashkirs*.

(2) The Hungarian Muslims in the 3rd-8th/9th-14th centuries. It seems that the most ancient Muslim elements which may be identified among the Hungarians appeared as early as the second half of the 3rd/9th century, thus in the period when the tribes constituting the Hungarian federation were still leading a nomadic existence between the Don and the Lower Danube, as neighbours and allies of the great Turkish state of the Khazars [*q.v.*], whose capital Ātil [*q.v.*] or Itil was situated close to the estuary of the Volga. The population of this state, which was of a heterogeneous nature, included, among others, numerous Muslim groups, among which were pure Khazars, partially Islamised, according to the Arab chronicles, from the 8th century A.D. onwards, Iranian Muslims of the Sarmatian tribe of Arsiyya (ancient Aorsi) who formed the guard of the Khazar Khagans, Khwārazmians, and finally a great number of Muslim traders, of very diverse origins, who lived in the Khazar capital where there were mosques and Ķur'ān schools. According to the *Risāla* of Ibn Faḍlān, there was in Ātil a Friday mosque, and the leader of the local Muslims was one of the pages of the king of the Khazars. According to al-Iṣṭakhrī, there were in Ātil 10,000 Muslim inhabitants and thirty mosques. Similarly, in the Khazar city of Samandar (situated in what is now Dāghistān) there were Muslims and mosques. The Khazar state and the heterogeneous population of this empire exerted a great social and cultural influence on the tribes of the Hungarian (Magyar) federation, especially at the time when this federation was joined, in the second half of the 9th century A.D., by the great rebel Khazar tribe known as Kabars (or Kavars) which took flight following an abortive revolt against the Khazar Khagan. It is known from the *De administrando imperio* of Constantine Porphyrogenitus that the Kabars played a leading role in the organisation of the Magyar federation and that they were at the head of this federation at the time when the Hungarians decided on the conquest of the Carpathian basin. It is also more than likely that this tribe, which no doubt included both Jewish and Khazar-Muslim elements, was the one joined by groups of Arisiyya and of Muslim Khwārazmians, as well as more or less numerous groups of Muslim traders from Ātil and Samandar and the neighbouring provinces of the ʿAbbāsid caliphate. But it should be stressed that all of this is only a conjecture which requires verification.

The earliest substantiated information concerning the presence of Muslim elements in the midst of the Magyar federation, at least in the context of written sources, does not appear until the first half of the 4th/10th century, some four decades after the Hungarians had conquered the land situated on the Middle Danube and the Tisza which subsequently became historic Hungary.

The first written information telling of Muslims living among the Hungarians in historical Hungary comes from al-Masʿūdī's *Murūdj*, in which he refers to the subject in his description of the war waged by the Magyars in alliance with the Pechenegs against Byzantium in 320-32/932 to 943-4. The Pechenegs, who at this period were leading a nomadic existence between the Don, the lower Danube and the Carpathians, are denoted in the *Murūdj al-dhahab* by the twofold name *Badjanāk* and *Badjanā*, and the Hungarians (Magyars) are called here by two different names, *Badjghird* and **Bazkirda*. Among these two tribes there lived, if al-Masʿūdī is to be believed, numerous Muslims divided into two quite different groups. To the first of these groups belonged the Muslim traders who came from

the land of the Khazars, also from Ardabīl, from Bāb al-Abwāb (Derbend) and from other places situated within the ʿAbbāsid caliphate, while the other found its recruits among the Hungarians and Pechenegs proper who had been converted to Islam. In addition, it should not be forgotten that among the Magyars who had come to Hungary from the steppes of southern Russia and among the Pechenegs immigrants to this country there were also Iranian Muslims, including Khwārazmians and probably also Arsiyya, descendants of the ancient Aorsi and kinsmen of the Alans. At all events, the Khwārazmians appeared in Hungary in large numbers at least as early as the 11th century A.D., at which time they are mentioned for the first time in Latin sources emerging from Hungary. As for the Muslim traders who came from the land of the Khazars and the provinces of the ʿAbbāsid caliphate and who lived, in the first half of the 4th/10th century, among the Hungarians and Pechenegs, these were so numerous that, according to al-Masʿūdī, they were able to form the entire vaguard of the "Turkish" army, that is, the allied Pechenegs and Hungarians, in the war against the Byzantines.

Furthermore, the Hungarians living in the Carpathian basin during the 4th/10th century maintained political and economic relations with lands situated to the south of the Caucasus and belonging to the ʿAbbāsid caliphate where their kinsmen lived. In fact, after the arrival of the Pechenegs in the steppes of southern Russia, the Hungarians, displaced by them, split into two parts, of which the first withdrew, in 889-92, towards the Midde Danube and the Tisza, while the second, less numerous, made its way towards the south-east in the direction of Transcaucasia. This is known from Constantine Porphyrogenitus who, in his *De administrando imperio* calls this second Hungarian group *Sabartoi asphaloi*; they were settled, according to this author, "in the lands of Persia". These *Sabartoi asphaloi* (the meaning of the second part of the title, *asphaloi*, remains obscure) are known in the Armenian chronicles by the name of *Sevord-ikʿ* (the termination *-ikʿ* is the sign of the plural in Armenian) and among the Arab historians of the 3rd-4th/9th-10th centuries by the name of *al-Sāwardiyya* (al-Balādhurī) or that of al-Siyāwardiyya (al-Masʿūdī). According to the latter author, the tribe in question lived on the banks of the river Kur, on the frontiers of Ādharbādjān and Georgia. Al-Baladhūrī knew them, furthermore, immediately before the year 279/892. According to Constantine Porphyrogenitus, the Hungarians established in the Carpathian basin often sent merchants to visit these *Sabartoi asphaloi*, who sometimes returned to Hungary with official messages. Little is known concerning the religion professed by the *Sabartoi asphaloi* but it is most likely that, living under Muslim domination, they were exposed to the influence of Islam.

The second author writing in Arabic who tells of the existence of Muslims in Hungary is Ibrāhīm b. Yaʿḳūb. In the course of a visit to the countries of Central Europe, this traveller made his way as far as Prague (Ar. F. rāgha) and he describes, among other things, the commercial life of the city. According to him, among the foreign merchants who came to this city from Hungary, besides the "Turks", i.e. Hungarians proper, there were also Jews and [*ahl*] *al-islām*, i.e. Muslims.

According to a passage in the Hungarian chronicle known as the *Anonymi gesta Hungarorum* composed in 1196-1203, there arrived in Hungary, during the reign of the prince Taksony (?955-972 A.D.), a group of Ishmaelites, i.e. Muslims, originally from *terra Bular* (Bulgaria), led by two semi-legendary figures, these being Billa (Ar. Bi 'llāh ?) and Bocsu(?). The majority of scholars who have studied this problem are of the opinion that the reference here is to Bulgaria of the Kama, a land which had been islamised several decades before. However, it is not impossible that the source used by the *Anonymi gesta Hungarorum* relates here rather to Bulgaria of the Danube, where there were numerous Muslims from as early as the middle of the 9th century A.D. In fact, a letter exists written by Pope Nicholas in the year 866, in which he orders the extirpation of the Saracens in Bulgaria of the Danube. The Bulgars of the Danube were a Turkish tribe, sister of the Bulgars of the Kama who settled to the south of the Lower Danube in 679 A.D., and soon adopted the Slavic language. It is interesting that the name of a settlement of people from *terra Bular*, according to the *Anonymi gesta Hungarorum*, bears the name of Pest (read Pesht) which is without any doubt of Slavo-Bulgar origin and signifies "furnace"; it is today a quarter of Budapest, capital of Hungary.

It seems that after the conversion of Hungary to Christianity, which took place during the reign of King Stephen I (997-1038), one group of Hungarian Muslims ostensibly adopted the Christian faith while remaining, in reality, crypto-Muslim. Prominent among this group were the Khwārazmians (in Hungarian, Káliz) who will be considered below.

In mediaeval Latin documents and in the ancient Hungarian chronicles written in Latin, the Muslims of Hungary are known by numerous names, which may be divided into four main categories, as follows:

(a) *Saraceni* (in the years 1206, 1221, 1231), *Saracenos sive Ismaēlitas* (1233), also *Sarateni*, in Hung. *Szereczen* "Saracens". This is how the Latin sources emanating from Western Europe denoted the Muslim Arabs. These are also the *Sarakenoi* of the Byzantine sources. It is stated, for example, in the *De administrando imperio* that the *Sarakenoi* were a people who followed "the false prophet Mouameth". The aristocratic Hungarian family *Szereczen* is known from documents dating from as early as the years 1138, *ca.* 1165, 1215 and 1222.

(b) *Ismaēlitae* (year 1233), *Hysmaelitae* (1192), *Hysma-helitae* (1222), "Ishmaelites". These are the descendants of Ismāʿīl, son of Abraham who was, according to Arab sources, the progenitor of the Arabs. According to the work of Constantine Porphyrogenitus, a **Nizaros* (in the ms. incorrectly written *Zinaros*), Arabic Nizār, descendant of Ismāʿīl, was "father of all the *Sarakenoi*". It is not impossible that by the name of *Ismaēlitae* the ancient Latin sources of Hungary specifically designated not the Muslim Arabs, but the Islamised Pechenegs who had settled in Hungary (to be further considered *below*). If this is the case, the ancient Hungarians followed the view of the ancient Russians who considered (as emerges from the chronicle of Nestor, beginning of the 12th century A.D.), that the Pechenegs, as well as the Oghuz Turks ("Torki"), the Turkōmans and the Comans (Polovtsī) were descended from the Biblical Ismāʿīl. In addition, the term "Ishmaelites" in certain Hungarian documents written in Latin also designated other groups of Muslims. It is known for example that the *Hysmaelitae* mentioned in a document of the Hungarian king Emeric in 1196, written on the occasion of the market at Eszek (the former county of Valkö, currently Osijek on the lower Drava in Yugoslavia)

were not Pechenegs, but rather Káliz or Khwārizmians.

(c) *Bissermini, Bezzermini, Bisirmani, Bezermen, Buzurman.* This is the transcription, in ancient Hungarian documents written in Latin, of the Hungarian word *Böszörmény* "Muslim". This is not the only usage of the word in Central and Eastern Europe. In fact, it is found in Polish, in Old Czech and in Russian, where the words *bisurman* (*busurman*), *besermen* and *basurman* (*busurman*) signify "Muslim". It is interesting to note that John Plano Carpini, the famous envoy of Pope Innocent IV to the Khān of the Mongols (1245-7), also mentions in his work a people which he calls *Bisermini*, correctly identified by I. Hrbek with the Khwārizmians living on the lower reaches of the Āmū-Daryā. Thus it is not impossible that the *Bisermini* of Hungary may also be identified, at least in part, with the Hungarian Khwārazmians. However, in two Hungarian vocabularies composed in *ca.* 1400, the terms *Ysmaelita* and *bezerman* and *ismaeliticus* do not refer to any ethnic group but indicate the Muslims in general. It should further be added that the name Böszörmény is attested in numerous Hungarian toponyms, in four or five administrative districts of Hungary, within its historical limits, and also in certain mediaeval documents. For example, in a document of 1248, *villa Nogbezermen* (in Hungarian, Nagy Böszörmény "the great Böszörmény") is the name of a village situated to the east of the middle Tisza, in the district of Nyir (Nyr).

(d) *Caliz* (year 1111), *Kalez* (1156), *Qualiz* (1156), *Kualez* (1212), modern Hungarian *Káliz*, in the German chronicles *Kotzel, Cozlones, Koltzens* "Khwārazmians". This name was mentioned for the first time in Hungarian sources in a Latin document of the year 1111, where there is a reference to people called "in Hungarian" *Caliz.* The Byzantine equivalent of this name is *Khalisioi*. According to the Byzantine historian John Kinnamos (writing 1150-65), this people was subject to the King of Hungary and, in the middle of the 12th century, as auxiliaries of the Hungarians, fought alongside the Dalmatians against the army of the Byzantine Emperor Manuel Comnenus. The opinions of this historian regarding the religion of the *Khalisioi* are very confused; in one place he considers this people as being of Persian (i.e. Islamic) religion, while in another passage he states that they professed the Mosaic faith. The Hungarian name of *Káliz*, as well as the Byzantine denomination of *Khalisioi*, corresponds to that of *Khvalisī* which was the old-Russian term for the Khwārazmians and Khwārazm; it is encountered for example in the Russian chronicle of Nestor composed at about the beginning of the 12th century. The Hungarian name of the Khwārazmians is also found in that of *al-Khazar al-khaliṣ*, "the *Khazar-Khaliṣ*", an ethnic group identical to the Khwārazmians which lived, according to al-Iṣṭakhrī and Ibn Ḥawḳal, in the western part of Khazar (Ātil), capital of the Khazar realm, with the king of this state and his army. The Khwārazmians-Khaliṣ appeared in the Khazar realm prior to the 8th century A.D. In fact, the bishop of *Khoualēs* is mentioned in a list of bishops composed before the year 787 A.D. These were the bishops subject to the metropolitan of Doros in the Crimea, and the list probably includes all the bishops of the Khazar empire. The bishop of *Khoualēs* is placed here immediately after that of Astel, i.e. the Khazar capital Ātil. According to Kulakovsky and Vasiliev, *Khoualēs* was a town situated in the Khazar realm, near the estuary of the Volga and near the Caspian Sea, which bore, in the chronicle of Nestor, the name of *Khvalinskoč more*, "the sea of *Khvalinsk*" (it was perhaps the eastern part of the Khazar capital, of which the western part was called *Astel* (Ātil). A section of the Khwārazmians of the of the Khazar realm had probably joined, prior to the years 889-92, along with the Khazar tribe of the Kabars or Kavars, the Hungarian (Magyar) federation and settled in historic Hungary after the conquest of this land by the Magyars. It seems furthermore likely that another group of Khazar Khwārazmians joined the Pechenegs. In fact, al-Bakrī says that in his time (1068 A.D.) there were among the Muslim Pechenegs (of which the main bulk was then leading a nomadic existence in the steppes of South Russia) considerable numbers of *al-Khawāliṣ* (*al-Khvalis*), that is to say, of Khwārazmians. This was the name given by the Pechenegs, says al-Bakrī, to [Muslim] foreigners, slaves who had come to them from Constantinople or from other lands. The Pechenegs gave them the choice of staying in their country, where they could marry their daughters, or of leaving for another country of their choice. It may be added furthermore that Anna Comnena mentions, in her *Alexiad*, a Pecheneg chief named *Khaliṣ*. Nor should it be forgotten that the ancestors on the maternal side of the great aristocratic Pecheneg-Hungarian family Aba, which gave Hungary the king Samuel Aba (1041-7) were, according to the Hungarian chronicles, of Khwārazmian origin (*de gente Corosmina, de Corosminis orta*).

It is certain that a number of Hungarian Muslims became Christians at the time of the conversion of Hungary to Christianity which took place during the reign of King Stephen I (997-1038). But subsequently, these converts reverted in part to their former religion. Such was the situation towards the end of the 11th century. This is known from the resolutions of the Hungarian Diet held at Szabolcs in 1092 during the reign of King Ladislas the Holy (*cap.* 9), which decreed that those Muslims who, after being baptised, reverted to Islam and were again performing the rites of this religion, must be removed to other villages. The successor to Ladislas the Holy, King Coloman III (1095-1114), was also the author of an edict containing resolutions directed against the Muslims. This was furthermore the time of the First Crusade, and it is easy to understand the hostility of the Hungarian clergy and Christian aristocracy towards Muslims in general in this period. According to the decree in question, all Ishmaelites caught in the act of performing their religious rites were to be taken before the king's tribunal, and a part of their property was to be forfeited to the one who had denounced them. According to the same decree, the inhabitants of Ishmaelite villages must build, in the middle of each village, a church which was to be maintained by the local Muslims. Besides this, half of these Ishmaelites must leave the village in question and settle in purely Christian villages in order to become assimilated with the local Christians. It was envisaged by the king that this scheme would lead to the conversion of these people to Christianity. Accordingly to another resolution of this decree, the Ishmaelites must give their daughters in marriage to Christians and, if entertaining Christian guests, must eat with them only pork. Obviously, this last requirement constituted a violation of one of the sternest prohibitions of the Muslim faith. Nevertheless, in spite of the decrees of Ladislas the Holy and Coloman III, a large number of the Ishmaelites of Hungary remained faithful

to Islam. It is even the case that in the 12th century there took place a major expansion of this religion in Hungary, especially during the reign of King Géza II (1141-61) who was, according to the account of the Arab traveller al-Gharnāṭī, a good friend of the Hungarian Muslims.

It is to this latter individual, both scholar and traveller, that there is owed an important illustration of the situation and the life of the Muslims in Hungary towards the middle of the 6th/12th century. Abū Ḥāmid al-Andalusī al-Gharnāṭī was born in the neighbourhood of Grenada in 473/1080-81 and left his native country for good in 500/1006-7, travelling to Egypt and subsequently to Syria to study there and to learn *ḥadīth*. In 516/1123-4, he left Syria and made his way to Baghdād, where he stayed for some time as a guest of Ibn Hubayra al-Shaybānī [*q.v.*] the eminent statesman, general, scholar and future vizier of the ʿAbbāsid caliph al-Muktafī; this politician became his protector and patron. Later, in 524-5/1130-1, Abū Ḥāmid travelled to Persia, to the Caucasus and subsequently to Khʷārazm, a land which he visited three times. Later, he travelled from this country (which had for many years maintained close relations with the land of the Volga), to Sadjsīn or Saḳsīn, a large Turkish commercial town situated on the lower reaches of the Volga. It seems that he settled there in 525/1131 and stayed for some twenty years until 545/1150. It is known that he possessed a house there and had concubines and sons. During his stay in Sadjsīn, he made a journey to Bulghār on the Volga, where he was seen in 530/1135-6. In 545/1150-51, Abū Ḥāmid made his way to Bāshghird, in Hungary, passing through the town of Bulghār and subsequently embarking on the *Nahr al-Ṣaḳāliba* or "River of the Slavs" (this name is to be taken as covering a whole system of rivers, including the upper Volga, its tributary the Oka, the Desna, tributary of the upper Dnieper, and finally the Dniepr itself, probably as far up as Kiev). Subsequently, he travelled towards the south-west, passing through South Russia, and arrived, having crossed the Carpathians, in Hungary. Abū Ḥāmid's stay in the latter country lasted three years, until 1153. In this year he left Hungary, making his way to the town of Ghūrkūmān (*Mankermān or Kiev) and later to Sadjsīn. On this occasion, the king of Hungary entrusted to him the mission of recruiting Turkish archers from South Russia and Sadjsīn for his army. In 549/1154-5, Abū Ḥāmid left the town of Sadjsīn for good with the object of making the Pilgrimage to Mecca, and travelled to Baghdād. During his second stay in the capital of the ʿAbbāsid caliphate, he composed his *al-Muʿrib ʿan baʿḍ ʿadjāʾib al-Maghrib*, which contains a rich store of information concerning Eastern and Central Europe and, *inter alia*, a long description of Hungary and of South Russia. In 566/1161, he travelled to al-Mawṣil, where he composed, the following year, his second work, the *Tuḥfat al-albāb*, a work which also contains a considerable quantity of information concerning Eastern Europe and Hungary. Later, towards the end of his life, he went to Syria where he stayed for five years (560-5/1165 to 1169-70), in Aleppo and subsequently in Damascus, where he died at the age of eighty.

Abū Ḥāmid's descriptions of Hungary contained in the *Muʿrib* and in the *Tuḥfa* are very important and factual, and they reveal some extremely interesting details. The account here will be limited to the information concerning the Hungarian Muslims. Our author, who lived in Hungary, as stated above, for three years, knew very well the Muslim milieu of this land, one to which he was joined by personal links; in fact, his eldest son Ḥāmid, who had accompanied his father on his journey to Hungary and had settled in the country, married the daughters of two local Muslim dignitaries and stayed in Hungary after his father's departure for the Orient in 1153. According to *al-Muʿrib*, there were in Hungary two distinct types of Muslims, these being the *awlād al-Maghāriba* "descendants of the people of the West" and *awlād al-Khʷārazmiyyīn* "descendants of the Khʷārazmians". In the case of the first of these groups, their name *al-Maghāriba* ("the Maghribīs") remains mysterious. It is true that Abū Ḥāmid speaks of the existence of "sons of the Arabs of the Maghrib" (*awlād al-ʿArab min al-Maghrib*) at Sadjsīn on the Volga, an important East European commercial centre, which could be true, especially as these people professed, according to this author, the Mālikī law school like the true Maghribīs; but in another passage of *al-Muʿrib*, he gives the name of *abnāʾ al-Maghāriba* "sons of *al-Maghariba*" to people with no connection whatsoever with true Maghribīs. In the second case, it is a question of some thousands of people living in the vicinity of *Mankermān "Kiev" who had "the appearance of Turks, spoke the Turkish language and shot their arrows like Turks". According to this passage of *al-Muʿrib*, the Maghāriba of the neighbourhood of Kiev also bore the name of Badjana, meaning Pechenegs (it may be recalled, in fact, that one of the two names given to the Pechenegs by al-Masʿūdī was Badjanā, without final -*k*). Thus it appears that the Maghāriba of Hungary were identical to the al-Maghāriba/Badjana of the Kiev region, and that one is dealing with numerous groups of Pechenegs (Abū Ḥāmid counts these Maghāriba/Pechenegs in thousands) living between the 10th-15th centuries A.D. in the Carpathian basin as a subsidiary people to the Hungarians. These Pechenegs (in the mediaeval Latin sources *Bisseni* or *Bysseni*, from the Hungarian *Besenyö*, read *Beshenyö* - *Badjana*/*Bedjene* or *Pačana*/*Pečene* of the Arabic sources) arrived in historic Hungary from the steppes of South Russia in several waves. The earliest of these waves apparently arrived in Hungary in the time of the prince Arpad, at the beginning of the 10th century A.D. The new arrivals who were, according to the Hungarian chronicles, led by a certain Chaba, received from Arpad land situated in the Matra mountains. As for the second wave, a very important group of Pecheneg immigrants, it arrived in Hungary (if credence is to be given to the chronicle *Anonymi Belae Regis Notarii de gestis Hungarorum*, composed in *ca.* 1200 A.D.) during the reign of the prince Zoltan who lived in the first half of the 10th century A.D. These Pechenegs were settled by Lake Fertö, near the north-western frontier of Hungary to protect the young Hungarian state against attacks by the Germans. Soon afterwards, there arrived in Hungary, during the reign of the prince Taksony (? 955-72), a new and very numerous group of Pechenegs led by Thonuzoba, a person of princely origin. Taksony gave him, as a seat, land situated in the vicinity of Kemey, extending as far as the river Tisza. During the reign of the prince Géza (972-7), there arrived in Hungary a new group of Pecheneg immigrants. This is known from the *Gesta Hungarorum* of Simon of Kéza (13th century), who calls the newcomers *Bessi*. The new wave was linked to the victory of John, *comes* of Sopron, a county situated in the

north-west of Hungary. In 1072, according to the *Chronicle of Thurocz*, the latter routed a large detachment of Pechenegs in the service of the Byzantine governor of Belgrade, taking prisoner several thousand Pechenegs whom he probably settled in his domain. The last wave of Pechenegs arrived in Hungary in 1122-3. These were the remnants of a large Pecheneg group which, in withdrawing from the steppes of South Russia, had attacked the frontiers of the Byzantine empire and had been defeated by the army of that state. These remnants settled in Hungary under the command of their Khān, named Tatar. The newcomers were received very amicably by the Hungarian king Stephen II (1115-31). This wave was the last phase in the long series of Pecheneg immigration into Hungary which had lasted almost two hundred years. The Pechenegs who were settled as guards on all the frontiers of Hungary, as well as those who lived in the interior of the state, were required to supply troops of horsemen, who constituted the light cavalry of the Hungarian army. The first information regarding Pechenegs as forming a part of the Hungarian army comes from the year 1052 A.D., at the time of the Hungarian war against the Germans on the river Leitha. In 1116 Pecheneg warriors are found in the army of Stephen II. Later, in the year 1146, the Pechenegs, who probably made up two detachments of the garrison troops on the Austrian frontier, were included in the formation of the Hungarian army during the war against the Austrian Duke Henry Jasomirgott, in the battle near Moson. They were commanded by two Pecheneg "counts". In the year 1150, the Pechenegs constituted, along with the Khalisians (Khʷārazmians) Hungarian auxiliary troops in the war of the Hungarians and the Serbs against Byzantium. The question of the participation of the Pechenegs in the Hungarian army has yet to be studied. However, it should be noted that in the battle between the Hungarians and the King of Bohemia Přemysl Ottokar II near Kressenbrun in 1260, the Pechenegs are not mentioned among the auxiliary troops of the Hungarians.

There were two different types of Pecheneg settlement in Hungary, these being settlements situated close to the frontiers and establishments located in the interior of the country. The colonists settled near the frontiers had the duty of defending the wooden stockades which surrounded the entire territory of Hungary. They were called in the Hungarian documents written in Latin *speculatores* or *confinarum custodes*. Pecheneg guards of this type existed as early as the time of St. Stephen (997-1038) and even before this period. They were settled in groups quite close together, not far from the western frontier of Hungary, notably in the counties of Sopron and Moson. This latter territory was even called, in *ca.* 1230, on account of the large number of Pecheneg military colonists, by the name of *terra Bissenorum* ("the land of the Pechenegs"). The Pecheneg guards settled near the Bohemian frontier were also very numerous, in contrast to the northern, eastern and southern borders, where their numbers were relatively small. As regards the Pecheneg settlements in the interior of Hungary, these may be divided into four groups, these being the group of Fejervár-Tolna (or of Sarviz), the group of Körös and the group of Csanad or Aranka. The largest of these four groups of villages, and at the time the largest group of Pecheneg settlements in Hungary in general, was the group of Fejervár-Tolna situated between the Danube and Lake Balaton, along the river Sarviz, in the southern half of the county of Fejervár and the northern half of that of Tolna. All these settlements had the duty of defending from the enemy the town of Székes-Fehérvár, the royal capital of Hungary under the Arpads (in the year 1192 Belgrade, 997 Alba Regia; in German Stuhlweissenburg). These Pecheneg villages enjoyed a degree of independence and various privileges. It may be added that besides this last group of villages, in the territory situated between Lake Balaton and the Danube, numerous other villages of the Pechenegs are encountered. Thus it may be stated that the largest number of settlements of Hungarian Pechenegs was situated in western Hungary, to the west of the middle Danube. Besides this, there were more than ten Pecheneg villages situated in western Slovakia, about twenty on the upper Tisza, some fifteen between the Tisza and the middle Danube, another fifteen in the basin of the Maros and a further ten in Transylvania.

The Pechenegs who arrived in Hungary through numerous waves during the 10th, 11th and 12th centuries, were for the most part pagans professing the primitive religion of the ancient Turks. However, there were considerable numbers of Muslims among the newcomers, as may be judged from al-Masʿūdī's account regarding the war waged by the *Badjanāk/Badjāna* in alliance with the Hungarians against the Byzantines in 320-32/932 to 943-4. This has been mentioned above. Later, however, Islam disappeared without trace among the Pechenegs of the steppes of South Russia, and al-Bakrī (460/1068) states in his geographical treatise that, according to the reports of Muslim slaves returning from Constantinople, this people professed, until the year 400/1009-10, the pagan faith (*dīn al-Madjūsiyya*). However, immediately after this date, there came among them a learned Muslim *faķīh* who succeeded in converting a number of Pechenegs to Islam. This, according to al-Bakrī, marked the beginning of an active Islamising campaign among the Pechenegs, which ultimately led to war between the new converts and their compatriots who had remained pagans. According to al-Bakrī's informants, the converts to Islam, who numbered only 12,000 warriors, succeeded in defeating the pagans. A large number of the latter were massacred, and the others became Muslims. According to al-Bakrī, this event took place prior to the year 460/1068. At this time there already were among the Pechenegs, if al-Bakrī is to be believed, *faķīhs*, scholars and Ķurʾān readers. If the account given by al-Bakrī is true, the conversion to Islam of the vast majority of the Pechenegs cannot have been other than superficial, with the retention of numerous pagan rites. In view of his account, it is not impossible that the Pechenegs taken prisoner by the Hungarians in 1072 A.D., in the Hungarian war against the Byzantines, and subsequently established, probably as guards, close to the frontiers of this kingdom, could have professed, at least in part, the Islamic faith. Similarly, it is quite possible that the last wave of Pechenegs immigrants which was established in Hungary in 1122-3 A.D., consisted of people half-Islamised, among whom there were *faķīhs* and Ķurʾān readers. If this is a case of Pechenegs very superficially Islamised, the fact is also confirmed by the image of the *Maghāriba/Badjana* (Pechenegs) presented by Abū Ḥāmid al-Andalusī al-Gharnaṭī in 1151-3. These people had only the vaguest ideas of the rites and duties of Islam. Thus, for example, they drank

wine, which was forbidden them by Abū Ḥāmid. Before his arrival, they knew neither the Friday prayer nor the *khuṭba*; they learned these only, this traveller boasts, after his arrival in Hungary. Nor did they practise, before the coming of Abū Ḥāmid, polygamy and concubinage as enjoined by Islam. As regards the former crypto-Muslims of Hungary (these were, for the most part, Bulgars and Khʷārazmians converted to Islam and later, during the reign of Stephen I, officially compelled to renounce this religion), their knowledge of the principles of Islam must, no doubt, have been considerably greater. The general situation of Muslims in Hungary in this period was relatively propitious, since King Géza II who reigned at this time, according to Abū Ḥāmid, "loved the Muslims". The *Maghāriba/Badjana* were, like a great many of the Khʷārazmians, warriors, and Abū Ḥāmid speaks of their participation in the war of Hungary against Byzantium. They were very numerous, "thousands of people" according to this author, referring both to the crypto-Muslims and to the Muslims openly professing their faith. As for the number of places inhabited by these two types of Muslims, there were, according to Abū Ḥāmid, "more than ten thousand"; this latter estimate seems much exaggerated.

It is known that the Pechenegs established between the 10th and the 15th century in Hungary possessed their own aristocracy and nobility. In fact, the various groups of Pecheneg immigrants arrived in Hungary led by their khāns (*dux* in the mediaeval Hungarian sources written in Latin) who enjoyed, in the first period of the Pecheneg presence in Hungary, that is in the 10th-13th centuries A.D., considerable respect. Among these khāns belonged, for example, *Zultan, princeps Bissenorum* of the ancient Hungarian chronicles, as well as other Pecheneg khāns named in these sources, for example Aba, Kemey, Botund, and the *dux nomine Tatar* known from the war between the Pechenegs and Byzantium in 1123, who settled in Hungary in the time of King Stephen II. It is known that the prestige of these Pecheneg khāns in Hungary was so great that one of these persons, Samuel Aba, became in 1041-7, king of Hungary. Later, the different groups of Pechenegs settled in various parts of Hungary were placed under the authority of representatives appointed by the Hungarian kings who bore the titles of *comes* or of *judex* and who were, in the majority of cases, of Pecheneg origin. These *comites* and *judices* also commanded the Pechenegs in times of war, as was, for example, the case of the *comes* of the Pechenegs in the Arpas locality in 1222. The descendants of the khāns and the Pecheneg nobility obtained posts in the administration of the Hungarian state and in the royal court. Thus, for example, a certain Pecheneg named *Mag* (*Magh, Moch*) whose name seems to derive from the Arabic Madjūs, was palatine of Hungary and *comes* of the district of Bácska situated between the Danube and the lower reaches of the Tisza. Another Pecheneg, named Benedict, was, in 1329, *comes* of the district of Baranya. In 1404-6 a certain *Paulus Byssenus de Eorghede* was governor (*ban*) of Dalmatia, of Croatia and of Slavonia. As for the Pecheneg aristocrats who made careers in the Hungarian royal court, there was for example a certain *Aba Bissenus* (of the Pecheneg family of Aba of Kemey) who was, in *ca.* 1226, a *homo regius* of King Andrew II. Besides the aristocrats, there were in Hungary a fair number of less exalted Pecheneg nobles. The mediaeval documents mention several of these nobles, who are designated by the title *nobilis* (for example, *nobiles bisseni de Kwzefalu*). It seems that it is from these Pecheneg khāns who came to Hungary as immigrants that Ismāʿīl b. Ḥasan was descended. He was, according to Abū Ḥāmid, "the descendant of valiant Muslim princes" of Hungary, and he accompanied this traveller on his journey from Hungary to "the land of the Slavs", that is, to Kiev. Abū Ḥāmid also states that his eldest son married the daughters of two respected Muslims of Hungary. It seems that the persons in question here were Islamised Pecheneg nobles (*nobiles bisseni*).

To return to the second group of Hungarian Muslims mentioned by Abū Ḥāmid al-Andalusī al-Gharnāṭī, these are the Khʷārazmians: the Káliz of the Hungarians, *al-Khawāliṣ* or *al-Khaliṣ* of the mediaeval Arab sources, the *Khalisioi* of John Kinnamos and the *Khvalisī* of the Russian Chronicle of Nestor. According to Abū Ḥāmid, there were thousands of them in Hungary (this author even states in one passage that they were "innumerable"); according to him they were in the service of the king of Hungary. Officially, they called themselves Christians and they disguised their Islam, in contrast to the Maghāriba/Pechenegs, who overtly professed the Muslim faith and served the Christians (meaning the king of Hungary) as soldiers. It is also known, from Hungarian documents, that the Káliz sometimes fulfilled the function of administrators of the royal treasury (*institores regii fisci, quos hungarice caliz vocant*). One Caliz (Khʷārizmian) named *Etheius* (from the Arabic ʿAṭiyyat [Allāh]) who occupied this post in the county of Nyitra (Nitra) is known to us from a Hungarian document of the year 1111 A.D. In the same document there is reference to another Káliz who was administrator of the royal treasury and at the same time count (*comes*) of the mint. His name was *Magiug* (Ar. Madjūdj). These two individuals must have been, judging by their names, Muslims overtly professing their faith. At about the middle of the 6th/12th century, Khʷārazmians (*Khalisioi*) lived, among other places, in the county of Szerém (in ancient times, Sirmium, currently Mitrovica in Slavonia) in the south of Hungary in its historic frontiers. The memory of this ethnic group is also preserved in some fifteen toponyms in the counties of Fejér, Veszprèm, Zala and Somogy (all four of these being situated to the west of the Middle Danube), in the county of Nyitra (Nitra) in western Slovakia, in the counties of Közép-Szolnok and Zemplén (both situated on the upper Tisza) and in the county of Pest situated immediately to the east of the middle Danube. The mediaeval Hungarian documents written in Latin also mention a road which takes its name from the Khʷārazmians (1212: *in valle Kualuz*), located in the county of Fejér. A colony of these people (*generatio Kalez*) also lived, according to a document of the year 1135, in the village of Budakálasz; it may be noted that the second part of this last name, i.e. *-kálasz*, has also retained the designation of its former Khʷārazmian inhabitants. A document of 1185 also mentions a road called *Kaluzwt* (Kaluz-ut) which in another document dating from the year 1208 bore the name of *Caluzutu*. The road in question was an important highway which led from Szeged, a town situated on the eastern bank of the middle Tisza, to Bátmonostor. In the Middle Ages, this road played an important role in the Hungarian salt trade and its name indicates that, in this case at least, the salt trade was managed by the Káliz or Khʷārazmians.

It is most probable that the Khʷārazmians also

sometimes hid themselves under the name of Böszörmény or "Muslims" (*Bissermini* of the Hungarian documents written in Latin). It is thus very likely that the Böszörmény toponyms which are encountered in four or five counties could also designate villages formerly inhabited by Khwārazmians. In the *Register* of Várad (13th century), concerning the eastern frontiers of Hungary as it then was, there is mention of a *Villa Nogbezermen dicta* (1248). According to the *Register*, this locality was the centre of the Ishmaelites (*Ismaēlitae*) of Nyr, a territory extending to the north of Várad. It is not impossible that the name of this village denotes the Khwārazmians. It is very probable that the terms *bezermen* and *buzermen* (*Bözörmény*) and *Ismaēlitae* do not refer to an ethnic group, in most cases, but quite simply indicate the Muslim religion. It is in this sense, for example, that the name of the *Bezermenkwt* well, situated in the region of Pest and mentioned in a document of the year 1325, refers not to an ethnic group (the population of this area was composed not only of Bulgars but also of Khwārazmians and Pechenegs converted to Islam) but to Muslims (in Hungarian, Böszörmény) in general. Similarly, the name *Saracenus* (Saracen) referred not to a people but only to the Muslim religion. This name is also identified with that of the Ishmaelites (in the mediaeval documents *Ismaēlitae*, *Hyzmaelitae*, etc.). So, for example, a village of the county of Bodrog (between the Danube and the lower Tisza) was called in 1192 *villa Hysmaelitarum*, and in 1206 *villa Saracenorum*. The Muslim soldiers who were sent to the aid of the Emperor's troops, at the time of the siege of Milan in 1161, according to one chronicle bore the name of Saracens (*Saraceni*). The Muslims of Pest, probably of Bulgar, or possibly of Khwārazmian (*káliz*) origin, who in the 12th century bore the name of Ishmaelites, are called Saracens in a document of 1218. On the other hand, the letter sent by the Czech King Přemysl Ottokar II to Pope Gregory IX, in which there is reference to the battle between the Czechs and the Hungarians near Kressenbrun (1260), distinguishes the *Bezzermini* from the *Hysmahelitae*. It is possible that in this case the first of these names denotes the Káliz or Khwārazmians (it will be recalled that the Khwārazmians were called *Bisermini* by John of Plano Carpini), while the second may refer to the Islamised Pechenegs.

The situation of the Muslims of Hungary which was, if al-Gharnāṭī is to be believed, very prosperous in 1141-61, during the reign of King Géza II, and continued to be favourable at the beginning of the 13th century, in the time of King Andrew II (1205-35). At first, this king also was a friend of the Muslims, but later he was forced to change his attitude under pressure from the clergy. The Hungarian Muslims were at this time still very numerous. In fact, in a papal letter of the year 1221 there is a reference to *multitudo Saracenorum Hungariae*. It is from the period of Andrew II that there emerges the description of the Hungarian Muslims supplied by Yāķūt in his *Muʿdjam al-buldān*. His account is based on information which this author received from a group of these Muslims (Yāķūt calls them *al-Bashghirdiyya*) whom he met at Ḥalab (Aleppo). The date of this meeting is not known exactly. It is known, however, that Yāķūt spent some time there in 613/1216-17, in 614/1217-18, in 621/1224 and finally in 626/1229, shortly before his death. According to this author, the *al-Bashghirdiyya* were people with very red (or blonde) hair, and with complexions that were also very rosy (here = white—Yāķūt uses in both cases the Arabic word *shukr*); they professed the law school of Abū Ḥanīfa. Yāķūt asked one of the members of this group for information on their country and their way of life, and received the answer that their country was situated beyond Constantinople among a population belonging to the Franks (in other words, Western Christians) who were called *al-Hunkar* or Hungarians. They were subjects (Ar. *raʿiyya*) of the *al-Hunkar* king, and were settled in the most distant parts of his domain, where they inhabited some thirty villages. It seems probable that these were the Muslim Pechenegs of which the most important groups had settled, in the 10th-13th centuries, in the counties of Sofron and Moson and between the middle Danube and Lake Balaton, in the western part of Hungary, on the Austrian frontier and around the ancient capital of the Arpads, Székes-Féhervár. According to Yāķūt's informant, each of these villages was large enough to resemble a small town. However, these places were not surrounded by walls. In fact, the king of Hungary did not allow the local Muslims to fortify their villages with walls, for fear lest they rebel against him. According to the remainder of this account, the language of *al-Hunkar*, as of *al-Bashghirdiyya*, was the same as that of the Franks. It is very likely that Yāķūt's informant was thinking here of Latin, which was the official language of the Hungarian state in the Middle Ages. According to other information from this source, the *al-Bashghirdiyya* dressed like the Hungarians and were liable for military service, as were all the other inhabitants of Hungary. In fighting the enemies of the country, Yāķūt states, the Hungarian Muslims were also engaged in the Holy War, the *djihād*, in view of the fact that Hungary was surrounded by infidels hostile to Islam. Yāķūt also asked his informant how the Muslims came to be living in Hungary, among infidel countries. He was told that according to the sayings of the ancestors of *al-Bashghirdiyya*, there came to Hungary, from the land of the Bulgars (*bilād Bulghār*), in ancient times, seven Muslim individuals who settled among the *al-Bashghirdiyya* and converted them to Islam. This tradition corresponds to that of the Hungarian chronicle known as *Anonymi gesta Hungarorum*, composed in 1196-1203, according to which there came to Hungary, during the reign of the prince Taksony a group of Ishmaelites from *terra Bular* (Bulgaria of the Kama or rather, of the Danube). This has been discussed above. Yāķūt's informant adds that the *Bashghirdiyya* who have performed the *ḥadjdj* are highly respected by the Hungarian Muslims, who entrust to them control of their religious affairs. He also says that the *Bashghirdiyya* who engage in military service in Hungary shave off their beards, as the Franks do, in other words in the Christian fashion. However, this is not the case as regards the others, those not performing military service. In view of the fact that the people met by our geographer at Aleppo had shaven beards, they would have belonged to the military caste. Elsewhere in Yāķūt's article it is revealed that the road leading from Hungary to Aleppo passed through Constantinople and was four months' travelling time in length. It was already known, from the account of al-Gharnāṭī, that the route used by Hungarian Muslims in their travels in the Orient also passed through Ķūniya (Konya) in Asia Minor.

It has been stated above that King Andrew II, who was initially well-disposed towards his Muslim subjects, was compelled, in the year 1222, to pro-

claim a charter, also known as the *Golden Bull*, defining the rights of the Hungarian people. The second edition of this *Bull* appeared in 1231, and the document contained numerous restrictions imposed on the Muslims and Jews of Hungary. It emerges from these documents that, until this time, the Muslims (*Hysmaelitae, Saraceni*) and the Jews of the country had the right to take on public functions, in particular, supervision of the mint and of the salt works (year 1222: *Comites camere monetarii, Salinarii et Tributatii Hysmaelitae fieri non possunt*; 1231: *Monetae et Salibus, ac aliis publicis officiis Saraceni non praeficiuntur*; 1232: *Saraceni praeficiuntur camerae et publicis officiis*; etc.), which were forbidden them in the *Golden Bull*. However, all these restrictions, in the period 1222-31, existed only on paper, as is shown by an edict of Archbishop Robert of Esztergom dating from 1232, an edict declaring the excommunication of Hungary. According to this edict Andrew II, after proclaiming the *Golden Bull*, again appointed Muslim dignitaries to public offices; he also tolerated the presence of Muslims in his estates. According to another passage of Archbishop Robert's edict, it was a royal chamberlain named Samuel who was especially favourable towards the Muslims and the "false Christians", i.e. the Patareni. The Archbishop forbade Christians to do business or maintain other relations with Hungarian Muslims, except those who had freed their Christian slaves (or slaves of Christian origin) who were of Hungarian, Bulgar, Cuman or any other race. Following the excommunication by Archbishop Robert, King Andrew II repented and concluded, on 12 August 1232, an agreement with the legate of Pope Gregory IX, in which he promised that in future the Saracens would be forbidden to administer the mint or the revenues of the state, and would be barred from occupying other public posts. He also undertook in this pact that in future the Saracens and Jews would be obliged to carry signs to distinguish them from Christians. They would in future be unable to buy or possess Christian slaves. The king further promised that each year there would be a census of Saracens and Jews carried out by the Palatine, or some other senior state official, who would be authorised, on behalf of the bishops, to take from the Saracens and the Jews any Christian slaves and Christian wives. According to the same undertaking by Andrew II, marriages of Saracens and Jews with Christians were to be dissolved or annulled, and both parties would be punished by the loss of their property and their freedom. Thus it is probably from the year 1232 that there began the most serious oppression of the Hungarian Muslims by the Church, and it is only from this time onward that one can speak of the Christianisation of this part of the Hungarian population. This Christianisation is marked especially by the building of Christian churches and monasteries, which began at about the middle of the 13th century in villages occupied by the Pechenegs who until this time had remained superficially Islamised or even pagan. It is in the documents of this period that phrases appear such as *ecclesia de Besenu* or even *abbatia de Besenu* (from Hungarian *Besenyő* "Pecheneg").

There is no doubt that the invasion of the Mongols (Tatars) in 1241 also contributed, in the highest degree, to the reduction of the Muslim element in Hungary, an element composed for the most part of soldiers in the service of the kings of Hungary. On account of its tenacious resistance, this element suffered particularly severe losses at the hands of the Tatars. This issue will be discussed further, in the context of an analysis of the description of Hungary given by Ibn Saʿīd al-Maghribī.

It is quite possible that there were also Muslims (or at least people superficially Islamised) among the Comans (in Hungarian, *Palocz*), a Ḳïpčaḳ tribe which took refuge in large numbers in Hungary in their flight from the Mongols, who appeared in 1223 in the plains by the Black Sea where the Comans were leading a nomadic existence during the 11th-13th centuries.

Moreover, these were not the first Coman groups to settle in Hungary. In fact, it is known that as early as 1080-7 the Hungarian king Solomon summoned a military detachment of this people into Hungary, and that another Coman group settled in Hungary in 1110-20 probably in the Matra mountains. These newcomers were exposed, in the steppes of South Russia (like other Turkish tribes who led a nomadic existence there and were in general animists and sharmanists), to the influence of Islam. They could thus add to the number of Muslims (or rather of superficially Islamised animists) in Hungary. In this manner, the Muslim presence in this country was maintained in spite of pressure from the Church and in spite of the losses suffered during the Mongol invasion of 1241. It is stated, in fact, in a letter of the king of Bohemia Přemsyl Ottokar II, addressed to the Pope and giving a description of the battle of Kressenbrun between the Czechs and the Hungarian King Béla IV (1260), that among the auxiliary units of the Hungarian army which took part in this battle, there were an *innumerum multitudinem hominum Comonorum et Ungarorum et diversorum Sclavorum, Siculorum quoque et Walachorum, Bezzerminorum et Hysmahelitarum, Scismaticorum etiam ut pote Graecorum, Bulgarorum, Rusciensium et Bosnensium haereticorum*. It has been demonstrated above that *Bezzermini* is the name not only for Muslims in general, but also for the Khʷārazmians (Káliz) and that the word *Hysmahelitae* (Ishmaelites) can also specifically denote the Muslim Pechenegs.

It is from approximately the period of the battle of Kressenbrun that there comes the last Arabic source concerning the Muslims of Hungary. The source in question is a short account of Hungary (*al-Hunkar*) and of the Hungarian Muslims (*al-Bashghirdiyya*) by Ibn Saʿīd al-Maghribī. This account, part of his major geographical work, has been reproduced in the *Taḳwīm al-buldān* of Abu 'l-Fidāʾ. According to this text, Hungary was divided at this time into two parts, of which one, situated in the east of the country, was inhabited by *al-Hunkar* (the Hungarians), a Christian people, while the western part of the country was inhabited by another people, known as *al-Bāshkird* and professing the Muslim faith. This people lived on the river Dūmā (to be corrected to Duna, "Danube") as neighbours to the Germans. The capital of the *bilād al-Bāshḳird*, according to Ibn Saʿīd, bore the name of *Ḳ.rāt* and was situated in the south of the country. In all probability this word is simply an Arabic transcription of the Slavic term *grad* "town" and represents the second part of the name *Belgrad* (the "White town") which was the Slavic name for *Székes Fehérvar*, the capital of Hungary under the dynasty of the Arpads. This name figures, with different forms, in numerous Latin documents of Hungary in the 11th-13th centuries. Its mediaeval Latin equivalent is *Alba civitas regalis*, in German it is *Stuhlweissenburg* and in Hungarian, as has just been stated, *Székes Fehérvar*. Al-Idrīsī calls this town

Bal(a)ghrāta or *Bal(i)ghrāta*. Ibn Saʿīd adds that the *al-Bashkird* people were converted to Islam by a Turkoman *faḳīh* "who taught them the rites of the faith". It seems that the mission of this *faḳīh* (who was not the first Muslim missionary to visit Hungary, a land where, as has been shown above, Islam had been present since the 4th/10th century) cannot have taken place until after the end of the 11th century, a time at which the Turkomans, a Turkish tribe mingled with Iranian elements, was living in a primitive state in Central Asia, as neighbours of the Saldjūḳ Turks. When the latter conquered Asia Minor towards the end of the 11th century, the Turkomans united with them and lived in this land, recognising the authority of the Saldjūḳ rulers of Konya. During his stay in Hungary in 1151-3, al-Gharnāṭī saw Turkoman mercenaries in the service of Byzantium taken prisoner by the Hungarians. Seeing that the route taken by Hungarian Muslims who, according to Abū Ḥāmid, made their way to the East and especially to Mecca, passed through Konya, the arrival in Hungary of a Turkoman missionary, probably a native of Asia Minor, seems entirely probable. It may also be noted that Ibn Baṭṭūṭa (757/1356) uses the name Turkomāns to denote the Ottoman Turks.

The *bilād al-Bashkird* was invaded, according to Ibn Saʿīd, by the Tatars (1241) who slaughtered many of the inhabitants. According to another passage in the work of this author, the *Bāshkird*, as allies of (or rather, subjects of) the Hungarians, took part, in the same year of 1241, alongside the Germans and the Hungarians, in a battle near Sebenico (Šibenik in Croatia), in which the Tatar forces were annihilated. The facts given by Ibn Saʿīd are also confirmed by the Latin sources, including the *Rogerii carmen miserabilis* where there is reference to the armed resistance of the Hungarian Muslims against the Tatars. In another Latin document of this period there is mention of the Saracen district called Bew which was entirely devastated during the Tatar invasion of 1231.

Little is known of the later history of the Muslims of Hungary because the Arab or Christian sources concerning this religious group become less and less numerous. However, it is stated in a Latin document that in 1290, at the time when the Hungarian King Ladislas IV left his capital, going to live as a nomad with the Comans (Hungarian Palocz) who lived in the Matra mountains and in some other districts of Hungary, he handed over all responsibilities of state to a Muslim dignitary named Mizse (Ar. Mūsā ?), who had himself baptised immediately after this appointment. As regards the Arabic sources of this period, the one most worthy of mention is the *Āthār al-bilād* of al-Ḳazwīnī who gives an interesting description of Hungary (he calls it "the land of *Bāshghirt*") composed on the basis of the account of a *faḳīh* who was a native of this country. This account was written, as can be seen from its content, some time after the Mongol invasion of 1241 (the *faḳīh* in question calls the invaders *al-Tatar*). According to this account, the *Bāshghirt* are a great people whose king has a large army at his disposal and of whom the majority is Christian; among them there is also a multitude (Ar. *djamʿ*, also "crowd", "mass of people") of Muslims who observe the law school of the *imām* Abū Ḥānifa. These Muslims pay a tax (*djizya*) to the Christians, just as the Christians pay a tax to the Muslims in lands of Islam. Of less value is a passage from the *Nukhbat al-dahr* of al-Dimashḳī. This author also mentions the Bāshghird people, which he locates in south-east Europe, alongside the *Madjar* or Hungarians. He does not take account of the fact that these are two branches of the same people. It is quite likely that he meant by this means to distinguish, as had been done by Ibn Saʿīd al-Maghribī, the Hungarian Muslims whom he calls *Bāshghird* from the Hungarian Christians whom he calls *Mādjār*.

It seems that Islam was maintained in pre-Ottoman Hungary until approximately the year 1340, the period in which the Hungarian King Charles-Robert of Anjou (1308-42) compelled all those of his subjects who were not yet Christians to embrace Christianity or to leave the country.

However, the Pechenegs, although converted to Christianity in the 14th century at the latest, retained until the end of the 15th century, even after the loss of their ancestral language (by this time they were speaking the Magyar language), some traces of Muslim culture. This is known from the work of A. Bonfinius, who has provided a vivid description of the Hungarian Pechenegs in his *Rerum Hungaricarum Decadis*, ii. liv, p. 220, Hanover 1606. According to this author, "they wore long beards and long moustaches and . . . dressed in the Persian fashion, in tunics of silk that were ruffled by the wind".

(T. Lewicki)

(ii) The Ottoman Period

After the occupation of Belgrade in 1521, Sultan Süleymān I led three campaigns into Hungary in 1526, 1529 and 1532, but by these he did not extend the frontiers of the Ottoman Empire to the north of the line of the Drava and the Lower Danube. It was only in 1541, after the death of János Zapolya, that the Sultan occupied the fortress of Buda, in order to prevent the Hapsburg Ferdinand, who laid claim to the whole of Hungary, from taking possession of it. In 1543 Süleymān launched another campaign against Vienna in accordance with his commitment as part of Franco-Turkish co-operation to attack the Hapsburgs from two sides. But the Turkish army suddenly stopped on its way to Vienna at the fortress of Esztergom because the Sultan had not received any reassuring news either about the activities of his fleet in the Mediterranean Sea or of the military operations of his French allies. So he had to content himself with occupying a few of the more significant fortresses in western Hungary, sc. Esztergom, Tata and Székesfehérvár, and then he started back for home with his army. Subsequently, the *beglerbegi* of Buda and later the *beglerbegi* of Rumelia began to enlarge the Turks' base in Hungary in the form of a wedge against the Hapsburgs by occupying several other fortresses and castles, sc. Visegrád, Nógrád, Hatvan, Temesvár, Szolnok, etc. The first phase of Turkish expansion in Hungary ended with Süleymān's last campaign, the occupation of Szigetvár and Gyula in 1566.

Administration in the Hungarian territories that had fallen under Turkish rule was gradually organised in the wake of the expansion, although the establishing of *sandjaḳ*s did not take place immediately after the occupation of even the more significant fortresses. The process of re-organisation in Hungary cannot have been so fast as was suggested by İ. H. Uzunçarşılı, who claimed that the Turks annexed the Hungarian territory possessed by János Zapolya to the Ottoman Empire in 1541, converted it into the *beglerbegilik* of Buda, which consisted of twelve *sandjaḳ*s, and appointed the *beglerbegi* of Baghdād, Süleymān Pasha, to be its head (*Osmanlı tarihi*², ii, Ankara 1964, 344). It is true that the Sultan appointed Süleymān Pasha to be *beglerbegi* of Buda. This post, however, could not involve the government of twelve Hungarian *sandjaḳ*s because, besides the territory of the *sandjaḳ* of Buda, which was just being formed under the protection of the strongholds of Buda and Pest, it was only Titel which was in Turkish possession north of the line of the Drava and the Lower Danube at that time. Therefore, the *beglerbegilik* of Buda had to be formed from *sandjaḳ*s which were south of the line of the Drava and the Lower Danube, i.e. Eszék/Ösek, Semendire, Izvornik/Zvornik, Aladjahisar/Kruševac and Vulčitrin/Vučitrn. If these remote *sandjaḳ*s had not been joined to Buda, it could have been governed only by a *sandjaḳbegi* in 1541.

Between 1541 and 1566 the Turks established the following *sandjaḳ*s north of the line of the Drava and the Lower Danube: Buda (1541); Mohács (1542); Szeged and Istolni Belgrad, i.e. Székesfehérvár (1543); Eger (1544), although the fortress of Eger itself had not yet been occupied, only its vicinities; Esztergom, Hatvan, Nógrád and Simontornya (1545-6); Siklós (1549); Koppány (1550); Becse and Becskerek (1551-2); Görösgál, Szekszárd, Temesvár and Csanád (1552); Lippa, Arad and Szolnok (1552-3); Szécsény (1553-4); Veszprém (1554); Fülek (1555); and Gyula and Szigetvár (1566). In the meantime, they formed the *beglerbegilik* of Temesvár (1552) from the *sandjaḳ*s of Temesvár and Csanád (the latter including Becse and Becskerek), to which they attached the *sandjaḳ*s of Semendire, Aladjahisar and Vidin, and later the *sandjaḳ*s of Lippa, Arad and Gyula, respectively.

The backbone of the Turks' base in the central part of Hungary was the *beglerbegilik* of Buda, but its upkeep against the Hapsburgs was very costly. According to the cash-book of the Treasury of Buda for the years 1559 and 1560, there were 10,300 Turkish troops in the fortresses belonging to the *eyālet* of Buda, for whose pay and equipment an annual sum of 260,000-80,000 gold pieces had to be brought in from Istanbul, because the taxes and duties obtained in Hungary covered but one-third of their expenses. The transport of money from Istanbul to Buda was necessary not only in the decades that followed, but also in the 17th century. According to Pečewī, the annual tax-yield of Egypt, 300,000 gold pieces, was sent directly to Buda (*Taʾrīkh-i Pečewī*, Istanbul 1283/1866, i, 36). The new campaigns also increased the expenses of retaining the Hungarian territories, and the burden which the newly-occupied fortresses imposed on the empire was clearly greater than the advantage they offered. Thus, e.g., when Eger (1596), Kanizsa (1600), or Várad (1660) and Ūjvár (1663) fell into Turkish hands, each of these fortresses had to be made the seat of a new *beglerbegilik*, so that greater forces could be concentrated for their defence in case of emergency. In accordance with their custom, the Turks formed new *begler-*

begiliks by a re-organisation of formerly-occupied territories. However, while earlier they were able to extend the boundaries of the new *beglerbegiliks* by further conquests (see e.g. the *beglerbegiliks* of Buda and Temesvár), they were no longer able to do so in the 17th century.

The decline in the military preponderance of the Ottoman empire is well-characterised by two episodes which happened in two phases of Turkish rule in Hungary, in the 16th and the 17th century respectively. In the first phase, when the Hapsburgs' envoy, Ferenc Jurkovič, appeared in a robe of state and with a sword on his side before Sinān Pasha, *beglerbegi* of Buda, in 1587, the Pasha had the envoy's sword broken to pieces. In the second phase, however, when Gáspár Tassi, a deputy, went to Murtaḍā Pasha of Buda in 1627 to lodge a complaint against the *ḳāḍī* of Hatvan, the Pasha immediately ordered that the *ḳāḍī* be given 500 lashes on the soles without hearing any witnesses. The Turks' attacks in the 17th century were chiefly mere flare-ups of enthusiasm. During one of them, the siege of Vienna in 1683, they displayed such military weakness that it was soon followed by the coalition of western powers and the eventual liberation of Buda in 1686. Within a decade after this, the Turks lost nearly all their conquests in Hungary except the *beglerbegilik* of Temesvár, which they managed to retain until 1718.

The effect of the Turkish rule in Hungary on general European conditions is variously evaluated in the literature of the subject. According to a noteworthy statement by B. H. Slicher van Bath, the rise in meat prices in Europe after 1550, which was partly due to the growth of population, was primarily caused by the fact that the Turks had occupied Hungary and so the import of cattle from South-Eastern Europe had decreased (*The agrarian history of western Europe A.D. 500-1800*, London 1963, 204). It seems likely, however, that the rise in European meat prices was due to other factors, because, according to Turkish customs registers, that part of Hungary which was under Turkish rule exported to the west 60-80,000 head of cattle yearly around the middle of the 16th century.

However prosperous cattle-breeding was in Hungary under Turkish rule, it was a negative phenomenon from the point of view of economic progress since it meant a return to extensive animal-keeping. The fields of a number of Hungarian villages destroyed in the Turkish wars lay uncultivated, deteriorated into pasture and were hardly fit for anything else than animal grazing. This explains how it was possible even after the Fifteen Years' War (1593-1608) for an English merchant to write the following words about the abundant cattle-stock of Hungary: "This Countrey doth much abound in cattle suffiecient to feed all Germany, the store is so great, that they yearly sell to their neighbours 80 or 100 thousand Oxen" (Lewes Roberts, *The merchant mappe of commerce*, London 1637, 177). When evaluating this attractive figure, however, one has also to consider the fact that such significant towns in southern Hungary as Pécs and Tolna lost the greater part of their vineyards, the source of their former wealth. For example in Tolna, a town with 5000 inhabitants, where, according to Turkish financial accounts, a yearly amount of 6,800 hectolitres (about 150,000 gallons) of wine was produced in the 1560s and 70s, wine-growing completely lost its importance in the course of the 17th century. The worsening of the economic situation can be traced on the basis of Turkish sources, not only along the Danube but also in the area of the River Tisza. For example, in the villages of Gyó and Tāpé, two imperial *khāṣṣ*-estates near Szeged, both the number of the inhabitants and the amount of their agricultural production had dropped to one-half of the original figure between 1550 and 1670, although these figures could have doubled in 120 years.

The demographic conditions of Hungary in the period of the Turks can be fairly well estimated on the basis of the *taḥrīr defterleri*. After their first conquests, as soon as they had strengthened their posts in Hungary, the Turks started to make written records of the settlements within the *sandjaḳs*, which they established with rather vague boundaries. As was written in one of the Sultan's instructions to the *sandjaḳbegi* of Mohács in March 1545: "The state of the local settlements and the conditions of *reʿāyā* must be examined in the same way as in the other provinces" (Istanbul, Topkapı Sarayı Müzesi Arşivi, D. 12321, p. 142). The first registers were made in the *sandjaḳs* of Mohács and Istolni Belgrad in 1545-6 by Čandarlīzāde Khalīl Beg, who was specially sent to Hungary with that task. Of these two *taḥrīr defterleri*, only the one of the *sandjaḳ* of Mohács has survived to this day. In the same years, Khalīl Beg prepared the registers of the *sandjaḳs* of Buda, Esztergom, Nógrád, Hatvan, Szeged and Simontornya as well; these *taḥrīr defterleri* and the *timār defterleri* compiled on their basis are all extant today. New registers of the *sandjaḳs* were usually made every ten years up to 1590. Later, however, the administrative organisation of the Ottoman empire became so loose that new registers were made only in the newly-occupied territories, while in other parts the old registers were re-copied. This is evident from certain income figures; e.g. a *timār*'s income in the *sandjaḳ* of Buda was exactly as many *akčes* in 1676 as in 1590, although the value of money had considerably changed in the meantime.

In the first half of the 16th century, the Turkish *taḥrīr defterleri* still presented a relatively favourable picture of Hungary's demographic conditions. In the town of Szeged, for example, where there were 1,449 families in 1522 before the Turkish occupation, 1,345 heads of family were entered in the first Turkish register of 1546, i.e. the population of Szeged decreased by only about 100 families after the battle of Mohács and the first Turkish occupation. After the subsequent wars and devastations, however, the Turks could levy the *djizye* tax on no more than 315 heads of family in the same area in the last years of the century.

Of course, this does not mean that the greater part of the Hungarian population perished, because, as is well-known, a large number of Hungarians escaped to territories of Hungary which had not passed under Turkish rule. As one can read in a Hungarian letter written as early as 1550: "The people of the land, especially in the country of Pest, left their homes in multitudes, seeking refuge in the counties of Zala and Somogy" (there had already been Turks in the county of Pest, but not in the counties of Zala and Somogy as yet). In spite of all this, there were relatively few Turks who came to settle down in Hungary. It is true that a few towns such as Esztergom, Visegrád and Nógrád, were evacuated after their occupation for strategic reasons and were inhabited almost exclusively by Turks in later times as well. Besides such places, however, it was only in Buda, Pest, Vác,

Tolna and the area of Szeged that a few hundred Turkish families settled down.

Süleymān and his successors made no deliberate efforts to settle large numbers of Turkish families in Hungary as they did in the Balkan peninsula. Neither did Islam gain any ground. Today there are but few architectural remnants to evoke the memory of the Ottoman period, and this is not because subsequent wars destroyed them but because the Turks preferred transforming old buildings to constructing news ones in Hungary. Similarly, present-day Hungarian vocabulary contains very few Ottoman Turkish loan-words; spoken Hungarian has preserved only a faint memory of former Turkish rule.

(GY. KÁLDY-NAGY)

AL-**MADJARRA**, the Galaxy or Milky Way. This remarkable celestial phenomenon was well-known to the peoples of the Islamic world. Its popular assimilation to the traces of spilt milk seems to be of Greek origin (cf. τὸ γάλα [Aristotle], ὁ τοῦ γάλακτος κύκλος [Euclid, Geminus], ὁ γαλακτίας [κύκλος] [Ptolemy], ὁγαλαξίας [κύκλος] [other authors]; see Liddell and Scott, *s.vv.*), whereas in the Near East the image of traces of lost straw, or chaff, prevails (cf. Pers. *rāh-i kāhkashān*, Turk. *samanyolu*, etc., and already Syriac *shbhīlā d-thebhnā* (A.D. 660), also colloquial Arabic *darb al-tabbāna*, etc.; see Wiedemann [1], 1 f., and [2]; and Eilers [1], 108-11; [2], 15 f.; [3], 4; for the Syriac, Severus Sēbhōkht, ii, 2 [p. 349]; xi, 1.3 [pp. 392-3]).

In Arabic, the indigenous designation is *al-madjarra*, which is derived both by classical Arabic lexicographers and by modern scholars from the root *dj-r-r* "to pull, or draw" and would designate a place, or path where something is drawn (Ibn Ḳutayba, *Anwā'* 123; al-Djawharī, in *LA*, iv, 129a; Ibn Sīda, *Mukhaṣṣaṣ*, 8; al-Marzūḳī, ii, 9; Ibn Manẓūr [2], 173; Eilers [1], 111). The mediaeval Latin translator of the Arabic *Almagest*, Gerard of Cremona, generally retained the Arabic designation *al-madjarra* as *almaiarati* etc.; but in one instance he added a gloss: *id est arca que mouetur*, in which he understood *al-madjarra* as a drawer that can be pulled (cf. Kunitzsch, *Der Almagest*, 139). Occasionally there occurs in Arabic texts a confusion between the name of the Milky Way, *al-madjarra*, and the graphically closely-similar word *al-midjmara*, which is the Arabic version for the Greek constellation name τὸ Θυμιατήριον, the Altar, *Ara* (see Kunitzsch, 203); cf., e.g., *al-madjarra* for *al-midjmara* on a celestial globe by Ibrāhīm b. Saʿīd al-Sahlī, dated 478/1085, described by J. M. Millás Vallicrosa, *Assaig d'història de les idees físiques i matemàtiques a la Catalunya medieval*,

i, Barcelona 1931, 55 ff.; the same confusion of *al-madjarra for al-midjmara*, in *Les mansions lunaires des Arabes. Texte arabe en vers de Moh'ammed El-Moqri*, trad. et ann. par A. de C. Motylinski, Algiers 1899, 99 (no. 11) and n. 2, where the translator did not realise and correct the mistake; cf. also ms. d of the Arabic *Almagest* in Kunitzsch, 346, no. 640. A literal Arabic translation from the Greek, in Ptolemy's *Almagest*, was *al-falak al-labanī* (al-Ḥadjdjādj b. Yūsuf b. Maṭar), and *al-dā'ira al-mushabbah lawnuhā bi-lawn al-laban*, or shortly, *al-dā'ira al-labaniyya* (Isḥāḳ b. Ḥunayn) (see Kunitzsch, *Der Almagest*, 139).

The Milky Way was known to the Arabs in their classical period; cf. a collection of classical and post-classical Arabic verses naming *al-madjarra*, in Wiedemann [1], 673-5 (see also Ibn Manẓūr [2], 118 f.). In lexicographical texts, the positions of several fixed stars are described in relation to the Milky Way. Abū Ḥanīfa al-Dīnawarī (d. 282/895) gave a description of the course of the Milky Way in the sky as seen by the Arabs in their "pre-scientific" period (Abū Ḥanīfa, in al-Marzūḳī, ii, 9 f.; tr. Wiedemann [1], 664-6).

Further, it was observed and mentioned by the Arabs that the position of the Milky Way in the sky changed in different seasons according to the annual revolution of the sky (Abū Ḥanīfa, in al-Marzūḳī, ii, 10 f. = tr. Wiedemann [1], 666-8; Ibn Ḳutayba, 123; al-Ḳazwīnī, 21 = tr. Ethé, 44). A late description based on personal experience was given around A.D. 1490 by Aḥmad b. Mādjid, the famous navigator of the Indian Ocean (see Aḥmad b. Mādjid, 149 f.; tr. Tibbetts, 140). It should be noted that some of these non-scientific authors understand the Milky Way as a dense accumulation of faint stars that appears to the observer's eye as a nebulous mass, a theory which seems to have originated from independent observations not influenced by the teachings of Greek philosophy (cf. Ibn Ḳutayba, 124; al-Ḳazwīnī, 21 = tr. Ethé, 44; Aḥmad b. Mādjid, 149 = tr. Tibbets, 140).

A scientific astronomical description of the Milky Way was given by Ptolemy in his *Almagest* (book viii, ch. 2), which became known in Arabic through a series of translations from the end of the 2nd/8th to the end of the 3rd/9th centuries. Abū Ḥanīfa's description, however, apparently was not influenced by the *Almagest*, since he uses descriptive elements of pure Arabic origin only. Also, his description of the galactic circle begins and ends in the constellation of Scorpius, near the ecliptic, whereas Ptolemy's description begins and ends in the constellation of Centaurus, in the southernmost region of the sky visible to him in Alexandria.

Cosmological theories of the Milky Way were conveyed to the Arabs by translations and paraphrases of Greek philosophical works, as, e.g., Aristotle's *Meteorology* (for the chapter on the Milky Way, see *al-Āthār al-ʿulwiyya*, ed. Badawi, 12-15; ed. Petraitis, 23-6 [Arabic]; ed. Schoonheim, 66/67-70/71; ed. Daiber, 62 f.), and their commentaries. While Aristotle taught that the Milky Way is a vaporous phenomenon belonging to the sublunar sphere, other philosophers such as Democritus, and younger commentators as Olympiodorus, etc., believed the Milky Way to be far out in space, similar to the fixed stars, and belonging to their sphere (cf. Petraitis, 23 [Arabic], n. 2; Daiber, 93-5). Muslim scholars apparently favoured these latter theories against Aristotle's one (see the texts cited by Wiedemann [1], 669-71, and Daiber, 93-5, and the following quotations from Ibn al-Haytham and al-Bīrūnī). Especially interesting are the scientific deductions of Ibn al-Haytham (d. *ca.* 432/1041), who arrived at the conclusion that the Milky Way does not form part of the air (the sublunar sphere) but must be far out in the space (see Wiedemann [1], 672, and the literature quoted there). Also, al-Bīrūnī in his *al-Ḳānūn al-Masʿūdī* (written around A.D. 1030) says that, contrary to the teachings of Aristotle and his followers, *al-madjarra* is of the same height (above the earth) as the fixed stars because the moon and the planets are not influenced by it when crossing in front of it, as should happen if the Milky Way was below them, and because it shares all the peculiarities of the fixed stars as described by Ptolemy, *viz.* that it is found in their sphere and unvariably keeps the same relations in distance and shape just as the fixed stars do (al-Bīrūnī [2], iii, 992, 16-993, 1; nearly identical with this is the quotation from Barhebraeus (d. A.D. 1286) in Wiedemann [1], 671).

(P. Kunitzsch)

MADJĀZ (A.), a term in rhetoric, means "trope" and, more generally, the use of a word

deviating from its original meaning and use, its opposite being *ḥaḳīḳa* ("veritative expression").

In Arabic literature. — The different modes of expression labelled as *madjāz* by the Arabic theorists were divided into twelve categories by Fakhr al-Dīn al-Rāzī (d. 606/1210) without, however, following a consistent system of criteria (cf. al-Suyūṭī, *Muzhir*, ed. Cairo 1282, i, 171). A more refined and detailed version of this classifying system was put forward by al-Suyūṭī (d. 911/1505) (*Itḳān*, ed. Calcutta 1856, 550 ff.). From the structural point of view, the *madjāz* systematology by al-Sakkākī (d. 626/1221), a younger contemporary of al-Rāzī, is more satisfactory.

Al-Sakkākī offers five different binarily-divided categories of *madjāz* (*Miftāḥ al-ʿulūm*, ed. Cairo 1318, 154 ll.-9 ff.; in detail 155-69). The two main categories are denoted as linguistic and intellectual *madjāz* (*lughawī* and *ʿaḳlī*). The intellectual *madjāz* comprises expressions which attribute the effect of a deed not to its proper author but rather to a piece of imagery or mediate one, as is shown in the instance, "their trade did not make a good bargain" (Ḳurʾān, II, 15). The linguistic *madjāz* is either lexicographically classifiable or relates to the context. The contextual *madjāz* comprehends ellipses which, for the remaining expression, entail a modification of the syntactical status. An instance of this is given in Ḳurʾān, XII, 82 "ask the village (acc.)", whereas it should read "ask the inhabitants of the village (gen.)". The lexical tropes may be divided into those having a proper value of meaning and use and those not having it. The latter group includes the transference of generic names of parts of the body from one genus to another, as is shown in the use of "labium" for the camel's lip. The expressive *madjāz* may be used to mean either a metaphor or some kind of metonymy; it merely depends on whether there exists a comparison or some less precise connection between the actual meaning and the mode chosen to express it. An instance for the latter may be found in the use of "hand" for "benefaction", as the latter is brought about by the former.

The conceptual elements of this system date from a period anterior to al-Sakkākī, one of its most meritorious promoters being ʿAbd al-Ḳahīr al-Djurdjānī (d. 471/1078). We owe to him the distinction between linguistic and intellectual *madjāz* (*Asrār al-balāgha*, ed. Ritter, 342 ff., 376; see also his statements in *Dalāʾil al-iʿdjāz*, ed. Khafādjī, Cairo 1969, 286 ff.). The notion "inexpressive trope" is based on a classification of metaphors that goes back from al-Djurdjānī (*Asrār*, 29, ll. 5 ff., 373 ff.) to al-Ḥātimī (d. 288/998) (*al-Risāla al-mūḍiḥa*, ed. Nadjm, Beirut 1965, 69 ff., 90 ff.; cf. also ISTIʿĀRA). Ibn Ḳutayba (d. 276/889) already pointed out that the metaphor constitutes the most important form of *madjāz* (*Taʾwīl mushkil al-Ḳurʾān*, ed. Ṣaḳr, 114). First attempts to classify tropical expressions were made by Abū ʿUbayda (d. 210/825) in his *Kitāb Madjāz al-Ḳurʾān* (ed. Sezgin, Cairo 8 ff., cf. J. Wansbrough, *Majāz al-qurʾān; periphrastic exegesis*, in *BSOAS*, xxxiii [1970], 248-54); however, they correspond more with those of al-Rāzī than with those of al-Sakkākī.

The *madjāz* theory received its first impulse from the study of Ḳurʾānic hermeneutics, scholars being guided by the want of a correct philological interpretation of the holy text. In its beginning, *madjāz* did not mean "trope" in the proper sense of the word, but more generally denoted any turns of phrase that, from the semantic, lexicographical or syntactical point of view, were not self-evident and needed explanation. An instance of this stage of the *madjāz* theory is represented by the *Kitāb Madjāz al-Ḳurʾān* by Abū ʿUbayda (see Sezgin, *GAS*, i, 35 ff., 48).

Parallel to the purely philological studies, research work on Ḳurʾānic hermeneutics was undertaken by theologians, whose investigations seem to have had a still greater bearing on the development of the *madjāz* theory. All theological groups, in fact, resorted to the Ḳurʾān in order to support their statements, since the text allowed quite contradictory interpretations. Ḥasan b. Muḥammad b. al-Ḥanafiyya (d. *ca.* 100/719) had already pointed out in his anti-Ḳadarī discussions that occasionally in the Ḳurʾān an effect proper to God is ascribed in its cause to a created being, and he thus anticipated the notion of *madjāz ʿaḳlī* (cf. Van Ess, *Anfänge muslimischer Theologie*, Beirut 1977, 105, 108 ff.). An instance of this phenomenon is given in the verses "The spring-time made the herbage come forth", the effect of bringing forth herbage not being ascribed to the Creator but to the spring [see AL-MAʿĀNĪ WA 'L-BAYĀN]. If credence may be given to Ibn Taymiyya, the corresponding pair of expressions *madjāz-ḥaḳīḳa* equally had its origin in theological and not in philological tradition (cf. W. Heinrichs, *Literary theory*, in *Arabic poetry, theory and development*, ed. Von Grunebaum, Wiesbaden 1973, 30, n. 50). The Muʿtazilis, for their part, took refuge in tropical interpretation in order to eliminate the anthropomorphisms of the Ḳurʾānic representation of God (cf. Goldziher, *Richtungen der islamischen Koranauslegung*, repr. Leiden 1952, 110 ff.). It likewise happened that in discussions with other religions, attempts were made to shift the difference from the mental to the verbal plane, thus making use of the *madjāz* theory. Ibn Ḳutayba actually thought it convenient to deprive the Christian term "Son of God" of its shockingness by taking refuge in a tropical interpretation (*Taʾwīl*, 10e, ll. 5 ff.).

It was, however, due to the theological aspects of the Ḳurʾānic *madjāz* that the question was raised how far tropical expressions might be valuable and useful. One of the major reproaches brought forward against the use of *madjāz* was that tropical language was likely to falsify the image of reality. Already Ibn Ḳutayba drew attention to this fact (*Taʾwīl*, 132 f.; see also Suyūṭī, *Itḳān*, 550, 11-10 ff.). It proved more rewarding, however, to tackle the positive aspects of the problem, as tropical expressions used in the Ḳurʾān were liable to express more clearly and more completely the intended meaning than would have been possible by means of a veritative expression. A number of excellent single studies relating to the above subject were brought together by al-Sharīf al-Raḍī (d. 406/1016) in his *Talkhīṣ al-bayān fī madjāzāt al-Ḳurʾān* (see also the statements made by Ṭabāna in *al-Bayān al-ʿarabī*, Cairo[3] 1968, 36 ff.). It thus happened that the discussion on *madjāz* was shifted into the field of interest of the inimitability of the Ḳurʾān (*iʿdjāz al-Ḳurʾān*).

Bibliography: Shorter or longer treatises on *madjāz* are to be found in all manuals and studies relating to rhetoric or the rhetorical art since the 5th/11th century, but especially in the works of the school of al-Sakkākī (see also AL-MAʿĀNĪ WA'L-BAYĀN). The *madjāz* literature equally includes everything written on *istiʿāra*; see particularly W. Heinrichs, *The Hand of the northwind*, Wiesbaden 1977.

(B. REINERT)

In Persian literature. — The use of the term *madjāz* by Persian writers has always been subject to the influence of the Arabic doctrine outlined above. A distinction between more borrowing on the one hand and autonomous development on the other can in each instance only be made on the basis of extensive and chronologically differentiated data which are not yet available. For that reason, no more than a rough sketch of Persian usage can be given here and questions concerning the origin and the history of specific aspects must be left aside.

The first writer who dealt with *madjāz* as a rhetorical term was, to our knowledge, Shams-i Ḳays, a contemporary of al-Sakkākī's. He defined it as an inclusive category of figurative speech being opposed to the category of literal, "true", speech (*ḥaḳīḳat*). His definition also comprises the necessity of a common aspect (*wadjh-i ʿalāḳat*) providing a link between the figurative and the literal meanings of an expression by means of which the real intention of the speaker can be established. The most important type of *madjāz* is the metaphor (*istiʿārat*) which can be used in all kinds of speech. Another type consists of allegorical devices occurring especially in poetic descriptions such as the tenzone (*munāẓara*) in which inanimate objects or animals are introduced as speakers in an exchange of arguments (*al-Muʿdjam fī maʿāyīr ashʿār al-ʿadjam*, ed. Tehran 1338/1959, 365 ff.). A much more complicated terminology is presented in the textbooks of the post-classical period, e.g. in the *Ḥadāyiḳ al-balāgha* of Mīr Shams al-Dīn Faḳīr-i Dihlawī (1141-83/1728-69), a digest of which was made by J. Garcin de Tassy (*Rhétorique et prosodie des langues de l'orient musulman*, Paris 1873, see esp. 40 ff. and 66 ff.). Recently, a summary of later Persian theory has been given by Djalāl al-Dīn Humāʾī (*Funūn al-balāghat wa ṣināʿāt-i adabī*, Tehran 1354/1975, 247 ff.). Two technical terms among the many dealt with in these surveys deserve mention here. The presence of a clue or *ḳarīna* (also called *ḳarīna-yi ṣārifa*, as it "leads" the mind the intended meaning) is required to express the relationship (*ʿalāḳat*) between a *madjāz* and the corresponding *ḥaḳīḳat*. Such a clue is either implied in the context or specifically added, e.g. in the example *shīr-i shamshīrzan* in which the adjective points to the actual meaning of "valiant warrior". If the trope is not based on a similarity of form but on abstract relationships (between a condition and the place where it manifests itself, a whole and its parts, a cause and its effects etc.) it is called *madjāz-i mursal* ("free trope", according to the interpretation of Humāʾī).

An especially Persian use, for which the authority of the early lexicographer Fakhr-i Ḳawwās (*fl.* ca. 700/1300 in India) is invoked, restricts the application of *madjāz* to metaphors based on terms which either refer to an accident (*ʿaraḍ*) or to imaginary things (*muṣawwarāt*) (cf. al-Tahānawī, *Kashshāf iṣṭilāḥāt al-funūn*, Calcutta 1862, ii, 963 f.).

In Persian grammar, a connection of one substantive to another by means of the *kasra-yi iḍāfa* is called 'figurative' (*iḍāfa-yi madjāzī*) if it reflects only an estimation (*iʿtibār*) of the speaker. This includes the *iḍāfa-yi tashbīhī* in which the particle of the *iḍāfa* denotes a comparison (*e.g. čashm-i āhū*, "an eye like that of a gazelle") and the *iḍāfa-i istiʿārī* (*e.g. tīgh-i adjal*, "the sword of death") which implies a metaphorical personification (see further, M. Muʿīn, *Iḍāfa*, Tehran 1341/1962, 140-52).

Outside rhetorics and philology, *ḥaḳīḳat* and *madjāz* have been used frequently for binary expressions in mystical terminology. Real love (*ʿishḳ-i ḥaḳīḳī*), directed towards the Eternal Beloved, has as a counterpart "figurative" love (*ʿishḳ-i madjāzī*), which concentrates on another object but only as a temporary substitute for the true goal of mystical love (see for early instances Sanāʾī, *Dīwān*, Tehran 1341/1962, 879; ʿAzīz al-Dīn Nasafī, *Kitāb Insān al-kāmil*, Tehran-Paris 1962, 115 ff.). Similar terms were coined to indicate the distinction between as well as the interdependence of the sphere of divine existence and the present world. Expressions like *wudjūd-i madjāzī*, *hastī-i madjāzī* or *sarāy-i madjazī* reflect the view that the latter can be predicated to be in existence by way of a trope only.

Bibliography: In addition to the works quoted in the article, see in general M. Muʿīn, *Farhang-i fārsī-yi mutawassiṭ*, Tehran 1345/1966, iii, s.v. *madjāz*. (J. T. P. de Bruijn)

In Turkish. — Although several neologisms, such as *addeğişimi* and *değişmede* have been proposed since 1928, this Arabic term continues to be in vogue in the sense of "trope" or "figurative language" as one of thousands of literary terms acquired from the Arabs and Persians by the Turks as they became practitioners within the Islamic literary tradition. In the process of borrowing, they also inherited much of the confusion and ambivalence that characterised the periodic definition and classification of the three divisions of the science of *balāgha* [*q.v.*]. By the end of the Middle Ages, when the Turks began to formulate their tropological utterances according to the Islamic perception of figurative language, they also accepted the assignation of *madjāz* to the "expression" (*bayān* [*q.v.*]) division of the Islamic system of rhetoric.

Until the 19th century, the Ottoman Turks did not produce any literary manuals of their own, preferring instead to refer to the standard Arabic and Persian texts or to their Turkish translations of these. This reliance on the works of their literary mentors was especially marked in the case of rhetorics, the productions of al-Djurdjānī (d. 471/1078), Shams-i Ḳays (*fl.* 600-27/1204-30), al-Sakkākī (d. 626/1226) and al-Taftazānī (d. 791/1389) [*q.vv.*] apparently amply meeting their need for reference works on this subject until the *Tanẓīmāt* period (1839-76). Thereafter, the new generation of Ottoman writers and teachers, now under strong European influence, began to create original works dealing with all aspects of literature. Reference works by literary innovators like Aḥmed Djewdet Pasha [*q.v.*] and Ekrem Bey [*q.v.*], who wrote mainly for the new schools, and the efforts of their continuators since the Republic (1923), point to an understanding of the meaning and use of the trope that is more in keeping with the syntax and morphology of the Turkish language. This activity, however, did not entirely eliminate the problems of definition and classification. Nonetheless, there is general agreement on the division of tropes into two major classes of *madjāz-i mursal* (synechdoche and variants) and *istiʿāra* (metaphor and extensions).

(1) *Madjāz-i mursal* (Mod. Tkish. *kapsamlama addeğişi*) in which the objects featured in the figurative expression have a relationship that is not described in terms of direct comparison. This type of trope is itself broken down to several variants of which the most frequently encountered are:

a. *ʿumūmiyya-khuṣūṣiyya*, the particular for the general, genus for species, etc., and vice-versa, "Every *sail* on the Marmara is flying merrily."

b. *awwaliyya*, referring to the projected state of the object, "Light the fire!"

c. *ḥāliyya-maḥalliyya*, position and locale conjuncture, "Emerging from *prayer*, they went to the *promenade area*."

d. *sababiyya-musabbabiyya*, cause and means relationship, "This *shop* has *earned* much money."

(2) *Istiʿāra* (*iğretileme*) in which the comparative elements of the relationship between objects are stressed in various degrees. There is no uniform agreement as to exact relationship and classification of these. The generally accepted two major divisions are:

a. *istiʿāra-i muṣarraḥa* (*açık iğretileme*) or explicit metaphor, in which the comparison is achieved by direct reference to an object, "Our *lions* are off to the battlefield."

b. *istiʿāra-i makniyya* (*kapalı iğretileme*) or implicit metaphor in which the comparison is achieved by reference to an attribute of an object without mentioning the object itself, "A cool stream *sang lullabies*."

Each of the above divisions is subdivided even further on the basis of other pertinent considerations affecting, or affected by, the nature of the attributive relationship between the referrer and the referred objects.

MADJD AL-DAWLA, Abū Ṭālib Rustam b. Fakhr al-Dawla ʿAlī, Kahf al-Umma, ruler of the northern Būyid amīrate of Ray and Djibāl (387-420/997-1029).

When Fakhr al-Dawla [*q.v.*] died in Shaʿbān 387/August-September 997, his young son Rustam succeeded him at the age of eight (thus according to the anonymous *Mudjmal al-tawārīkh wa 'l-ḳiṣaṣ*, ed. Bahār, Tehran 1318/1939, 396, giving Rustam's birth-date as Rabīʿ II 379/July-August 989, and Ibn al-Athīr, ed. Beirut, ix, 69, but according to al-Rūdhrāwarī, in *Eclipse of the ʿAbbasid caliphate*, iii, 297, and Ibn al-Athīr, ix, 132, at the age of four). Actual power was exercised by his mother as regent, the redoubtable Sayyida, who was probably the sister of the Marzbān b. Rustam, ruler of Firrīm [*q.v.* in Suppl. and also bāwandids] and author of the *Marzubān-nāma* (a name apparently inverted by ʿUtbī into Rustam b. Marzbān in his account of the capture of Shahriyārkūh by Shahriyār b. Dārā in 388/998, *Yamīnī*, with comm. of Manīnī, ii, 192); and the Būyid *amīr* of ʿIrāḳ and Fars, Bahāʾ al-Dawla [*q.v.* in Suppl.] was acknowledged during the latter's lifetime as supreme Būyid ruler over the confederation, with his name appearing on Madjd al-Dawla's coins.

The death of Fakhr al-Dawla and the accession of a weaker *amīr* allowed the Ziyārid Ḳābūs b. Wushmagīr [*q.v.*] to return to his former lands in Gurgān and Ṭabaristān, and he could not henceforth be dislodged by the Būyids. In 397/1006-7 Madjd al-Dawla attempted to break loose from the tutelage of his mother, but was captured by his brother Shams al-Dawla of Hamadhān and the Kurdish chief Badr b. Ḥasanūya [see ḥasanwayh] and imprisoned for a year before his release and return to Ray; and in 405/1014-5 Shams al-Dawla was able temporarily to occupy Ray.

Sayyida died in 419/1028, leaving Madjd al-Dawla totally unfitted for assuming the reins of the government after over 30 years' exclusion from the substance of power; the sources speak of his sensuality, so that his numerous wives and concubines gave him 30 children. According to Bayhaḳī, *Taʾrīkh-i Masʿūdī*, ed. Ghanī and Fayyaḍ[1], 263, the powerful and aggressive Ghaznawid Maḥmūd b. Sebüktigin had for long refrained from attacking Ray and Djibāl because he regarded the region as effectively neutralised under a feminine *de facto* ruler. Now, with Madjd al-Dawla unable to control the turbulent Daylamī soldiery in Ray and with mounting public disorder there, the helpless *amīr* unwisely appealed to the Ghaznawid sultan for help. With this ready-made pretext to hand, Maḥmūd sent westwards an army, which deposed and seized Madjd al-Dawla and subjected Ray to a frightful sacking, the grounds for this, according to Maḥmūd's *fatḥ-nāma* sent to the caliph al-Ḳādir, being the need to extirpate Muʿtazilī, Ismāʿīlī and other extremist Shīʿī heresies which had flourished in Ray under Būyid tolerance. Ray was now used as a base for Ghaznawid military operations in northwestern Persia. Madjd al-Dawla and his son Abū Dulaf were kept in honourable confinement in India and then Ghazna by Sultan Masʿūd b. Maḥmūd, according to Gardīzī, with the ex-*amīr* eventually dying at Ghazna.

Madjd al-Dawla enjoyed some reputation as a patron of culture and learning, probably a reflection of the continuing heritage at Ray from the celebrated vizier the Ṣāḥib Ibn ʿAbbād's patronage of literature; he himself had had the privilege of having the philologist and grammarian Aḥmad b. Fāris [see ibn fāris] as his tutor.

For Madjd al-Dawla's coins, see Miles, *The numismatic history of Rayy*, New York 1938, 173-6, 177-86, noting that this *amīr* bore the title *Shāhānshāh*.

(C. E. Bosworth)

MADJD al-Dīn [see hibat allāh b. muḥammad].

MADJD AL-MULK, Abu 'l-Faḍl Asʿad b. Muḥammad al-Ḳummī al-**BALĀSĀNĪ**, *mustawfī* or director of finances under the Saldjūḳ sultan Berk-yaruḳ [see barkyāruḳ] in the early years of his reign and then vizier (490-2/1097-9), but whose death was brought about by the great military commanders in Shawwāl 492/September 1099 on an accusation of Shīʿī sympathies, and even of Ismāʿīlī ones, which he was said to have displayed during the struggle against the rival sultan Muḥammad b. Malik-Shāh [*q.v.*].

Bibliography: *Cambr. hist. of Iran*, index; C. L. Klausner, *The Seljuk vezirate, a study of civil administration 1055-1194*, Cambridge, Mass. 1973, 42, 46-8, 92, 105-6; C. E. Bosworth, in *Encycl. Iranica*, s.v. *al-Balāsānī*. (CL. CAHEN)

MADJDHŪB ("the attracted one"), in Ṣūfī literature the name for the representative of a type of piety which is chiefly of a passive nature (*munfaʿil*: al-Rundī), in contradistinction to the more active (*fāʿil*) "striding one" (*sālik*), a characteristic which is expressed in numerous other pairs of opposition, like: *mudjāhada-mushāhada*, *makāsib-mawāhib*, *maḳām-ḥāl*, *murīd-murād*, *muḥibb-maḥbūb*, *mukhliṣ-mukhlaṣ*. While the *madjdhūb*, on the way to God, may abandon himself to be drawn by divine attraction (*djadhba*, *djadhb*, Persian *kashish*), the *sālik* depends on his own exertions (*kūshish*), which is, however, in the same way as the attraction, a gift (*bakhshish*) of God. Usually, mixed forms occur, as is clear from the works of Nadjm al-Dīn-i Kubrā [*q.v.*] and Nadjm al-Dīn-i Dāya, for whom the "strider" is the one who, while striding, is attracted gently, and the *madjdhūb* the one who, while striding, is attracted intensely. Others, like ʿUmar al-Suhrawardī, Maḥmūd-i Kāshānī and ʿAzīz-i Nasafī, speak of a "strider who is attracted" (*sālik-i madjdhūb*) when the striding came earlier in time, and of an "attracted one who is striding" (*madjdhūb-i sālik*) when the being attracted came earlier in time. The general principle is that neither the one who is merely striding, nor the one who is merely attracted, is qualified to be a *shaykh* and to lead others on the mystical path, since the former has never arrived at his aim, while the second, as being only attracted, has never stridden along the path by himself. With regard to personal progress, it is true, the word of the Prophet holds good: "One single attraction by God is equivalent to the activity of men and *djinn*", but only the one who has personal experience of striding, its labours and dangers, is able to assist others in advancing.

In more recent literature in particular, *madjdhūb* is a frequently used extenuating and exculpating designation of eccentric ecstatics, love-maddened persons, holy fools, and despisers of the law. Occasionally, the term is also used as a nickname, like in Ibrāhīm-i Madjdhūb (7th/13th century).

(R. GRAMLICH)

AL-**MADJDHŪB**, surname of the Moroccan holy man whose complete name is Abū Zayd ʿAbd al-Raḥmān b. ʿAyyād al-Ṣanhādjī al-Faradjī al-Dukkālī. He came originally from Tīṭ, in the district of Azemmūr, but lived in Fās, where one of his disciples was in particular Abu 'l-Maḥāsin Yūsuf al-Fāsī, whose great-grandson, ʿAbd al-Raḥmān b. ʿAbd al-Ḳādir [see AL-FĀSĪ, in Suppl.] left behind a work called *Ibtihādj al-ḳulūb bi-khabar al-shaykh Abi 'l-Maḥāsin wa-shaykhihi al-Madjdhūb* (extracts in ms. Rabat 522/6; see Lévi-Provençal, *Catalogue*, 252). ʿAbd al-Raḥmān al-Madjdhūb died in the Gharb in 976/1569 and was buried in Meknès. He is especially famed for his gnomic poetry which took the form of quatrains in dialectal Arabic [see MALḤŪN] and which, towards the end of the 19th century, attracted the attention of H. de Castries (*Gnomes de Sîdy Abder-Rahman el-medjedoub*, Paris 1896). Basing himself on this publication and on citations in various works, ʿAbd al-Ḳādir Nūr al-Dīn has had lithographed in Algiers (at the beginning of the 1950s) *al-Ḳawl al-maʾthūr min kalām al-shaykh ʿAbd al-Raḥmān al-Madjdhūb*, which contains 127 quatrains with a commentary in classical Arabic; they have been published, translated and commented upon by J. Scelles-Millie, *Les quatrains de Mejdoub le sarcastique (poète maghrébin du XVIe siècle)*, Paris 1966.

AL-**MADJDJĀWĪ**, ʿABD AL-ḲĀDIR B. ʿABD ALLĀH B. MUḤAMMAD B. ʿABD AL-KARĪM, Algerian teacher and scholar, born in 1266/1848 in Tlemcen and died in 1331/1913 in Algiers.

Following the example of his father who had lived for a long time in Morocco where he had studied and taught, especially at al-Ḳarawiyyīn [*q.v.*], before returning to his native city to practise there the duties of *ḳāḍī*, al-Madjdjāwī travelled to this country at a very early age. At Tangier and later at Tetouan he undertook classical studies which he completed at Fās as a pupil of distinguished *ʿulamāʾ*, including Mawlāy Muḥammad al-ʿAlawī, Muḥammad b. al-Madanī Gannūn, Ṣāliḥ al-Shawī, Aḥmad b. Sūda and Djaʿfar b. Idrīs al-Kattānī. Returning to Algeria in 1869, in 1873 he was appointed *mudarris* at the Sīdī al-Kattānī mosque of Constantine, which he left in 1877 for the official *madrasa* of the town, where he spent more than twenty years. His very conscientious teaching was already complemented by personal scholarly work. Transferring to Algiers in 1898, he was in addition entrusted with the duties of *imām* and *khaṭīb* at the Sīdī Ramaḍān mosque. His widespread knowledge and cultured personality attracted to him the affection of numerous disciples, among whom it is appropriate to mention in particular Ḥamdān al-Wanīsī, who was to become the patron of ʿAbd al-Ḥamīd Ibn Bādīs, al-Mawlūd b. al-Mawhūb, a teacher at the *madrasa* and Mālikī *muftī* of Constantine, ʿAbd al-Karīm Bāsh Tarzī, Ḥanafī *muftī* of the same town, Ḥammū b. al-Darrādjī, Ḥanafī *ḳāḍī* of Algiers, and Muḥammad Saʿīd Ibn Zakrī, a teacher at the *madrasa* and Mālikī *muftī* of Algiers.

A teacher by nature and by profession, al-Madjdjāwī revealed his views on educational issues in three monographs (see below). On the other hand, his tastes as well as the specialised responsibilities of the two chairs that he occupied in Constantine and Algiers led him to take an interest in the traditional disciplines of law and of religion. Deeply committed to orthodoxy, he allied himself with scholars who, in the name of the Ḳurʾān and of the Sunna, denounced superstitious practices, impious innovations (*bidaʿ*) and the popular demon-

strations encouraged by the leaders of the Ṣūfī brotherhoods. He also tackled with equal confidence such varied subjects as morphology, syntax, rhetoric, astronomy, cosmography, mathematics and economics. Through his writings, al-Madjdjāwī aims to present the image of an *ʿālim* of encyclopaedic learning. To this end, he introduces into his texts numerous and lengthy quotations not only from the Ḳurʾān and from *ḥadīth*, but also from the works of jurists, philosophers, historians, poets and even of obscure writers. Faithful in this respect to scholastic method, he demands from the ancient scholars more than simple references or entertaining curiosities. His borrowings have a relevance that goes beyond words and forms; he is indebted to the Arabo-Islamic tradition which provides him with the models for life and thought, and he takes it upon himself to convey this tradition in its entirety to his contemporaries.

The corpus of al-Madjdjāwī's work comprises eighteen titles, of which the list is as follows: 1. *Irshād al-mutaʿallimīn*, Cairo n.d.; 2. *Naṣīḥat al-murīdīn*, Tunis n.d.; 3. *Sharḥ Shawāhid Ibn Hishām*, Constantine n.d.; 4. *Sharḥ manẓūmat Ibn Ghāzī fi 'l-tawḳīt*, Constantine n.d.; 5. *Sharḥ al-Madjdjāwī ʿalā manẓūmat Muḥammad al-Madjrād* (*sic*) *al-Slāwī*, Constantine 1878; 6. *Sharḥ al-Lāmiyya al-mudjradiyya fi 'l-djummal*, ʿAnnāba 1894; 7. *Sharḥ ḳaṣīdat Muḥammad al-Manzilī al-Tūnisī*, Algiers n.d.; 8. *Nuzhat al-ṭarf fi 'l-maʿānī wa 'l-ṣarf*, Algiers n.d.; 9. *Kitāb al-ifāda li-man yaṭlub al-istifāda*, Algiers 1901; 10. *al-Farīda al-saniyya fi 'l-aʿmāl al-djībiyya*, Algiers 1903; 11. *al-Mirṣād fī masāʾil al-iḳtiṣād*, in collaboration with ʿUmar Brihmāt, Algiers 1904; 12. *al-Iḳtiṣād al-siyāsī*, Algiers n.d.; 13. *Sharḥ al-djumal al-naḥwiyya*, Algiers n.d.; 14. *al-Durar al-naḥwiyya ʿalā 'l-manẓūmat al-shabrāwiyya*, Algiers 19(?); 15. *Risāla fī masāʾil al-kasb wa 'l-ikhtiyār*, Algiers n.d.; 16. *Tuḥfat al-akhyār fi 'l-djabr wa 'l-ikhtiyār*, Algiers n.d.; 17. *al-Kawāʿid al-kalāmiyya*, Algiers 1910; 18. *al-Lumaʿ ʿalā naẓm al-bidaʿ*, Algiers 1912.

(R. BENCHENEB)

MĀDJID B. SAʿĪD, Sultan of Zanzibar, 1856-70, was born *ca.* 1835, the sixth of his father's twenty-seven known sons, and of an Ethiopian mother. He married a kinswoman, Asha, and had one child only, Khamfura.

When his father, Sayyid Saʿīd, left Zanzibar for Masḳaṭ for the last time on 16 April 1854, he had appointed his second son, Khālid, as governor and successor in the event of his death. Khālid died in November 1854, and shortly afterwards orders came from Masḳaṭ appointing Mādjid in his stead, thereby passing over three older brothers, Thuwaynī (later Sulṭān of ʿUmān), Muḥammad (Governor of Sumayl), and Turkī (also later Sulṭān of ʿUmān). At this time Mādjid was about twenty-one years old, and from childhood had suffered from a mild form of epilepsy, which at times handicapped him as *sulṭān*. Shortly after his appointment as governor, he was approached to denounce his father's treaties and edicts against the slave trade, but firmly declined. His sister Salma says that during his regency he "contrived to gain the goodwill of all by his kind and gentle manners". At the beginning of his reign, the real power behind the throne was the British consul, Atkins Hamerton, and his death in July 1857 was a severe blow to Mādjid. Fearing assassination, he took refuge on one of his warships, returning to the palace only after the arrival of Hamerton's successor, Rigby, on 28 July 1858. Very shortly after, Saʿīd's third son, Thuwaynī, who had been designated *sulṭān* in ʿUmān by his father, attempted to gain control of his father's African dominions by sending an armed expedition. It was turned back at sea by a British man-of-war. Next, a plot was uncovered to dethrone Mādjid and to replace him by his brother, Barghash. In October 1859 Mādjid ordered him to leave Zanzibar for Masḳaṭ; but, after being placed under house arrest, he managed to escape to a country palace known as Marseilles, where armed slaves and Arabs of the al-Ḥarthī tribe rallied to his support. Mādjid then invoked the assistance of the British Navy. The palace was bombarded, and Barghash fled back to Zanzibar, whence he was deported to Bombay.

In Masḳaṭ, Thuwaynī still insisted that his father's eastern African possessions were part of his heritage. He was able with justice to claim that for many years the government of ʿUmān had been sustained by revenues collected from Zanzibar. Mādjid therefore agreed to an annual payment to Thuwaynī of 40,000 Maria Theresa thalers *ex gratia*, but Thuwaynī construed this as tribute. After Thuwaynī's abortive expedition of 1858, Mādjid discontinued payment, denying any question of tribute. Eventually the dispute was submitted to the arbitration of Lord Canning, Viceroy of India. His award stated that Mādjid should be recognised as lawful successor to his father's African possessions; and that the ruler of Zanzibar should pay to the ruler of ʿUmān an annual subsidy of 40,000 Maria Theresa thalers. He further stipulated that this payment should not in any way be construed to imply the dependence of Zanzibar upon ʿUmān. The settlement and the independence of the two sovereigns was recognised by an Anglo-French Declaration on 13 March 1862. Mādjid paid the annual subsidy until 1866, when Thuwaynī was murdered by his son Sālim, declining thereafter to pay the subsidy to a parricide. For two years Mādjid remitted the annual payment to Bombay under protest, but this he refused to do after Sālim's deposition by his kinsman ʿAzzan in 1868.

Weak and procrastinating, Mādjid was greatly under the influence of a certain Sulaymān b. ʿAlī, one of his ministers whom Mādjid's sister Salma describes as a dandy and a libertine. Rigby and his successors had great difficulty in persuading Mādjid to control the so-called "northern" Arabs, Arabs from the small principalities of the Gulf, who were determined to evade the treaties against the slave trade. A trade treaty was signed with the Hanse towns in 1859, and German trade was soon second

only to that with British India. It was through this connection that Mādjid's sister Salma succeeded in making contact with one of the employees of the German consulate, Heinrich Ruete, whom she subsequently married. In 1861 Mādjid led an expedition to reassert his authority in Pate, which had rebelled; but he failed in 1866 when there was a similar, but more determined, rebellion in Witu.

Mādjid's decision that led to the foundation of Dar es Salaam, the present capital of Tanzania on the mainland, taken in 1862, has been obscured by differing claims. The French claim that the idea was initiated by the French consul is surely exaggerated. The British claim, originated by (Sir John) Kirk, is that Mādjid thought of it as "a place to retire to when consuls trouble him or when he is kicked out of the island". These seem to leave out of account the facts that Arab, Indian and Swahili traders were increasing in number of the mainland, and that the harbour of Dar es Salaam in its landlocked bay was far more convenient than the open roadsteads then in use at Bagamoyo and Mboamaji. Building seems to have begun only in 1865-6, and included a palace for the *sulṭān*, parts of which still stand. Here, in September 1867, Mādjid gave a "dinner in the European manner" for the American, British, French and German consuls, apparently by way of a formal inauguration.

There are several descriptions of Mādjid, notably by Richard Burton and Fr. Horner. He had a light complexion and pleasing manners, and generally resembled his distinguished father. He sat to hear causes and complaints three times a day, in a long, bare reception hall paved with black and white marble from Marseilles, and with some dingy chandeliers and "three rows of common wooded-bottomed chairs". There were French clocks and bureaux, cheap prints, gaudy china and shabby artificial flowers. The *sulṭān*, nevertheless, took great interest, as his father had so broadmindedly done, in both explorers and missionaries. A learned ornament of the court who attracted even Burton's respect for his learning was the Shāfiʿī *ḳāḍī*, Shaykh Muḥyī al-Dīn b. Shaykh b. ʿAbd Allāh al-Ḳaḥṭānī.

Mādjid died in 1870, and was succeeded by his brother Barghash [*q.v.*].

(G. S. P. Freeman-Grenville)

AL-**MADJISṬĪ** [see baṭlamiyūs].

MADJLIS (a.), a noun of place from the verb *djalasa* "to sit down" and, by extension, "to sit", "to hold a session"; starting from the original meaning of "a place where one sits down, where one stays", thence "a seat" (J. Sadan, *Le mobilier au Proche-Orient médiéval*, Leiden 1976, index), the semantic field of *madjlis* is of very wide extent (see the dictionaries of Lane, Dozy, Blachère, etc.). Among the principal derivative meanings are "a meeting place", "meeting, assembly" (cf. Ḳurʾān, LXVIII, 12/11), "a reception hall (of a caliph, high dignitary or other personage)" and "a session which is held there", "a hall in which a professor's courses are given or a judge's sentences delivered" (hence "praetorium, tribunal"), or further where the debates of an assembly take place (hence "council").

1. In social and cultural life
2. In Ismāʿīlī usage
3. In Indian Shīʿī usage
4. In the sense of representative institutions
   A. In the Middle East and North Africa
   B. In Afghānistān
   C. In the Indo-Pakistan subcontinent

1. In Social and Cultural Life

From the pre-Islamic period, *madjlis* designated an "assembly or council of the tribe's notables" [see badw, III, c] and this institution is still alive (see e.g. J. Chelhod, *Le droit dans la société bédouine*, Paris 1971, 55), sometimes under another name [see djamāʿa; below, 4. B. In Afghānistān; djirga in Suppl.]. In various states of the Middle Ages, an elaborate governmental structure contained a series of *madjālis*, councils given precise powers (see notably al-Ḳalḳashandī, *Ṣubḥ*, index, 421-3). This usage plainly justifies the adoption of this term to designate in the contemporary age any council (*madjlis al-baladiyya* "municipal council", *m. al-wuzarāʾ* "council of ministers", etc.), an elected assembly (*m. taʾsīsī* "constituent assembly"), a chamber of deputies (*m. al-nuwwāb*), a senate (*m. al-shuyūkh* or *al-aʿyān*), etc. The historical account of the legislative assemblies and parliaments in the Muslim countries will be the subject of section 4 below, and the present notice will be limited to a brief survey of the *madjālis* which played a rôle in the social, religious and intellectual life of the Muslims of the Middle Ages.

The first to be considered is that of the sovereign who dedicated part of his activity to "public or private meetings (*majlis*, pl. *majālis*), where political and judicial decisions were adopted, plaintiffs, panegyrists and other visitors gathered, and questions of literature or law were debated—for this was also regarded as a normal function of the head of state" (R. Brunschvig, *Ḥafṣides*, ii, 37). These sessions followed a ceremonial which varied according to the dynasties and the character of the monarchs.

The etiquette of the court under the Umayyads is not well-known, and it is not known exactly what respective place was occupied by the representatives of the different social classes regularly admitted to the caliph's *madjlis*. For the ʿAbbāsid period, we possess a manual falsely attributed to al-Djāḥiẓ, the *Kitāb al-Tādj* (ed. Aḥmad Zakī Pasha, Cairo 1914; French tr. Ch. Pellat, *Le Livre de la couronne*, Paris 1954; cf. F. Gabrieli, *Etichetta di corte e costumi Sasanidi nel* Kitāb aḫlāq al-mulūk *di al-Ǧāḥiẓ*, in *RSO*, xiii/3 [1932], 197-247), which sets forth, mainly for the people and part of the aristocracy unfamiliar with the customs, the rules of royal protocol of the Sāsānid court which it was proper to adopt, and supplies us with information derived from Islamic history only on the entertainment

sessions. For the Fāṭimids (see M. Canard, *Le cérémonial fatimite et le cérémonial byzantin*, in *Byzantion*, xxi [1951], 355-420), the information is more detailed. The caliph habitually held a public audience on Mondays and Thursdays each week and sat on a golden throne separated from these attending by a grill (*shubbāk*) and a curtain (*sitr*) which was raised after he was seated. Among the title-bearers with public and private functions who had their places, according to their rank, in the reception hall, there must be noted the presence of a *ṣāḥib al-madjlis*, a high-ranking eunuch entrusted with organising the session and advising the dignitaries as soon as the caliph had taken his place on his throne (al-Ḳalḳashandī, *Ṣubḥ*, iii, 480-8; cf. B. Lewis, *Islam from the Prophet Muhammad to the capture of Constantinople*, New York, etc. 1974, i, 201-8). We also possess some information on the status of the people admitted into the audience chamber: for Muslim Spain, e.g., it consisted of elements constituting the *khāṣṣa* [see AL-KHĀṢṢA WA 'L-ʿĀMMA]; for Tunisia in the time of the Ḥafṣids, see R. Brunschvig, *op. laud.*, ii, 28-9.

In these public audiences, plaintiffs and petitioners were present, but poets and scholars who were admitted to the ruler's presence also participated, and for those who solicited the same honour it was an occasion to be introduced to this privileged circle by the mediation of someone already established at court, to recite a panegyric and receive an immediate reward.

The crowning of this process was well on the way when the ambitious man was retained at the royal table after the public audience or at another time of the day. The majority of caliphs actually were accustomed to surrounding themselves with a group of *nudamāʾ* (pl. of *nadīm*), companions who had in theory to respect quite strict rules, of which one can gain an idea from the *Kitāb al-Tādj* (11-20, tr. 39-48) and to possess a certain number of qualities and kinds of knowledge that al-Masʿūdī detailed in his *Akhbar al-zamān* (see *Murūdj*, viii, 103-4 = §§ 3229-30).

A long account will not be given here of the entertainment evenings which many of the Muslim rulers organised regularly and in the course of which they gave themselves up to "pleasure" or *ṭarab* provoked by the music, singing and drinking. The *Kitāb al-Tādj* (31-9, tr. 59-66) enumerates those who, surrounded by women slaves and eunuchs, hid themselves behind a screen and those who showed themselves shamelessly to their familiars and to the musicians and singers; among the latter, al-Rashīd is said to have been the first to follow the example of the Sāsānids and establish divisions. This work makes no allusion to the presence of poets and story-tellers in these sessions, which were evidently distinguished from the meals of which al-Masʿūdī speaks and during which a certain dignity surely reigned. As R. Blachère says with reference to Sayf al-Dawla (*Motanabbî*, 130), during intimate meetings known as *madjālis al-uns*, "the cups were passed round, the social barriers fell, giving way to a semi-intimacy where protector and protégés treated one another with simplicity, at times even with familiarity", without too much casualness, it seems. Al-Masʿūdī (*Murūdj*, viii, 102 = § 3229) supplies some details on the conversations held in the *madjlis* of al-Muʿtamid and mentions that their proceedings were recorded in writing; poetry occupied an important place there, as al-Ṣūlī confirms, who, describing a meeting of this kind around al-Rāḍī (see *Akhbâr ar-Râdî billâh wa'l-Muttaqî billâh*, French tr. M. Canard, Algiers 1946, i, 60 ff.), indicates the place of each of the guests designated by name, cites the subjects approached and reproduces the verses recited on this occasion.

This is not the place to dwell on the rôle of poetry considered as an instrument of government and propaganda by some monarchs, always inclined to make use of the eulogies which were presented to them by versifiers of talent. Often skilled in stirring up rivalries, the caliph would put into competition poets, story-tellers, grammarians or *fuḳahāʾ*, to rejoice in the victory of some and sneer at the discomforture of others. The ruler's *madjlis* also became a circle which J. E. Bencheikh (*Les voies d'une création. Essai sur la poésie arabe à Bagdad dans la première moitié du III*ᵉ*/IX*ᵉ *siècle*, thesis Paris 1971, 130; idem, *Poétique arabe*, Paris 1975, 22 ff.; idem, *Le cénacle poétique du Calife al-Mutawakkil* ..., in *BEt.O*, xxix [1977], 33-52) describes as "a court of legitimation", adding that "the creator confronts there a well-informed prince, formidable men of learning, uncharitable colleagues; in short, criticism is made immediately and pronounced without appeal. On the other hand, it plays a basic role in the diffusion of masterpieces: the scholars comment on them, the musicians are inspired by them, the listeners spread their renown". These general considerations inspired by the study of a limited period of the history of poetry in Baghdad are perfectly applicable to the majority of courts of Muslim sovereigns who were friends of letters and the arts to any extent and concerned about their reputation as patrons.

In addition, before even the dismemberment of the ʿAbbāsid empire was accomplished, parallel to the caliph's *madjlis*, there were some literary groups directed by provincial governors and high dignitaries who had it at heart to gather around them, to ensure their prestige, poets and scholars frequently attracted by ethnic or politico-religious affinities, but also for basely material reasons, for the isolated man of letters or scholar could only live sparsely, if he were without fortune; in any case, if he were not particularly ambitious, he had to appeal to a patron, who, in default of the caliph, he could find in the provinces, then at the court of the dynasts who flourished from one end to the other of the Muslim world.

This necessity was undoubtedly prejudicial not only to the quality of the work at least of the poets, but also to their dignity, for they could not help but compromise themselves, to obey the tastes of the patrons and their entourage, and to adopt at times a politico-religious attitude contrary to their own convictions. In any case, the study of patronage in the history of Arabo-Islamic civilisation (which remains to be undertaken, for it has only been so far sketched out, e.g. by R. Blachère, *HLA*, iii, 544-51) would be really instructive; based on the literary groups and salons in evidence from the Middle Ages to our own days, it would provide a global idea of the influence that the latter exercised on the evolution of literature.

In a society where, as R. Blachère (*Motanabbî*, 130) writes "the life of the salon occupied an important place, no-one could aspire to public admiration, if he were not also a man of the world, an agreable conversationalist with a lively mind and prompt at repartee, skilled in creating situations which he could turn to his advantage". These remarks, valid for the *madjālis* of kings and princes, hold

good for those who, at an inferior social level, stayed simply in the home of well-to-do poets and writers and even in the shops of merchants who practised in their own way a form of patronage. So some *madjālis* were and still are constituted which are real literary salons, where good speech is honoured and extemporisation reigns.

When the person who "held session" was a professor, his *madjlis*, which could possibly be transformed into a côterie, was the place (mosque, *madrasa*, personal home, etc.) where he dispensed his teaching; the same term designated the whole body of his audience, the session during which he dictated his course and, finally, the course itself; his lessons, once recorded by his pupils, were "published" most often under the heading *amālī* "dictations" [see TADRĪS], but also at times *madjālis* (see Sezgin, *GAS*, ii, 83-5); one of the most famous works of this category is the *Kitāb al-Madjālis* or *al-Amālī* of Thaʿlab [*q.v.*]. (ED.)

2. IN ISMĀʿĪLĪ USAGE.

Here, *madjlis* referred to a formal session of religious instruction, the place of it, and also to the lecture or sermon read in it by a *dāʿī* [*q.v.*] to the faithful. These lectures were known more properly as wisdom sessions (*madjālis al-ḥikma*). In the Fāṭimid age, their preparation and delivery twice weekly was the official duty of the *dāʿī 'l-duʿāt*. Outside the capital Cairo, they were read by his deputies (*nuwwāb*). The sessions were the occasion for the payment of a religious duty known as "the [fee for] confidential discourse (*nadjwā*)". According to al-Musabbiḥī (d. 420/1029), the *dāʿī 'l-duʿāt* prepared the lectures, submitted them to the caliph for approval, and then read them separately to various groups of different sex, social and religious rank. Describing later Fāṭimid practice, Ibn al-Ṭuwayr states that they were drafted by the chief assistants (*nuḳabāʾ*) of the *dāʿī 'l-duʿāt* employed in the Dār al-Ḥikma and read by him, if possible, to the caliph who would affix his mark of ratification (*ʿalāma*) to the text. Collections of such lectures are extant, like the *Taʾwīl daʿāʾim al-Islām* of Ḳāḍī al-Nuʿmān, the *Madjālis Mustanṣiriyya*, of ʿAbd al-Ḥakīm b. Wahb al-Mālīdjī (wrongly ascribed to Badr al-Djamālī), and the *Madjālis Muʾayyadiyya*, containing 800 lectures of al-Muʾayyad fi 'l-Dīn al-Shīrāzī (d. 470/1077; see on this work, Brockelmann, S I, 326). On the other hand, the *Kitāb al-Madjālis wa 'l-musāyarāt* of the Ḳāḍī al-Nuʿmān (d. 363/974) is a kind of account of sessions held with the caliph al-Muʿizz (ed. Ḥ. al-Faḳī, I. Shabbūḥ and M. al-Yaʿlāwī, Tunis 1978). In the post-Fāṭimid age, the Ṭayyibī *dāʿī muṭlaḳ* assumed the teaching function of the Fāṭimid *dāʿī 'l-duʿāt*, and collections of *madjālis* of some of them have also been preserved.

3. IN INDIAN SHĪʿĪ USAGE.

This term is especially used in the Indian subcontinent for the Shīʿī mourning assemblies held during Muḥarram to commemorate the tragedy of Karbalāʾ. These assemblies are organised in private homes or, more properly, in the *imām-bārās* [*q.v.*], where miniature replicas of al-Ḥusayn's tomb at Karbalāʾ, made out of paper or other material, are kept throughout the year. The *madjlis*, though dating back to earlier times, acquired real prominence in the 12th/18th century with the impetus given to it by the *Nawwābs* of Awadh or Oudh (1722-1856). Under these rulers, Lakhnaw [*q.v.*] or Lucknow, which was the seat of administration, became the undisputed centre of Shīʿī culture in India and a place where the *madjlis* found its full development. Since then, the *madjlis* has retained much of its traditional character. The central theme of the ceremony is the recital, in prose or verse, of the events connected with the martyrdom of al-Ḥusayn, followed by lamentations and the beating of the breast, in which the whole assembly takes part. The service ends with the distribution of sherbet, sweets or food to all those present in the *madjlis*. An important outcome of the institution was the emergence of individuals performing distinct functions in the *madjlis* proceedings. As related by ʿAbd al-Ḥalīm Sharar, these included the *ḥadīth-khwāns* (*ḥadīth* reciters), recounting the virtues of the Prophet's family; the *wāḳiʿa-khwāns* (narrators of anecdotes), describing the misfortunes of those martyred at Karbalāʾ; the *marthiya-khwāns* (reciters of elegies), whose poetic narration of the events was accompanied by gesticulations and facial expressions; and the *sūz-khwāns* (singers of dirges), who were accomplished musicians. Among these various activities, the singing of dirges, in particular, enjoyed much popular appeal, despite its disapproval by the religious leaders. In its literary role, the *madjlis* contributed to the development of the *marthiya* in Urdu, as illustrated by Anīs (1802-74) and Dabīr (1803-75), the recognised masters of that genre [see MARTHIYA, 4. In Urdu].

4. IN THE SENSE OF REPRESENTATIVE INSTITUTIONS

A. In the Middle East and North Africa

The terms *Madjlis* (Arabic), and *Medjlis* (Ottoman Turkish), *Meclis* (Modern Turkish) and *Madjles* (Persian), meaning "Parliament", appear in various word-combinations as indicated below. In Arabic, the synonym *Barlamān* (borrowed from the French) has also been in frequent use, as has *Pārlāmentō* in Ottoman Turkish (from the Italian), *Parlâmento* in modern Turkish (mostly used for parliaments outside Turkey) or *Pārlemān* in modern Persian (from French). *Madjlis* (usually in *Madjlis al-nuwwāb*, or *Madjlis shūrā al-nuwwāb*) assumed this connotation in the 19th century, as the concept of parliamentarism became widespread, thanks to the impact of Western influence on the Middle East, without, at least initially, implying parliamentary government. While it is not certain when the term was first used in this sense, its first official use appears to have been in 1866, with the promulgation of Khedive Ismāʿīl's *Ḥudūd wa-niẓām-nāmat madjlis shūrā al-nuwwāb al-miṣriyya* of Radjab 1283 (see below, under (xvi) *Egypt*).

The following article attempts to outline and evaluate the advent and fate of parliamentarism in the Ottoman Empire, Republican Turkey, Iran, Arab states and Middle Eastern countries with Muslim

minorities, such as Israel and Cyprus. In certain countries, parliamentary bodies were convened in response to growing demands for political participation by individuals or groups impressed by Western patterns of democratic government, who hoped to use such bodies as national instruments for obtaining (or preserving) independence, overall progress and especially for curbing absolutism. The above were established by local rulers, usually in response to popular demands. Sometimes, they were established by the local ruler on his own initiative, originally in an advisory capacity only; in this latter case, these bodies eventually showed greater political awareness and demanded more than anticipated. During the colonial period, especially in Arab areas under British and French control after the First World War, parliamentary institutions were set up by the foreign Power. Elsewhere, as in Iran and Turkey, they were established by independent régimes, generally during the first half of the 20th century. On the whole, the latter proved to be more durable than the former. However, when adapted to the social, economic and political realities of the country, all such parliaments did continue to function, even those which were colonial creations, as in Lebanon or the Maghrib.

Parliaments in the Middle East and North Africa, whether dating from the colonial or independent era, in general were modelled on Western patterns and functioned with varying degrees of effectiveness, especially during the first half of the 20th century. Most parliaments in Arab states were considered mainly consultative bodies by the government. In recent years, under the new, revolutionary, highly centralised régimes they have lost much of their effectiveness (after having been challenged by Islamists and right- and left-wing groups). In many cases, party competition has all but disappeared and the role of parliament (if at all extant) in the initiation of legislation and public policy-making has diminished, as have its representational attributes. In reality, parliaments in Iran and most Arab states—eagerly hailed by nationalist movements both as symbols of emancipation and desirable vehicles for political expression—had failed, largely because of their inability to resolve or even regulate the sharp conflicts rooted in socio-economic, ethnic and political differences. Such parliaments had indeed identified with the status quo forces. On the other hand, that of Turkey, with a longer parliamentary tradition, has maintained its importance to date (1978).

In summary, parliamentary institutions in each of the countries discussed below have reflected the local political culture of the time. Their impact on national affairs, however, has been merely marginal in most cases, as parliaments in the Middle East and North Africa (Turkey and Israel excepted) have rarely provided political leadership, except through legislation. Their probable main function has been to *legitimise* the new states, *moderate* internal conflict by allowing argument and *integrate* diverse elements. Most Middle Eastern parliaments have succeeded only partially in carrying out these functions, especially the last one.

(i) *The Ottoman empire*

The first Ottoman parliament was inaugurated in 1877, although local parliamentary institutions had occasionally convened prior to that time in certain parts of the Empire, such as Egypt (see below). Earlier, in 1845, a General Assembly, or *Medjlis-i ʿumūmī*, was convened in Istanbul by ʿAbd al-Medjīd, seating one Muslim and one Christian from each province. It met for two months, concerning itself with improvement of local matters. However, it could hardly be considered as more than a mere forerunner of a genuine parliament. Ottoman reformists ("The Young Ottomans"), had indeed discussed the principle of representation, especially since the mid-nineteenth century; many thought of it as a cure for the Empire's ills.

The First Ottoman Parliament. Convocation of a parliament was one of the stipulations of the 1876 Constitution, granted by ʿAbd al-Ḥamīd II [*q.v.*] at the instance of Midḥat Pas̲h̲a [*q.v.*] and his supporters. The Sultan convened a parliament for two principal reasons: firstly, Ottoman reformists and liberals were firmly convinced that a Western-style parliament, anchored in a written constitution, was essential for curtailing absolutism and propelling the Empire on the road to its salvation; secondly, representatives of the European Powers, then meeting in the Constantinople Conference, would thus be impressed with the Ottoman Government's earnest desire to rule more democratically and guarantee individual freedoms more effectively.

The 1876 Constitution stipulated that parliament, or *Medjlis-i ʿumūmī*, would comprise an elected Chamber of Delegates, *Medjlis-i mebʿūt̲h̲ān* and an appointed Senate, literally a Chamber of Notables, *Medjlis-i aʿyān*. The former Chamber, although intended to play the major role, was nevertheless limited chiefly to debating, since initiation of legislation was to be a prerogative of the Ministers who were not responsible to the *Medjlis*; also, a Member of the Chamber of Delegates could initiate a bill only via the Grand Vizier's office, which then forwarded it for the Sultan's approval, while the Sultan retained the right of veto. Voting on the budget was the sole meaningful task of the Chamber of Delegates, and even this could be circumvented. Consequently, the Chamber's real importance was not in its powers, but rather, in its very establishment as a debating forum rendering it a possible restraint on despotism.

According to an *irāde* dated 28 October 1876 (the draft of the electoral law was promulgated only in 1908), elections for the Chamber of Delegates commenced in December 1876 and continued throughout the Empire for several weeks—with the noteworthy exception of Egypt, Tunisia, Montenegro and Serbia (these had special international status and were consequently excused) and of Mount Lebanon (where the Maronites and Druzes refused to vote, lest it affect their special status). In theory, every 50,000 male Ottoman subjects were to elect one delegate. In practice, members of various administrative councils wrote in the delegates of their choice on the ballots, Muslims and non-Muslims alike (although the latter were subject to a quota). All ballots were checked at the provincial governor's office by a public committee headed by the governor himself; they were then counted and despatched to Istanbul for verification. Elections in the capital itself followed a slightly different procedure.

The *irāde* stipulated that the Chamber of Delegates comprise 130 Members. However, only 119 were elected and attended the first session; in the second, which commenced in December 1877—after new elections had been held—there were 113 delegates, including 55 who had attended the first session as well. All sessions convened in Istanbul, where the Chamber—along with an appointed Senate of 31 (4 others were appointed subsequently)—met from 19 March 1877 until 13 February 1878, when the Sultan dissolved parliament. It appears that ʿAbd al-Ḥamīd II considered reconvening it, but then changed his mind; Parliament was not to convene again until 1908.

Senate meetings were closed to the public and little is known of them (other than that it debated several bills passed by the Chamber); sessions of the Chamber of Delegates were open, however. These dealt with foreign demands on Ottoman territory and subsequently with the Turco-Russian War—all with patriotic spirit They discussed bills presented by

Ministers, passing a number of them with certain changes. Most significant were the Provincial Administration Law, the Municipalities Law and the Electoral Law for the Chamber. They debated finances (e g. they sharply criticised the Baghdād Railway concession) and made some pertinent observations thereupon to the Ministers. Their most noteworthy contribution, however, was most likely the constant stream of criticism of the Government's handling of the war, bureaucratic mismanagement and administrative corruption. These manifestations of an independent stand received coverage in the local press, which commented approvingly on their lively character.

Many Members of the Chamber of Delegates were former government officials, including several members of the administrative councils supervising the elections. Socially, most seem to have been of the middle and upper middle classes, hence their interest in administrative reform and their conservative approach to most socio-economic issues. On the religious and ethnic levels, they were much more of a mixed gathering. In the first session, there were 71 Muslims, 44 Christians and 4 Jews; in the second 64 Muslims, 43 Christians and 6 Jews. They belonged to various ethnic groups throughout the Empire: a contemporary observer counted ten: Turks, Arabs, Kurds, Greeks, Armenians, Bulgars, Albanians, Bosnians, Vlachs and Jews. There was an even greater diversity of languages, though Turkish was the official language of proceedings. Rich and poor, educated and uneducated, they were not unrepresentative of the Empire's overall population. Despite their disparate character, they succeeded in cooperating and in publicising personal, local and national grievances to such an extent that the Sultan was prompted to send them home.

Parliaments in the Second Constitutional Period. The 1876 Constitution was reinstated (it had never been officially abrogated) in August 1908, after the Young Turk Revolution; parliament was thus revived. The Committee of Union and Progress (CUP) [see ITTIḤĀD WE TERAḲḲĪ DJEMʿIYYETI] and other groups sought to assert themselves—and limit the Sultan's powers—via the Chamber. ʿAbd al-Ḥamīd II re-inaugurated parliament in Constantinople on 17 December 1908; it functioned until April 1920, when the last Ottoman parliament was dissolved.

Elections were held according to an electoral law which modified the *irāde* of 28 October 1876 but retained the limited franchise and voting through administrative councils. The CUP was in conflict with other groups in the Chamber, which opposed it on either ideological or ethnic grounds (Greek members, for example). Still, it generally held an uneasy majority, useful during the historical meeting of Chamber and Senate, sitting as a single National Assembly (22 April 1909) which decided to depose ʿAbd al-Ḥamīd II after his counter-revolution had failed. This was one of the high points in the annals of parliaments of the Second Constitutional Period. A partial result of this decision was the debate and subsequent passage of various amendments to the 1876 Constitution, rendering the Chamber an important component of the state. Concurrently, the once unconditional sovereignty of the Sultans was restricted; their prerogative to appoint Ministers and nominate others to high office became the right of parliament or the cabinet. Even the cabinet itself was made responsible, and to some extent subservient, to parliament.

During its early years, the Chamber debated and passed numerous laws, chiefly of a financial, administrative, or judicial character (list and summaries may be found in Sarrou—see Bibliography); during the First World War, several laws of military significance were considered. However, the CUP itself, in firm executive control, strove to curtail the powers of parliament, achieving only limited results. The CUP enjoyed more success in passing legislation in the Chamber from 1909 onwards. It was generally aimed at centralising the Empire's administration and strengthening their own position at its head. Examples are the Laws of: Vagabondage and Suspected Persons; Public Meetings; the Press and Printing; Associations; and the Prevention of Brigandage and Sedition. These were intended to curb individual as well as public opposition and to limit the freedom of the press. Such measures did not pass without determined opposition; the Chamber included a group which resisted these restrictions, along with the limitation of the Chamber's powers in favour of the Sultan, whom the CUP manipulated. In April 1912, new elections were held with the CUP obtaining strong support, reportedly by pressure and bribery. Yet another Chamber was inaugurated in May 1914, which prolonged its tenure in April 1918 (by amending the Constitution), after its four-year term had ended. However, in December 1918, Meḥemmed VI dissolved parliament. Elections were held a year later; the new Chamber convened on 12 January 1920, adjourned itself in March and was dissolved on 11 April 1920. It convened briefly, again, in March 1921; however, for all practical purposes, the sessions of parliament in Istanbul had come to an end.

The composition of parliament during the Second Constitutional Period was no less heterogeneous than in 1877-8. The nationalism of the Young Turk leaders had a market ethnocentric tenor, bolstered to a degree by their Islamic policy. Consequently, increasing preference was shown to Turks and Arabs in the elections, although the Turks, a minority in the Empire, constantly maintained an absolute majority in the Madjlis. The CUP was suspicious of Arab and Armenian nationalism, on the one hand, and impatient with Greek and Albanian criticism within the Chamber, on the other. The following table (from Feroz Ahmad—see Bibliography) demonstrates this trend.

Bibliography: For the reconstructed records

Ethnic Representation in the Ottoman Chambers during the Second Constitutional Period

Year	Turks	Arabs	Albanians	Greeks	Armenians	Slavs	Jews	Total
1908	147	60	27	26	14	10	4	288
1912	157	68	18	15	13	9	4	284
1914	144	84	—	13	14	—	4	259

of the 1877 Chamber's proceedings, see Hakkı Tarık Us, ed., *Meclis-i mebʿusan 1293-1877 zabıt ceridesi*, Istanbul 1939-54, i-ii. The verbatim records of the Young Turk parliaments were printed in *Taḳwīm-i Veḳāyiʿ* and distributed by the *Medjlis-i mebʿūthān*. A register of all the meetings of the Young Turk parliaments, the laws discussed and their contents, and their approval or rejection, with dates, was published regularly as *Medjlis-i mebʿūthānīñ . . . idjtimāʿīndaki khulāṣa-yi mesāʿīsīnī we teshkīlātīnī mübeyyin defterdir* (Istanbul). A parallel publication summed up the Senate debates. The laws passed are available in *Meclis-i tanzimat defterleri*, in the Başbakanlık Arşivi, Istanbul; cf. S. J. Shaw, in *IJMES*, vi (1975), 99. The Public Record Office, London, under FO 198/93, has a collection of documents relating to the Young Turk parliaments 1908-14, several with English translations. (ii) *Turkey*.

Turkey's Grand National Assembly (GNA), or *Türkiye Büyük Millet Meclisi*, forged during Turkey's War of Independence, was soon given a legal basis; attention to legality has, in fact, characterised this body throughout its existence. Mustafa Kemal and his advisers were careful to maintain legal continuity: When the GNA opened as a Constituent Assembly in Ankara, on 23 April 1920, twelve days after the Chamber in Istanbul had been dissolved (see *Ottoman empire*, above), it comprised no fewer than 92 Members of the dissolved Chamber, including its erstwhile president (who now became vice-president of the GNA). Nevertheless, the GNA may be considered as a distinctly new institution. As early as 20 January 1921, the GNA adopted a provisional constitution for Turkey, entitled *The Law of Fundamental Organisations*, which vested all legislative authority and executive power in the GNA and charged it with governing the state.

The amendment of 29 October 1923 declaring Turkey a republic and the 1924 Constitution institutionalised the above in a more detailed manner. All powers were centred in the unicameral GNA which was to be elected by universal male suffrage. The GNA would elect the President of the Republic, who in turn, would appoint the Prime Minister. The GNA reserved the right to approve the latter and his Cabinet, all of whom were responsible to it. The size of

the GNA remained fluid, adjustable to population fluctuations. Until 1945, the GNA housed (with brief exceptions) a single party, the People's Party (later renamed the Republican People's Party [see DJÜMHŪRIYYET KHALḲ FİRḲASİ]; several experiments with including additional parties were short-lived. During the post-1945 era, several parties have vied for power in the GNA.

The 1961 Constitution (passed by a Constituent Assembly convened after the military intervention of 27 May 1960 and subsequently approved by a popular referendum on 9 July 1961) greatly resembled that of 1924, with certain modifications concerning the GNA. It became a bicameral body comprising a National Assembly (*Millet Meclisi*) of 450 members, elected for a maximum term of four years and a Senate (*Senato*) of 150 members elected for six years (with one-third renewed every two years). This Senate included 22 of the ex-officers who had engineered the 1960 intervention (and became Senators for life), another 15 appointed by the State President, as well as all surviving former State Presidents. The National Assembly was the more important body of the two, as Cabinets had to obtain its vote of confidence; in addition, it had the right to initiate and support legislation in the event of a dispute with the Senate. The powers of parliament and the cabinet were considerable; however, a Constitutional Court, established at that time, was able to rule on the constitutionality of parliamentary laws and decisions (among its other powers).

There have been several changes in the laws governing parliamentary elections. Up to 1945, elections were indirect and thus liable to manipulation. Women were enfranchised in 1934. Between 1945 and 1950, with the transition to a multi-party system, the electoral laws were modified. In 1946, direct elections replaced indirect ones (first applied in the 1950 elections) and a secret ballot and public vote-counting were guaranteed. In 1950, supervision of elections passed from the executive to the judiciary. The simple plurality system continued until the 1960 military intervention, when a modified system of proportional representation was instituted for elections to the National Assembly. According to the new electoral laws passed by the Constituent Assembly in April-May 1961, each of Turkey's 67 constituencies (identical to its administrative districts) was assigned its share of the 450 seats, proportional to its population. Each party received a number of seats relative to its vote in each constituency. In the Senate elections of 1961, the party winning the majority in a constituency carried all its seats (Istanbul and Ankara excepted). Since 1964, the Senate elections system was adapted to resemble that of the National Assembly. Since 1961, all Turkish citizens aged twenty-one or over (barring convicted criminals) could vote: candidates for the National Assembly had to be literate and aged 30 or over; for the Senate—university graduates aged 40 or over. Membership in the GNA was considered incompatible with service in the state bureaucracy, the armed forces or the judiciary. Democratisation of the electoral process was bolstered by the requirement that parties hold primary elections six weeks before voting-day and that party representatives participate in the supervision of the balloting.

Parliamentary history in the Republic of Turkey appears to be divided into three major periods: 1923-46, 1946-60, 1961 to date (1978). During the first period, the single-party era, general elections to the GNA were held in 1923, 1927, 1931, 1935, 1939 and 1943. The GNA was not only identified with the cadres of the People's Party but was, to a certain extent, an extension of the party itself, co-operating with it in a single-minded effort towards rapid modernisation. The second period ranges from the beginning of the multi-party era until the first military intervention. General elections to the GNA were held in 1946, 1950, 1954 and 1957. This period witnessed the orderly transfer of power from the ruling party to the Democrat Party [see DEMOKRAT PARTI], which obtained and kept a comfortable majority in the GNA for ten years (1950-60). While opposition within the GNA had been negligible during the first period, it was active indeed during the second. Although several smaller parties had a minor share in electoral competition and parliamentary contests, most of the campaigning was undertaken by the two mass parties, the Republican People's Party and the Democrat Party; their rivalry for power engendered a constant see-saw in parliamentary debates on legislation and general policy. The third period commenced with the establishment of a bicameral system under the new constitution. General elections to the National Assembly were held in 1961, 1965, 1969, 1973 and 1977, general elections to the Senate in 1961 and partial elections in 1964, 1966, 1968, 1973, 1975, 1977 and 1979. The see-saw continued, this time between the Republican People's Party and the Justice Party (heir to the Democrat Party in many respects), although with three principal differences:

(a) The relative liberalisation of political party activities, initiated in 1961, enabled several radical groups to form legal parties, stand for election and enter parliament. Examples were: the socialist Workers' Party of Turkey, active since 1961, in parliament since 1965; the Republican Peasant's Nation Party (renamed Nationalist Action Party), active in its pan-Turk ultra-nationalist character and in parliament since 1965; and the strongly Islam-oriented National Salvation Party, active (under a different name) since 1970 and in parliament since 1973. All this reflected a diminishing of the national consensus and increased the difficulties of passing legislation, especially since some of the other parties broke up as well.

(b) For the first time in Turkey's parliamentary history, coalition cabinets were required in order to obtain votes of confidence in the National Assembly. While the Justice Party obtained an absolute majority in the general elections of 1965 and 1969, in those of 1961, 1973 and 1977 the Republican People's Party obtained only a relative majority (see table of Election Results below) and rather unstable coalition cabinets had to be formed. This hindered meaningful legislation in both Houses and encumbered policy-making in the Cabinet (although the parliament and cabinet still could—and did—move decisively in times of national crisis, as in Cyprus, in July 1974).

(c) Frequent elections were held; scarcely a year went by without an election for the National Assembly, the Senate or local authorities. Thus public excitement never abated; on the contrary, it increased, often to the point of physical violence. Indeed, violence appealed to several extra-parliamentary groups, small but vocal and active, supported by those who had despaired of obtaining speedy socio-economic and other reforms by parliamentary means, especially during the years of coalition government stalemate. Consequently, political processes in contemporary Turkey appear to continue

on two different levels, only one of which is centred in the GNA and follows the parliamentary rules-of-the-game; the other level is extra-parliamentary, radicalised and favours violence.

The GNA has attracted many well-educated persons; approximately 70%-80% of its members, in all sessions combined, had studied at the university. However, the socio-economic and occupational composition of parliament in Turkey reflects more accurately the transition to a multi-party régime and the changes brought about by modernisation. The key-date for this process is 1950, as it was then that a counter-élite was largely substituted for the Kemalists. Analyses conducted separately by Frey and by Tachau (see Bibliography) have established that prior to 1950, the GNA comprised—in descending order—former government officials, retired officers, lawyers, merchants and businessmen, and educators. After 1950, the main groups—again, in descending order—were lawyers, merchants and businessmen (i e., the groups with more experience in a competitive system) followed by former government officials and retired officers. Before 1950, a much larger proportion of the GNA came from the more developed areas in Western Turkey; since then, there has been a much more equitable distribution. In the sessions between 1927 and 1943, 63% or more of the membership had already served in parliament; since then, the proportion has dropped to below 50%, with new members entering not only for natural reasons but also thanks to new ideologies enjoying some popular support. The above indicates a broadening of the Turkish political élite, as expressed in the GNA, as well as a freer élite circulation and greater competition between rival élites, reflecting the growth of pluralism in Turkish society and the increase in its upward mobility during the multi-party era. Electoral participation has been quite a crucial factor, as it has generally been rather large, between 64.3% and 89.3% (56.2%-81.0% for the Senate). Voting has usually been heavier in the rural, less-developed areas in Central and Eastern Anatolia, perhaps because of the influence of local landlords. This status-quo factor has been offset, however, by the considerable internal migration from village to town and city, on the one hand, and to a lesser extent, by the impact of Turkish workers returning from Europe, on the other. In recent years, the Justice Party and the National Salvation Party have been particularly strong in rural, less developed areas and have consequently enjoyed electoral support there. The Republican People's Party, enjoying more electoral support in the cities, has benefitted in recent elections from population migration into the cities. It is not easy to predict how all this will be affected by the military intervention of 12 September 1980, one of whose first measures was to dissolve both Houses of Parliament in Turkey.

Notes: The Democrat Party was forbidden to participate in politics after the 1960 military intervention. The Democratic Party is a new group which seceded from the Justice Party.
The Nation Party and the Republican Nation Party were run by the same leadership-core, essentially.
The Nationalist Action Party was the new name of the Republican Peasants Nation Party since 1969.
The Workers' Party of Turkey, closed down in 1971, re-entered electoral contests in 1977.

Notes: In 1961, elections were held for all 150 Senate seats that were earmarked for election (other Senators were appointed).
Since 1964, elections were held in about a third of the constituencies, for a third of those seats and for those that had become vacant.
The Nationalist Action Party was the new name of the Republican Peasants Nation Party since 1969.

(iii) *Iran*

No significant representative institutions existed in Iran until the 1906 Revolution, when the Iranian Parliament was established, reflecting the basic intention of the Fundamental Law of 30 December 1906 and the Supplementary Fundamental Law of 8 October 1907 (both principal components of Iran's first Constitution) to curb the absolute monarchy of the Ḳād̲j̲ārs. These laws, largely patterned after the Belgian Constitution of 1831, provided for a National Consultative Assembly (*Mad̲j̲lis-i s̲h̲ūrā-yi millī*), to which was added a Senate (*Mad̲j̲lis-i Sinā*) in 1949 (first meeting in April 1950). The former body was not only much older, but also far more influential in public life than the latter: it was empowered to discuss all national affairs, pass laws, approve the budget, grant concessions and ratify treaties. The all-Muslim Senate, half of whose 60 Members were nominated by the Shah, was largely intended as a check on the Assembly's powers.

Up to the 1978 revolution, the National Assembly was elected by universal suffrage, excluding the armed forces and convicted criminals but since 1963 including women, who might both vote and be elected. Election was by simple plurality in constituencies. A number of seats were earmarked for Armenians, Assyrians, Jews and Zoroastrians (but only a Muslim might be Prime Minister). In 1957, the number of seats was increased from 136 to 200; it was subsequently raised to 219 and currently (1978) stood at 268. The Assembly's term of office was extended from two to four years (the Senate's term was four years as well) in 1956. The last elections under the Shah's régime were those of 20 June 1975 for the 24th Assembly and the 7th Senate. These were held on one day, whereas formerly they had lasted for weeks and even months. Furthermore, these were the first held under the single-party system. In those elections, all Iranians aged twenty and above could vote in the Assembly elections in 173 constituencies; those aged twenty-five and up could vote for the Senate as well. There were 6,805,647 votes cast for the Assembly, about 51% participation; and 5,834,666 votes for the Senate in 30 constituencies, amounting to nearly 50% of eligible voters. Twenty women entered the Assembly and one the Senate.

The 24 Iranian Assemblies from 1906 to 1978 have had an uneasy and sometimes tumultuous history of in-fighting and of struggling with the Shah for power. The First Assembly began as a nationalist and reformist parliament, which improved fiscal controls and dealt with the administration of justice (including anti-bribery measures) and the organisation of municipalities and provincial councils. Muḥammad ʿAlī S̲h̲āh forcibly dissolved it in June 1908. The Second Assembly, elected in November 1909, moved in the same direction as its predecessor, reorganising the state bureaucracy, but passing laws on education, health and taxation as well. When it rejected an ultimatum from Tsarist Russia, it too was dissolved in December 1911. The Third and Fourth Assemblies which met during and immediately after the First World War were short-lived and achieved but little. Beginning with the Fifth Assembly, elected in November 1921, Iranian parliaments had to contend with the forceful personality of the new ruler Riḍā K̲h̲ān, who became Prime Minister in 1923 and the new Shah in 1925. Riḍā S̲h̲āh banned all political parties and ensured the subservience of the Assemblies by influencing the elections, silencing potential opposition and circumscribing opportunities for reaching national prominence through the Assembly. Turnover decreased and capable, ambitious persons sought other avenues to power during the term of the Sixth until the Thirteenth Assemblies.

The abdication of Riḍā S̲h̲āh in August 1941 immediately released suppressed energies and brought about the creation of political parties and groups and a flurry of Assembly activity. Constant bickering also characterised the Fourteenth Assembly, elected during wartime, which introduced many few faces (nearly half the Members). Unruly behaviour and lack of legislation caused the new Shah, Muḥammad Riḍā Pahlavī, to convince parliament to grant him the right to dissolve the Assembly and add a Senate (1949). Meanwhile, nationalist fervour led to the election of a veteran Member of the Assembly, Muḥammad Muṣaddiḳ, as Prime Minister (1951). Muṣaddiḳ worked against the Shah, nationalised oil (which worsened Iran's economy for a time, as it brought about an international boycott) and alienated many of the Shah's sympathisers. Muṣaddiḳ, however, enjoyed less certain support in the Assembly than he did amongst Tehran's population. His dissolving of the Assembly was countered by a pro-government coup, supported by pro-Shah forces. Muṣaddiḳ was arrested and political parties were banned.

More than half the membership of the Eighteenth Assembly, elected in 1954, was new. The Shah consolidated his power and Assembly Members were invited to join one of two court-sponsored parties. In 1961, the Shah dissolved parliament indefinitely and began to rule by decree (promulgating more than 600 laws in two-and-a-half years). A popular referendum approved the Shah's impressive new plans for a "White Revolution", calling for the re-distribution of land, improvement of agriculture and industry, and increasing literacy. When a new Assembly was elected in September 1963, the Ḥizb-i Īrān-i Nuvīn party predominated. This party comprised technocrats and former civil servants; it supported the Court (probably having been initiated by it), identifying with the policies of the Shah and his Ministers. Later on, the Rastak̲h̲īz Party followed suit. This co-operation, which characterised all subsequent assemblies, was justified by continuous economic growth and an increase in military power.

In Assembly-Shah relations, the Assembly was in ascendance in 1906-25, when it was a partner in the removal of the Ḳād̲j̲ār dynasty and again in 1941-53, when a nucleus of its leaders even succeeded in temporarily exiling the Shah. The Shah subdued the Assembly in 1926-41 and again since 1954, mostly because of his prestige and central position, his executive control over legislative recruitment and endemic divisiveness within the Assembly. Even then, Muḥammad Riḍā Shāh has consistently praised the positive role and great importance of parliamentary democracy in Iran. In actual practice, the Assembly had had a long (although mixed) record in legislation, as well as in criticism of the Cabinet and administration (although not of the Shah and armed forces).

The character of the *Mad̲j̲lis* was determined by the electoral laws, by the bargaining which ensued, and sometimes by official manipulation, but even more so by Iran's socio-economic and political

realities. Indeed, at least until the early 1960s, most political parties in the *Madjlis* were recognisable by their affinity to the person of a leader, rather than their being held together by a cogent ideology. Socio-economic ties were, characteristically, more relevant. Originally, the electoral law institutionalised the situation, by stipulating that the Members of the *Madjlis* were to be elected under a system of indirect balloting, which curtailed popular voting, placing it under the supervision of electoral committees representing six social groups (or classes, *ṭabaḳāt*): nobles, landlords, men of religion, businessmen, traders, and farmers. The 1963 Electoral Law substituted workers and peasants for the first two groups; nevertheless, several members of aristocratic families continued to be elected to the *Madjlis*. Other characteristics were, however, no less evident among *Madjlis* Members: in general, Members of the *Madjlis* had to be well-to-do; in 1906, they were required to be property owners and pay a minimum annual tax. Later on, it was still necessary to be a person of means, in order to assume campaign costs. In addition, they had to be somehow identified with the "Establishment" headed by the Shah and his Court—with the exception of the first few Assemblies, which were essentially revolutionary, and of groups in the Assemblies immediately following the Second World War, which included outspoken members identifying with leftist, ultra-nationalist and extreme religious factions.

The average educational level of *Madjlis* Members has risen steadily: university degree holders made up 62% of the total in the 21st Assembly (1963-7). Landlord representation, although still strong, is declining against an increase in the members of the technical and free professions, with clear emphasis on former mid-to high-ranking government employees (69% of the membership in the 21st Assembly). Mullahs have all but disappeared from the *Madjlis* in recent years. Even so, the *Madjlis* remains an élitist institution, although less so than the Senate. J. A. Bill (in his article, in Lenczowski—see Bibliography) has calculated that during the years 1906-67, the "Forty Families" of Iran have held, between them, 66 seats in the Senate and 410 seats in the Assembly. It is this élitism in membership that secured prestigious character for the Iranian *Madjlis* and warranted—no less than the formal constitution—its participation in the conduct of public affairs. After the "Islamic Revolution" of 1979, the new *Madjlis* opened on 28 May 1980.

(iv) *ʿIrāḳ*.

The parliamentary history of ʿIrāḳ commenced virtually simultaneously with the inception of the British Mandate. Following the signing of the Anglo-ʿIrāḳi Treaty of 10 October 1922, King Fayṣal I, in a Royal Decree dated 21 October, called for elections to a Constituent Assembly. These elections were held in two stages during 1923 and the first Constituent Assembly, numbering 100 members, was inaugurated by Fayṣal on 27 March 1924. The Assembly's main task was to ratify the 1922 Treaty, to draft an Organic Law—approved by Fayṣal on 21 March 1925—and to adopt an Electoral Law. When this was accomplished, the King dissolved the Assembly.

The Organic Law and the 1924 Electoral Law regulated between them the elections to the Chamber (*Madjlis al-nuwwāb*) and the functions of parliament. Elections were to be held by administrative departments, in two degrees, with every 20,000 male citizens, aged 20 or over returning one Elector. Barred were criminals, the insane, those not paying a minimal state or local tax, policement and soldiers —unless on leave. The Electors, aged 25 or over, elected the Members of the Chambers by simple majority vote, one Member for every 250 Electors. Provision was made for the election of minority ethnic groups in three of ʿIrāḳ's constituencies, as follows: one Christian and two Jews in Baghdād; two Christians and one Jew in Mosul; one Christian and one Jew in Baṣra.

The Organic Law—the basic for ʿIrāḳ's first constitution—established a bicameral parliament (*Madjlis al-umma*), partially based on the British model, consisting of a Chamber of Deputies (*Madjlis al-nuwwāb*) and a Senate (*Madjlis al-aʿyān*). The former was elected, as above, for four years; its membership, originally 88, was increased to 108 in 1935, 118 in 1943 and 135 in 1952. The Senate was appointed by the King for eight years, with half the Senators concluding their term of office every four years (they could be reappointed). The number of Senators, 20 at first, was not to exceed a quarter of the Chamber's size. Deputies had to be aged 30 or over, Senators 40 or over. Both Houses were supposedly equal, although only the Chamber had the right to pass the budget and vote on a no-confidence motion in a Minister or the entire Cabinet. Both Houses passed legislation although it was generally initiated in the Chamber, through several standing committees; joint sessions resolved disagreements. Both Deputies and Senators enjoyed parliamentary immunity. The Cabinet was to be made of Deputies and/or Senators; no Minister could serve more than six months without being (or becoming) a Deputy or Senator. Parliament was to convene in Baghdad for four months a year, from November to the end of February (in practice, it frequently sat for longer periods, due to unfinished business).

In July 1925, Fayṣal nominated the first Senate and convened it together with the recently-elected Chamber for an extraordinary session. Since then, parliamentary life has been characterised by a great deal of controversy. One type of conflict was between the Chamber and the King—first Fayṣal and then his son, Ghāzī (since 1933). The two attempted to influence, if not manipulate, the general elections held in 1928, 1930, 1933, 1935 and 1937, in order to ensure a more compliant parliament; they then tried to assert their power, in defiance of the Chamber. The Chamber invested no little effort in asserting itself against both the King and the British, who were suspected of plotting to perpetuate and even enhance their special status as Mandators of ʿIrāḳ.

Later on, another type of conflict envolved on political and socio-economic grounds. In ʿIrāḳ, as in Syria and about the same time, the two-degree electoral system favoured the influential landowners and their urban allies. Furthermore, the constituency system often helped the same families and groups to obtain perennial representation. With the advent of political parties, chiefly after the Second World War, the power of the established, conservative circles within the Chamber was challenged. Heated arguments were carried on concerning the internal socio-economic situation and ʿIrāḳ's foreign policies towards Arab states and international alignments. Most effective decision-making in ʿIrāḳ took place outside parliament—to a greater extent, perhaps, than in certain other Middle Eastern states. This continued even after ʿIrāḳ had formally obtained its independence in 1932. While parliament was characterised by haranguing, the King and the Cabinet of Ministers continued to be the true foci of power, with the British still very influential; since the mid-1930s the military became increasingly involved in politics as well. While the parliament's low status owed more to the then-prevalent political culture in ʿIrāḳ than to anything else, certain corrective steps, principally of a formal nature, were attempted, especially in electoral reform.

During the early 1940s, electoral reform had been increasingly suggested as a palliative; the Chambers elected since 1939 appointed committees to debate the subject. In 1946, a new electoral law for the Chamber was promulgated. Essentially, it was based on the 1924 Electoral Law, although it modified constituency zoning, increased the representation of ethnic minorities (six Christians and six Jews) and imposed legal restrictions on the arbitrariness of local officials supervising the elections. It did not, however, transform the two-degree system into a one-degree system as was vociferously demanded by those desiring democratisation of the popular vote; this was achieved only by a 1952 decree, later

incorporated into the Electoral Law of 1956. The 1952 decree set membership in the Chamber at 135, including eight Christians (but no Jews), re-dividing ʿIrāḳ into 72 constituencies. The decree also insisted upon secret ballots and regulated the ways and means of electoral propaganda.

Considering the electoral reforms of 1946, 1952 and 1956 as a whole, one tends to attribute them, at least in part, to the increasing pressure of ʿIrāḳi political parties on public life. Of moderate consequence before the Second World War and banned during the War itself, parties were permitted to function once again in 1946; old and new ones alike increased their activity, both in and out of parliament. Concomitantly, the Government and its supporters, obviously considering these parties as rivals, took steps to limit their chances of success in the elections and their power within the Chamber. Various parties boycotted the elections of 1947, 1948 and 1952. The January 1953 elections were particularly unsuitable for free voting: several parties were banned, the press severely censored and martial law imposed in Bag͟hdād. The mood was such that only 57 seats were contested; the others were filled without opposition. As a result, Nūrī al-Saʿīd's Constitutional Union Party came within one seat of winning an absolute majority.

Opposition to suppression and repression by the government became pronounced among various political parties and groups: Kurdish strongholds in the north, S͟hīʿīs in the Lower Euphrates Valley and residents of the main cities and environs of Bag͟hdād, Mosul and Baṣra. Political and socio-economic ideologies within and without parliament concerning ʿIrāḳ's joining a Western pact (later named "The Bag͟hdad Pact"). The Government decided on new elections, which were duly held on 9 June 1954. These were the first direct elections to be held with ʿIrāḳ not under martial law, thus allowing free electioneering by all major political parties. Although the balloting was not secret, the Constitutional Union Party, still the largest parliamentary group, obtained only 50 seats, losing its majority; but all conservative groups together still managed to obtain a majority (counting many independents); however, the Government considered this situation unsatisfactory and dissolved the Chamber after less than two months, holding new elections on 12 September of the same year. With most parties split over the issue of boycotting the elections, only 13 out of 135 seats were contested. Consequently, the Opposition was heavily defeated; only 7 out of the 32 Opposition Members of the Chamber elected in June were returned again in September. Many, perhaps most of the independents elected in September were partial to Nūrī al-Saʿīd's policies. The Cabinet enforced its position by issuing, on 22 September 1954, an Association Ordinance. This effectively banned some political parties and restricted the activity of others.

Holding three general elections within twenty months and eliminating much of the opposition from the Chamber of Deputies, the Government succeeded in making most opposition extra-parliamentary. The above Association Ordinance drove many civilians and soldiers underground. The 1954 Chamber was even less representative than several of the preceding ones, so that in the following general elections, on 5 May 1958, only 27 seats of the then-expanded Chamber of 143 were contested; the press hardly reported the voting, which was very sparse, in any case, even though women were enfranchised for the first time. Consequently it is hardly surprising that when the military revolution occurred soon afterwards, on 14 July 1958, none came to the Government's assistance.

With the end of the monarchy, the ʿIrāḳi parliament passed into history as well. One of its last acts had been to approve the Arab Union of ʿIrāḳ with the Hashemite Kingdom of Jordan, on 13 May 1958 (the Union's constitution provided for a joint parliament with 20 delegates from each component). The Arab Union, too, disappeared with the 14 July revolution. During the following years, succeeding governments and their spokesmen repeatedly mentioned the establishment of some sort of parliament, but no practical steps towards this end have been taken. A National Council of the Revolutionary Command, formed soon after the revolution, has assumed both executive and legislative functions; its title has changed, but its powers have not. The Provisional Constitution of 27 July 1958 mentioned no parliament. The Interim Constitution of 29 April 1964 spoke of vesting legislative power in a National Assembly. However, this has remained a dead issue so far. A law promulgated on 14 December 1964 amended the constitution with the aim of instituting an advisory body for legislation (each member to be elected by 70,000-100,000 inhabitants). In February 1967, the Government issued an electoral law, with the (unfulfilled) intention of holding elections before May of the same year. When it became effective on 16 July 1970, the Provisional Constitution of September 1968 had an amendment which mentioned the eventual convening of a National Assembly. On 15 November 1972, President al-Bakr issued a National Charter—the basis for a permanent constitution—which once again spelled out the intention of having a 100-member National Assembly, to be nominated by the Revolutionary Command Council. The latter did indeed approve a law instituting such an Assembly in July 1973. It was to be elected by the various political, economic and social organizations in ʿIrāḳ and would legislate in all non-military and non-security matters. ʿIrāḳ's 1974 Constitution repeated this intention. Such ʿIrāḳi leaders as ʿAbd al-Karīm Ḳāsim in 1962, ʿAbd al-Salām ʿĀrif in 1965, Prime Minister al-Bazzāz in 1965 and others promised to restore parliament—but to no avail. The Revolutionary Command Council retained all executive and legislative powers.

Revolution leaders of republican ʿIrāḳ have hesitated to restore parliament at least partly because of its very modest success during the monarchy. Parliamentary history in ʿIrāḳ may be divided into two principal periods: before and after independence in 1932; however, its character remained essentially the same throughout both periods. Elections appear to have been mismanaged to such an extent that relations between Chamber and Cabinet were anything but productive of healthy criticism. None of the 59 Cabinets serving from 1921 to 14 July 1958 was ever brought down by a no-confidence vote. A principally landed oligarchy, mostly conservative in outlook, generally supported preservation of the status quo. Political parties, to the extent that they were allowed to run in parliamentary elections, were sometimes corrupt and frequently ineffectual within the Chamber. Indeed, many important decisions were made outside the Chamber, with obvious results for the future of parliamentarism in ʿIrāḳ. Only on 20 June 1980 were general elections held in ʿIrāḳ for a National Assembly. For 250 seats, 840 candidates ran. This was, however, intended

to be mainly a deliberative body, with the final decisions remaining with the Revolutionary Command Council staffed by the Baʿth.

Bibliography: The minutes of the Constituent Assembly have been published as *Madjmūʿat mudhākarāt al-madjlis al-taʾsīsī al-ʿIrāḳī*, i-ii, Baghdād 1925. Parliamentary debates in the Chamber of Deputies have been published regularly in the official *Madjlis al-nuwwāb—al-dawra al-intikhābiyya ... maḥḍar al-djalsa* ... (Baghdād); so have reports on the proceedings of the Chamber's standing sub-committees, as *Taḳrīr sekreter al-madjlis ʿan aʿmāl al-lidjān al-dāʾima*; so have summaries of the work of the Senate's standing sub-committee, as *Madjlis al-aʿyān—khulāṣat aʿmāl al-lidjān*. The laws passed by the Chamber and the Senate, countersigned by the King, have appeared in the *ʿIraq Government Gazette* (Baghdād). See also Q. (v) *Syria*.

The history of parliament in Syria is a turbulent one, not uncharacteristic of this country's political culture in recent years. Indeed, the Syrian parliament has been both an agent of and a contributor to the politics of instability. At first, parliament was dependent upon relations with the authorities of the French Mandate; then, after complete independence was achieved at the end of the Second World War, it became subject to political vicissitudes: constitutions have been proclaimed and abolished and parliaments convened and dissolved.

When Fayṣal entered Damascus in October 1918, with the declared intention of setting up an Arab government, a Syrian Congress was convened, holding three sessions between 3 June 1919 and 19 July 1920. This first experiment at parliamentarism in Syria even considered the draft of a constitution (although it did not have the opportunity to approve it) providing for a bicameral legislature (among other stip-

ulations). Its work was cut short, however, by the armed intervention of the French forces, which instituted the Mandate over Syria.

The parliamentary history of Syria under the French Mandate centres around the struggle between Syrian nationalists, who desired a constitutionally-guaranteed parliament endowed with independent powers, and the French authorities, who sought to limit them. At first, the French authorities experimented with Representative Councils in the various "states" of Syria. Elected in two degrees, these Councils were regarded by Syrian nationalists as partial and even subservient to the French. The 1925-7 revolt convinced the French of the need to reach some accommodation with the Syrians. In February 1928, the French High Commissioner Ponsot charged a moderate provisional government with holding general elections for a Constituent Assembly. These were held in April and the Assembly first met on 9 June. It elected a leading nationalist, Hāshim al-Atāsī, as its Speaker and a draft-commission of 27 to prepare a constitution. The nationalists, although not clearly in the majority, were the only group well-organised in a National Bloc (*al-Kutla al-waṭaniyya*). They inscribed their own views into the Constitution, which was approved by the Constituent Assembly in August 1928. The French objected to several paragraphs, but the Assembly stood firm. The High Commissioner therefore adjourned the Assembly, in February 1929, *sine die* and dissolved it in May 1930. He then proceeded on his own to proclaim the same Constitution, with a few minor changes.

Among its other provisions, the 1930 Syrian Constitution established a 60-member unicameral Chamber of Deputies (*Madjlis*), elected every four years and meeting in two sessions of two-and-a-half months annually, from mid-March and from mid-October. Voting was in two stages, each adapted to Syria's administrative divisions, resulting in quite an accurate representation of local, religious and socio-economic interest; it also assisted a well-established oligarchy in obtaining and maintaining control of parliament. Every Syrian male aged 20 years or over was able to vote and every literate Syrian male aged 30 years or over could be a candidate. The number of seats in the Chamber increased over the years according to Syria's population growth. The Chamber's duties were: to legislate, elect the President of the State (for a five-year term), approve the budget and vote confidence in the Government.

The first Chamber, elected in March 1932, met on 7 July of that year. The main subject of dispute between nationalists and moderates concerned relations with France on the nature of Syrian statehood. The Chamber was adjourned again in November 1933 and dissolved in 1934. Only in November 1936 were general elections held. The Chamber was to consist of 86 members, of whom 16 were to represent minority religious denominations and another represented Bedouin tribes. The National Bloc had an overwhelming majority in the Chamber, which convened in December. They elected Hāshim al-Atāsī as State President. The Chamber's most important achievement was to approve a treaty with France, signed by both the Syrian Cabinet and the French High Commissioner but never ratified in Paris. Hopes for Syrian independence were dashed once again—and nationalists both within and without the Chamber reacted accordingly. In July 1939, the High Commissioner suspended the Chamber again, as well as the Constitution, in view of the tense international situation.

The Second World War, in particular the fall of France, strengthened the hand of those Syrians striving for independence. After the Free French and British forces had occupied Syria and Lebanon in 1941, General Catroux, representing de Gaulle, proclaimed Syria's independence on 28 September. Early in 1943, the French, surrendering to nationalist demands, restored the Syrian Constitution of 1930 and ordered general elections. These were held in July and resulted in an overwhelming victory for the National Bloc, now led by Shukrī al-Ḳuwwatlī. The new 124-seat Chamber met on 17 August electing al-Ḳuwwatlī State President. One of the main tasks of this Chamber was to bring about a full French retreat spelling total independence.

The vicissitudes of Mandatory Syrian parliaments continued in independent Syria as well. The first Chamber of independent Syria was elected in May 1947 and sat until dismissed by Colonel Ḥusnī Zaʿīm, who seized power at the end of March 1949. The 1947 Chamber, increased in membership to 140, was elected according to the new Electoral Law of 29 April 1947, which provided a seat for every 6,000 voters or fraction thereof exceeding 3,000 (in reality, only 135 members took office). A local journalist, Ḥabīb Kaḥḥāla, reported later (in his *Dhikrayāt nāʾib*) that this very mixed parliament was merely "a bundle of contradictions" in social composition, organisation, literacy and dress. This certainty could have applied to its ethnic make-up also, for representation took into account the mosaic of minorities. Representation of the National Bloc, which had had a majority in the 1947 Chamber, dwindled to a mere 24 out of 135 seats, while the opposition commanded 53 and the independents 58 seats. Distribution of representation by district and religious denomination was as follows (based on George Haddad—see Bibliography):

The Syrian Chamber of 1947, According to District and Religious Denomination

District	*Muslims*	*Christians*	*Druzes*	*Jews*	*Total*
Damascus	24	4	—	1	29
Ḥims	6	2	—	—	8
Ḥamā	5	1	—	—	6
Aleppo	30	7	—	—	37
Ḥawrān	5	—	—	—	5
Djabal al-Durūz	—	1	3	—	4
al-Lādhiḳiyya	16	2	—	—	18
Euphrates	11	—	—	—	11
al-Djazīra	6	1	—	—	7
Bedouin Tribes	10	—	—	—	10
Total	113	18	3	1	135

Further analysis indicates that the Muslim members comprised 100 Sunnīs, 12 ʿAlawīs and one Ismāʿīlī, while the Christians consisted of seven Greek Orthodox, two Greek Catholics, two Syriac Orthodox, one Syriac Catholic, two Armenian Orthodox, one Armenian Catholic, one Maronite and two other Christians.

The electoral decree of 10 September 1949 stipulated a seat in the Chamber for every 30,000 inhabitants, or fraction thereof exceeding 15,000 and lowered the voting age to eighteen. Nevertheless, membership was set at 114—100 Muslims and 14

Christians—thus modifying the overall ratio only insignificantly. This Christian presence in the Chamber (and in Syria in general) most likely prevented the Chamber from proclaiming Islam as state religion in the 1950 Constitution, adopting instead a formula which established Islam as the religion of the Head of State (essentially repeating the text of the 1930 Constitution). No less significantly, in the November 1949 elections Syria proved to be the first Arab state to enfranchise women (albeit only those holding at least an elementary school certificate). In November 1949, elections were held for a Constituent Chamber, rapprochement with ʿIrāḳ being one of the main electoral issues The National Bloc and several other parties boycotted these elections, suspecting the military of mismanaging them. The People's Party thus achieved a plurality of 50 seats, while another 5 seats apiece were won by the Republican and by the Renaissance Party respectively and another 54 (nearly half of the total membership) by independents. The most useful task of this Constituent Chamber was most likely the drafting and subsequent approval of a new constitution on 5 September 1950, following which the Constituent Chamber became the Chamber of Deputies.

The 1950 Constitution did not differ essentially from that of 1930, insofar as the legislature was concerned. The unicameral Chamber of Deputies was to be elected every four years by direct universal suffrage of Syrians aged eighteen and over; candidates, however, had to be male. The Chamber was to sit twice a year for a total of five-and-one-half months in public sessions (unless otherwise decided). Legislation was the Chamber's prerogative (although it could also be initiated by the State President). The Chamber elected the State President for a five-year term; Chamber interpellations and votes of confidence controlled the Cabinet, whose Ministers could be Members of the Chamber. All Members enjoyed parliamentary immunity.

Adīb al-S̲h̲īs̲h̲aklī, the Colonel who had engineered the third coup d'état in 1949, dissolved the Chamber on 29 November 1951, sensing correctly that it could hamper his dictatorship. Under his guidelines, a draft for a new constitution was prepared and approved by a popular referendum on 10 July 1953. The 1953 Constitution strengthened the Executive at the expense of the Legislature. The three principal limitations on the attributes of the Chamber were: (a) The Chamber no longer elected the State President; (b) The Constitution abolished the post of Prime Minister and made the Cabinet responsible to the State President alone; and (c) The Chamber was to convene from October to February only; during the remainder of the year, a token Chamber, composed of 25% of its total membership, would deliberate and legislate.

Under the provisions of this constitution, elections to a new Chamber are held on 9 October 1953. Suffrage was universal: any Syrian citizen aged 18 and over could vote and any Syrian citizen aged 25 and over could stand for election. One member would be elected for every 30,000 inhabitants. Not unexpectedly, S̲h̲īs̲h̲aklī's own party, the Arab Liberation Movement, obtained 72 out of a total of 82 seats; one of the remaining seats went to the Syrian Social National Party and another nine to independents. However, the 1953 Constitution and the 1953 Chamber remained only brief episodes in Syria's parliamentary history. After S̲h̲īs̲h̲aklī's downfall on 25 February 1954, the Chamber of 1949, dissolved in 1951, re-convened. One of its first acts was to re-establish the 1950 Constitution and restore the parliamentary regime in Syria.

General elections were held again, on 24-5 September (with a new round, for undecided seats, on 4-5 October) 1954, for a new Chamber of 142 members: 126 Muslims—including 9 Bedouins—and 16 Christians. This time, however, no special seats were earmarked for any religious or other groups. Apart from dealing with internal issues, this electoral campaign was largely concerned with Syria's joining a Western-inspired defence treaty. The elections themselves were characterised by their free atmosphere; secrecy was enforced for the first time. The results were as follows: People's Party—30, the Baʿt̲h̲—22, National Party—19, Popular Syrian Party—2, Cooperative Socialist Party—2, Arab Liberation Movement—2, Communists—1, and independents 64 (or 45% of the total membership). The Chamber met in November 1954 and functioned until Syria's union with Egypt in February 1958; it came closer than any preceding Chamber to completing its four-year term and legislated energetically. It ceased to exist with the establishment of the United Arab Republic, when Syrians sent 200 of the joint parliament's 600 members to Cairo (see Egypt, below).

After Syria seceded from the UAR, on 28 September 1961, its separate parliamentary life was soon restored. General elections were held on 1-2 December, with a simultaneous referendum on a new provisional constitution (approved by a 97.6% majority). Voting for the Chamber was secret and free; despite Egyptian appeals to boycott the elections, participation reached 63%—the highest in Syrian parliamentary elections. The outcome was again a sharply-divided Chamber, lacking a comfortable working majority: the People's Party received about 22% of the vote, with 14% for the National Party (heir to the National Bloc), besides 32% independents and several smaller groups. The Cabinet, based on broad right-of-centre support in the Chamber, aimed to rescind the nationalisation decrees and the agrarian reform of the UAR era. Displeased military groups repeatedly intervened in politics, leading to the dissolution of the Chamber, at the end of March 1962 and then to the seizure of power by the Baʿt̲h̲ Movement, in March 1963.

The Baʿt̲h̲, in power since then (despite factional strife and personal changes), has altered perceptibly the structure and functions of parliament, rendering it subservient to the Executive. At the beginning of the Baʿt̲h̲ régime, a National Council of the Revolutionary Command (*al-Mad̲j̲lis al-waṭanī li-ḳiyādat al-t̲h̲awra*) was established, comprising military officers. Under a provisional constitution, this council—both executive and legislative— exercised the real power. In 1964, it was renamed The National Revolutionary Council (NRC) and was expanded to 95 members, mostly civilians: 20 ranking Baʿt̲h̲ officials, five members of the former National Council of the Revolutionary Command, five representatives of the military, 14 trade unionists, 13 peasants, seven women representatives, seven representatives of the teachers' union, five selected from the free professions, two university professors and 17 "progressive citizens". NRC, Syria's parliament, could enact laws (its main function), pass the Budget, amend the constitution, supervise referenda and elect a five-man Presidential Council—the principal executive body. In February 1966, NRC was expanded from 95 to 134 members, ousting

30 and adding 69, thus changing the balance of power. Two weeks later, a military coup by Ṣalāḥ al-Djadīd put an end to this experiment and dissolved NRC; legislative authority was henceforth vested in the President's office and in the Cabinet. However, on 1 May 1969, a new constitution was promulgated by the Regional Command of the Baʿth. This stipulated the establishment of a People's Assembly (*Madjlis al-shaʿb*), to be elected for a four-year term, by a method to be determined. Its main attributes were to be the drafting of a permanent constitution, approving laws, debating the budget, ratifying agreements and treaties, electing the State President, and interpellating Ministers. This constitution, however, was never put into practice.

During the rule of Ḥāfiẓ al-Asad, from 1970 to date (1978), the character of the Syrian parliament was changed to suit even more the socialist ideology of Asad's faction within the Baʿth. Under the amended Provisional Constitution of 1971—promulgated as permanent on 31 January 1973—legislative powers are vested in a People's Assembly (*Madjlis al-shaʿb*), comprising 173, then 186 and finally (since 1977) 195 members, elected by popular associations and trade unions, with the proviso that at least half of the members be peasants and workers. The People's Assembly is elected every four years by secret ballot in constituencies, convening for three sessions annually. In theory, the People's Assembly passes all laws; the State President, who may veto its laws, must nevertheless submit to the Assembly's will if it passes the same law again by a two-thirds majority. In addition, the Constitution grants the People's Assembly the following powers: to approve the candidate for Presidency of the Republic, debate government policy, withdraw confidence from Ministers, approve the budget and ratify all foreign agreements and treaties concerning state security. In practice, the Assembly has generally limited itself to discussing matters of internal relevance, displaying little if any independence of the Executive. The Syrians were not unaware of this: in the 1973 and 1977 elections for the People's Assembly, only a small part of the eligible voters participated.

The People's Assembly nominated by Syria's President, Ḥāfiẓ al-Asad, in February 1971, consisted of 87 Baʿthists, or just over half of the total 173; another 36 represented the General Union of Peasants. In the Assembly elected on 25 May 1973, the Baʿthists numbered at least 111 out of a total 186, while another 46 labelled themselves independents; 97 of the total number of seats had been earmarked for peasants and workers. In the Assembly elected on 1-2 August 1977, Baʿthists numbered 125 out

of a total 195; another 36 labelled themselves independents, and 99 of the total number of seats had been earmarked for peasants and workers.

The history of Syrian parliaments is not easily divided into distinct periods. Nevertheless, it may be divided into three main eras: (a) The French Mandate, during which time the Chambers were distinguished by the struggle for Syrian sovereignty and independence; (b) Independence, when Chambers were marked by even deeper internal strife with determined efforts by the Cabinet and the party (or parties) to gain power, at the Chamber's expense, against equally determined opposition; and (c) Dependence, first on Egypt, during the UAR years, then on the guidelines set for it by the Ba^cth-military coalition which governed Syria after the UAR broke apart. One may conclude with some justification that the role of parliament in Syria has diminished, from one era to the other, at least regarding its impact on public decision-making.

Syrian parliamentarians were characterised by factors besides distinct and religious denomination (which were relevant during the first two eras of the Chamber). An investigation of these periods based on Winder—see Bibliography) concludes as follows: (a) Parliamentarians were youthful—the median age (at time of entering each Chamber) was between 39 and 46; this was perhaps chiefly due to a fairly large turnover; (b) The proportion of Members with university education rose consistently, reaching 48% of the Chamber in 1954; there was also a steady rise in the proportion of those exposed to Western culture, particularly with respect to facility in foreign languages; and (c) With regard to occupations of members, rural landlords have continuously comprised the largest single group; the tribal-notable group was regularly second or third in size. Together they dominated the Chamber and generally appeared to form a conservative, pro-status quo force. Lawyers were, no doubt, an important group, gradually increasing in size and becoming second only to the landlords. On the other hand, very few Members were either *^culamā[>]* or military officers.

(vi) *Lebanon.*

The Lebanese parliament was first initiated by the French Mandatory authorities in 1922. It was intended to support the Mandate, but gradually became more independent and attracted various leaders of public opinion, thus enabling it to work for independence during the Second World War. Its weakness, however, became increasingly more apparent since the achievement of Lebanese statehood in 1943 and of complete independence in 1945—when the French departed and all responsibilities of government passed into Lebanese hands.

Although the Lebanese parliament contributed only modestly to policy-making and was inefficient as a check on both the executive and the bureaucracy, it has been an integral part of the political system nonetheless. Its powers have been hampered constantly by the lack of public consensus on central issues, the personal character of politics, the important role of religious communities and the peculiarities of the electoral system. These constraints have hindered the Lebanese parliament from fulfilling the role of conflict-resolution; rather, it has assumed a role of conflict-accommodation which, in practice, frequently meant conflict-postponement.

Lebanon's Constitution, unwritten guidelines (usually called the "National Pact" of 1943), government structure, parliamentary system and elections, as well as many of the laws, are peculiarly suited to an involved complex of rivalries and based on the desire to maintain an equilibrium between them—with at least a semblance of consensus. The electoral system in particular has harmonised with traditional pluralism. Constantly relying on the need for compromise, the Lebanese parliamentary system has consequently displayed weakness. Checks and balances are considered essentially desirable in democratic regimes. However, distribution of key positions in Lebanon among various religious denominations, although allowing for much-needed compromise, does not necessarily ensure smooth effective functioning either within or without parliament.

The character of the Lebanese parliament was essentially determined early during the French Mandatory period. In March 1922, the Mandatory authority instituted a consultative Representative Council of 30 members, to be elected in two degree-voting by male suffrage. Seventeen of its seats were earmarked for Christians and 13 for Muslims. Thus representation by denominational groups became institutionalised in the legislature; it was soon to be the main organisational feature of the entire public administration. A second Representative Council was elected in 1925. Two days after the promulgation of the 1926 Constitution, it became Lebanon's Chamber of Deputies. A 16-member Senate (seven of them appointed by the State President, the others elected) was established to check this Chamber; the two houses fused in 1927.

In 1926, the Representative Council adopted a constitution which, as amended, has essentially remained in force to date. The main provisions concerning the legislature were as follows: in addition to the Senate, elected for six years, a Chamber would be elected, in two degrees, for four years; its two annual sessions would be of two and two and one-half months duration, respectively. The formal powers of parliament were legislation (which could also be initiated by the executive); approving the budget and taxation; electing the State President, for three years (since 1929—for six years); supervising the Cabinet (by interpellations and no-confidence votes) and amending the constitution.

The unicameral body, the Chamber of Deputies (*Madjlis al-nuwwāb*) still kept its partly-appointed character for some time, undoubtedly in order to ensure compliance; between one third and two-fifths of the membership was appointed by the Lebanese President and Cabinet. Since the 1943 general election, the entire Chamber is elected. The final denominational ratio in parliament dates from 1943, the year when the Chamber set it at 30 Christians and 25 Muslims and Druzes. This ratio of 6:5 has remained unchanged, although the actual numbers have varied. There were 55 members after the 1947 elections (the first after the evacuation of the French), followed by 77 (1951), 44 (1953) and 66 (1957). The number of members was set at 99 for the 1960 elections and did not change for the 1964, 1968 or 1972 elections (no elections were held in 1976, due to the civil war). The following is the official, pre-determined breakdown by religious denominations.

Denominational makeup of the Lebanese Chamber (1960, 1964, 1968 and 1972 Elections)

Christians		*Muslims and Druzes*		*Grand Total*
Maronites	30	Sunnīs	20	
Greek Orthodox	11	Shīʿīs	19	
Greek Catholic	6	Druzes	6	
Armenian Orthodox	4			
Armenian Catholic	1			
Protestant	1			
Smaller groups	1			
Total	54		45	99

This ratio no longer reflects the demographic breakdown of Lebanon's population (the last census was taken before the Second World War). This has been only partly offset by frequent changes in the number of electoral constituencies and the resultant re-zoning. Since 1960, these have corresponded to the state's administrative districts; a serious attempt has thus been made to represent Lebanon's regions fairly and still keep the religious denominations reasonably happy. Each district now elects from two to eight Members of the Chamber (the only single-Member district is Ṣaydā) according to a pre-determined breakdown by denomination (roughly reflecting the assumed ratio). For example, the district identical with the city of Tripoli elects four Sunnīs and one Greek Orthodox. Similarly-composed slates of candidates (in the above example, of four Sunnīs and one Greek Orthodox) run against each other. Single candidates may also compete, although they have consistently met with little success. Every eligible voter in the district, whatever his denomination, votes for the candidate or slate of his choice, provided he observes the denominational breakdown prescribed by law. An obvious advantage of the system is that, on the one hand, it compels candidates to ally themselves with others from different denominations and on the other, to show moderation and refrain from antagonising any particular denomination in the district. A possible drawback is that many Members of the Chamber are rather tame individuals who have run as compromise candidates. Political parties competing in these elections are under the same constraint in forming slates of candidates by denominations, thus possibly limiting their activities.

Emphasis on a denominational "key system" has

served as an obstacle to structural political change —for better or worse, depending on one's viewpoint. It has also bred antagonism, hardly mitigated in the Chamber by the above electoral arrangements: loyalty to affiliation to a religious denomination is only one variable in parliamentary politics. When Members do not vote by religious denomination, they take sides according to the local interests of their constituencies. There are also ideological differences in the Chamber, of which the longest-standing has been support for Lebanon as a separate political entity versus a union or federation with one or more Arab states. Furthermore, there is competition among the political parties, which frequently, although not always, are identified with the respective denominations; in the 1960s, only one-quarter to one-third of the Members were officially affiliated to parties. Within the wide scope of denominations, one finds smaller, feudal-loyalty groups as well. Personal parties are also often identified with denominations (chiefly Christian) as are several ideological ones, such as the Phalangists or Progressive Socialist Party; the Baʿth and several others, however, are not so, identified.

Under the aggregate pressure of denominational, local, ideological and party competition, as well as personal rivalry, the Lebanese Chamber has been fracile and cautious—and consequently limited in policy-making. It expects that a good share of the decision-making and executive policies be carried out by a Cabinet, whose Ministers are drawn from the Chamber and which works closely with the State President. Even legislation has been a lengthy and sometimes inconclusive process, although its overall record is impressive; during the years 1953-72 the Chamber passed 2,106 bills (or an average of 105 annually). The Chamber has often skirted divisive issues, at least insofar as decision-making is concerned. On the whole, its role appears to have been chiefly deliberative; argumentation in the Chamber displays a high level of competitiveness, within the framework of political and cultural pluralism. However, this has afforded satisfaction only to the participants themselves rather than to those Lebanese who have no access to it and to disenfranchised groups, such as the Palestinian refugees, who have been largely instrumental in using extra-parliamentary, increasingly violent ways to make themselves heard. By 1975 they had succeeded in fracturing the delicate minimum consensus concerning Lebanese polity and shattering the precarious status-quo of which the Chamber had been both an exponent and an advocate. It is symptomatic that two earlier serious national conflicts—in 1952 and 1958—were settled by the Chamber's agreeing on the election of a State President. During the civil war (since 1975), the Chamber has met several times, in order to elect a new State President (in June 1976); it has accomplished little else, however, not really succeeding at resolution of the conflicts which keep violence alive. Its inability to agree on action in urgent issues has prevented the Chamber from taking a stand, also, on an important suggestion of President Farandjiyya (in a speech on 14 February 1976). He then suggested altering the Muslim-Christian ratio in the Chamber from 5:6 to 1:1; the Chamber, however, has not even debated this.

The socio-economic composition of Lebanese Parliaments has had little to do with the rate of voter participation. While countrywide participation has usually been between 50 and 61 per cent (women were enfranchised in 1953), rural turnout has regularly been proportionately higher than the urban, possibly due to recruitment by landowners and local leaders. In addition, rural districts have had a slight relative edge in the seats allocated them in the Chamber. The reason seems to be that the Lebanese Chamber is an exclusive club, reserved in practice for those with better-than-average education who can afford the registration fee and campaign expenditures. Indeed, every slate of candidates includes at least one who finances the campaign; he is generally a prosperous businessman hankering for political power (incidentally, this has provided an avenue for the nouveaux riches to penetrate the power system, avoiding a cleavage between the political and economic élites). The outcome, however, has been that the well-to-do generally represent the poor. Even among the former, however, there are meaningful differences in socio-economic make-up, as the following table (based on Hudson and Harik, see bibliography) indicates:

The shift is most interesting: landlords comprised the largest single group between 1943 and 1953; lawyers predominated in 1957. The business and professional groups made up more than half the membership betweent hem. Otherwise stated, the top political élite in the first decade of the Republic failed to hold its own in parliament; the typical Member of the Chamber nowadays is an educated person of upper or middle income, actively engaged in business, law or some other free profession.

Bibliography: The minutes of parliamentary proceedings have been published regularly, since the 1940s, in the official *Madjlis al-nuwwāb—al-dawr al-tashrīʿī* (Beirut). The laws passed in parliament have appeared in the official *al-Madjmūʿa al-ḥaditha li 'l-ḳawānin al-Lubnāniyya*. The periodical publication *al-Ḥayāt al-niyābiyya*, issued since 1924, comprises original material about parliamentary debates as well as research on the Lebanese parliament. (vii) *Jordan.*

The Emirate of Transjordan, carved out by ʿAbd Allāh in 1921 and recognised by the British as such in May 1923, has displayed strong British influence in its parliamentary structure and procedure, both during the Emirate itself and in the subsequent independent Hashimite Kingdom of Jordan (further: Jordan).

As early as July 1923, ʿAbd Allāh formed by decree a Committee to prepare an electoral law for a representative assembly. The law was ready in June 1924, although the entire Assembly project was postponed, reportedly due to British discouragement of the idea. In October 1926, a group of notables was convened to prepare another electoral law, meeting with similar results. More tangible progress was achieved, however, after the Anglo-Jordanian Treaty was signed on 20 February 1928. In accordance with

this Treaty, an Organic Law was promulgated on 16 April setting up a Legislative Council (*Madjlis tashrīʿī*), to be elected for three years by two-degree male suffrage. It was to consist of 16 Members, with guaranteed representation for the Christians (3), Circassians (2) and Bedouins (2). There was no Cabinet responsibility towards the Council. Laws passed by the latter required the approval of both the Emir and the British Resident, while the Council could not override the Emir's veto.

Despite repeated protests by nationalists that the Council was in effect merely consultative and unrepresentative of the people, it remained the basic instrument of parliamentary activity until 1946. In actual practice, it demonstrated greater independence than had been anticipated. The first Council demanded and obtained immunity and freedom of debate for its Members and was dissolved by the Emir on 9 February 1931, when it refused to approve the financing of the Desert Patrol. The lesson was not lost and the following four Councils appear to have been considerably less oppositionist towards the Emir.

Following the new Anglo-Jordanian Treaty of 22 March 1946, which recognised Jordan's independence with ʿAbd Allāh as its King, a new constitution and an appropriate electoral law were promulgated. The constitution provided for a bicameral National Assembly (*Madjlis al-umma*). The Chamber of Deputies (*Madjlis al-nuwwāb*) was to consist of 20 Members (12 Muslims, 4 Christians, 2 tribal representatives and 2 for the Circassians and Sheshans), elected by all male Jordanian citizens aged 18 or over. Candidates had to be at least 30 years of age; they were required to deposit a sum of money which would be forfeited in case of failure to be elected. The Senate (*Madjlis al-aʿyān*) was to number precisely half the membership of the Chamber and was to be appointed by the King, for eight years, from among more mature persons (at least 40 years of age), with half the Senators completing their terms every four years (as in ʿIrāḳ).

General elections were held on 20 October 1947, over the objections of nationalist circles that the King retained too much power under the 1947 Constitution and the Cabinet was not responsible to the Chamber. The only party running, the government-sponsored *al-Nahḍa* ("Revival"), obtained 4 seats; other seats were won by independents, also identified with the Establishment. In general, this Chamber —dissolved on 1 January 1950—was no different in character and tone from the Legislative Councils it had superseded.

More substantive change occurred after Jordan's annexation of a part of the West Bank in 1950 and the granting of citizenship (including the franchise) to its inhabitants. Since then, the political history of Jordan has been largely the struggle between an embattled monarchy and its Palestinian subjects. One of the fronts of this struggle was the Chamber (a cautious nomination policy prevented clashes in the Senate), practically the sole forum for uninhibited criticism and unhampered propaganda. General elections were held on 11 April 1950, with high voter participation, reportedly about 70 %. With the increased number of eligible voters, the Chamber's membership was increased in 1950 to 40, equally divided between East Jordanians and West Bankers. The latter also obtained 7 seats in the Jordanian Senate, whose membership was expanded to 20. The system favoured East Jordan by minimising representation of the more populous West Bank. Nevertheless, the West Bankers—who were more politically-conscious and less attached to the Royal House than the East Jordanians—ultimately altered much of the Chamber's character. Most of the Chamber's West Bankers introduced an ideological dimension both into electioneering and the Chamber's deliberations through their relations with political parties. This was so even when those parties were not legally permitted to run, which was virtually the general practice (since 1957, all parties have been banned). The following table illustrates the party affiliations of Members of the Chamber during the first twelve years after the enfranchisement of the West Bankers (based on Abu Jaber, see Bibliography).

The first Chamber to comprise West Bankers (Jordan's second since independence) had a nucleus of six or seven oppositionists, all West Bankers who, although a minority in the Chamber, often took the lead in the debates. Briefly stated, this Chamber behaved much as did the first Legislative Council in 1931. It refused to pass the budget and consequently was dissolved by the King in May 1951, with new elections called for 29 August. Although ʿAbd Allāh was assassinated on 20 July 1951, the August 1951 elections were held on time (with a voter participation of about 50%). In the new Chamber, the Opposition was even stronger and numbering about 14 of the 20 West Bankers. It was also more vociferous and passed a new constitution on 8 January 1952, which made the Cabinet (singly and jointly) responsible to parliament: a two-thirds majority no-confidence vote in the Chamber was to result in the dismissal of the Cabinet. Furthermore, the 1952 Constitution provided for legislation in both Houses and a joint session in case of disagreement; the King's veto could be overriden if each House re-adopted the law by a two-thirds majority. Foreign treaties and financial agreements were to be ratified in parliament. Immunity was reaffirmed and interpellation of Ministers introduced.

Parties in the Jordanian Chamber 1950-1961

Party	Second Chamber 20/4/50-3/5/51	Third Chamber 1/9/51-22/6/54	Fourth Chamber 17/10/54-26/6/56	Fifth Chamber 14/10/56-20/10/61
National Socialists	10	11	1	11
Communists	2	2	2	3
Baʿth	2	3	—	2
Arab Constitutional	8	9	17	4
Community (*al-Umma*)	2	1	—	1
Muslim Brethren	—	—	4	4
Liberation (*Taḥrīr*)	—	—	1	1
Independent Candidates	16	14	15	14
Total	40	40	40	40

The increase in the legislature's powers and concomitant curtailment of those of the Executive were noteworthy, even though in practice King Ḥusayn and the Cabinet frequently succeeded in circumventing these constitutional provisions during the turbulent years which followed. Nevertheless these provisions remained a frame of reference for the Opposition, which soon demanded and passed a constitutional amendment that established a simple majority (instead of two-thirds) as sufficient for a vote of no-confidence. Alarmed, the Palace dissolved the Chamber in January 1954, and reportedly rigged the general elections of 16 October 1954 (in which participation was about 57%). This election brought in a more compliant Chamber: (half of the Members of the previous Chamber were defeated and only 3 out of 18 Opposition Members were re-elected). Consequently, about 35 (of the 40) Members were loyal to the Government; much of the opposition became extra-parliamentary, with foreign elements allegedly inciting mob violence.

The general elections of 21 October 1956 almost entirely concerned foreign issues, and brought in the most radically nationalist Chamber until then. Most matters involved a traditional, pro-Western orientation versus a Pan-Arab (i.e., pro-Egyptian) policy. The King, favouring the former trend, won this contest of ideologies and succeeded in replacing some of the more radical Members of the Chamber. Meanwhile, the Chamber's membership had been raised to 50 and that of the Senate to 25. Elections to all subsequent Chambers were reportedly influenced by the Government and the Chambers were considerably more conservative politically. Although not always docile (several had to be dissolved), Chambers generally did find a *modus vivendi* with King and Cabinet.

In the general elections for the Sixth Chamber, held on 22 October 1961, only about a tenth of the electorate participated. Under the new Electoral Law of 22 May 1960, the Chamber's seats had been increased to 60 (with 10 earmarked for Christians and 2 for Circassians) and the Senate's to 30 (in both cases, half of the seats were earmarked for West Bankers). However, only 20 seats were contested in the 1961 elections. The Chamber was dissolved on 1 October 1962; general elections for the Seventh Chamber were held on 24 November. These elections were freer in nature and about 70% of the electorate participated. The Chamber was still politically moderate, perhaps due to the official ban on political parties. Still, it was bold enough to bring down the Cabinet in April 1963 and was consequently dissolved. During this period, the Baʿth had taken over in both ʿIrāḳ and Syria, firing the imagination of Pan-Arab nationalists in Jordan as well. Elections for the Eighth Chamber were held on 8 July 1963 and for the Ninth on 15 April 1967. Both elections yielded fairly conservative Chambers, probably the result of manipulation, with 21 and 7 candidates, respectively, returned unopposed.

Since the Six-Day War of June 1967, there have been no parliamentary elections in the Israeli-held West Bank, although some West Bankers visited ʿAmmān and assumed their seats in both Chamber and Senate several times. Since 1967, the ratio between East Jordanians and West Bankers has been maintained through the tactic of having Members decide how to fill vacant seats. Ḥusayn has continued to appoint Palestinians to the Cabinet, although the key Ministries have gone to East Jordanians. Lately, seeking to broaden its popular East Bank representation, the Jordanian Cabinet—acting on instruction from King Ḥusayn—decided (1 April 1973) to amend the state's electoral law in order to grant women both passive and active voting rights for the Chamber. Keeping Jordan's options open concerning its future relations with the West Bank, the Chamber—on the King's initiative—passed a constitutional amendment which empowered the King to dissolve the Senate as well and to postpone general elections for a period of up to one year. On 5 February 1976, the two Houses were called upon to approve another amendment, empowering the King to postpose the elections *sine die* and, meanwhile, to reconvene parliament as required.

However, the semblance of a king governing in consultation with his people had to be maintained. On 13 April 1978, Ḥusayn requested his government to enact a temporary law, providing for a National Consultative Council to assist the Executive. The new Council, nominated Governorate by Governorate, ought to comprise legal and competent persons, representing various public sectors. On 17 April, a royal decree promulgated the law instituting the National Consultative Council (*al-Madjlis al-waṭanī al-istishārī*). It stipulated that the Council would be composed of 60 nominated Members, men and women, Jordanians, aged 30 or over, not simultaneously employed elsewhere, nor Senators. Its duties were to study and discuss all draft laws and advise the Cabinet before it approved them. The Members of the Council had full authority to demand explanations from the Ministers, on any subject, and to speak freely. The Council would be formed every two years. The King had the right to dissolve it at any time, or relieve a Member of his position. The Council was to be dissolved automatically when the suspended parliament was revived, after new elections.

There are apparently three main periods in Jordan's parliamentary history. During the first, when the country was still called Transjordan, the Emirate's Legislative Council was generally compliant with ʿAbd Allāh's wishes. During the second, commencing with independence and the annexation of the West Bank, the Chamber of Deputies (although not the Senate) witnessed the growth of a real Opposition. The Opposition, comprising part of the West Bankers' contingent, was concerned less with socio-economic affairs than with essentially political ones, chiefly relating to foreign policy, such as the non-recognition of Israel, a tougher border policy and the strengthening of Jordan's relations with one or more of the Arab states. The third era begins in 1967, when Jordan rules the West Bank no more and West Bank connexions with the parliament in ʿAmmān, although still extant, become weaker and less frequent.

The character of the Jordanian legislature has been markedly conservative, particularly during the first period, although later on as well, due to the regulation that gave the right-of-vote to tax-payers only. The Legislative Councils elected between 1931 and 1946 always comprised the same people (or their relatives)—all belonging to thirty six leading families. In the Chambers of Deputies elected between 1947 and 1967, despite the addition of the West Bankers and the increase in the number of Members, only 230 individuals, representing 183 prominent famlies, occupied the available 437 seats (details correct only for candidates originally elected, not for replacements).

This explains why the socio-economic character of the Chambers in the second period varied but

little. As to the educational level, West Bankers surprisingly had only a slight edge over the East Jordanians in the Chamber, perhaps because the latter sent some of their best men there (the less educated came from amongst the Bedouin). Even these differences disappeared by the mid-1960s with the overall increase in the educational level of the Chambers, as illustrated in the following table (based on Abu Jaber—see Bibliography).

Comparison of the level of education of members of the Second and Fifth Jordanian Chamber of Deputies

Level	Second Chamber 1950-1951		Fifth Chamber 1956-1961	
Elementary	5	12.5%	3	7.5%
Secondary	10	25.0%	13	32.5%
College	21	52.5%	23	57.5%
Illiterate	1	2.5%	1	2.5%
Unknown	3	7.5%	0	0
Total	40	100%	40	100%

Bibliography: The proceedings of the Legislative Council have appeared as *Mudhākarāt al-madjlis al-tashrīʿī al-Urdunnī*, ʿAmmān 1929-1946. Since 1947, they have appeared, in ʿAmmān, as *Mudhākarāt madjlis al-nuwwāb* and *Mudhākarāt madjlis al-aʿyān*. The laws passed by the Jordanian parliament are published in the official gazette, *al-Djarīda al rasmiyya* or its *Mulḥaḳ* (supplement). (viii) *Saudi Arabia*.

Saudi Arabia has not yet established anything resembling a parliament, although the matter has been occasionally mentioned among the ruling circles as something to be dealt with in the future. The King has delegated authority to various councils and committees, although no representative institution has been set up to date (1978). The King retains most powers and is a *Madjlis* unto himself (as vividly described in *Time*, 29 May 1978, p. 23). The Ministers, headed by the King, fulfill the function of a legislative as well as executive body. A Ministry of Justice co-ordinates laws and regulations with the injunctions of the *shariʿa*.

(ix) *Kuwait.*

Independent since June 1961, Kuwayt soon began to introduce some changes in the paternalistic, absolute rule of its Amīr. In 1938, a Consultative Assembly had been established. Although headed by the Crown Prince and mostly nominated, it voiced criticism of foreign concessions in Kuwayt. It was dissolved soon afterwards because of anti-British sentiment expressed by its nationalists. Following a decree of the Amīr on 26 August 1961, an electoral law, decreeing a Constituent Assembly, was issued on 7 October 1961, granting the franchise to all literate male citizens aged 21 or over; candidates were to be literate male citizens, aged 30 or over. Elections were held that December for 20 seats in the Constituent Assembly; Ministers constituted the other members. The Assembly first met on 20 January 1962 and drafted a constitution, promulgated on 11 November.

The constitution provides for a National Assembly (*Madjlis al-umma*), elected every four years, comprising 50 members. The right to vote is granted to literate male citizens aged 21 or over, with ten constituencies each electing five members. Candidates stand as individuals (as no political parties are allowed); they must be male citizens aged 30 or over. The Assembly is in session eight months per year. The main powers of the National Assembly are legislative (although the Amīr has the right of veto), discussing general policy and ratifying foreign agreements. Members enjoy parliamentary immunity. Ministers are responsible *singly* before the Assembly and *collectively* before the Amīr alone; this means that the Assembly cannot topple the Cabinet by a no-confidence vote. Both this and the right-of-veto reflect the paternalistic attitude of the Amīr towards the National Assembly.

The first elections were held on 23 January 1963, then in January of 1967, 1971 and 1975. The electoral base was very narrow, only about 50,000 Kuwaiti citizens having the right to vote. In every Assembly, several members formed an opposition, noted for its leftist views, to the Amīr and his government; although a minority, they were usually educated, articulate and active, often demanding more powers for the National Assembly. In April 1963, they requested abrogation of the defence arrangements with Great Britain and rapprochement with Egypt or Syria. In December 1965, seven opposition members resigned from the National Assembly, protesting limitations on individual liberties and on the Kuwayti press. Late in 1972, an opposition group succeeded in persuading the Assembly to refuse the ratification of Kuwayt in the Oil Participation Agreement. The Amīr, who had had enough of such activities, suspended the constitution and the National Assembly on 29 August 1976.

(x) *Al-Baḥrayn.*

The Shaykh of al-Baḥrayn held both executive and legislative powers until independence was declared in August 1971. Soon afterwards, the Amīr announced his intention to draft a written constitution. After some consultation, he promulgated a decree on 20 June 1972, establishing a Constituent Assembly for the drafting of a constitution; a later law, promulgated on 16 July, specified the manner of election to the above Assembly. It was to comprise 22 members, elected in 8 districts by all male citizens aged 20 or over, excepting the military, the police and criminals; candidates had to be aged 30 or over and literate. In addition, the Assembly was to include another ten members nominated by the Amīr and his Ministers. Both the above laws closely followed the Kuwayti model, as did the subsequent constitution.

Elections for the Constituent Assembly were held on 1 December 1972, after a fairly heated campaign in which candidates appeared to consider seriously statements by the Amīr concerning the advantages of democracy. This mood probably helped bring about the very large voter participation of 88.5%. Efforts by leftist groups to influence the electorate failed, while moderate, conservative candidates generally succeeded in these elections. The Shīʿī minority cast bloc-votes for candidates of their own denomination. Consequently, elected members were mostly Shīʿī (14 out of 22), young (11 of the 22 were under 39 years of age) and well-educated (8 of the 22 were university graduates and another 2 had studied at universities for two years or more). The Amīr and his Cabinet, always cautious to maintain the Sunnī-Shīʿī balance, corrected the above ratio by their own nominations (so that the Assembly comprised 21 Sunnīs and 21 Shīʿīs).

The Constituent Assembly, which was first convened on 16 December 1972, approved a constitution in June 1973—essentially the draft submitted by the Cabinet, although several additional safeguards for constitution and Assembly were worked in. This constitution provided for a National Assembly (*al-Madjlis al-waṭanī*) of 30 elected members (the second legislature was to have 40) and no more than 12 Ministers, to be elected every four years. The Assembly's powers were mainly legislative, although one of its attributes was the authority to grant conces-

sions concerning the natural resources of al-Baḥrayn.

The first election to the National Assembly, held on 7 December 1973, was even livelier than the Constituent Assembly campaign. About 250,000 people had the right to vote. The number of constituencies had been increased from 8 to 20, half of which elected two members each and the other one member each. Not unexpectedly, this gave rise to charges of gerrymandering. The issues ranged from socio-economic (women's suffrage, unemployment, inflation) to religious (Shīʿīs versus Sunnīs) to political (various ideologies competed, although parties were banned). A count of those sympathetic to the nationalists and the socialists indicates radicalisation in the make-up of the National Assembly, as compared to that of the Constituent Assembly. Consequently, the December 1973 Assembly displayed independence towards the Amir and even criticised his policies; therefore, the Amīr dissolved the Assembly on 26 August 1975. By 1978, it had not yet been re-convened.

(xi) *Ḳaṭar*.

The Shaykh of Ḳaṭar maintained all executive and legislative powers until 2 April 1970, when a provisional constitution was promulgated (even before Ḳaṭar became independent). This provided for a Consultative Assembly (*Madjlis al-shūrā*), comprising 33 members: 30 elected, 3 nominated by the ruler (in practice, from his own family) and ten Ministers. Ḳaṭar was divided into ten constituencies, each electing four members, the ruler himself ultimately selecting three out of each four. Candidates had to be born Ḳaṭar citizens, aged 24 or over, with no criminal record. No political parties were allowed, as elections were meant to be personal. The Consultative Assembly is elected for three years (with the option of another three-year extension). It meets eight months per year (with at least one meeting each month) and is to deliberate and pass laws submitted to it by the Cabinet; to approve the budget; and to discuss overall policy-making in Ḳaṭar.

Ḳaṭar became an independent Amīrate in September 1971; an amended Provisional Constitution was promulgated in April 1972. On 23 April, the Amīr nominated the first Consultative Assembly. In May 1975, its term was renewed by the Amīr for another three years. It appears to have consistently obeyed the Amīr. The only constraints over his powers are Islam and family relations.

Bibliography: Ḳaṭar—Wizārat al-maʿārif, *Nahḍat Ḳaṭar*, n.p. 1964, 17-22; Peaslee[2], ii (1966), 1280-1; Sadik and Snavely, 136-8; Blaustein and Flanz, eds., *Constitutions* ..., xi (1973): *Qatar*; Albaharna, xxxix ff.; Anthony, 75-6; Nyrop *et alii*, *op. cit.*, 258-63; D. E. Long, 34.

(xii) *United Arab Emirates*.

The United Arab Emirates, a federation of seven former Trucial Coast principalities [see AL-IMĀRĀT AL-ʿARABIYYA AL-MUTTAḤIDA in Suppl.], was established, after protracted negotiations and some initial difficulties, on 2 September 1971. A provisional constitution was agreed upon on 18 July 1971 and extended for another five years in November 1976. This constitution and other agreements declared that although the patternalistic rule of each Amīr was to continue, matters of federal interest were to be settled by the Supreme Council (*al-Madjlis al-aʿlā*) of the seven Amīrs, aided by an appointed federal Cabinet.

Legislative authority was vested in the Federal National Assembly (*al-Madjlis al-waṭanī al-aʿlā*), comprising 40 members delegated by the seven states according to the following distribution:

Abū Ẓabī	8
Dubayy	8
al-Shāriḳa (Sharja)	6
Ra's al-Khayma	6
ʿAdjmān	4
Fudjayra	4
Umm al-Ḳaywayn	4
Total	40

The mode of selection was left to each member state (in practice, they are nominated by the respective Amīrs). The Assembly's term is two years; sessions commence each November and last for six months. Its main functions are to debate the federal budget and drafts of laws presented to it by the federal Cabinet. The Cabinet must inform the Assembly about international agreements. Voting is by simple majority and Assembly Members enjoy immunity. The President of the United Arab Emirates—who has continuously been the Amīr of Abū Ẓabī—may dissolve the Assembly.

In actual practice, the Federal National Assembly is merely a consultative body, debating mostly matters of internal interest to the federation. Its character is largely determined by the fact that all members are appointed by the Amīrs, who select males from their own families or from among the community of wealthy merchants and businessmen, interested in preservation of the status quo. In addition, the powers of the Federal National Assembly are limited, in practice, by the fact that each state legislates individually according to the *sharīʿa*. Abū Ẓabī even has an Advisory National Council (*al-Madjlis al-istishārī al-waṭanī*) of its own, comprising 50 nominated members, although with no meaningful power.

(xiii) *ʿUmān.*

The Ibāḍī Imām of ʿUmān (and Muscat) is its Sultan as well. In these two capacities, he functions as an absolute ruler. The Sultan and his family have not yet considered (1978) the establishment of parliamentary institutions in ʿUmān, nor have they promulgated any sort of constitution.

(xiv) *Yemen.*

The Yemen Arab Republic (formerly Yemen, sometimes referred to as North Yemen) has had a fairly recent and brief parliamentary history. Under the Imāmate, the Imām was an absolute ruler, subject to the Ḳurʾān and the *sharīʿa*. He alone held executive, legislative and judicial powers and there were no representative institutions. Although Yemen joined with Egypt and Syria in a United Arab Republic on 8 March 1958, it did not send any representatives to the National Assembly of the UAR in Cairo. The revolution of 26 September 1962 gave birth to the Republic and touched off a six-year civil war. The republicans promulgated their first constitution on 27 April 1964, which also provided for a Consultative Assembly to be selected from among Yemen's learned men for a three-year term. Its main tasks were to be passing laws and advising the government in public policy. During the civil war, however, this constitution was not put into practice.

Since March 1963, Yemen had a legislature, the 45-member consultative National Council, nominated to afford a fairly wide occupational and geographical representation. It comprised 20 *shaykhs* (tribal and rural), 9 *ʿulamāʾ*, 8 more persons with formal education and 8 merchants. The Council's first task was to elect the President of the Republican Council —who was also to be State President, and head of the republican government at Ṣanʿāʾ. In the summer of 1970, its membership was increased to 63, including 12 Royalist representatives.

Several provisional, Islam-oriented constitutions were drafted, beginning with the one promulgated on 3 October 1962. The permanent constitution of 28 December 1970 described Yemen as "an Arab Islamic state", with the *sharīʿa* as the source of all legislation. It established a Consultative Assembly (*Madjlis shūrā*), as a legislative body to supervise the Executive. The Assembly comprised 159 members, of whom 139 were elected and 20 nominated by the Executive. Voters had to be at least 18 and candidates, 25; the Assembly's term was set at four years.

The first elections to the Consultative Assembly were held in February-March 1971, without the participation of political parties (banned in the Republic). Elections were two-degree: villages and tribes selected their representatives, which then elected 139 Members of the Assembly. After nomination of the remaining 20, the Assembly met to select a three-man Presidential Council—which, in actual practice, was responsible for nearly all major decisions, while the Consultative Assembly offered advice only when asked to do so.

After a bloodless military coup in Ṣanʿāʾ on 13 June 1974, the Military Command Council suspended both the constitution and the Consultative Assembly; a new, provisional constitution was promulgated, granting the Military Command Council both executive and legislative powers. Nevertheless, the Consultative Assembly was re-convened in November 1974, under the pressure of tribal chieftains, then suspended again in September 1975, without much achievement. Its critics argued that it had been a forum for self-interested cliques, with no real understanding of national development. Brief and unstable in its history, parliamentarism in Yemen appears to lack a firm foundation to this very day.

(xv) *South Yemen.*

The People's Democratic Republic of Yemen (sometimes called South Yemen) was established on 30 November 1967, upon the departure of the last British troops from Aden. This withdrawal followed the failure of the British to bring about a Federation of South Arabia between the Colony of Aden and the former Protectorates bordering it. The issue had been hotly debated in the Legislative Council, the only apparent representative institution in the Colony of Aden. Inaugurated in 1947 as an entirely nominated body, it was changed in 1955 to include an elected element—largely because of pressure by the Aden Association (a group formed in 1950-1 to promote greater Adenese participation in the government, which consequently advocated independence). In the 1955 elections, 4 of its Members were elected; and in 1959 and 1964, 12 (out of 24).

The Front for the National Liberation of South Yemen has ruled the new state since 30 November 1967. Soon becoming the sole legal party and renamed the National Front, its General Command circulated a draft of a constitution in order to obtain reactions; in November 1970, this constitution was promulgated. It vested legislative powers in the Supreme People's Assembly (*Madjlis al-shaʿb al-*

aʿlā) of 101 members, elected for three years. Of these, 86 were to be elected by all those aged 18 or over, through local councils, under the supervision of the General Command of the National Front, and another 15 by the Trade Union Federation. A quota was reserved for women among the 86 (though they could run independently as well).

The formal powers of the Supreme People's Assembly were fairly wide-ranging: election of the state President and Cabinet; debating and passing of laws, including the budget and development plans; ratification of international agreements and the anouncing of a state of emergency. Members enjoyed parliamentary immunity.

As the local councils required for the elections were not in existence in 1970, a provisional Supreme Peoples' Assembly was nominated by the National Front. It first met between 31 July and 4 August 1971, in order to elect certain state officials, as directed by the National Front. Insofar as can be ascertained, this nominated Supreme People's Assembly has continued to meet regularly, passing laws presented to it by the Cabinet and debating and approving economic plans. However, the Assembly's constant subservience to the National Front has minimised its effectiveness considerably. The first elections in South Yemen to the Supreme People's Assembly were held on 18 December 1978; it is not known whether its powers versus the National Front have changed since.

(xvi) *Egypt*

Egypt was the first part of the Ottoman Empire to experiment with parliamentary bodies (in 1866). Earlier, in 1829, Muḥammad ʿAlī had instituted a Consultative Council (*Madjlis al-mas̲h̲wara*), although it was merely an advisory board, meeting only once a year. Ismāʿīl was the first to endow Egypt with a representative assembly modelled on Western European parliaments, even though he undoubtedly intended it to remain solely advisory. This body, the "Assembly of Delegates" (*Madjlis s̲h̲ūrā al-nuwwāb*) was constituted in November 1866 by Khedivial decree (for the text of this decree, see Bibliography—*Ḥudūd wa-niẓāmnāmat madjlis s̲h̲ūrā al-nuwwāb al-miṣriyya*). The 75 members, Egyptians aged at least 25, were to be elected for three years, indirectly, as befitted a partially-illiterate population; in addition, it enabled the Khedive to exercise better control over the results. This intention was also manifested in the paragraphs prohibiting Delegates from receiving petitions, limiting them to debate over purely internal affairs and to proffering advice on projects submitted to them by the Khedive's Council of Ministers (*Madjlis al-wuzarāʾ*). In any event, all decisions had to be ratified by the Khedive, who nominated the Assembly's President and Vice-President and had the exclusive right to convene, adjourn and dissolve it. The Assembly's name was changed to *Madjlis al-nuwwāb* at the end of Ismāʿīl's rule, although its functions underwent no essential changes. These Assemblies were convened for several weeks per year, most likely in order to impress Egypt's creditors—especially the European Powers—with the supposed liberal-constitutional views of its ruler. However, the general ferment in Egypt in the late 1870s and 1880s led to the Assemblies demanding a greater share in decision-making, which they did obtain in February-March 1882. Soon afterwards, however, the Assemblies were adjourned, during the events leading to the British armed intervention; they were never convened subsequently.

Soon after the British Occupation, Lord Dufferin issued a special report suggesting the institution of a Legislative Council (*Madjlis s̲h̲ūrā al-ḳawānīn*) and a General Assembly (*al-Djamʿiyya al-ʿumūmiyya*), both of which functioned from 1883 to 1912. The first was to consist of 30 members of whom 14, including the President, were to be appointed by the Khedive and his Ministers; the other 16 were to be elected for 6 years by indirect balloting. It would debate (but not initiate), legislation and discuss the budget. The second was to consist of eighty-two members, including the Ministers, the Legislative Council and another 46 members elected for 6 years from among candidates over 30 years old, literate and who paid at least £ E. 50 per annum in direct taxes. The first body met 5 times per year and the second—at least once every two years to debate more important matters, including new taxes. While these partly-appointed bodies were less representative than the Assembly of Delegates, they had a greater share in approving government expenses.

These bodies were superseded by a unicameral Legislative Assembly (*al-Djamʿiyya al-tas̲h̲rīʿiyya*), according to a Fundamental Law, issued on 1 July 1913, initiated by Lord Kitchener, then Great Britain's Consul-General in Egypt. In addition to the Ministers and 66 elected members, this Assembly was to include another 17, nominated in order to guarantee minimal representation for the Copts, Bedouins, merchants, physicians, engineers and teachers. Elections were to be indirect, with candidates aged at least 32, literate and paying a minimum amount of taxes. The mandate of the members was to be for six years, with one-third of the membership renewed every two years. Most important amongst the prerogatives ascribed to the Legislative Assembly were that no new law could be passed before it had been debated and no new tax imposed before it had been duly approved. The Assembly met several times during 1914, although its convocation was postponed again and again following the outbreak of World War I and it never reconvened subsequently.

The Constitution of 19 April 1923, superseded by a less liberal one on 22 October 1930, was reinstated on 12 December 1935. Essentially modelled on the 1830 Belgian Constitution, it provided for a monarchy largely in control of parliament. The latter was to be bicameral, comprising an Assembly of Representatives (*Madjlis al-nuwwāb*) and a Senate (*Madjlis al-shuyūkh*). The former was to be elected for five years by indirect balloting; candidates were to be at least 30 years old and literate. Two-fifths of the latter were appointed and three-fifths elected by indirect balloting. The term of office was ten years, with half of the Senators, appointed and elected alike, leaving every five years. Senators had to be at least 40 years old and enjoy a certain social and economic status. The King and either House had the right to initiate legislation. Every law had to be passed by both Houses; the King had the right of veto, although it could be over-ridden by a two-thirds majority. The Assembly had a slight advantage over the Senate in discussing the budget and voting confidence in the government; however, unlike the Assembly, the Senate could not be dissolved, but merely ajourned.

Attempts by King Fu'ād [see FU'ĀD AL-AWWAL] to increase his prerogatives at the expense of Parliament—despite opposition by the Wafd Party—culminated in his promulgating a new constitution, by Royal Decree, on 22 October 1930. The new constitution raised obstacles to parliamentary censure, increased the proportion of appointed Senators from two to three-fifths (60 out of 100) and empowered the Executive to legislate during the parliamentary recess. In addition, the Assembly of Representatives could not initiate financial laws, while the King could do so. Modifications in the electoral law favoured the King and his supporters; the number of Representatives was reduced from 235 to 150.

The 1923 Constitution was reinstated, on 12 December 1935, with all its former parliamentary attributes; it remained in effect until the Revolution of 23 July 1952. The constitution was formally abolished on 10 December 1952 and political parties disbanded on 13 January 1953. Since April 1954, the new régime had declared repeatedly its intention to return to some form of parliamentary rule. The new constitution of the Republic of Egypt was promulgated on 16 January 1956 and approved by a popular referendum. It provided for a 350-member unicameral National Assembly (*Madjlis al-umma*), to be elected every five years by general, secret and direct balloting, controlled by the National Union (established in May 1957 and the only political grouping permitted). For the first time, women were granted the passive and active franchise, although voting was compulsory for males only. Voters had to be aged 18 or over, with no criminal record; candidates had to be 30 or over and literate. Some 2,528 candidates filed papers, although only 1,318 were approved after a screening by the National Union, including 5 out of the 16 female candidates (of the 5, two were elected—the first women to serve in any Arab parliament). Elections were held on 3 July 1957.

Most, although not all legislation was vested in the National Assembly; legislation was, in fact, its only significant attribute. It first met from July 1957 to February 1958, when the United Arab Republic (UAR) of Egypt and Syria was established. The 1957 parliament was dissolved and a new provisional constitution for the UAR was promulgated on 5 March 1958, providing for a joint National Assembly, to be convened in Cairo, with 400 Egyptian and 200 Syrian members. The first UAR National Assembly, mostly nominated by Djamāl ʿAbd al-Nāṣir [*q.v.* in Suppl.], duly met on 21 July 1960. Its powers and tasks approximated to those of the 1957 National Assembly, although legislation continued to be promulgated largely by presidental decree.

The joint parliament was dissolved when the UAR broke up on 28 September 1961. The 1962 founding of the Arab Socialist Union (as successor to the National Union) and the Constitution of 25 March 1964—which later was the basis (with a few modifications) for that of 1971—determined anew the prerogatives of parliament. The new National Assembly first met on 26 March 1964; its first act was to ratify the provisional constitution. It met regularly and was renamed The People's Assembly (*Madjlis al-shaʿb*) in May 1971. Its 350 members are elected for five years, by general, secret and direct balloting in 175 constituencies (two members in each). Candidates must be approved by the Arab Socialist Union; at least half of those elected must be peasants (owning no more than 25 acres of land) and workers. Another 10 members are nominated by the State President. Members enjoy parliamentary immunity, although they may be deprived of their seats by a motion of twenty members and a subsequent vote of two-thirds of the Assembly. The President of the Republic, his Ministers and members of the Assembly may initiate legislation. Proposed laws are studied and screened in parliamentary committees and subsequently submitted for voting in the plenary.

The most recent People's Assembly elections to date (1978) were held on 28 October 1976, with a second ballot on 4 November for those candidates who did not obtain 51 % of the vote in their constituencies in the first round. There were about 9,500,000 registered voters; participation was compulsory for men and optional for women. There were 1,531 candidates, of whom more than half were running for the first time. About 56 % of all the candidates were independents, while concerning the others, a novel situation had arisen. The Arab Socialist Union was then, officially, still the only party allowed to contest the elections. In 1976, however, it served more as an organisational framework, within which several parties were competing with one another (a situation legalised, *post facto*, by the June 1977 Party Law). In 1976, these were the Arab Socialist Party of Egypt (centrist) the Socialist Liberals (right-of-centre), and the Patriotic Progressive Unionist Alignment (left-of-centre). In the first round, the first won 280 seats, the second 12, the third 2, and independents 48. After the remaining 8 seats were decided, in the second round, the State President appointed another 10 Members (all of the Arab Socialist Party of Egypt), and several independents and others crossed the lines; the final allegiances were as follows:

The Arab Socialist Party of Egypt	312
The Socialist Liberals	11
The Patriotic Progressive Unionists Alignment	3
Independents	34
Total	360

On 29 June 1977, the People's Assembly adopted the new Party Law, liberalising the situation within limits and legitimising certain groups, which had previously been forced to act clandestinely. The debate within the Assembly became livelier, regarding both legislation and policy-making, and frank criticism was expressed more frequently. The government, however, remained secure in the Assembly's support. On 22 July 1978, President Anwar al-Sādāt

announced the formation of his own party, the National Democratic Party, which 306 of the Arab Socialist Party Members in the People's Assembly joined on 21 September 1978. Following this merger, the National Democratic Party became the ruling party in the state and in the People's Assembly (subsequently winning a handsome majority in the 7 June 1979 general elections to this body).

The history of parliamentary institutions in Egypt may be divided into three principal periods. The first, from 1866 to 1914, is the stage of experimentation with Western parliamentary models, advising the ruler and largely dependent on him (or on the British Occupation, after 1882), with no political parties playing any significant role. The second, from 1924 to 1952, represents the closest approach in Egypt to a multi-party representative body, debating policy, passing legislation and in frequent conflict with the executive, particularly until Fuʾād's death and Fārūḳ's accession in 1936. Even so, during this period, only one parliament completed the five-year term allotted to it (1945-50). The Wafd Party, victorious in the Assembly in the first elections (1924) with 150 out of 211 members, frequently (although not always) repeated its victories, thus compelling the King to dissolve parliament. The third period, from 1957 to date, represents a move towards the single-party parliamentary model (with a reported turnout of over 90% of the voters and nearly 100% support), generally subservient to the executive power of the President of the Republic. This has been particularly evident since 1967, when the Assembly empowered the President of the Republic to issue laws by decree, indefinitely. During the late 1960s, some 6,000 such laws were issued annually. However, the situation has changed somewhat since the Assembly elections of October-November 1971, particularly due to the relative liberalisation of the regime under Anwar al-Sādāt—one sign of which has been the renewal of multi-party activity. Consequently, opposition to the State President is being voiced more freely now (1978) and the standing of the People's Assembly has risen, even though it has to its credit few crucial policy-making decisions.

Due to the limited role of parliament in the decision-making process, Egyptian parliamentarians can hardly be considered a very important component of the country's political élite, except, perhaps, during the multi-party era. Nevertheless, the socio-economic make-up of Egypt's Assemblies may serve as an indication of the shift in the balance of power. To some extent, this has been determined by the electoral system—indirect balloting in the first period, which facilitated the decision of public functionaries. Indirect balloting during the multi-party period, subverted by the power structure and the wealthy (as Egyptians were the first to admit), enabled constant re-election of the politicians and the rich. The single-party controlled election system under the Republic enabled those trusted by the new régime to enter parliament.

While no definite studies of the socio-economic composition of the Assemblies are available, some incomplete data confirm the trends influenced by the electoral system. In the first Assembly, elected in 1866, there were 58 *ʿumda*s out of a total membership of 75; the proportion of *ʿumda*s decreased from one Assembly to the other. Since 1924, parliament has become more broadly representative, although landowners, businessmen and professionals (chiefly lawyers) played an important and possibly decisive role. In the Republic, the Assemblies of the late 1950s and early 1960s comprised a relatively large proportion of lawyers, businessmen, bureaucrats, officers and landowners, but very few workers and peasants. For example, according to the calculations of H. Hopkins, 332 ff. (see Bibliography), the Assembly of 1957-8 comprised one-third lawyers and businessmen, nearly one-third senior civil servants, ex-Ministers, former officers and landowners, and about one-third village *ʿumdas* and *s̲h̲ayk̲h̲*s—but very few peasants and even fewer workers. This situation was reversed by legislation in the Assembly elected in 1964, where only 76 members—out of a total of 360—had served in previous Assemblies. Out of the 350 elected members, about 114 had registered as *fallāḥīn* and another 75 as workers. Other groups—academics, journalists, lawyers, physicians and Bedouins—numbered considerably fewer. The Christians elected were under-represented (one Copt and one Greek); this was partially corrected by allotting 8 out of the 10 appointed seats to Christians. Since 1964, more than half (actually, 50% to 60%) of the membership has comprised workers and peasants, although few indeed hold important positions (such as Ministers or chairmen of parliamentary committees).

Bibliography: The records of the Sessions of the Legislative Council, starting with 24 November 1883, were published as al-Ḥukūma al-Miṣriyya—Mad̲j̲lis s̲h̲ūrā al-ḳawānīn, *Mad̲j̲mūʿat maḥāḍir d̲j̲alsat sanat* ..., n.p. 1884—. Those of the Assembly of Representatives, starting with 15 March 1924, were published as al-Dawla al-Miṣriyya—Mad̲j̲lis al-nuwwāb, *Mad̲j̲mūʿat maḍābiṭ dawr al-inʿiḳād* ..., Cairo 1924—, while those of the Senate, starting with the same date, were published as al-Dawla al-Miṣriyya—Mad̲j̲lis al-S̲h̲uyūk̲h̲, *Mad̲j̲mūʿat maḍābiṭ dawr al-inʿiḳād* ..., Cairo 1924—. Indexes of these were printed, entitled *Iḥṣāʾ ʿan aʿmāl al-mad̲j̲lis fi dawr* ..., Cairo. The internal rules of procedure of these parliaments were printed severally as *al-Lāʾiḥa al-dāk̲h̲iliyya*, Cairo, while the laws passed appeared in the *Journal Officiel du Gouvernement Egyptien*, Cairo, and the debates themselves were issued as supplements to the above *Journal*. In the Republican period, the Egyptian parliament has published the projects of law, the debates of its Legislative Committee and the final text of the laws, as approved, in the plenary sessions—e.g. D̲j̲umhūriyyat Miṣr al-ʿArabiyya, —Mad̲j̲lis al-s̲h̲aʿb—al-Lad̲j̲na al-tas̲h̲rīʿiyya, *Ḳānūn istit̲h̲mār al-māl al-ʿArabī wa 'l-ad̲j̲nabī wa 'l-manāṭiḳ al-ḥurra*, Cairo 1974. A journalist's impressions of parliament and parliamentarians, in Fārūḳ's time, by *al-Balāg̲h̲*'s parliamentary correspondent, is Muḥammad al-Sawādī's *al-Barlamān fi 'l-mīzān*, Cairo 1941. For an exposition in simple terms, of parliament and elections during the Republican régime, see Muḥammad Zāyid, *Ṣawtuka lahu t̲h̲aman*, Cairo n.d. [1963?]. (xvii) *Sudan.*

Sudan's parliamentary history commenced later than that of Egypt and several Maghrib states; the Anglo-Egyptian Condominium, set up in 1899, did not provide for development of any meaningfully representative institutions. It was only in September 1943 that the British authorities, aware of rising nationalist sentiment, announced their intention of setting up an Advisory Council (*Madjlis istishārī*), comprising 18 members elected by all of Sudan's northern districts; another 2 elected by the Chamber of Commerce; and 8 others nominated by the Government General (to secure representation for social and economic groups). The Governor-General himself was to be the Council's president; the civil, financial and legal secretaries were to be full members. The Advisory Council was inaugurated on 15 May 1944, despite the protests of Egypt, which had not been consulted and of some Sudanese, who criticised its partially-nominated character, its being restricted to advisory functions and the exclusion of representatives from southern Sudan. Nevertheless, in retrospect, the creation of the Advisory Council may be seen as the first serious

British attempt to come to terms with Sudanese nationalism.

After the end of the Second World War, Sudanisation proceeded swiftly and comprised representative bodies as well. A joint British-Sudanese administrative conference met for several months during 1946 and 1947, suggesting the foundation of a Legislative Assembly and Executive Council, based largely on the British model. As the Egyptian government was reluctant to commit itself to a project which endangered its future ties with Sudan, the British went ahead alone and on 14 June 1948 authorised the governor-general to promulgate an ordinance establishing the above institutions. According to this ordinance, the Legislative Assembly (*Djamʿiyya tashriʿiyya*), elected for three years, was to represent all of Sudan; the inclusion of the south in the Assembly was a significant step in Sudanese integration. It provided for 52 elected members to represent the north and another 13 to represent the south. The governor-general could nominate up to 10 members; several were to present the executive. Of the 65 elected members, 10 would be elected directly in towns and the others by indirect elections in the rest of the Sudan. Voters must be Sudanese, male and aged 25 or over; candidates must be Sudanese, male and aged 30 or over. An Executive Council (*Madjlis tanfīdhī*), comprising between 12 and 18 members (at least half of them Sudanese), headed by the leader of the Legislative Assembly, was to supersede the governor-general's Council. The governor-general still retained important powers: vetoing decisions of the Executive Council, the right to legislative by ordinance, and excluding certain matters from the Legislative Assembly's competence. Nevertheless, Sudan's parliament had come into its own. The elections held in November 1948 were boycotted by political parties favouring union with Egypt. The first Legislative Assembly met on 15 December 1948, with the Umma party —favouring self-determination for the Sudan and amicable relations with the British—in the majority. Another influential group was that of the north Sudan tribal chieftains—self-styled Socialist Republicans.

The first Legislative Assembly, using both Arabic and English, debated economic matters, such as the Budget, local affairs, labour legislation and the introduction of Arabic in the administration and education of southern Sudan. Its most immediate concern, however, was relations with Britain and Egypt in the context of Sudan's own political future. A "Self-Government Statute" was enacted by the Legislative Assembly on 23 April 1952, providing for an entirely Sudanese Cabinet responsible to a bicameral parliament—a Chamber of Deputies (*Madjlis al-nuwwāb*) and a Senate (*Madjlis al-shuyūkh*); the governor-general would retain some authority on internal affairs—particularly in public services and in southern Sudanese matters—and exclusive powers in foreign relations. After initial strong opposition, Egypt eventually accepted the Statute. In the Anglo-Egyptian Agreement of 1953, however, Egypt made a bid for popularity in the Sudan against the British and suggested several modifications in the Statute, which the British could not reject. An elaborate plan was worked out for a maximum three-year transition period from self-government to self-determination. This provided, among other arrangements, for a specially-elected Constituent Assembly to decide between complete independence for the Sudan and links with Egypt. An internal commission supervised the elections to this Assembly, in November-December 1953. Voting was by constituencies; voters had to be 21 or over and resident in their respective constituencies for a period of not less than six months. The National Unionist Party on a decisive victory in both Houses (51 out of 97 seats in the Chamber of Deputies and 22 out of 30 elected seats in the Senate).

The new Sudanese parliament, meeting as a Constituent Assembly (*Madjlis ta'sīsī*), was convened on 1 January 1954. The majority National Unionist Party, formerly assumed to favour union with Egypt, correctly interpreted the mood of the country and gradually changed direction. On 19 December 1955, the Chamber of Deputies declared Sudan's independence; the Senate declared its support three days later. A transitional constitution, largely based on the 1952 Self-Government Statute, was adopted and the Republic of Sudan was proclaimed on 1 January 1956. The struggle for independence gave way to translating sovereignty into practical terms, which meant parliamentary debates and decisions on numerous issues, including relations between North and South Sudan. Sudan's parliament was rather hampered by a spirit of factionalism, expressing itself through groups leaving the political parties and forming strong new *rapprochements*.

Parliament was dissolved on 30 June 1957. General elections were held between 27 February and 9 March 1958, with the number of Members of the Chamber of Deputies raised from 97 to 173, to be elected by constituencies of 50,000-70,000 inhabitants each. The Senate remained the same: 50 members of whom 30 were elected. The new parliament met on 20 March 1958 with the Umma party holding 63 seats; it formed a Coalition Cabinet with the People's Democratic Party, a group which had broken away from the National Unionist Party. The disparity between these two partners, the constant bickering between the other factions and rumours of corruption in high circles discredited both parliament and government. The military, led by Ibrāhīm ʿAbbūd, thereupon seized power on 17 November 1958. Among its first acts were to suspend the transitional constitution, ban political parties and dissolve parliament. The work of the Legislative Assembly ceased; moderate legislative powers were granted to a Central Council, two-thirds of whose members were elected by provincial councils and one-third nominated by the President of the Republic. The Central Council's term of office was two years; the first Council, which convened on 15 November 1963, served a shorter term, as less than one year later, in October 1964, civilian rule was restored following a popular revolt.

The new elections held in northern Sudan during April-May 1965 were based on the 1958 Electoral Law, with a few modifications, most important of which were: institution of a unicameral legislature (the Senate was done away with), reduction of the voting age from 21 to 18, and enfranchisement of women. Fighting in the south led to postponement of elections to March-April 1967. Now that independence had been achieved, the main issues were the state of the economy, the character of Sudanese society and the question of the south. In 1965, the Umma Party achieved the largest plurality (92 seats) in the north, while the National Unionist Party was second with 73. The other parliamentary groups were much smaller and the Legislative Assembly (meeting again as a Constituent Assembly) included 18 independents as well. A coalition cabinet of the

two largest parties, supported by the People's Democratic Party and the Muslim Brethren—all four forming a so-called United Front—was characterised by friction among the partners and among the various party components. Disagreements were so frequent and serious and parliamentary work was so hampered that the Cabinet decided to dissolve the Assembly in February 1968.

General elections were held in April-May, 1968 for an enlarged Assembly, seating 215. The National Unionist Party and the People's Democratic Party had merged into a Democratic Unionist Party and obtained 101 seats; the Umma Party obtained 73. Other seats went to smaller groups, including 10 independents. Again, the two largest parties formed a coalition cabinet suffering from essentially the same discord as the preceding one. Efforts at approving a permanent constitution failed and bickering prevailed. It was against this background of disillusionment with parliamentary democracy that the "Free Officers", led by Colonel Dja^cfar al-Numayrī, seized power by a bloodless coup on 25 May 1969. The constitution was suspended, the Legislative Assembly dissolved and all parties banned. The government which had seized power soon vested all executive and legislative powers in a ten-man Revolutionary Command Council, nine of whom were military officers.

It took some time until the new military régime of the Democratic Republic of Sudan felt secure enough to experiment with parliamentary institutions. On 12 August 1972, al-Numayrī announced that a People's Assembly (*Madjlis al-sha^cb*) of 207 members would draft a new constitution, after which it would disband and new elections would be held, based on the constitution. In September-October 1972, 175 members were elected and another 32 nominated by al-Numayrī including 13 women. On 12 April 1973, the first permanent constitution was approved by the People's Assembly; it became effective on 8 May 1973, superseding the 1954 provisional constitution. The first People's Assembly, acting as a legislature, was elected—according to the 1973 Constitution—under the supervision of the Sudanese Socialist Union, the only legal party. Candidates for the Assembly were nominated by the Sudanese Socialist Union; they had to be members of the party, Sudanese citizens aged 21 or over, literate and not deprived of their political rights. The Assembly itself is elected for a four-year term and sits for at least six months annually. Constitutionally, it has vast legislative powers, it may approve the budget, confirm the government's action and vote no-confidence (by a two-thirds majority). The Assembly elected in 1974 comprised 250 Members: 125 were directly elected from geographical constituencies, 70 elected by occupational organisations (workers, businessmen) and popular associations (youth and women's unions), 30 by provincial People's Councils, and another 25 (no more than 25 % of the total) nominated by the State President. The Sudanese Socialist Union has been very active in the Assembly elected in 1974 and is responsible for legislation and general policy.

The cease-fire agreement of April 1972, ending a 17-year civil war between North and South, granted Southern Sudan its own, separate Assembly. First meeting in April 1974, it enjoys wide autonomous powers; the head of its Executive Council is the Vice-President of the Republic. Southern provinces also send delegates to the People's Assembly in Khartum.

Sudanese parliamentarism has been too brief for any detailed evaluation. Commencing with a stage of preparation and guidance by the British, the bicameral legislature got off to a fair start, although it was rather hampered both by the north-south dichotomy and by factional bickering. Its development has been twice interrupted—first between 1958 and 1964, then since 1969. Both interruptions —the result of military interventions—led to the establishment of unicameral legislatures, subservient to the respective heads of the military régime, although still indicating perhaps that parliamentarism had struck sufficient roots in the Sudan so as not to be wholly eradicated. This is also confirmed by the fact that all parliamentary elections held under civilian rule were generally carried out smoothly and fairly.

Bibliography: The minutes of the debates and the voting in the Legislative Assembly were published in Khartum, in Arabic and English, from October 1949 to May 1952. They were superseded, since 1953, by two separate series: a weekly, entitled *al-Barlamān al-Sūdānī, Mulakhkhaṣ al-mudāwalāt al-usbū^ci—Madjlis al-nuwwāb*; and a less regular one, entitled *al-Barlamān al-Sūdānī, Mulakhkhaṣ mudāwalāt madjlis al-shuyūkh*. Both were published in Khartum, in Arabic and English. (xviii) *Libya.*

The Kingdom of Libya was established on 24 December 1951, largely as a result of the inability of the Great Powers to agree on the future of this area, which had been vacated by a defeated Italy. Prompted by the United Nations, a 60-member National Constituent Assembly (referred to as *Djamʿiyya waṭaniyya* or *Madjlis taʾsīsī*) of Libya met, beginning 25 November 1950 and resolved, on 3 December, that Libya should be a federal kingdom under the Amīr Muḥammad Idrīs, henceforth called King Idrīs I. By October 1951, it had also adopted a constitution, considering that the new state was made up of three rather disparate components—Tripolitania, Cyrenaica and Fezzan. Strong rivalry existed between the first two: Tripolitania was the most populous, Cyrenaica the base of the Sanūsiyya [*q.v.*] and of its then leader, Libya's Idrīs I.

The constitution provided for legislative assemblies in each of the three provinces and for a federal National Assembly (*Madjlis al-umma*). The latter was bicameral and consisted of: (a) The Chamber of Deputies (*Madjlis al-nuwwāb*), directly elected on the basis of one member per 20,000 male inhabitants aged 21 or over (candidates had to be 30 years or over and literate). The first Chamber comprised 55 members: 35 from Tripolitania, 15 from Cyrenaica and 5 from Fezzan. (b) The Senate (*Madjlis al-shuyūkh*, comprising 24 members aged 40 or over, equally divided among the three provinces: four Senators were nominated by the legislative assembly of each province and the remaining 12 by the King. The main task of the National Assembly was to enact legislation on issues of national significance, such as foreign affairs (local matters were essentially left to the respective legislatures of the three provinces). The King, or either House, could initiate legislation, although the privilege of initiating financial laws remained with the Chamber alone. The King could vote legislation and dissolve the Chamber at his own discretion. The Chamber's usual term was four years and the Senate's eight, with half the latter leaving every four years. Ministerial responsibility was to the Chamber only, where a two-thirds majority was required for a no-confidence vote.

On 7 April 1962 and 25 April 1963, legislation was passed in both Houses of the National Assembly to alter the 1951 Constitution and change Libya from a federal to a unitary state, based on its ten administrative districts instead of on its three provinces (which thus lost their special privileges). All of the Senate, rather than half of it, was to be nominated by the King. The Chamber was to be elected as formerly, although women were enfranchised and the number of seats was raised from 55 to 103. Some of these changes were a response to nationalist pressures for a unitary rather than federal state and an expression of the government's desire to decrease local and provincial rivalries and conflict between the National Assembly and the King and Cabinet.

The first elections to the Chamber were held on 19 February 1952 (based on the Electoral Law of 6 November 1951). The principal issues were relations with the Arab States and the Western Powers. Candidates opposing the King and the new régime grouped together in a National Congress Party, based on Tripolitania and supported by Egypt; its platform was strongly nationalist and opposed foreign bases in Libya. Elections were held on time in all constituencies, despite rioting. The National Congress Party won in and around the city of Tripoli, but lost elsewhere. Forty-six out of the 55 Members of the Chamber supported the King and government; the National Congress Party obtained only 7 seats. The first duly elected National Assembly convened in Benghazi on 25 March 1952. Subsequently, it met regularly and was concerned with debating and passing legislation. Although Assemblies were generally compliant, not infrequent criticism of government internal and external policies was voiced, particularly in the Chamber—frequently expressed by interpellations.

The successive general elections of January 1956, January 1960 (with secret balloting imposed on the whole state), October 1964 (with women voting for the first time and the number of constituencies increased to 103) and May 1965 (after King Idrīs had dissolved the Chamber on 13 February 1965) were

held on a personal (or family) competition basis (as political parties were not permitted to function legally). In the 1965 elections the number of constituencies was decreased to 91; all successful candidates were apparently pro-government—16 ran unopposed.

One of Libya's main problems during the first two decades of statehood was a lack of personnel trained in the skills required for running the state. Nevertheless, the many skilled Libyans serving in the National Assembly or its administration sufficed to cause Muʿammar al-Kadhdhāfī to annul the constitution and dissolve the Assembly after his coup of 1 September 1969 (the Assembly was, obviously, also one of the bases of power of the King he had deposed). All executive and legislative authority was vested in the Revolutionary Command Council. Libya's provisional constitution, promulgated by the new régime in December 1969, reaffirmed that the Revolutionary Command Council of the Libyan Arab Popular Republic (as the state was now called) holds sovereign power and is to promulgate laws and decrees. Al-Kadhdhāfī declared, in January 1971—and has reaffirmed since—his intention of convening a legislative assembly, but has not done so to date (1978). This postponement is compatible with his views, as expressed in his *Green book*, that parliament is not sufficiently representative and that direct participation by the masses is preferable. A National Congress (*al-Muʾtamar al-ḳawmī*) of the only legal party, the Arab Socialist Union, represents trade unions, professional groups and popular associations. Its main task is to debate the ideological premises of the régime and ratify its policy decision. However, this 618-member body, established by decree on 13 November 1975, has to date apparently convened in January 1976 only. Since then, it seems to be in cold storage. Instead, again following the principle of direct participation, al-Kadhdhāfī has been convening (once or twice per year) a "General Assembly of the People". First called in March, 1977, this 970-member *Madjlis* is selected in 178 constituencies by popular councils and trade unions. It is officially supposed to discuss all policy-matters, but in effect it approves (and legitimises) the decisions of the Libyan leadership.

Libya's parliamentary history, which came to an end with the abolition of the monarchy in September 1969, was brief, but not necessarily a total failure. The National Assembly's greatest merit was in its assisting King and government in welding together Libya's disparate areas into one unitary state. During its first decade, at the very least, it also curtailed the Monarch's autocratic tendencies. The ban on political parties and, since 1965, the almost complete subservience of the National Assembly to King and Cabinet, minimised whatever significance the Assembly still had in public life and paved the way for those who eliminated it in the military coup.

(xix) *Tunisia*.

Under French rule, Tunisia had experimented with several French-imposed semi-representative

advisory institutions. The Consultative Conference (*Conférence Consultative, Hay'a istishāriyya*), established in 1891 (with defined powers since 1896), comprised only Frenchmen, elected by universal direct suffrage since 1905; from 1907 on, they were joined by 16 Tunisians, nominated by the French Governor General (*Résident général*). At first, the French and Tunisians met together, and later (since 1910) separately. The main task of the Consultative Conference was to advise concerning the budget.

In 1922, the French replaced the Consultative Conference with the Grand Council (*Le Grand Conseil de Tunisie, al-Madjlis al-Kabīr li 'l-Iyāla al-Tūnisiyya*). Elected for six years, it comprised two sections possessing equal rights: one of 56 French members, elected by the French in Tunisia and the other of 41 Tunisians, elected by other Tunisians. The task of the Grand Council was to discuss the budget; in case the two sections differed, the decision rested with an Upper Council (*Conseil Supérieur*), comprising the Governor General, several Ministers and ranking secretaries, as well as seven members from each of the Grand Council's two sections. The Grand Council could also raise and discuss any economic or financial matters, but not political or constitutional ones. Although the powers of the Council were limited and minimal, the Vichy Government was still wary and abolished it on 21 November 1940, transferring its authority to a Consultative Committee (*Comité Consultatif*) of 5 Frenchmen and 5 Tunisians.

After the end of the Second World War, the Grand Council was re-established; its make-up and powers were altered on 15 September 1945. After then, it comprised two sections, French and Tunisian, each numbering 53 Members elected for six years. The franchise for the French section was extended to include all Frenchmen and Frenchwomen in Tunisia, aged at least 21 (candidates—at least 25), with direct voting and proportional representation. The franchise was also somewhat extended for the Tunisian section as well, including all Tunisian males aged at least 25 (candidates—at least 30), who either paid direct taxes, were war veterans, or had completed secondary school. Voting was in two stages. Although the Grand Council essentially remained concerned with economy and finance, its powers were increased to cover advising the government on all legislation—although the government could still bypass it in urgent cases. Even so, the Grand Council was not convened from the end of 1951 until 1954, when its powers were slightly extended.

Tunisian nationalists were obviously not happy with the limited powers of the above-mentioned Conference, Council and Committee, nor with their selective representation, which disenfranchised many Tunisians and afforded preferential voting to the French minority. As early as 1921, the Destūr Party demanded the creation of a representative assembly, to which Ministers would be responsible. When the Neo-Destūr was set up in 1934, it demanded the establishment of such an assembly as an instrument of national sovereignty and for limiting the arbitrary government of the Bey or of France. Consequently, the Neo-Destūr rejected the reforms suggested by the French in March 1954. These reforms provided for a legislative assembly, including French representatives, with full powers in social and economic matters, to be elected by universal suffrage. Under the pressure of the Neo-Destūr and more radical nationalists led by Ṣāliḥ ben Yūsuf, the Bey signed a decree, establishing a Constituent Assembly, on 29 December 1955.

The Neo-Destūr, a "dominating party" (in Duverger's sense) has continued since to consider itself as the instrument of "national will". Hence in order to dominate the 98-seat Constituent Assembly (*al-Madjlis al-Ḳawmī al-Ta'sīsī*), it insisted on an electoral law (promulgated on 6 January 1956) which would favour it over smaller parties and groups. All Tunisia was divided into 18 constituencies: and the slate of candidates obtaining a relative majority of the vote in each was considered as "winner take-all".

Complete independence was the main issue in the 25 March 1956 elections to the Constituent Assembly. The National Front, led by the Neo-Destūr Party, won an impressive victory (597, 813, out of a total of 610,989 votes, or 97.84%). Consequently, it induced the Assembly to pass regulations granting considerable parliamentary powers to the Assembly, its Bureau and six committees. Adoption of those regulations enabled the political bureau of the Neo-Destūr to control the proceedings of the Assembly efficiently and to delay the formation of any meaningful opposition within it. The wide and often unanimous support of the Assembly was skilfully exploited by the Neo-Destūr, especially by its leader, Ḥabīb Būrgība, who was also the Assembly's first Speaker; in April 1956, he left this post to become Prime Minister. The party utilised Constituent Assembly support to extend the powers of the Assembly beyond those of the Bey, his government and the French, on the one hand, and to achieve full independence for Tunisia, on the other. The Constituent Assembly increasingly considered itself sovereign; one of its most significant steps was to proclaim the republic on 25 July 1957. No less significantly, it established the norms for future Assemblies, both by its own practice and by adopting the June 1959 Constitution.

This constitution grants the National Assembly (*Madjlis al-umma*) wide powers, limited, however, by the very essence of Tunisia's presidential regime: the State President is elected by universal suffrage and neither he nor the various Ministers are responsible to the National Assembly. The National Assembly is elected in constituency voting for five-year terms by all Tunisian citizens aged 20 or over (candidates must be 30 years or over). In theory, it is the only legislative body and its members enjoy parliamentary immunity. However, the State President also has the right to initiate legislation—taking priority over the Assembly; he may also enact decrees while the Assembly is in recess (subject to the Assembly's subsequent confirmation). Thus, further restrictions are imposed upon the Assembly's legislative prerogatives.

The National Assembly elections of 8 November were, in many respects, similar to the 1956 Constituent Assembly elections. Once again, a National Front led by the Neo-Destūr ran without serious competition. However, Tunisia was independent in 1959 and women were enfranchised for the first time. Separate polls determined the composition of the Assembly and elected the President of the Republic. The National Front won in the Assembly and Būrgība was elected President. All 90 Members of the National Assembly belonged to the Neo-Destūr Party or were independents sponsored and supported by it. As a result, main policy decisions were initiated and controlled by Būrgība and the party in the 1959-64 Assembly; in this respect, the National Assembly in Tunisia may be considered as an extension of the Neo-Destūr Party, renamed the Socialist Destūr

Party in October 1964. However, as Tunisia achieved full independence and secured its place in international relations, internal affairs increasingly took precedence, and wide divergences of opinion became apparent in the Assembly, both because of the various interests represented in the single party and because the Assembly could not help but be influenced by the extra-parliamentary demands and reactions of those socio-economic and political groups excluded from the official political game.

Much of the above holds true for subsequent National Assemblies as well. In the Assembly elected on 8 November 1964, the Socialist Destûr Party again held all 90 seats (a majority of the outgoing Members of the Assembly including its only woman, were re-elected). The 2 November 1969 National Assembly elections (increased to 101 seats) were essentially a repetition of earlier ones, with heavy voter participation and the election of the party's own candidates, even though the issues debated at this time chiefly concerned the government's economic policies, which had led to considerable controversy. Consequently, economic problems occupied much of the attention of the National Assembly elected in 1969. The results of the elections of 3 November 1974 to the Assembly (increased to 112 seats) were no different from previous ones. The party obtained all seats, although 71 of its Members were elected for the first time, including many representatives of the younger generation. Concurrently, several Members who had opted for a more liberal political and economic régime, thus opposing the line of Būrgība and the party leadership, had been dropped from the candidates' list.

Although there is no detailed statistical breakdown of the Members of all National Assemblies in Tunisia, available material indicates several characteristics. As mentioned above, all Assembly members were selected from within the single party; the top party leadership—identical with Tunisia's political leadership—had occupied the Assembly. The first National Assembly, elected in 1959, comprised 12 members of the party's political bureau, 9 Ministers, the director of Būrgība's Cabinet, 8 former Ministers, 4 former governors, the secretary-general of the Neo-Destūr youth and 7 former and then current party political commissioners. Members of that Assembly were remarkably well educated: 31 had graduated from French universities, and another 25 from modern secondary schools; thus 56 out of the 90 had had a good French education. Most of the others had had traditional education; only one was illiterate. Professionally, the Assembly comprised 15 lawyers, 15 businessmen, 14 manual or clerical workers, 12 professors, 12 farmers, 7 physicians, 6 school teachers, 5 senior civil servants and 4 others While later elections obviously introduced new members, the essential characteristics of the Assembly elected in 1959 have not changed substantially.

The parliamentary history of Tunisia since the 1950s indicates that the Constituent and then the National Assemblies have generally been of secondary importance to the single party. The latter has been the real focus of most important decisions, even in legislative matters. The Assembly's work is scheduled by its Bureau, usually after due consultation with the party. Assembly control is minimal, as nearly all its work is done in committees; on the average, only fifteen plenary meetings take place each year, mostly to approve legislation submitted by Būrgība. On the whole, the Assembly has displayed docile subservience, rarely demonstrating a will of its own or even reflecting differences of opinion within the party itself.

Bibliography: The regulations passed by the Grand Council (and some of the speeches) were published annually, since 1922, as al-Iyāla al-Tūnisiyya—al-Ḥimāya al-Fransāwiyya, *Taḳārir al-madjlis al-kabīr li'l-Iyāla al-Tūnisiyya*. From 1956 to 1959, the proceedings of *al-Madjlis al-Ḳawmī al-Ta'sīsī*, and, since 1959, those of *Madjlis al-Umma*, have appeared in Arabic (all in Tunis). For later years, the bi-monthly *Maghreb*, published in Paris since 1974, frequently has a "rubrique législative". See also M. Dauphin, *La conférence consultative tunisienne*, Paris 1919; E. (xx) *Algeria*

The French, who ruled Algeria from 1830, introduced several moderately-representative institutions on 23 August 1898. The decrees established the Financial Delegations (*Les Délégations financières*)—intended to represent economic interests—which existed until 1945. The franchise changed several times, while candidates consistently had to be French citizens aged 25 or over, residing in Algeria at least three years. All were elected for six-year terms, half of them leaving every three years. Two of the three Delegations comprised 24 European Members each; a third, with 21 (later 24) non-European Members, included six who were nominated. Each Delegation was concerned solely with its own economic interests. Delegations served in an advisory capacity only, concentrating on the budget. United into one body by a decree in 1918, their powers remained unaltered. During 1945-1947 they were transformed into a Financial Assembly (*L'Assemblée financière*) of 37 elected members with broader representation but the same essential capacities.

The Financial Assembly was obviously unsatisfactory to proponents of Algerian nationalism, particularly during the period following the Second World War. All legislation was still passed by the National Assembly in Paris or by the French Governor-General in Algeria. Pressured by Algerian nationalists and by its own Algerian and French Members, the National Assembly in Paris approved a new Statute for Algeria (*Statut Organique de l'Algérie*, or *al-Ḳānūn al-asāsī*), setting up an Algerian Assembly on 20 September 1947.

This Statute provided for an Algerian Assembly (*al-Madjlis al-Djazāʾiri*) of 120 Members, elected for six years—with half renewed every three years—in two separate "colleges" of 60 members each. The franchise was granted to all French citizens of legal age (although participation of Muslim women was deferred) in two-stage constituency voting. Candidates were subject to the same criteria but had to be at least 23 years old. Members of the Assembly enjoyed parliamentary immunity. The Assembly was to convene in Algiers, for three sessions per year, each lasting not longer than six weeks (probably to prevent it from becoming too powerful). Much of its work was to be done in six committees. As legislation for Algeria remained the prerogative of the National Assembly in Paris, the Algerian Assembly's function was chiefly to apply—with some modification—French laws and regulations to Algeria. The Algerian Assembly could also transmit its proposals to the National Assembly in Paris.

The first elections to the new Assembly under the Statute were held in April 1948, with partial elections in February 1951 and January 1954. It soon became evident that the Statute satisfied no one; it was too much for the local French and too little for the Muslims. Nationalism, expressed in moderate to extreme anti-French terms, was the main issue in the elections. Nevertheless, the Nationalists obtained only 16 seats in the 1948 Assembly and even fewer in subsequent elections—perhaps because the two-stage voting, the constituency-system and the enfranchisement of French citizens only favoured upholders of the status quo, supported by the French Administration. The three Assemblies devoted much time to economic and financial matters—particularly Algeria's annual budget; they were also responsible for instituting social security throughout the country. However, debate moved increasingly towards politics, largely as a result of the rise in nationalist, anti-French campaigns, now impelled into extra-parliamentary activity after the total failure of the nationalists in the 1954 elections. This appears to be the main reason for the Assembly's dissolution on 12 April 1956. Algeria's sole parliamentary representation remained in the National Assembly in Paris alone, which (in 1957-8) was concerned with drawing up a new constitution for Algeria, providing for a Federal National Assembly. However, this concept was never put into practice, because of growing unrest and violence in Algeria.

Parliamentary life revived only after the end of the war in Algeria; the Evian Agreements spelled out the necessity for electing a representative assembly. A Constituent National Assembly was elected accordingly on 20 September 1962, first meeting on 25 September. Its powers included legislation, promulgation of a constitution and selection of a provisional government. It comprised 196 Members, about one-third of whom had been guerilla leaders and another 16 European Algerians. The 60-Member Front for National Liberation (known by its French acronym—FLN) dominated the Constituent Assembly, which had elected Aḥmad Ben Bella Prime Minister, and dedicated only part of its time to legislating, as Ben Bella and the government were busy decreeing laws. However, the Constituent Assembly did initiate a fruitful exchange of opinions, with free criticism, meeting increasing disapproval from Ben Bella and his close advisers. Thus there was a marked difference between the level of tolerance for the opposition during the first year of the Assembly, presided over by liberal-minded Farḥat ʿAbbās and during the second, when others presided. In the second year, political debates became increasingly infrequent and most attention was focused on economic matters, in which there were fewer differences of opinion.

Elections to the National Assembly took place in September 1964, in accordance with the August 1963 Constitution, approved by popular referendum on 8 September. This aimed at legitimising personal rule in Algeria, as well as the predominance of the party over the National Assembly. The constitution declared FLN as the only legal party and consequently empowered it to control the National Assembly. It provided for a unicameral National Assembly (*al-Madjlis al-waṭani*), seating candidates endorsed by FLN and duly elected by a general, direct vote for five-year terms. The Assembly and the State President were to initiate legislation; the latter exercised direct legislation under certain circumstances. The Assembly was also supposed to control the government's policy-making. Ministers were responsible to the Assembly's committees, whose members could interpellate them. Members of the Assembly enjoyed parliamentary immunity. According to a new electoral law, adopted in the Assembly on 25 August 1964, the number of seats was reduced from 194 to 138, which proved useful to the FLN government in eliminating members who were considered oppositionist. Nevertheless, about 43% of the Members were indeed re-elected. This Assembly, however, was short-lived and its achievements unspectacular, as more and more laws were promulgated by Presidential decree. Būmedyen's coup of 19 June

1965 resulted in the suspension of both the 1963 Constitution and the National Assembly.

In June 1975, Bûmediyen announced his intention to hold elections for a new representative assembly. Algeria's new constitution, approved by a popular referendum on 19 November 1976, provides for a National People's Assembly, to be elected for a five-year term by direct secret and universal suffrage at the proposal of the single Party's leadership. A number of seats is to be reserved for representatives of peasants and workers. Legislation is to be the prerogative of both the Assembly and the State President, although only the latter may introduce bills on national defence. The Assembly is to hold two annual sessions of not more than three months each, while its sub-committees meet regularly. Members are to enjoy parliamentary immunity. A National People's Assembly has not yet been elected to date (1978) and the Council of the Revolution, headed by Bûmedyen, is the state's supreme executive and legislative organ.

There is only meagre data available on members of the various parliamentary bodies in Algeria. During the pre-independence era, most were middle-class and were frequently identified with circles co-operating with the French and interested in preservation of the status quo. More specific data are available for the post-independence Constituent National Assembly, which sat for two years, between 1962 and 1964. Among its 194 members, 15 were of European origin; 10 were women. The average age was 39—fairly young as parliamentary bodies go. Its occupational breakdown was as follows:

Occupational breakdown of 183 of the 194 Members of the Algerian Constituent Assembly, 1962-1964 (%)

Military	18 %	Students	10 %
Free Professions	18	Workers	7.2
Merchants	14	Party cadres	4
Teachers	12	Salaried	3.2
Peasant-farmers	10.6	Officials, clerks	2.6
		Total	99.6 %

(Source: Anisse Salah Bey—see Bibliography).

The "military" component was a direct result of the Algerian war; some had probably had a different background initially. The proportion of merchants and clerks seems high for a revolutionary Assembly. Those representing the free professions, on the other hand, comprised a relatively small group; apparently, however, some of the military had formerly been professionals. In any event, it was a well-educated body: some 25 % of the Members had had university education and many others secondary school training. More than 75 % spoke French, which was consequently the language used in the Assembly.

Algeria's parliamentary history falls into two main periods: the colonial era, until 1956, when the nature of the Assemblies, determined by the French, remained largely consultative, although some autonomy was acquired gradually; and the brief experience in independent Algeria, with the Assembly controlled by and largely subservient to the FLN.

Bibliography: The parliamentary debates (generally held in French) have been published in the *Délégations financières Algériennes*, *Débats* and, later, in *Conseil du Gouvernement*, *Débats*. These were superseded, during 1948-1962, by *Assemblée, Journal Officiel ... Débats ... compte rendu in extenso des séances*. During 1962-1965, this appeared weekly as *Assemblée Nationale, Journal Officiel ... Débats parlementaires ... Compte rendu in extenso des séances* (all published in Algier). The bi-monthly *Maghreb*, published in Paris since 1964, frequently has a "rubrique législative". See also H. Gmelin, *Die Verfassungsentwicklung von Algerien*, Hamburg 1911, 149-249; L. (xxi) *Morocco*.

Under the French Protectorate, Morocco was an absolute monarchy, in which the Sultan and the French (particularly the latter) ruled without any parliamentary institutions. A first step forwards parliamentarism was taken by the Protectorate in 1919, with the establishment of a Government Council (*Conseil de Gouvernement*), comprising the representatives of the French in Morocco; local Moroccans joined during subsequent years. From 1926 on, the Council comprised three French sections (*collèges*), elected by economic groups (agriculture, commerce, industry) and one, nominated Moroccan section. The Council served only as a debating forum and its decisions were purely advisory.

When independence was achieved, King Muḥammad V considered the issue of parliamentary bodies. Morocco had had no experience with political elections; even its political parties were divided as to the benefits of immediate representative government. Therefore, the King nominated a 76-member Consultative National Assembly (*Assemblée Nationale Consultative, al-Madjlis al-waṭanī al-istishārī*) on 3 August 156, striving to make it as representative as possible of the three major political parties, of the different regions of Morocco and of various socio-economic groups. The King inaugurated the Assembly on 12 Novembre 1956.

The powers of the Consultative National Assembly, amplified by a royal decree on 27 November 1956, were clearly advisory. The Assembly meets twice a year, in spring and autumn. Most of its work is carried out in four (three since 1958) committees comprising between 12 and 24 members each (every member may belong to one committee only). The Assembly's regular term is two years, although the King may prolong it (in 1958 it was prolonged by six months) and Members enjoy immunity. Since the Moroccan Cabinet preceded the convocation of the first Assembly, the Ministers were neither part of the Assembly, nor responsible to it, although the Members of the Assembly could interpellate them. Ministers were responsible to the King alone, who succeeded in imposing his will on the Assembly thanks to both the definition of its powers and to his own standing and prestige. Hence there were large pro-government majorities in practically every vote on all important matters during the Assembly's first two years. Only during its third year were there signs of growing independence—and even increasing criticisms and opposition, probably reflecting the overall political climate outside the Assembly. This seems to have led Muḥammad V to allow the Assembly to die a natural death in May 1959; its term was not renewed, nor did the King convene another Assembly during his reign.

Muḥammad V's son and heir, Ḥasan II (mounted the throne in 1961), contributed to the course of parliamentarism in Morocco. On 2 June 1961, the new king promulgated a Fundamental Law, which was mainly a declaration of principles. This was enhanced by Morocco's first constitution, prepared by a commission and submitted by Ḥasan II to a popular referendum on 7 December 1962. Some 80% of those eligible voted, with a heavy majority in favour (3,706,732 versus 112,879).

The 1962 Constitution provided for a bi-cameral legislature—a Chamber of Representatives (*Chambre des Représentants, Madjlis al-nuwwāb*) and a Chamber of Counsellors (*Chambres des Conseillers, Madjlis al-mustashārīn*). The former was to be elected for four years by direct universal suffrage and the latter for six years (with half the membership changing every three years)—by and from colleges consisting of local assemblies (two-thirds of this body) and chambers of agriculture, commerce and industry, artisans and trade-unionists (one-third). Both Chambers debate policy and legislate, although the Chamber of Representatives has greater authority. For example, the latter may bring about the resignation of the Cabinet by a vote of censure (Ministers are nominated by the King, who has also the right to dismiss them). While the Representatives have greater authority, legislation in both Chambers is hampered, in practical terms, by their meeting for only two annual two-months sessions. Furthermore, the King may withhold approval of laws indefinitely and may submit laws for popular referendum without prior consultation with the two Chambers. Members of both Chambers enjoy parliamentary immunity.

Although the 1962 Constitution was criticised by both traditionalists and modernists in Morocco as being too modern or too traditional, respectively, it remained in force for several years; the first two Chambers were elected following its provisions and those of a subsequent Electoral Law.

Elections to the 144-seat first Chamber of Representatives were held on 17 May 1963, following a simple majority system with single-member constituencies, of which 117 were rural. There were 694 candidates running; each was required to deposit 1000 *dirhams* (then about £ 70), to be forfeited if the candidate obtained less than 5% in his constituency. About 73% of the 4,650,000 eligible voted. The Front for the Defence of Constitutional Institutions, a pro-King and pro-Government group, won 69 seats, four short of an absolute majority. Next came two nationalist groupings, the *Istiḳlāl* with 41 seats and the National Union of Popular Forces with 28, together equalling the number of seats obtained by the Front, with Independents holding the remaining 6 seats. Elections to the 120-seat Chamber of Counsellors were held on 13 October 1963; the Front for the Defence of Constitutional Institutions won decisively with 107 seats, the *Istiḳlāl* received 11 seats, and independents another 2. Ḥasan II opened the first Moroccan parliament on 18 November, re-

linquishing the post of Prime Minister which he had filled until then.

The achievements of the 1963 parliament were not particularly remarkable and ended abruptly in June 1965, with the declaration of a state of emergency by Ḥasan II (all within the framework of the constitution). There followed a pause in parliamentary activity, restored by the 1970 constitution published by the King on 8 July. It was reportedly approved by a 98.7% majority in a popular referendum held on 24 July. These official figures are questionable, however, as many have indicated the strong opposition of most parties and many organisations to the new constitution, largely caused by its differing from that of 1962 in that it further strengthened the powers of the King at the expense of the Prime Minister and parliament. According to the 1970 Constitution, the King was empowered to amend the constitution at will, promulgate decrees in almost any matter (even to declare war) and reject parliamentary bills and requests. Conversely, the nature of parliament was altered; it was now to be a unicameral Chamber of Representatives of 240 seats: 90 elected directly, 90 by members of local councils and 60 elected in two-stage voting by chambers of commerce and industry (including professional and workers' groups), all elected for six-year terms.

As most parties boycotted the 21 and 28 August 1970 elections to the Chamber of Representives, the majority of candidates were independents supported by the government. Many candidates were returned unopposed and the government claimed huge participation despite the boycott. The Chamber comprised 158 independents (nearly all pro-government), 60 members of the pro-government *Mouvement Populaire* and 22 belonging to other parties and groups. The Chamber achieved little during its two-year lifespan and was sharply criticised from many quarters, prompting Ḥasan II to promulgate yet another constitution.

Morocco's third constitution was promulgated on 10 March 1972, following a popular referendum which approved it on 1 March. It was slightly more liberal regarding parliamentary powers; two-thirds of the unicameral Chamber of Representatives (of 264 seats) were to be elected by direct, universal suffrage and only one-third by two-stage voting of local councils as well as professional and employees' organisations. The Cabinet was made responsible to both the King and the Chamber. Nevertheless, the King's position remained pre-eminent, particularly as he had postponed the holding of new elections several times, ruling by decrees in the interim.

Under the 1972 Constitution, elections to the Chamber of Representatives were held on 3 June 1977. For the benefit of illiterate voters, each party was allotted a specific colour for its ballot. Some 82.36% of those eligible voted. Independents, mostly pro-Government, held 141 seats and *Istiḳlāl* candidates, 49; the pro-Government *Mouvement Populaire* held 44 seats and other groups 30. The King enjoyed a comfortable majority of his supporters in this Chamber, which he inaugurated on 14 October 1977.

The characteristics of Moroccan parliamentarians have not yet been studied in detail. Both the will of the Sovereign and subsequent electoral laws ensured that all Morocco's regions were represented, with rural areas favoured somewhat. Many of the Members were young: according to official figures, about 40% of the Members of 1963 parliament and 60% of those of the 1970 Chamber, were between 25 and 40 years of age. When nominating the Members, the King and his officials strove to strike some balance among political parties, non-political leaders, economic and social groups and diverse occupations. In November 1956, the occupational distribution was as follows: free professions – 10, agriculture – 19, commerce and industry – 17, workers – 16 and religious personalities – 5. In later Chambers the distribution appears to have been more diversified.

Independent Morocco's hither-and-thither experience with parliamentarism at first continued the tradition of the French Protectorate in nominating the whole institution, then moved towards elections, although the King did preserve his special powers in both the written constitutions and in the practice of imposing a two-stage electoral system (for at least a part of the membership) on parliament, ensuring the election of a largely-compliant body. Legislating by decree, without the benefit of parliamentary participation, completed the circle of the King's powers vis-à-vis the elected Chamber. This is all the more remarkable in light of Morocco's multi-party system.

(xxii) *Mauritania*

The Islamic Republic of Mauritania, independent since 1960, had already experience of a legislative assembly under French rule. Since 1925, the Governor-General of the Afrique Occidentale Française or AOF (of which Mauritania was a part) was assisted by an appointed advisory council, functionally representative of the federation's major interest groups (military and civil servants, businessmen, Africans). Meaningful measures concerning representative bodies in Mauritania were introduced, however, only in 1946, as part of the new French policy in the region. Representation was then provided on three levels: (a) Territorial: a General Council (*Conseil Général*), called the Territorial Assembly (*Assemblée Territoriale*) since 1952, has had extensive control over the budget, although it functioned solely in an advisory capacity on any other issue. In Mauritania, it first comprised 20, then 24 members, divided into two sections (*collèges*)—the first (6, then 8 members) elected by Europeans and the second (14, then 16 members), by Africans. They were reorganised into one *collège* in 1952; (b) Federal: Mauritania sent five delegates, elected from its General Council (Territorial Assembly) to the AOF's General Council; and (c) National (French): Mauritania elected a *député* to the National Assembly in Paris. The winner of the legislative elections of November 1946 was elected by 6,076—or about two-thirds—of all votes cast. Several weeks later, Mauritania's first General Council was elected. In 1947, the General Council's French section duly elected a *Sénateur* to the French Senate in Paris and its African section a representative to the recently established Assembly of the Communauté Française.

The 1946 French Constitution gave the right of vote to but a few: members of certain local associations, trade unions and co-operatives, government officials, wage earners, owners of registered property and war veterans. Consequently, few were eligible to vote in the 1946 Mauritanian elections. In 1947, the literate were added and in 1951, heads of households and mothers of two or more children. The following table indicates the sizable increase in the number of eligible voters.

By 1956, the franchise was universal, so that the population was not unprepared for the new *Loi cadre*.

The *Loi cadre* of June 1956 bestowed a larger measure of autonomy on France's overseas territories, vested in respective elected Territorial Assemblies and in Councils of Government (*Conseils de Gouvernement*), comprising senior French officials and Ministers elected by the Assembly. Each Territorial Assembly could formulate its own policies in such local affairs as agriculture, forestry, trade, health and primary and secondary education. In Mauritania's first elections to the Territorial Assembly, held on 31 March 1957 (the first held under universal suffrage), the Mauritanian Progressive Union (Union Progressiste Mauritanienne) won 33 out of the Assembly's 34 seats, obtaining 252,898 out of the 272,474 votes cast. This party represented both the administration and traditional attitudes, as well as tribal chieftains; it had already participated in the 1952 election to the General Council (Territorial Assembly), winning 22 out of 24 seats. It was led by Mukhtār Ould Dādda, a lawyer-turned-politician who was to lead Mauritania to independence and serve as its first president.

Mauritania's heavy "yes" vote in the De Gaulle referendum of 28 September 1958 signified its approval of the Constitution of the Fifth Republic and its autonomous membership in the new Communauté Française. Mauritania's Territorial Assembly was converted into a Constituent Assembly (*Djamʿiyya taʾsīsiyya*), on 28 November 1958, with the task of drafting a constitution. Prepared by former administrators, the Assembly approved and promulgated a constitution on 22 March 1959, providing for a 40-seat Legislative Assembly (*Assemblée législative*, *Djamʿiyya tashrīʿiyya*), to be elected for five years by direct, universal and secret voting. The Assembly was to meet for two sessions annually, not exceeding two months each. Its powers were mainly legislative, although it also elected the Prime Minister, who in turn appointed the rest of the

Registered voters, and votes cast in Mauritania in elections for the National Assembly in Paris, 1946 and 1951

Cabinet. Ministers were responsible to the Assembly, which could bring the Cabinet down by a no-confidence vote. Members enjoyed parliamentary immunity. The first elections to the Legislative Assembly were held on 17 May 1959, with some 326,000 out of about 373,000 participating. This time, the Mauritanian Progressive Union, renamed *Parti du Regroupement Mauritanien* (since 1958), captured all 40 seats.

After negotations with France, the independence of the Islamic Republic of Mauritania was proclaimed on 28 November 1960. A new constitution, required for a sovereign state, was adopted by the Assembly on 20 May 1961 by a vote of 31 to 2, with one abstention. The 1961 Constitution—amended in 1972—was basically a modification of the former one, adapted for a presidential régime. It established the office of a state president, absorbing that of the prime minister, strengthening it at the expense of the Assembly. The 1961 Constitution provided for a 40-seat National Assembly (Assemblée Nationale) (50-seat since 1971 and 70-seat since 1975), elected for five years, legislating only in a limited number of areas, including the budget. The Assembly convenes for one four-month session per year. It cannot pass a vote of no-confidence in the President or the Ministers (although it may impeach them). Ministers are responsible to the President but not to the Assembly. The President has priority in legislation and right of veto, but cannot dissolve the Assembly.

In the early 1960s, the Assembly produced much-needed legislation, such as the establishment of an adequate judicial system for Mauritania (1963). It also discussed policy, sometimes displaying an independence of spirit which caused considerable friction between the National Assembly and President Ould Dădda. The latter succeeded in strengthening his position, however, particularly since a constitutional amendment was passed, institutionalising the Mauritanian Progressive Union as the only legal party. Since this action of his, it is the single party (led by Ould Dădda), rather than the National Assembly, which has served as the main focus of power in Mauritania and dominated its politics. This has been at least partly motivated by Ould Dădda's intention to use the party as Mauritania's main vehicle for modernisation, as traditionalists still have a strong hold in the National Assembly.

Consequently, in the general elections for the National Assembly held on 9 May 1965, the party, whose name had been changed to Mauritanian People's Party (*Parti du Peuple Mauritanien, Ḥizb al-sha*ʿ*b*), won all 40 seats; it obtained 445,644 votes or 92.1% of the 447,660 valid votes cast (out of a total of 482,305 eligible to vote). Such results were repeated in the general elections for the National Assembly, held on 8 August 1971, when the party won all 50 seats, obtaining 502,547, out of 502,945, valid votes cast (nearly 100%). Again, in the general elections held on 26 October 1975, the party won all 70 seats obtaining 99.9% of all valid votes cast.

In February 1976, Mauritania participated with fourteen other African states, in Agadir, in the establishment of a Union of African Parliaments (*Union des parlements africains*), whose avowed aim was "to strengthen parliamentary institutions by improving the functions of representative democracy". Mauritania was represented in this new body by one of the Union's Vice-Presidents, ʿAbd al-ʿAzīz Sall, President of Mauritania's National Assembly and by Muḥammad Fall, who entered the Union's Executive Committee. Mauritania's own parliament, however, was suspended following the July 1978 military coup.

Not much is known about the socio-economic composition of the National Assembly, although the 1965 Assembly reflected the administrative character of the single party; 39 out of the 40 members were civil servants. There is every reason to believe that this group has continued to predominate.

The parliamentary history of Mauritania falls into two periods: until independence, the Assembly was virtually led by the French, who even had a special collège within it to protect the interests of France and French settlers. Since independence, it has been dominated by President Ould Dădda and his single party, generally (although not invariably) serving in a rather docile manner.

(xxiii) *Israel.*

Israel is one of the few Middle Eastern states with a sizable Muslim minority sharing in its parliamentary life. Upon the establishment of the State, on 14 May 1948, Israel had a population of about 156,000 Arabs, out of some 750,000 people; on 1 October 1978 there were approximately 590,000 (including those in East Jerusalem) out of a total population of 3,708,300. With some variation, the Arabs generally comprised some 70% Muslims, 20% Christians and 10% Druzes (all the above statistics refer to Israel proper and not to territories held by Israel since 1967. Inhabitants of those territories refuse to opt for Israeli citizenship and consequently may not vote in its parliamentary elections).

All Israeli citizens aged 18 and over may vote in elections for Israel's unicameral, 120-seat parliament, the *Kĕneset*. Elections are universal, direct, equal, and secret; the entire country is considered as one constituency and voting is by proportional representation, so that every vote counts. Israel's Arabs have indeed participated heavily in all nine general elections held in 1949, 1951, 1955, 1959, 1961, 1965, 1969, 1973, and 1977. In all except the first (1949) and ninth (1977) elections, their participation has been relatively greater than that of Jews, reaching a peak of 92.1% of those eligible to vote in elections for the sixth *Kĕneset* (1965). Rural Arab voting has consistently been heavier than urban.

Slates of candidates are usually put forward by the political parties. Arabs, like Jews, vote for the slate of their choice, frequently those comprising Arab, or Jewish and Arab, candidates, generally seating between 6 and 8 Arabs in each *Kĕneset*. Arabs connected with the Establishment through left-of-centre parties such as MAPAI (later the Labour Party) and MAPAM have become Deputy Ministers, like Sayf al-Dīn al-Zuʿbī and ʿAbd al-ʿAzīz al-Zuʿbī, or Deputy Speakers of the *Kĕneset*, like Sayf al-Dīn al-Zuʿbī. Those active in the Communist Party have been prominent in the Opposition. During the past twenty years, Arab electoral support for the Communist Party has increased, probably due to the success of the nationalist Arab image created by this party. The following are the percentages of Arab votes for the Communist Party, out of the total Arab vote, in recent *Kĕneset* elections: 1959 - 10%; 1961 - 22%; 1965 - 23%; 1969 - 29%; 1973 - 33% (about 48,000 votes); 1977 48% (about 70,000 votes). This party, formerly strongly principally among Christians, has made considerable inroads among Muslims and Druzes in recent years. As aresult, its representatives in the *Kĕneset* have increasingly claimed to speak for all Israel's Arabs and have frequently insisted upon using the Arabic language there (Israel has two official languages—Hebrew and Arabic).

Most (although not all) of the Arab *Kĕneset* Members connected with the Establishment have been farmers; one was a Bedouin *shaykh*. Those voted in as Communists, however, have generally been townspeople. All have been—or have become—professional politicians. The education level of Arab *Kĕneset* Members, like that of Jewish ones, has risen from one legislature to the next; the Arab contingent has increasingly comprised journalists and writers.

Bibliography: The deliberations of the *Kĕneset* are published, verbatim, in the *Divrey ha-Kĕneset*, in Hebrew; and in *Maḥāḍir al-Knīset*, in Arabic. The laws passed there are printed, in Hebrew, in *Sefer ha-Ḥukķim*; in Arabic, in *Kitāb al-Ķawānīn*; and, in English, in the *Laws of the State of Israel*. The immediate results of parliamentary elections are published by the Central Bureau of Statistics, Jerusalem, in *Rĕshūmōt —Yalķūṭ ha-Pirsūmīm* and, later, in detail, in special volumes entitled *Results of election to the Knesset* (Hebrew and English). (xxiv) *Cyprus*

Cyprus is another Middle Eastern state with a large Muslim minority: although estimates vary, the Turkish community there numbers close to 20% of the island's inhabitants—the second largest after the Greek community.

The island was a part of the Ottoman Empire from 1571 to 1878. One of the first measures of the British, after they had taken over Cyprus in 1878, was to institute some form of representation for its inhabitants. Their first experiment, in August 1878, was a nominated Council of 4 to 8 members, with official and unofficial appointees in equal numbers. Soon, however, in the March 1882 Constitution, promulgated by an Order in Council, a more representative Legislation Council was appointed. This could initiate discussion in certain matters, although some financial matters were not within its competence. The Legislative Council comprised 12 elected members (9 Greeks and 3 Turks) and 6 appointed members, generally officials, with the British High Commissioner or another senior official presiding and having a casting vote in case of a tie. The members were elected within their respective communities. On 6 February, 1925, the membership was increased to 24: 12 Greeks, 3 Turks, and 9 officials. The British intention appears to have been to be able to offset a collective vote of the Greek majority against the Turkish community. In practice, however, the British officials voted almost regularly together with the Turkish members. This led to no little frustration on the Greek side and to its increasingly introducing extreme politics into the Council, chiefly in its support for Enosis, which the Turks (with frequent British support) opposed with equal determination. Consequently, the Legislative Council, instead of serving for accommodation, sharpened the inter-communal conflict; instead of being a training-ground for self-government, it promoted inter-communal strife. The fact that three languages were officially used (English, Greek and Turkish) was no help, either. On 12 November 1931, following disturbances on the island, the Legislative Council was dissolved, all legislative authority being vested since in the Governor, aided by a six-man Executive Council. As from 1933, the Governor was assisted by a handpicked Advisory Council of five Cypriots—4 Greeks and 1 Turk, nominated and merely consultative.

After the end of the Second World War, the British appeared to be more inclined towards granting the Cypriots limited self-government. A Constituent Assembly was convoked by the British on 6 November 1947, to discuss a new constitution. Of the 40 invited, only 18 attended, including 7 Turks and 1 Maronite; because of Greek Cypriot opposition, within the Assembly and without (and some Turkish Cypriot reservations, too), the Assembly was dissolved on 12 August 1948, with the matter left pending. In 1954, 1956, and 1958, new British proposals for a constitution for Cyprus were rejected by the Greek Cypriots.

The Zürich Agreement of February 1959 and its ratification in the London Conference of February 1960 provided the legal and constitutional basis for the Republic of Cyprus. The 1960 Constitution has a marked bi-communal character, institutionalising and legitimising Greek Cypriot and Turkish Cypriot interests. It ensures bi-communal participation on all levels of government, at a ratio of 70% for the Greek, and 30% for the Turkish community. The Cabinet has 7 Greek, and 3 Turkish, Cypriots—who may be Members of the House. Legislative authority is vested in a House of Representatives, elected for five years; it is made up of 35 Greek Cypriots and 15 Turkish Cypriots, elected within their communities. The Speaker of the House is a Greek Cypriot, the Deputy Speaker a Turkish Cypriot. While the President of the Republic (a Greek) or the Vice-President (a Turk) alone may initiate financial bills, the House discusses them. The House's powers are limited further by the absolute right of veto of the President and Vice President in foreign affairs, defence and security, as well as by the establishment of separate communal Chambers of the Greek Cypriots and the Turkish Cypriots, which have competence in all religious, cultural and educational matters, and by the decisions of the communal courts in matters of personal status. Both Greek and Turkish are official languages.

The first House of Representatives was elected, according to the pre-independence Electoral Law of 31 December 1959, in 6 multi-member constituencies; each community voted only for its own candidates. The first elections to the House of Representatives were held on 31 July 1960. Those to the Communal Chambers were held on 7 August; the Turkish Cypriots elected, to all the 15 seats of their Chamber, the National Front of Fazıl Küçük.

From the start, Turkish Cypriots stood fast for protecting their constitutional rights, while the Greek Cypriots argued that their rivals were taking an unfair advantage of the constitution. Constant friction continued in the House and other levels of government, sometimes reaching crisis dimensions. As with the Legislative Council a generation earlier, the House of Representatives served to emphasise discord rather than accommodate conflict. Without the moderating British presence, however, legislation slowed down frequently and policy debates turned to bickering. Deadlock sometimes ensued, and in November 1963 Makarios, the State President, proposed various constitutional amendments; the main ones were to do away with the separate voting of Greeks and Turks in passing certain laws, and to abolish the privilege of the State President and Vice-President, separately, of vetoing legislation. The amendments were energetically rejected by the Turkish Cypriots, who argued that the amendments would undermine the régime. When disturbances, late in 1963 and early in 1964, prevented the Turkish Cypriots from attending the House, the Greek Cypriots passed the above amendment, anyway, on 23 July 1965, modifying also the 1959 Electoral Law to make voting general, instead of by communities. The Turkish Cypriots rejected all the above—and the joint House of Representatives ceased to exist, becoming a Greek Cypriot body. The Turkish Cypriots reacted by boycotting the House and instituting their own "Turkish Cypriot Transitional Administration" (December 1967).

General elections for the House of Representatives were held on 5 July 1970 (the former House, elected in 1960 for five years, had had its term prolonged, annually, by Presidential decree). The Turkish Cypriots, on the same day, elected their own 15 Representatives to the House, These, however, continued to boycott the House and, together with the 15 Members of the Turkish Cypriot Communal Chamber, formed a joint 30-Member Chamber, part of the Turkish Cypriot Transitional Administration. After Turkey's military intervention in July 1974, an Autonomous Turkish Cypriot Administration was established, with an Executive Council and a Legislative Assembly. Following the decision, on 13 February 1975, to create a Turkish Cypriot Federated State in the whole area under Turkish control, a 50-Member Constituent Assembly (*Kurucu Meclis*) was elected in the same month, comprising 25 Members of the joint Chamber and another 25 Members selected by various organisations. This body prepared a new, separate constitution for the Turkish Cypriot Federated State, which was approved with a large majority, by a popular referendum, on 8 June. Elections for the President and for the first 40-Member Legislative Assembly (*Yasama Meclisi*) were held on 20 June 1976. The National Unity Party, led by Rauf Denktaş, obtained 30 seats, the Communal Liberation Party 6, the Populist Party and the Republican Turkish Party 2 each.

The parliamentary history of the Turkish community in Cyprus falls into three main parts. Under British rule, the Turkish Cypriots sat—from 1882 until 1931—as a minority group together with the Greek Cypriots and the British, usually voting with the British for what they saw as their special interests. In the independent Republic of Cyprus, from 1960 to 1963, they sat with the Greek Cypriots in a House of Representatives, as a minority group, but with special safeguards for their community. Since 1963, first in their own area in the Republic, later in what they consider the Turkish Cypriot Federated State, they have maintained their own, all-Turk, representative institutions.

Bibliography: The Public Record Office (London), under CO 69, has the manuscript *Minutes of the Legislative Council*, 1878-1895, as well as the printed ones, 1895-1930. Information about elections, bills of law, and the laws themselves, issued by "The Officer administering the Government ... with the advice and consent of the Legislative Council", were printed in *The Cyprus Gazette* (Nicosia). A "schedule" of all the laws appeared annually in the *Cyprus Blue Book* (Nicosia). The Turkish Communal Chamber—later, the Turkish community—has been publishing, since the early 1960s, a *Special News Bulletin* (daily, Nicosia). See also W. J. B. In Afghānistān.

Afghānistān has known two distinct types of representative assembly, the *djirga* and the *madjlis*. Their origins, development and functions are quite different and they are best discussed separately.

The *djirga* is a tribal council operating at all levels from the family upwards and reflecting the collective authority of the group over the individual. At the lowest levels its membership comprises all adult males; at higher levels various units are represented by men chosen primarily on the basis of seniority, but also for skill in negotiation or family reputation. *Djirga* decisions represent a consensus, weighted according to age and reputation. The functions of the *djirga* embrace all matters, but especially the resolution of disputes within the group and the relations of the group with outside organisation. The authority of the *djirga* depends upon the distribution of power within the group concerned. In state affairs, two varieties of *djirga* were employed. One was the permanent council of chiefs, members of the royal family and other notables, which was consulted frequently on all matters of state business and which offered detailed advice. References to such an institution under various names are common from the time of Aḥmad Shāh Durrānī [*q.v.*] Abdālī onwards. The second, usually known as the Loya Djirga, dealt with the most important matters. It was a much larger body, including all men of influence in the region or country, and it was usually summoned to deal with one issue alone and subsequently dismissed. It was called in cases of succession where the legitimacy of the claims of a candidate to the throne were in doubt and where some broad expression of national endorsement was required. In 1747 Aḥmad Shāh Durrānī Abdālī was elected ruler by a *djirga* of Abdālī and Ghalzay tribal chiefs and religious figures; in August 1880 ʿAbd al-Raḥmān [see ʿABD AL-RAḤMAN KHAN] was chosen by an assembly of tribal chiefs; and in February 1919 Amān Allāh [*q.v.* in Suppl.] was proclaimed *amir* by a gathering of tribal chiefs and notables at Kābul. Bačča-yi Saḳaw legitimised his claim to the throne through the *ʿulamāʾ* and in March 1929 was challenged by his rival, Nādir Khān, to submit his claim to a national *djirga* of all Afghān tribal chiefs. In September 1930 Nādir Khān himself secured confirmation of his own claim to the throne from a Loya Djirga of 286 notables. The Loya Djirga was also used to obtain national approval or confirmation of major policy decisions. According to Munshī Sulṭān Muḥammad, for ordinary purposes ʿAbd al-Raḥmān (like his predecessor, Shīr ʿAlī) employed an advisory council of *sardārs*, *khāns* and *mullās*, but in time of war, or other national emergency, ʿAbd al-Raḥmān sought the advice and assistance of a murch larger assembly (Loya Djirga) of notables and *mullās*. In 1915 Ḥabīb Allāh [*q.v.*] was reported to have called a Loya Djirga to discuss Afghān foreign policy during the First World War, although when the ruler determined to adopt an unpopular policy of neutrality he changed the meeting into a great *darbār*, summoned to hear his decision, not to discuss it. In 1921 Amān Allāh summoned a Loya Djirga, the decision of which formed the justification for the issue of the 1923 constitution, which in turn was submitted to the approval of another Loya Djirga. As well as setting up other permanent bodies (including the Darbār-i ʿĀlī, an assembly of elders chosen in the manner of the Loya Djirga to review the work of each year), the 1923 constitution provided for the summoning by the ruler at his discretion of a Loya Djirga. Amān Allāh made use of this provision. In July 1924, following the Khōst [*q.v.*] rebellion, a Loya Djirga was called to amend the constitution; and in August 1928 another one, 1,000 strong, was called for a similar purpose and to hear Amān Allāh's plans for reform. In 1941 a Loya Djirga was called to endorse Afghānistān's foreign policy in the Second World War following the Allied demand for the expulsion of German citizens; and in 1949 and 1955 Loya Djirgas (possibly representing only certain tribes) were called in connection with the Pakhtūnistān dispute. The constitutions of 1964 and 1977 were also submitted to Loya Djirgas for approval. In keeping with its inclination towards parliamentary democracy, the 1964 constitution considerably reduced the role and importance of the Loya Djirga. The Loya Djirga of January-February 1977, which considered the new constitution and elected Muḥammad Dāwūd as President of the Republic of Afghānistān, provides good evidence of the development of the Loya Djirga and its continuing importance as a major source of legitimation. In the Presidential proclamation of 28 December 1976, which announced the summoning of the Djirga, it was stated that "in accordance with the conventions of our society Loya Djirgas in the course of the history of Afghānistān have been convened on sensitive and important occasions and have deliberated vital national issues". The Loya Djirga was described as a supra-parliamentary body. Article 65 of the 1977 constitution defined the composition of the Loya Djirga, which was represented as "the supreme manifestation of the power and will of its [Afghānistān's] people". The 1977 Loya Djirga consisted of elected representatives, members of the government, members of the central committee of the only political party, the high judicial council, the constitutional drafting committee, military officers, and other persons appointed by Presidential decree. The Djirga sat for twenty-six sessions and made several amendments to the constitution before finally approving it [see further DJIRGA in Suppl., in particular, for the institution on the Indian side of the Frontier].

The institution of the *madjlis* proper has a much shorter history. Until 1923 Afghānistān knew only consultative councils appointed by the ruler from among the notables. The 1923 constitution provided for three national bodies: a council of ministers; the Darbār-i ʿĀlī; and an advisory state council, half nominated and half elected. The state council was the first Afghān institution which possessed some likeness to a Western parliament, but its role was severely limited, and it seems to have played an insignificant role in Afghān public life. The 1923 constitution also provided for regional advisory councils, an innovation continued under Nādir Shāh. The 1931 constitutions provided for a two-chamber Parliament: the Upper House or *Madjlis-i Aʿyān* consisted of twenty or more (later limited to forty-five) "experienced and far-sighted persons" approved by the king; and the Lower House or *Madjlis-i Shūrā-yi Millī* consisted of 116 (later 173) representatives elected for a three-year period. In form, the Afghān parliament bore a strong resemblance to the European institutions upon which it was, no doubt, modelled, although in his defence of the constitution Nādir Shāh argued (in the manner of

the Islamic modernists from the time of Nāmiḳ Kamāl onwards) that the Afghān Parliament was derived from the early Islamic precept of consultation which, he claimed, had survived in Afghānistān in the form of the *djirgas*, which he described as "regular governmental channels of the people of Afghānistān". Between 1931 and 1964 eleven Afghān Parliaments met, being chosen every three years as provided in the constitution. With the exception of the seventh, so-called "Liberal Parliament" (1949-52), all functioned as rubber stamps for government policy. The group of liberals in the seventh parliament did attempt to interrogate ministers and agitated for greater parliamentary power, but the government eventually reacted sharply and imprisoned the liberals. Parliament thereafter reverted to its former docile role. The 1964 constitution also provided for a two-chamber parliament, chosen for a four-year term. The Upper House (Meshrano Djirga) consisted of eighty-four members, partly appointed and partly elected; the Lower House (Wolesi Djirga) consisted of two hundred-and-sixteen elected members, Two Parliaments met during the so-called constitutional period: the first (twelfth) sat from 1965 to 1969 and was notable for the presence of vociferous radicals in it and for its attacks on the government of the period; and the second (thirteenth) which sat from 1969 to 1973 showed a smaller number of radicals (traditional leaders having apparently decided that membership of Parliament conferred more power than formerly and exerted their influence to obtain election themselves) but maintained an appearance of hostility to the governments, although their criticisms were of a conservative rather than a radical character. Throughout the constitutional period, Parliament saw its role as destructive rather than constructive. The 1973 revolution brought the parliamentary period to an end. The constitution of February 1977 (articles 48-64) provided for a single-chamber parliament (the Millī Djirga) elected for four years from men nominated by the single National Revolution Party (*Ḥizb-i Inḳilāb-i Millī*). Half of the parliamentarians were to be peasants or workers. The Millī Djirga was due to meet for the first time in December 1978, but the April 1978 revolution supervened and, for the time being, has brought to an end the experiments of Afghānistān with parliamentary government.

Bibliography: For constitutional aspects, see the bibliography in *Dustūr: a survey of the constitutions of the Arab and Muslim states*, Leiden 1966, 59. An English translation of the constitutions of 14 February 1977 was provided in the *Kabul Times* of 5 March 1977-16 March 1977 and reprinted by the Afghanistan Council of the Asia Society as Special Occasional Paper no. 7. A preliminary draft was published in *Kabul Times* of 29 January 1977, which issue also contained a list of all members of the Loya Djirga. There is no good study of the tribal institution of the *djirga*. See Mountstuart Elphinstone, *An account of the Kingdom of Caubul*, London 1815, D. C. J. Ibbetson, *Outlines of Panjab ethnography*, Calcutta 1883, and F. Barth, *Political leadership among Swat Pathans*, London 1969, 115-18. C. In India, Pakistan and Bangladesh.

Under British rule in India, Muslims were involved in two forms of assembly. There were the sessions of the various Muslim organisations, the most important of which were those of the All-India Muslim League, founded in 1906, in which major matters concerning Indian Muslims were discussed and resolutions passed. But for most of its existence the League was not a particularly representative organisation; support was limited in the main to landlords and professional men from provinces where Muslims were in a minority, *ʿulamāʾ* refused to join, some Muslims preferred to support the Indian National Congress, others supported regional organisations of Hindus and Muslims like the Unionist party in the Pandjāb or the Krishak Proja Samiti in Bengal. The League's fundamentally limited appeal was emphasised in the general elections to the legislative councils in 1937, when it won a mere 104 out of 489 seats reserved for Muslims. Only in the years 1937-47, as the meaning of Congress government was revealed and as the League began to campaign for a Muslim homeland of Pakistan, did the organisation come to win the support of most Muslims and its sessions to embrace their views. The extent of this support was demonstrated in the general elections to the legislative councils in 1945-6, when the League won 439 out of 494 seats reserved for Muslims.

The second form of assembly in which Muslims participated was the system of legislative councils which the British began to introduce in the second half of the 19th century. These operated at two levels, there being a legislative council for the whole of India and a legislative council in each province. When, from the beginning of the 20th century, the British began to make elections the main way of choosing council members, Muslims demanded special measures to protect them against Hindu majorities, which they feared. Each time the franchise was extended and council powers were increased, that is in 1909, 1919 and 1935, Muslims were given separate electorates and, where appropriate, extra seats to take account of their "political importance". Each time the result was to raise the Muslim proportion of seats above their proportion of the population where they were in a minority, to reduce their number of seats where they formed a large majority of the population, and to destroy the possibility of a majority of seats where they formed a small majority of the population, notably in the key provinces of Pandjāb and Bengal. Up to 1937, although quick to defend Muslim interests when they saw them

threatened, whether it was the matter of money-lending in the Pandjāb or local schools in the United Provinces, Muslims did not in general operate in council politics from a specifically Muslim platform, tending to belong to supra-communal groupings of landlords, local interests or nationalists. But all changed after the Indian National Congress formed governments in seven out of eleven provinces following the 1937 elections and the prospect of independence began to loom during World War II. Now Muslims realised that they must either support the Indian nationalist cause or follow the Muslim League. Most chose the latter course. Between September 1942 and March 1947, helped both by the mistakes of the nationalist leadership and the skill of its own, the League was able to form governments in the provinces of Sind, the North-West Frontier Province, Assam, Bengal and the Pandjāb.

After the partition of the subcontinent, 40 million Muslims remained scattered in minorities throughout the provinces (now known as states) of independent India, except in Kashmīr where they formed a large majority. The new Indian constitution, promulgated in 1950, abolished the old Muslim safeguards of separate electorates and reserved seats; the law forbade any political appeals on the basis of religion. Nevertheless, distinctively Muslim political parties persisted; the relics of the pre-independence Muslim League survived in Kerala and spread to the northern states in the 1960s; in 1957 the Madjlis Ittiḥād al-Muslimīn revived in Hyderabad and a decade later was petitioning the Government of India for the foundation of a purely Muslim state on India's eastern coast; in 1964 the Madjlis-i Mushāwarat was formed to press for specifically Muslim concerns through the political system. But, beyond winning a few seats and striking the occasional bargain with other parties at state level, these communal parties had little success in promoting Muslim interests or in winning large-scale Muslim support. Most Muslims have entered both state assemblies and national Parliament as members of the Congress Party, which has come to be seen, among the unsatisfactory alternatives available, as the best protector of Muslim interests. Indeed, so firm has been Muslim support that it has been recognised as one of the main sustainers of Congress dominance in Indian politics since 1947. The weakening of their support is marked down as a major cause of the Congress's defeat in the general elections of 1977; the return of their support as a cause of its victory in the general elections of 1980.

In the Muslim state of Pakistan, we are concerned less with Muslim representation in assemblies than with the fortunes of assemblies themselves. At independence there were the old provincial legislatures inherited from the British period, and these elected a Constituent Assembly whose task was to frame a constitution for the new country and at the same time to act as a national legislature. Framing a constitution proved immensely difficult. Amongst the many problems were those of balancing the claims of East Pakistan, where a majority of the people lived, against those of West Pakistan, and finding an appropriate place for Islam in the country's constitution. The Assembly worked with much rancour and increasing slowness. When in 1954 it moved to curb the powers of the Governor-General, he replied on 24 October of that year by dismissing the Assembly and declaring a state of emergency. In June 1955 the provincial legislature elected a second Constituent Assembly and on 29 February 1956, nearly nine years after independence, the Assembly adopted Pakistan's first constitution which provided for a federal and parliamentary system of government with a strong centre, adult franchise and direct elections. There was to be one house of Parliament and its members were to be divided equally between East and West Pakistan [see DUSTŪR xiv]. General elections were proposed for 1958, but they were not held. Politicians squabbled. Faction, violence and corruption were rife. The public lost all respect for political institutions. On 7 October 1958 President Iskandar Mīrzā, under pressure from General Ayyūb Khān, declared martial law, abrogated the constitution and dissolved all legislatures. Thus democracy lost its first struggle with authoritarianism in Pakistani life. In the first eleven years of its existence, the National Assembly met for a mere 338 days and passed only 160 laws. For the rest of the time, the executive had unrestricted power and issued 376 major ordinances.

On 1 March 1962 President Ayyūb Khān promulgated a new constitution, which provided for two provincial assemblies, one for East and one for West Pakistan, and a National Assembly of 156 members whose seats were equally divided between the two wings of the country. Members were to be elected by a college of 80,000 "Basic Democrats" who had been directly elected by the people. The first meeting of the National Assembly was convened on 8 June 1962, but from the beginning it met with powerful opposition in the country. As political parties were forbidden, and as all executive and much legislative power was in the hands of the President, the Assembly seemed less a forum for democracy than a weapon of dictatorship. Eventually, opposition grew so great that Ayyūb Khān was forced to declare martial law in March 1969 and to dissolve the Assembly. Agitation continued. On 25 March 1969 the Commander-in-Chief, Yaḥyā Khān, took over power from Ayyūb Khān and abrogated the 1962 constitution. On 28 November 1969 he reaffirmed a pledge to restore parliamentary government and announced that general elections would be held on the basis of one man, one vote, in autumn 1970 to elect a National Assembly to draft a constitution. Parity between the East and West wings of the country was now abandoned; on the basis of its population East Pakistan could now control 56% of the seats. On 7 December 1970 Pakistan held its first general elections. The ʿAwāmmī League won 160 out of 162 seats in East Pakistan and therefore had a potential majority in the National Assembly. On 1 March 1971 Yaḥyā Khān, under pressure from the West Pakistani leader, Zulfiqar Ali (Dhu 'l-Fiḳār ʿAlī) Bhutto, decided to postpone the National Assembly, and events were set moving which led to the transformation of East Pakistan into the new state of Bangladesh in December 1971.

In 1972 the National Assembly of the now truncated Pakistan began to meet and agreed that the country should have a federal and parliamentary system of government. There were to be four provincial assemblies and two houses of Parliament, a National Assembly and a Senate. This, the first constitution framed by a directly elected assembly, was adopted on 10 April 1973 and came into force on 14 August. The National Assembly was dominated by the Pakistan People's Party whose leader, Zulfiqar Ali Bhutto, resigned the presidency of Pakistan to become Prime Minister. In 1977 Mr Bhutto called Pakistan's second general elections for March. His party won 155 of the National Assembly's 200 seats. Soon it became evident that the elections had been

rigged on a huge scale. The nine opposition parties which had coalesced to form the Pakistan National Alliance refused to accept the results, launched a mass movement to press for Mr Bhutto's removal and for fresh elections supervised either by the Judiciary or by the Army. On 5 July the Army took the leaders of both sides into "protective custody", declared martial law and disbanded the national and provincial assemblies. The Chief Martial Law Administrator, General Zia-ul-Haqq (Ḍiyāʾ al-Ḥaḳḳ) promised elections for 18 October. They were postponed. He promised elections again for 17 October 1979. They did not take place. Now, General Zia-ul-Haqq has promised to establish a government of people's representatives who are to be chosen through the "Islamic mode".

In Bangladesh, a Constituent Assembly met on 23 March 1972 which comprised those members who had been elected from Bangladesh to the Pakistan National Assembly and the East Pakistan Provincial Assembly in the general elections of 1970. On 4 November 1972 the Assembly adopted a constitution which provided for a Parliament (Jatiya Sangsad) of one house. Three hundred members were to be directly elected by universal adult suffrage, and a further fifteen seats were reserved for women who were to be elected by the members of Parliament. General elections were held on 7 March 1973 in which Shaykh Mujeeb-ur-Rahman (Mudjīb al-Raḥmān)'s ʿAwāmmī League won 291 seats. But then, by means of a series of amendments passed between 1973 and 1975, Mujeeb-ur-Rahman changed the constitution, creating a presidential and one-party system in which all the powers of government were concentrated in the President, and the power of the legislature to control the executive was virtually destroyed. On 15 August 1975 an army faction killed Shaykh Mujeeb. Martial law was declared, Parliament was dissolved, Shaykh Mujeeb's subversive constitutional amendments were repealed and elections promised for 28 February 1977. These elections were eventually held on 18 February 1979 and produced a majority in Parliament for the Bangladesh National Party, the party of General Zia-ur-Rahman (Ḍiyāʾ al-Raḥmān), Chief Martial Law Administrator and President.

(F. C. R. Robinson)

MADJLIS AL-SHŪRĀ, the name given to extraordinary, *ad hoc* consultative assemblies in the last century-and-a-half or so of the Ottoman empire. While it had long been customary in the Ottoman Empire, and in earlier Islamic states, to hold special consultations about urgent matters [see MASHWARA], such meetings appear to have become especially frequent among the Ottomans between the Russo-Ottoman War of 1182-88/1768-74 and, roughly, the abolition of the Janissaries in 1241/1826. Referred to by a variety of synonymous terms, such as *medjlis-i shūrā*, *dār al-shūrā*, *medjlis-i meshweret* (or *müshāwere*), or *endjümen-i meshweret*, these assemblies were convened *ad hoc* as need arose, and included a variable list of high-level officials: the grand *wezīr*, the *sheykh ül-Islām*, the senior military commanders, top scribal officials, and perhaps others. The place of meeting was also variable: the palace, the Sublime Porte (*Bāb-i ʿālī* [*q.v.*]), the headquarters of the *sheykh ül-Islām* (*bāb-i meshīkhat* [*q.v.*]), military headquarters in the field, or even provincial administrative centres. The increased frequency of such consultations clearly reflected the gravity of the crises of the time; it may have been related, too, to the decline of the old system of *dīwāns* [*q.v.*]—meaning, in Ottoman usage, conciliar bodies, rather than government

bureaux. The pattern of convening consultative *medjlises* continued to some degree until the end of the empire (Devereux, 37-8, 45-6, 96-7, 243-4; Davison, *Reform*, 348-9, 354, 356, 363, 368, 393-4; Pakalın, *OTD*, iii, 361; Findley, 245).

Ottoman histories of the late 18th and early 19th centuries provide many accounts of consultative *medjlises* (e.g. Wāṣif, i, 99-102, 175-7, 316-9; ii, 9-10, 12-4, 18-9, 21-2, 46-7, 85-6, 104-5, 135-6, 175-6, 221-2, 235, 238-9, 294-6; Shānīzāde, i, 61-6, 199-201; ii, 96-102; iii, 198-9; iv, 2-5, 37-8, 155-8, 201-4; Djewdet, ii, 242-3, 276-8; iii, 35-47, 53-6, 74-5; iv, 154-60, 187-95, 289-91; vi, 52, 53; vii, 28-9; ix, 180-1, 300-2; x, 17-20; xi, 95, 186-7, 272-5; xii, 147-51, 158-9; Meḥmed Esʿad, 14-15; Luṭfī, i, 291-2; v, 172; cf. d'Ohsson, vii, 228-32; Shaw, *Old and new*, 73-5). These accounts contain some of the most vivid documentation available for any facet of Ottoman history. Often, they include what purport to be extended quotations from the participants. The remarks may be quite heated, and are sometimes expressed in plain language sharply in contrast with the normal style of the author who quoted them. It is not impossible to find different accounts of the same assembly, in which a given remark will be rendered in "plain Turkish" according to one author, and in highflown Ottoman according to another. In recounting an assembly of 1808, for example, Djewdet Pasha commented on the "reckless" (*lā-ubāliyāne*) way in which ʿAlemdār Muṣṭafā Pasha then grand *wezir*, expressed himself. Djewdet went on to quote the ʿAlemdār as using the plainest of language to say that his earlier action had been mistaken (*gidishimiz yolsuz ve bilishimiz yañlish*; Djewdet, ix, 5). Shānīzāde's earlier history recounts the same assembly, but there the same remark is "translated" into Ottoman (*sülūkümüz ʿayn-i khaṭāʾ ve fehm-i ʿtiḳādīmiz wehm-i bī-maʿnā olub*; Shānīzāde, i, 63). At moments like this, one senses that the published accounts of the assemblies have their source in minutes that were taken at the meetings, were full enough to record at least some of what was said verbatim, and were preserved in the archives. Wāṣif seems to confirm this, albeit laconically, in introducing an account of an assembly of 1182/1768-9 with the statement that he was transcribing the "copy of the assembly" in full (*ṣūret-i medjlis ʿaynī ile bu maḥalle ḳayd olundī*: i, 316-7; here, the "copy" itself is sketchy by later standards).

The issues laid before the councils were characteristically ones that the sultan and grand *wezir* could not decide, or did not wish to take responsibility for deciding, alone. The sessions appear normally to have begun with the reading of instructions from the sultan and other documents relevant to the issue. Discussion would then begin, with the highest-ranking participants speaking first. Lesser figures were typically reluctant to speak their minds following men of such weight as the grand *wezir* or the *sheykh ül-Islām*. Given the insecurity of officials in relation to the sultan and their superiors, and given the traditionally very narrow scope of consultation, there was reason for hesitancy. Still, it was common to urge the participants to speak, with strong reminders about the sultan's commands for consultation and about the seriousness of the matter under discussion, and with promises not to hold anyone's statements against him after the meeting (Djewdet, iii, 37-8, 332; iv, 360; vii, 28-9; ix, 302). Such assurances did not allay all fears. Yet lively debate could ensue, particularly when the issue at stake meant the choice between peace on unfavourable terms and war with almost certain prospect of defeat. At such moments, the proceedings could become highly dramatic. The *sheykh ül-Islām* might become so agitated that he would threaten to take a gun in hand and set out on the *djihād* himself (Shānīzāde, iv, 201; cf. Djewdet, iii, 40). The senior military men would answer such effusions with sober talk of what war really meant for a state in the position of the Ottoman Empire (Djewdet, iii, 38, 42). Certainly, one of the tensest consultative assemblies occurred at Ṭopḳapī Palace in 1241/1826, just prior to the decisive strike against the Janissaries. With the sultan himself hesitating due to uncertainty over the outcome, it was an impassioned speech by one of the participants that incited him to rush into the chamber where the mantle of the Prophet (*khirḳa-yi sherīf* [*q.v.*]) and other relics were kept, bring out the banner of the Prophet, turn it over to the grand *wezir* and *sheykh ül-Islām*, and thus symbolically launch the attack (*ibid.*, xii, 158).

In general, the accounts of the *medjlises* of the late 18th and early 19th centuries convey a number of interesting points about what such assemblies were supposed to be and do. On a comparative note, first, it is worth comment that Shānīzāde ʿAṭāʾ Allāh (d. 1242/1826) already knew enough about parliamentary institutions to compare the Ottoman consultative assemblies with what sound like bicameral parliaments (Shānīzāde, iv, 3). Probably by design, Shānīzāde omitted references to the legislative function of the assemblies of the "well-ordered states" (*düwel-i munta̤ẓama*), but he did give a recognisable account of such features as popular election of members, majority rule (*ḥükm-i aghleb*), and membership in two "classes", described as government servants and agents or representatives of the subjects (*khademe-yi dewlet we wükelāʾ-i raʿiyyet*). This comparison of Ottoman assemblies with those of the West is of particular interest as an early illustration of a theme to which later writers often returned [see SHŪRĀ]. As for Shānīzāde, his point in making the comparison was to argue—with appropriate reference to the authority of the sultan and the *sunna* of the Prophet—that Ottoman assemblies ought not to be as large as those of the states he was describing. He argued that some of those invited to participate in the larger of the Ottoman assemblies had nothing to add to the discussion. In fact, the issue was not so simple. Particularly as the problems at hand grew more threatening, the Ottomans discovered a variety of needs, of which some reinforced, but others conflicted with, the tradition of a narrow scope of consultation.

One of the first concerns to emerge out of the consultative assemblies of the late 18th century was for greater care in maintaining the confidentiality of proceedings. At first, it appears that there had been little care to have the councils meet in closed session (Djewdet, ii, 243) or otherwise maintain secrecy. By the 1780s, however, great concern had developed over this point. Participants were sometimes made to swear secrecy. Threats were invoked upon those who divulged what they had heard or later criticised decisions they had supported in council (*ibid.*, iii, 35, 43, 332; iv, 188, 360; vi, 135; x, 18). Maḥmūd II carried out such a threat on at least one occasion, by exiling Kečedjizāde ʿIzzet Mollā, father of the future grand *wezir* Fuād Pasha, for criticising a measure that he had not opposed in assembly [see ʿIZZET MOLLĀ].

Perhaps the most striking procedural trait of the consultative *medjlises* of this period was the

demand that the participants arrive at their decisions in "unanimity of opinion" (*ittifāḳ-ı ārā'* or equivalent expressions; Wāṣıf, i, 177, 317; ii, 14, 235; Shānīzāde, i, 62, 64; Djewdet, iii, 38, 43, 333; iv, 360; v, 270; vi, 6, 10; ix, 3; x, 18; xi, 201). "Consensus" would perhaps be a more exact rendering of what was really desired. Still, the idea of "unanimity" is a striking sign of desire to maintain unity of decision even while broadening participation in decision-making. This desire, like the need for secrecy, would have suggested keeping the consultative assemblies small in size.

By the time of Maḥmūd II, however, there were clearly situations where it seemed necessary to enlarge the councils, or even use them as means for mobilisation of mass opinion. One example of this occurred in 1223/1808, when the grand *wezīr*, ʿAlemdār Muṣṭafā Pasha, himself one of the provincial *aʿyān*, held a great assembly in Istanbul, to which he invited not only high officials of the central government, but also other provincial notables, to conclude an agreement between the *aʿyān* and the sultan (Shānīzāde, i, 62; Djewdet, ix, 3; Lewis, 75-6; Shaw and Shaw, 1-3). In the 1820s, with the outbreak of the Greek Revolution, there were *medjlis*es to which an unusually large range of military officers and even such non-officials as the agents (*ketkhüdā*) of various guilds were summoned (Shānīzāde, iv, 2, 37, 201); these were the assemblies that Shānīzāde criticised as being too large. By this time, however, the concerns of the government had clearly extended beyond secret consultation into mass mobilisation of Muslim opinion. The "crowded" (*djemʿiyyetlü*) assemblies contributed to this purpose by making, or legitimating, decisions that were communicated to the populace through the non-official participants, or by such other means as dispatching circular orders to local officials or sending out public criers (*münādī*; Shānīzāde, iii, 203-6; iv, 201-4; Djewdet, xi, 272-5; xii, 159; al-Shihābī, *Taʾrīkh*, i, 102-3).

Appeals to Muslim solidarity are a special illustration, finally, of perhaps the most important feature of the *medjlis*es: the emphasis on Islamic ideals and values. Such appeals were a general theme of traditional Ottoman culture; even so, they appear particularly prominent where the consultative assemblies are concerned. It is surely no coincidence that these important assemblies were designated by the term *shūrā* [*q.v.*] or its derivatives, or that Ottomans were quick to cite *ḥadīth* in support of the consultations or the procedures followed in them (Shānīzāde, iv, 3; Djewdet, iii, 35). More important was the role of the *ʿulemā'* in the *medjlis*es, and the care taken to verify the conformity of decisions to the *sheriʿat* (Wāṣıf, i, 317; ii, 13; Shānīzāde, iii, 199; iv, 37; Djewdet, iii, 41, 43; iv, 158, xii, 149-50, 158, 263-6). That the problems confronting the assemblies could challenge the *ʿulemā'* in their capacity as legal scholars became clear on at least one occasion when, in 1227/1812, the *fetwā emini* [*q.v.*] found that since there was no clear traditional response (*naḳl-ı ṣarīḥ*) on an issue, he would have to reason by analogy (*ḳiyās* [*q.v.*]; Shānīzāde, ii, 100; cf. Djewdet, iii, 43). The statement is a harbinger of a later theme of Islamic reformism (cf. A. Merad, IṢLĀḤ, iv, 152-4). A more conspicuous harbinger of the same phenomenon is the perception, which gradually emerged in the assemblies, that the problems under discussion were threats, not just to the Ottoman state, but to the "heart of Islam" (*beyḍa-yi islāmiyye*) or the entire Muslim community (*djümle-yi ümmet-i Muḥammad*) and would require its combined efforts in response (Shānīzāde, ii, 99-100; iv, 202; Djewdet, x, 19; xi, 273).

During the *Tanẓīmāt*, both this Islamic emphasis and the *medjlis-i shūrā* itself, quickly faded as features of Ottoman decision-making. The reasons for the decline of the Islamic emphasis must include the political consolidation of the new civil-bureaucratic élite, as well as the alienation of the leading *ʿulemā'* from policies that it seemed impossible, after the Gülkhāne Decree of 1255/1839, to rationalise in terms of defence of the empire as an Islamic state. It is significant in this regard that Djewdet Pasha, who was trained as an *ʿālim* prior to his transfer into the civil bureaucracy and who was politically quite conservative, was consistently critical of the capacity of the *ʿulemā'* to contribute to the *medjlis*es that we have been discussing. If Djewdet's opinion is debatable for the period before the 1830s, it points to a problem in relations among governmental élites, and to a feature of policy, that was unmistakable thereafter (Djewdet, iii, 38; iv, 195, 261-2; v, 27-35, 231; xii, 82-3; Heyd, 63-96; Findley, 61-3).

As for the apparent decline of the *medjlis-i shūrā*, on the other hand, there are signs that this signifies, not a loss of interest in consultation, but rather an adaptation and institutionalisation of the deliberative *medjlis* in a variety of settings. The fact that the term *medjlis* from this time on virtually supplanted the term *dīwān* as a designation for conciliar bodies suggests that the frequent *medjlis*es of preceding decades indeed form the major link through which the Ottoman *dīwān* tradition evolved into the 19th century.

As early as 1832, then, we find a military council (*shūrā-yı ʿaskerī*; Levy, 479-89). A key moment in the proliferation of councils occurred in 1838, when, as part of an effort to abolish the grand vizierate and redistribute its powers, Maḥmūd II set up two councils, the Consultative Assembly of the Sublime Porte (*dār-ı shūrā-yı bāb-ı ʿālī*) and the Supreme Council of Judicial Ordinances (*medjlis-i wālā-yı aḥkām-ı ʿadliyye*). The latter was supposed, like the imperial *dīwān* of earlier times, to meet at the palace (Luṭfī, v, 106-8, 178-9; vi, 92-6; Kaynar, 198 ff.; Shaw, *Legislative councils*, 54-7; Findley, 141). Following Maḥmūd's death in 1255/1839, the grand vizierate was quickly restored; and the various ministers (*nāẓır*), whom Maḥmūd had begun to appoint on European example in the mid-1830s, were grouped into a "council of ministers" (*medjlis-i wükelā'*) or "privy council" (*medjlis-i khāṣṣ*). The *shaykh ül-Islām* also served as a member of the cabinet. Of the two councils created in 1838, only the *medjlis-i wālā-yı aḥkām-ı ʿadliyye* survived. It assumed the function of drafting the new legislation called for under the Gülkhāne decree. It also served as the highest court for trying cases under the new legislation. Thus the *medjlis-i wālā* embarked on a long evolution, in course of which it turned, in 1868, into the Council of State (*shūrā-yı dewlet* [*q.v.*], later the *Danıştay* of the Turkish Republic). In the late Ottoman period, the council of state was the most important civil administrative body after the council of ministers; it also normally retained top-level responsibility for administrative justice (Shaw, *Legislative councils*, 57-84; Findley, 172, 174-6, 247-50, 307-9).

The early history of the *medjlis-i wālā*, as well as that of the military council created in 1832, also included important steps in the development of Ottoman ideas of conciliar procedure. Procedural

regulations for the *medjlis-i wālā*, dating from *ca.* 1255/1839, began by citing problems experienced in earlier deliberative assemblies. The document went on to require changes such as circulating documents on important issues prior to meetings, requiring those who wished to speak to sign up in advance and speak in order of signing (thus without regard to rank), and—most important—taking decisions by majority approval (*ekt̲h̲eriyyet-i ārāʾ*), rather than by unanimity. At this point, Western ideas of parliamentary procedure, known in some measure at least since S̲h̲ānīzāde, began to be incorporated into Ottoman practice. The fact that a French translation of the new regulations for the *medjlis-i wālā* reached the British embassy almost immediately may be a sign of direct European influence on their formulation (Kaynar, 206-8; Levy, 480-1; Findley, 198-9, 385 n. 129).

As the council of state took shape, the *Tanẓīmāt* also witnessed an unprecedented proliferation of smaller, specialised *medjlises*, many of which subsequently disappeared. In part, this is because they served as committees to perform new tasks for which, up to that point, there were no permanent administrative agencies to assume responsibility. Some of the specialised *medjlises* evolved into such agencies. This is clearly how the Ministry of Trade and Agriculture emerged; traits of the pattern also appear in the formation of the Ministry of Justice. In other cases, *medjlises* continued to supplement the regular bureaucratic apparatus where it remained thinly developed (Findley, 176-7, 179, 181, 245, 253). The clearest example of this is the local administrative councils, first created in 1840 and ultimately known as *medjlis-i idāre*. These administrative councils were originally intended to supplant the *dīwāns* of the *ḳāḍīs*, at least in the roles that these had acquired in local administration, as well as the *dīwāns* of the provincial governors. Emulation of conciliar institutions created under Muḥammad ʿAlī in Egypt and Syria may also have stimulated the development of the Ottoman local councils (Heidborn, i, 164-6; Maʿoz, 87-107; Russell, i, 159, 322-3, 325-8; Guys, 143-9; Barker, i, 144-8, 316-7; Davison, *Advent*, 98 ff.; İnalcık, *Tanzimat'ın uygulanması*, 623 ff.; idem, *Application of the tanzimat*, 100-1, 107-10; Kornrumpf, 44-57; Ortaylı, 13 ff, 42 ff.). As organised in 1840, the councils included not only the local officials and religious leaders, but also indirectly-elected representatives of the notables. These councils were thus the first Ottoman governmental institutions to include representatives of the people as a matter of system. In 1261/1845, there was even an experiment—clearly following an Egyptian model—with the convening of a consultative assembly in Istanbul, to which each province of the empire was to send two delegates. The Istanbul assembly of 1845 had no sequel in the years immediately following, but the local administrative councils became permanent fixtures. Since they exercised not only administrative functions, but also local responsibility for cases tried under the new legislation of the *Tanẓīmāt*, they also represented the starting-point of an important organisational development of a different kind: the emergence of what eventually became the distinct system of *niẓāmiyye* courts [see MAḤKAMA. 2. The Ottoman Empire excluding Egypt. ii. The Reform era]. Even as the *niẓāmiyye* courts became separate from the local administrative councils, they retained marks of their origins in being known, until the 1860s, as *medjlis* or *dīwān*, rather than *maḥkeme* (*Düstūr*[1], i, 610-12, 615-18; Heidborn, i, 226 n. 57), and in continuing until the end to be collegial bodies.

In terms of elaboration of the underlying organisational form, the most important of the organisational progeny of the Ottoman *medjlis-i s̲h̲ūrā* was the Ottoman parliament. The link to the earlier councils appears both in the Ottoman name for the parliament, *medjlis-i ʿumūmī* [see MADJLIS. 4 A. In the Middle East and North Africa, section i] and in the adoption, which S̲h̲ānīzāde had anticipated, of the concepts of *s̲h̲ūrā* and *mes̲h̲weret* to refer to parliamentary government. The parliament also represented the ultimate extension among the Ottomans of the representative principle first introduced in the local administrative councils. In this sense, whatever the shortcomings of the Ottoman parliaments, their emergence indicates the extent to which the scope of political participation, or at least the demand for it, had continued to broaden since the convocation of the consultative assemblies of the 18th century.

Organisations like the Ottoman *medjlis-i s̲h̲ūrā* and its derivatives appeared in other Islamic political centres as well. In Egypt, Muḥammad ʿAlī Pas̲h̲a was as attached to conciliar deliberation as he was to the centralisation of ultimate decision-making. Under him, the development of conciliar institutions advanced to the point that the *dīwāns* —a term referring in Egypt to administrative bureaux—were sometimes displaced by councils with corresponding functions (Deny, 33-4, 108). This happened with his civil and military councils (*medjlis-i ʿāli-i mülkiyye, medjlis-i djihādiyye*). The former of these was also known by designations including the terms *medjlis-i s̲h̲ūrā* or *medjlis-i mes̲h̲weret* and was in existence from 1240/1824-25 to *ca.* 1254/1838. As with some of the Ottoman councils, the responsibilities of this council included matters of administrative justice (*ibid.*, 108-9; Lane, i, 141-2). Muḥammad ʿAlī also had a "cabinet" referred to as the *s̲h̲ūrā-yi k̲h̲āṣṣa* (Deny, 109, 151). Beginning in 1245/1829, there was an annual "general assembly", including leading officials, together with provincial notables and the leading *ʿulemāʾ*. This assembly was known by a variety of names, such as *medjlis-i ʿumūmī, djemʿiyyet-i ʿumūmiyye, medjlis-i mes̲h̲weret* (or *s̲h̲ūrā*), and *endjümen-i mes̲h̲weret* (*ibid.*, 110-1). There was also a "comprehensive and regular system of local councils", at least in Syria and Palestine, while they were under Egyptian control in the 1830s (Maʿoz, 90; al-S̲h̲ihābī, *Taʾrīk̲h̲*, ii, 72; idem, *Lubnān*, iii, 865; Rustum, ii, 358, no. 3204). The local councils of Egyptian-ruled Syria may have provided a model for the Ottoman local administrative councils. Subsequently, under the Khedive Ismāʿīl (1863-79), when Egypt acquired a "parliament", it was known as the *madjlis s̲h̲ūrā al-nuwwāb*. It was in fact an advisory assembly of delegates, most of whom were local notables. This assembly did not attempt to assume any more active role before 1879 (Deny, 515-7; Schölch, 27-30, 77-88, 93-4, 173-85, 188-96, 207-8, 234; see also MADJLIS. 4 A. In the Middle East and North Africa, sections v, Syria, xvi, Egypt.

Ḳād̲j̲ār Iran also eventually acquired consultative assemblies resembling, and to some degree inspired by, those of the Ottoman Empire. Like Maḥmūd II before him, Naṣr al-Dīn S̲h̲āh decided in 1858 to rule without a prime minister (*ṣadr-i aʿẓam*). Instead, he appointed a six-man council of ministers, as well as—a year later—two advisory councils, a *madjlis-i s̲h̲ūrā-yi dawlatī* and a larger *maṣlahat-*

khāna. Both were expressly intended to give larger numbers of people a chance to participate in affairs of state (Bakhash, 4). Of these two assemblies, the *madjlis-i shūrā-yi dawlati* had a membership of higher standing and was expected in some sense to make decisions, while the *maṣlaḥat-khāna* was to do little more than generate ideas and recommendations. Much as in the earlier Ottoman *medjlis-i shūrā*, however, the members of the councils concentrated on figuring out the shah's wishes and expressing their opinions in the same terms (*ibid.*, 91-3). It is not clear how long either of these two councils functioned; but by 1871, Naṣr al-Dīn Shāh was moved to reinstate the office of *ṣadr-i aʿẓam*, assigning it to Mīrzā Ḥusayn Khān Mushīr al-Dawla, ambassador to Istanbul *ca.* 1859-70 and an important conduit for ideas acquired there (*ibid.*, 43-9). Just prior to this appointment, the shah also created a new deliberative assembly, known as the *dār al-shūrā-yi kubrā*, appointing to it a number of individuals who had served in the earlier councils. In 1872, Mushīr al-Dawla went on to reorganise the ministries and set up a cabinet, the *darbār-i aʿẓam* (*ibid.*, 93-4, 96-7).

Over the years that followed, the "cabinet" and the *dār al-shūrā* went through many changes. The *dār al-shūrā* was at best an approximation of the Ottoman council of state (*shūrā-yi dewlet*). Yet it suffered in that both its membership and the purpose of the consultative processes that were supposed to occur in it remained ill-defined. Ten years after the creation of the *dār al-shūrā*, its members were still unclear as to whether they were empowered to initiate legislation. Not surprisingly, the *dār al-shūrā* faded into oblivion in the early 1890s (*ibid.*, 138, 152-65).

In the long run, then, the development of consultative assemblies proved less extensive in Ḳādjār Iran than in the Ottoman Empire. It should be noted, however, that the meaning of the term *medjlis-i shūrā* eventually expanded in Iran, too, to refer to parliamentary institutions. By the 1890s, Mīrzā Malkum Khān [*q.v.*] was expounding the concept of a "great national consultative assembly" (*madjlis-i shūrā-yi kubrā-yi millī*) in his journal *Ḳānūn*. This was to be a representative body with powers of legislation and budgetary review (*ibid.*, 337-39; cf. Algar, 236). The Iranian parliament created after the revolution of 1906 was in fact known as the *madjlis-i shūrāyimillī* [see MADJLIS. 4 A. In the Middle East and North Africa, section iii, Iran].

(C. V. FINDLEY)

MADJLISĪ, MULLĀ MUḤAMMAD BĀḲIR, known also as ʿAllāma Madjlisī and Madjlisī-yi Thānī (1037-1110/1627-98), an authoritative jurist, a most prolific *ḥadīth* collector, an unprecedentedly influential author in the world of the Twelver Shīʿa. He was also a distinguished expert in bibliog-

raphy, a well-read man in Islamic philosophy and mysticism, and an active authority in politics, social and judicial matters during the late Ṣafawīd period. He belonged to a distinguished clerical family; his father, Muḥammad Taḳī, mostly referred to as Madjlisī-yi Awwal [*q.v.*], his ancestors as well as his descendants, have been mentioned among men of knowledge.

Madjlisī, in line with his family tradition, became "eager for learning various Islamic sciences and noble branches of arts right from ... early youth" (Muḥammad Bāḳir Madjlisī, *Biḥār al-anwār*, i, Tehran 1887, 3). He successfully studied Islamic subjects such as *fiḳh* (jurisprudence), *uṣūl al-fiḳh* (fundamentals of jurisprudence), commentary of the Ḳur'ān, *kalām* (theology), philosophy, mysticism, etc., under his father and many other professors such as Sayyid Amīr Sharaf al-Dīn al-Ḥusaynī al-Shūlastānī (d. 1060/1650) and Ḥasan ʿAlī al-Tustarī (d. 1075/1664); the names of eighteen of his teachers and other authorities who granted him certain certificates are given in Ḥusayn Nūrī, *al-Fayḍ al-ḳudsī fī tardjama al-ʿAllāma al-Madjlisī*, Tehran 1887, 12-13 (attached to the first volume of the old edition of the *Biḥār*). At a certain point in life, however, Madjlisī decided to abandon all those fields of knowledge which had then become popular, and to concentrate only on the study of prophetic traditions which were, in his belief, beneficial for him in the hereafter, though they had then a depressed market (*kāsid*) (*Biḥār*, i, 4).

Henceforth, Madjlisī devoted the most part of his life not only to lecturing on the Shīʿī subjects to the students, whose number at times exceeded one thousand (*al-Fayḍ*, 13-8; in this book, only forty-nine of them are introduced with some bibliographical information), but also to collecting the scattered and forgotten Shīʿī *ḥadīth*s and to compiling them into various Arabic and Persian books. His main work in this field is the immensely voluminous Arabic book *Biḥār al-anwār* whose outline he sketched out in 1070/1659 and completed its compilation *ca.* 1106/1694. He also wrote books in Persian, a number of these being translations of different sections of the *Biḥār*. His aim in writing in Persian, as he himself repeatedly mentioned, was to make the prophetic traditions easily accessible to "the masses of believers and common Shīʿa" who had "no familiarity with the Arabic language", hoping that his works "may give life to the hearts and spirits of the dead-hearted people" (Muḥammad Bāḳir Madjlisī, *ʿAyn al-ḥayāt*, Tehran 1952, 4). In his efforts, in fact, Madjlisī was quite successful because his *Ḥaḳḳ al-yaḳīn* alone reportedly converted 70,000 of the Syrian Sunnīs to Shīʿism (Muḥammad b. Sulaymān Tunakābunī, *Ḳiṣaṣ al-ʿulamā'*, Tehran n.d., 205).

Madjlisī had very close relations with at least two of the Ṣafawīd monarchs, Shāh Sulaymān (d. 1106/1694) and Sulṭān Ḥusayn (d. 1125/1713). In compiling his book, he received effective financial and other types of support from them, and in return he praised those rulers and dedicated several of his books to them. In reference, for instance, to Shāh Sulaymān, he used many phrases of a hyperbolic nature (Muḥammad Bāḳir Madjlisī, *Ḥayāt al-ḳulūb*, i, 1869, 3; the second volume of this book is translated into English by James L. Merrick under the title of *The life and religion of Mohammed as contained in the Sheeʿah tradition of the Hyât-ul-kuloob*, Boston 1850). He used also highly eulogistic expressions for Sulṭān Ḥusayn (see, for instance, Muḥammad Bāḳir Madjlisī, *Zād al-maʿād*, 1903, 2-3).

In 1098/1686, Madjlisī was appointed as the official *Shaykh al-Islām* by Shāh Sulaymān. Madjlisī's title was changed to *Mullābāshī* on Sulṭān Ḥusayn's accession to the throne in 1106/1694. While holding these highest, institutionalised clerical offices, Madjlisī "personally undertook all proceedings of law and legal matters" (Ḥusayn Nūrī, *Mustadrak al-wasā'il wa-mustanbaṭ al-masā'il*, iii, Tehran 1903, 408). He used his power and influence to suppress anything which appeared to him as heresy and infidelity. He ordered the Indian idols of Iṣfahān to be demolished in 1098/1686 (*al-Fayḍ*, 3) and "suppressed the agressors and transgressors who were adherents of sectarianism and innovation, and were enemies [of the right religion], especially the heretic Ṣūfīs" (Yūsuf Baḥrānī, *Lu'lu'at al-baḥrayn fi 'l-idjāzāt wa-tarādjim ridjāl*, Nadjaf n.d., 55). These "aggressors and transgressors" also included Zoroastrians and the Sunnīs (L. Lockhart, *The fall of the Safavi dynasty and the Afghan occupation of Persia*, Cambridge 1958, chs. 3-4, 6).

During the last four years of his state position under Sulṭān Ḥusayn, Madjlisī was practically the actual ruler of Iran. With his vast power and influence in the country, he undertook so strict a religious policy against the Sunnīs that, in some authors' opinion, it expedited the Afghān invasion of Iran in 1135/1722 (cf. *inter alia* Hamid Algar, *Shīʿism and Iran in the eighteenth century*, in T. Naff and R. Owen (eds.), *Studies in eighteenth century Islamic history*, London and Amsterdam 1977, 288-302, 400-3). It is interesting to note that Madjlisī wrote his famous *Ḥaḳḳ al-yaḳīn* when the execution of his anti-Sunnī policy was about to reach its culmination. In this book, written one year before Madjlisī's death (1110/1697), he clearly declared the first three Sunnī caliphs, i.e. Abū Bakr, ʿUmar and ʿUthmān, to be hypocrites and unbelievers who deserved God's curse (Tehran 1968, 154-278, 519, and *passim*).

There is no doubt that the culture and tradition of Twelver Shīʿism enjoyed an unprecedented florescence through Madjlisī's efforts, and the influence of his teachings and practices on later generations —common believers as well as clerical circles and leaders—is undeniable. One of Madjlisī's fundamental teachings is that the Shīʿa should have full respect for the rulers. He emphatically warns that anyone "who despises the kings" will suffer abasement; he says that "one who does not obey the kings, has not in fact obeyed God". He also reminds his audience that "the hearts of the kings and those of all mankind are in the hands of God; one must have regard for all tyrannical kings and other oppressors, and it is even compulsory to exercise dissimulation before them, to prevent [oneself] from their harms, and not to expose [oneself] to their wrath" (*ʿAyn al-ḥayāt*, 560-7).

Among the distinguished clerical leaders who, following Madjlisī's teachings, had regard for the tyrannical kings by not opposing their oppressive rule and never despising them was Shaykh Murtaḍā Anṣārī (d. 1281/1864) [*q.v.* in Suppl.], whose aloofness from state affairs seems to have been taken as a sign of his asceticism (Ḥasan Khān Shaykh Djānirī Anṣārī, *Ta'rīkh-i Iṣfahān va Ray va hama-yi djahān*, Tehran 1943). One may also mention Shaykh Muḥammad Taḳī Iṣfahānī, known as Āḳa Nadjafī (d. 1332/1913) [*q.v.* in Suppl.) as a good example of those Shīʿī religious leaders who followed Madjlisī's pattern of strict religious policy by putting heavy

pressures upon religious minorities in Iran (cf. *inter alia* Abdul-Hadi Hairi, art. *Āqā Najafī*, to appear in *Encyclopaedia Iranica*). It is not, therefore, unexpected to see that the latter cleric made strenuous efforts to propagate in favour of Madjlisī's ideas by translating into Persian, summarising and publishing several volumes of Madjlisī's books (Khānbābā Mushār, *Muʾallifīn-i kutub-i čāpī-yi fārsī va ʿarabī az aghāz-i čāp tā kunūn*, ii, Tehran 1961, nos. 198-203).

Madjlisī's thoughts, teachings, and practices, however popular and influential, have not been secure from the criticism made by a number of Shīʿī religious thinkers since Madjlisī's time. Mīr Lawḥī [*q.v.*] for instance, accuses him of the distortion of the sense of some *ḥadīths*, and suggests its reason to have been either ignorance or wordly interests (Muḥammad Mīr Lawḥī, *Kifāyat al-muhtadī fī maʿrifat al-Mahdī*, ms., no. 1121, Faculty of Theology, Mashhad, 21-2). ʿAbd al-Ḥayy, another contemporary of Madjlisī, criticised him particularly over the Friday Prayer which Madjlisī and his father had revived (Muḥammad Bāḳir Khwānsārī, *Rawḍāt al-djannāt fī aḥwāl al-ʿulamāʾ wa al-sādāt*, Tehran 1947, 131) and which ʿAbd al-Ḥayy, *inter alios*, believed that in the absence of the Twelfth Shīʿī Imām should not be performed. He also criticised Madjlisī because "he authorised every imbecile and wicked person to transmit *ḥadīth* on Madjlisī's authority" (ʿAbd al-Ḥayy Raḍawī Kāshānī, *Ḥadīḳat al-Shīʿa*, Arabic ms., Madjlis Library, no. 3770, p. 110). A Persian Ṣūfī of the Ḳādjār period believed that Madjlisī was inconsistent in his ideas (Muḥammad Maʿṣūm Shīrāzī Maʿṣūm ʿAlī Shāh, *Ṭarāʾiḳ al-ḥaḳāʾiḳ*, i, Tehran 1960, 279 ff.). In reference to some of the *ḥadīths*, quoted from *Biḥār*, which indicate the Shīʿī Imāms' humiliation at the hands of contemporary caliphs, a Persian author of our time writes that if any person trusting Madjlisī happened to read some of Madjlisī's writings he (or she) would certainly lose his (or her) belief in the Shīʿī Imāmate. This author is deeply disturbed by the fact that the custodians of Shīʿism have been able to tolerate and pass in silence over these types of "terrifying insults" that Madjlisī has reported against the infallible Shīʿī Imāms (ʿAlī Sharīʿatī, *Tashayyuʿ-i ʿAlawī va tashayyuʿ-i Ṣafawī*, Tehran 1971, 189-99).

Since the late 19th century, Iran has experienced a number of anti-government movements, all of which were led by the clerical leaders. The *ʿulamāʾ*'s active participation in the Persian Constitutional Revolution of 1906-11/1324-9 (Abdul-Hadi Hairi, *Shīʿism and constitutionalism in Iran: a study of the role played by the Persian residents of Iraq in Iranian politics*, Leiden 1977) and their unquestionable leadership in the Islamic Revolution of 1979 (Ḥamīd Rūḥānī, *Barrasī va taḥlīlī az nahḍat-i Imām Khumaynī dar Īrān*, Ḳum 1979) were certainly in sharp contradiction with Madjlisī's teachings. Although the *ʿulamāʾ* rose against the political establishments in these revolutions, they seem in reality, one may say, to have revolted against the legitimacy of many of the legacies of Madjlisī.

Bibliography: No comprehensive and critical study of Madjlisī's life and work seems to have been yet undertaken. The most informative available biography of Madjlisī is *al-Fayḍ*, written in 1302/1884 and mainly based on Aḥmad b. Muḥammad ʿAlī Bihbahānī's work still in manuscript entitled *Mirʾāt al-aḥwāl-i djahān namā*, Persian ms., Madjlis Library, no. 5551; this valuable, original book, written between 1210/1796 and 1225/1810, is skilfully outlined in Abdol Hossein Haeri, *Fihrist-i kitābkhāna-yi madjlis-i shūrā-yi millī*, xvii, Tehran 1969, 6-19. Madjlisī's own books may well be rated as the best sources of information concerning his thought as well as his links with the Ṣafawīd monarchs. Over 50 Persian books are ascribed to Madjlisī, and 13 Arabic books are also listed under his name, all in *al-Fayḍ*, 6-9. Madjlisī's major work is the *Biḥār*, which was first published in twenty-five large volumes in Tehran in 1305-15/1887-97, and a new edition of it has recently appeared in 110 volumes (Tehran 1956-72). This edition, however readable, finely printed and handily accessible, is not only devoid of any notably valuable editorial work, but since no pagination of the old edition is given in the new edition, the researcher has to face certain difficulties in collating the references to and quotations from the old edition with the new one. An extremely useful alphabetically-arranged guide to the *Biḥār* is ʿAbbās Ḳummī's *Safīnat al-biḥār wa-madīnat al-ḥikam wa 'l-āthār*, i-ii, 1943, but its abbreviation systems apply only to the old edition. Some of Madjlisī's books have been translated into other Islamic languages; many of his books have also been published, but only forty-five of them are listed in Mushār, *Muʾallifīn*, ii, nos. 23-42.

In addition to the sources introduced above, see also Muḥammad Ḥurr al-ʿĀmilī, *Amal al-āmil*, i-ii, Baghdād 1965; Muḥammad b. ʿAlī Ardabīlī, *Djāmiʿ al-ruwāt*, i-ii, Tehran [?] 1952; E. G. Browne, *LHP*, iv; C. de Bruyn, *Travels into Muscovy, Persia and part of the East Indies*, i-ii, London 1737; Sayyid Niʿmat Allāh Djazāʾirī, *al-Anwār al-nuʿmāniyya*, iv, Tabrīz 1962; ʿAbd al-Karīm Djazī, *Ridjāl-i Iṣfahān yā tadhkirat al-ḳubūr*, 1949; D. (Abdul-Hadi Hairi)

MADJLISĪ-YI AWWAL, Muḥammad Taḳī (1003-70/1594-1659), a prominent Shīʿī religious leader and author of the Ṣafawīd period.

Originally, he was on his mother's side from

Djabal ʿĀmil (southern Lebanon) because, according to his son Muḥammad Bāḳir Madjlisī [*q.v.*], Darwīsh Muḥammad b. Ḥasan al-ʿĀmilī, a great *mudjtahid* of Djabal ʿĀmil, was his maternal grandfather (Muḥammad b. ʿAlī Ardabīlī, *Djāmiʿ al-ruwāt*, ii, Tehran n.d., 551); the latter was also called Naṭanzī from his stay in Naṭanz, north of Iṣfahān, for a certain period of time (Muḥsin al-Amīn al-Ḥusaynī al-ʿĀmilī, *Aʿyān al-Shīʿa*, xxx, Damascus 1949, 371-3). Muḥammad Bāḳir Khwānsārī [*q.v.*] has held that Madjlisī-yi Awwal's place of origin also on his father's side was Djabal ʿĀmil because Shaykh ʿAbd Allāh b. Djābir, a *mudjtahid* from the same region, was his paternal cousin. This view, however logical and acceptable, seems difficult to combine with the fact that Madjlisī-yi Awwal's son and great grandson claimed descent from Abū Nuʿaym Aḥmad b. ʿAbd Allāh of Iṣfahān (d. 430/1038) (*Rawḍāt al-djannāt fī aḥwāl al-ʿulamāʾ wa 'l-sādāt*, Tehran 1947, 74-5, 130; see also *Nāma-yi dānishwarān-i nāṣirī dar sharḥ-i ḥāl-i shishṣad tan az dānishmandān-i nāmī*, vii, Ḳum n.d., 1-21). At any rate, he himself was born in Ardastān, north-east of Iṣfahān, and brought up and lived in Iṣfahān (Walīḳulī Shāmlū, *Ḳiṣaṣ al-Khāḳānī*, photographed ms., no. 69, Faculty of Theology, Mashhad, 370); and owing to the above-mentioned personal and familial background, he sometimes called himself "al-Iṣfahānī al-Naṭanzī al-ʿĀmilī" (Muḥammad Taḳī Madjlisī, *Lawāmiʿ-i ṣāḥibḳirānī*, i, Tehran 1913, 363).

Having been born into such clerically distinguished family, he began his religious education very early in life. He himself writes that at the age of four he knew about God, prayers, paradise and hell, and used to preach to children according to the verses of the Ḳurʾān and passages of the *ḥadīths* which his father had taught him (Madjlisī-yi Awwal, *Lawāmiʿ*, new edition, Tehran n.d., i, 903). He studied with remarkable steadiness under a number of teachers, including Bahāʾ al-Dīn al-ʿĀmilī and ʿAbd Allāh b. Ḥusayn Shūshtarī. He writes, at the age of sixty: "I spent over fifty years of my life in doing research on the traditions of the Prophet [Muḥammad] and on those of the infallible Imāms . . . First of all, I read the ordinary books written on theology (*kalām*), fundamentals of Islamic jurisprudence (*uṣūl*), and jurisprudence (*fiḳh*); secondly, I studied whatever [works] our Twelver *ʿulamāʾ* and others had compiled" (Muḥammad ʿAlī Kashmīrī, *Nudjūm al-samāʾ fī tarādjim al-ʿulamāʾ*, Ḳum 1974, 61). Madjlisī-yi Awwal seems to have begun to be exceptionally prolific towards the end of that fifty-year period, because he wrote his voluminous work *Rawḍat al-muttaḳīn* within approximately two years, i.e. from *ca.* 1063/1652 to 1064/1653 (*Nudjūm*, 63; cf. also Muḥammad Taḳī Madjlisī, *Rawḍat al-muttaḳīn fī sharḥ man lā yaḥḍuruh al-faḳīh*, 1973, i, 1-3; this book is being published in many volumes, the twelfth of which appeared in 1979), and translated a substantial portion of it into Persian during the years 1065/1654-1066/1655 (*Lawāmiʿ*, i, 363, and ii, Tehran 1906, 409).

Madjlisī-yi Awwal has been recognised as one of the outstanding Shīʿī *mudjtahids* who, after the accession of the Ṣafawīds to power, began to promulgate the Shīʿī *ḥadīths*, especially in the Persian language. He in fact enjoyed good relations with the Ṣafawīd monarchs. In some of his own writings, Madjlisī-yi Awwal describes a dream he saw while visiting the shrine city of Nadjaf. He tells us that in his dream ʿAlī b. Abī Ṭālib urged his immediate return to Iṣfahān in order to prevent the confusions which ʿAlī told him would follow the death of Shāh ʿAbbās I (1038/1628). Madjlisī-yi Awwal, therefore, returned to Iṣfahān a few months earlier than originally planned; the dream was told by one of his friends to Shāh ʿAbbās's heir to the throne, Sām Mīrzā (later Shāh Ṣafī) (Khwānsārī, *Rawḍāt*, 131) and must have played a role in the strengthening of his ties to Shāh Ṣafī (d. 1052/1642). The extent of Madjlisī-yi Awwal's intimate friendship with another Ṣafawīd monarch, Shāh ʿAbbās II (d. 1077/1666), can be seen by the fact that, upon the latter's request, he translated his Arabic commentary on Ibn Bābuwayh's *Man lā yaḥḍuruh al-faḳīh* into Persian. The Arabic title of the book is *Rawḍat al-muttaḳīn* ("The garden of the pious") which addresses itself to the people of piety, whereas Madjlisī-yi Awwal not only dedicated the Persian version, with a great deal of highly eulogistic expressions, to the Shāh, but he also changed its title to *Lawāmiʿ-i ṣāḥibḳirānī* ("The shimmerings of the invincible and just king"), a title that does not honestly represent the contents of the book written on the Shīʿī *ḥadīths* (*Lawāmiʿ*, new edition, i, 4-10).

Madjlisī-yi Awwal has been described by many of his biographers as a Ṣūfī, and a number of his books also attest this fact (cf. *inter alia*, his *Tashwīḳ al-sālikīn*, 1893; for a list of his other works, see Muḥammad ʿAlī Mudarris Tabrīzī, *Rayḥānat al-adab fī tarādjim al-maʿrūfīn bi 'l-kunya aw al-laḳab*, iii, Tehran 1950, 460-2). However, his famous son, Muḥammad Bāḳir, and many other authors who considered Ṣūfism as heresy, have attempted to exonerate him from any truly mystical ideas or practices, and some of them have questioned the authenticity of Madjlisī-yi Awwal's authorship of those mystical books which have been ascribed to him (*Nudjūm*, 59-64). Muḥammad Bāḳir writes that his father had close associations with the Ṣūfīs during the early part of his life and that he tactically pretended to be a Ṣūfī in order to lead them to the right path. Towards the end of his life, however, he found his efforts to have been useless and henceforth he openly turned against the Ṣūfīs and even declared them unbelievers (Muḥammad Bāḳir Nadjafī Yazdī, *Sharḥ-i kitāb-i iʿtiḳādāt-i Islam bi ḳalam-i ʿAllāma Madjlisī*, Tehran 1975, 393-4). Muḥammad Bāḳir's statement, however important and thought-provoking, may well be questioned by the fact that his father's *Lawāmiʿ*, written as late as 1065-6/1654-5, that is to say four years before his death, contains many favourable references to Ṣūfism (cf. 1-2, 38, 44, and *passim* in the new edition of vol. i; for an interesting discussion on this particular subject, consult Muḥammad Maʿṣūm Shīrāzī Maʿṣūm ʿAlī Shāh, *Ṭarāʾiḳ al-ḥaḳāʾiḳ*, i, Tehran 1960, 268 ff.).

Madjlisī-yi Awwal's deep ties to Ṣūfism were also demonstrated by the spiritual stages he was known to have attained and by his asceticism, which became proverbial. He, despite his close friendship with a tyrannical ruler such as Shāh ʿAbbās II, claims to have established certain relations with the Shīʿī Imāms and the Prophet Muḥammad, who gave his sanction to the path Madjlisī-yi Awwal was pursuing (*Lawāmiʿ*, new edition, i, 1-2). With regard to his attitude towards ʿAlī b. Abī Ṭālib, Madjlisī-yi Awwal points out that while paying a visit to the shrine of ʿAlī in Nadjaf and "becoming occupied with an earnest spiritual striving (*mudjāhadat*), many things which weak intellects cannot bear were unveiled to me (*mukāshafāt*) through the blessing of that honourable [Imām]" (ʿAbbās Ḳummī,

Fawāʾid al-raḍawiyya fī aḥwāl ʿulamāʾ al-madhhab al-djaʿfariyya, Tehran 1948, ii, 444).

(ABDUL-HADI HAIRI)

MADJMAʿ ʿILMĪ.

(i) ARAB COUNTRIES.

Madjmaʿ, pl. *madjāmiʿ*, lit. "a place of collecting, a place in which people collect, assemble, congregate" (Lane i/2, 459), became in the second half of the 19th century, as *madjmaʿ ʿilmī*, a technical term for Academy of Science, *madjmaʿ al-lugha* being an Academy of [Arabic] language. There is thus a close relationship between both kinds of *madjmaʿ*, since the striving for science takes place in an Arabic language made capable of it.

Whereas *madjlis* [*q.v.*] had been the current term in earlier Arab civilisation for [the place of] an informal literary gathering and developed the meaning of "council", *madjmaʿ* and *nādī* came to be used in the second half of the 19th century for private academies and cenacles or clubs which met to discuss language and literature as well as other problems. The rise of such scientific and literary *madjāmiʿ* and *nawādī* is connected with *al-Nahḍa al-ʿarabiyya*, "the Arabic renaissance". The rise of Arabic as an official language in Egypt under the Khedive Ismāʿīl (over against Turkish); its development in Lebanon, Egypt and elsewhere with a new style of writing, expanded vocabulary and simplified grammar, with translations from western languages; the development of journalism with its needs to write in a clear and easily understandable language; the extension of the reading public and its social background; and of course the progressive modernisation of thought and its direction towards hitherto unknown subjects and problems: all these and other factors were posing a challenge to the classical Arabic language (*al-ʿarabiyya al-fuṣḥā*). On the one hand, they gave new impulses for its further development; on the other hand, they meant a crisis for the fixed forms which the classical language had taken. These turned out to be inadequate for modern use, and consequently there was a threat to the language. The crisis had a religious aspect, inasmuch as classical Arabic became desacralised and demystified. This was less critical for the Christian than for the Muslim Arabs, whose religious scholars, seeing Arabic as the language of the Ḳurʾān, opposed such a modernisation of the language. Among Muslims, the call for *iṣlāḥ* or reform in language is consequently parallel to that for *iṣlāḥ* in religion. It was, however, the modernisation of society itself which finally forced such a modernisation of language. The problem of how to develop Arabic without abandoning the *fuṣḥā* as an essential part of Arabic culture may be considered to have been at the basis of the foundation of *madjāmiʿ* and *nawādī*, which in the beginning were of a private nature. This implied a confrontation between what were called "progressive" and "conservative" views of the Arabic language.

Fāris al-Shidyāḳ appears to have been the first person to suggest founding an academy for the Arabic language (in *ca.* 1870). The idea was taken up by others and supported and even promoted by journalists who, for professional reasons, were in need of a "modern" Arabic. This call for an academy of language had, besides its linguistic purposes, political and cultural aspects. It aimed at a rehabilitation of Arabic and the Arabs after three and a half centuries of Turkish domination, and represented the rediscovery of a common cultural heritage and a common language of discourse. In the *nahḍa*, there was a clear parallel between linguistic and political aspirations, which were directed first against the Turks and later against the British and French. Moreover, an openness existed towards modern science and instruments of knowledge and their assimilation in Arab society. These aspirations, together with the religious aspects, gave to all discussions on science and language a particular acuteness.

(1) Private *madjāmiʿ*

Several private *madjāmiʿ* of language and scholarship arose as a consequence, though their existence was short-lived. In Beirut, *al-Madjmaʿ al-ʿIlmī al-Sharḳī* was established in 1882 with the co-operation of Fāris Nimr (1856-1952). In Egypt, the Institut d'Égypte founded by Napoleon in Alexandria in 1797 and transferred to Cairo in 1859 stood as the model for different *madjāmiʿ* in Cairo. Thus a *madjmaʿ* existed there in 1892-3 due to the initiative of Shaykh al-Sayyid Tawfīḳ al-Bikrī (1870-1933). An equally short existence was enjoyed by a *Djamʿyyat tarḳiyat al-lugha al-ʿarabiyya* founded by Ibrāhīm al-Yāzidjī (1847-1906), Djurdjī Zaydān (1861-1914) and Shaykh Muḥammad Rashīd Riḍā (1865-1935). Former students of the Dār al-ʿUlūm, like Ḥifnī Nāṣif (1855-1919) and ʿĀṭif Barakāt Bey, founded the *Nādī Dār al-ʿUlūm* in 1907 with the explicit purpose of "Arabising" foreign words. This circle disappeared, as well as a similar *nādī* which was founded by Fatḥī Zaghlūl (1863-1914) around the same time. The same fate overcame the *Ladjnat al-muṣṭalaḥāt al-ʿilmiyya* founded by Aḥmad Ḥishmat Pasha when he was Minister of Education, and of which Aḥmad Zakī Pasha (1860-1934) was a prominent member. A *madjmaʿ* founded by Luṭfī al-Sayyid (1872-1963) [*q.v.*] in 1917 and presided over first by Shaykh Salīm al-Bishrī (1832-1917) and then by Shaykh Abu 'l-Faḍl al-Djizāwī (1847-1927) existed from 1917 until 1919 with 28 members, among whom were a Persian, a Syrian Christian and a Jew. From 1921 to 1925 there existed a *madjmaʿ* in Cairo which was presided over by Idrīs Rāghib Bek. Manṣūr Fahmī (1886-1959) and Ṭāhā Ḥusayn (1889-1973) were counted among its members. It had as its explicit purpose the composition of a modern Arabic dictionary; but this was abandoned in 1925 because of the lack of official support.

(2) Official *madjāmiʿ*

(a) *Syria*. On 8 June 1919, the Arab government of King Fayṣal I in Damascus requested Muḥammad Kurd ʿAlī to found and organise an Arab Academy which would replace the *Shuʿbat dīwān al-maʿārif* which had been founded on 2 February 1919. This was an off-shoot of *al-shuʿba al-ūlā li 'l-tardjama wa 'l-taʾlīf* established some two months earlier. The first meeting of *al-Madjmaʿ al-ʿilmī al-ʿArabī*, which had been organised on the model of the Académie Française, took place on 3 July 1919 in Damascus, where it was established in the Madrasa ʿĀdiliyya. Later, a section was established in Ḥalab (Aleppo). The Academy consisted at that time of eight members and a president, and it administered the *Djāmiʿ Sūriyya* (where courses were given in Arabic) from 17 June 1923 until 15 March 1926. Its constitution (*niẓām asāsī*) was recognised officially on 8 May 1928 and published in vol. xii (1932) of the *Madjalla* of the Academy (pp. 765-8); its "house rules" *niẓām dākhilī*) followed on the recognition of the constitution. Constitution and house rules have

subsequently been amended. Administratively, the Academy depends on the Ministry of Education, but it has financial autonomy. In 1960 a fusion took place with the Academy of Arabic Language in Cairo.

Besides the active members (*ʿāmilūn*), whose number is fixed at present at fifteen, there are corresponding members (*murāsilūn*) without a fixed number. All members and the president are elected and then appointed by the head of State. Well-known presidents were Muḥammad Kurd ʿAlī (1876-1953), ʿAbd al-Ḳādir al-Maghribī (1868-1956) and Muṣṭafā al-Shihābī (1893-1968). The president, vice-president and permanent secretary have the direction of the Academy. The Academy has published the *Madjallat al-madjmaʿ al-ʿilmi al-ʿarabī* since Rabīʿ II 1339/January 1921 at first as a monthly and since 1949 as a quarterly. Besides the journal, which has a wide scope of interests, the Academy publishes separate articles and text editions. In addition, it organises lectures (*muḥāḍarāt*) and sends representatives to congresses, etc. abroad. It does not publish special word lists as the Academy in Cairo does. The Academy also administers the *Dār al-Kutub al-ʿArabiyya* (al-Ẓāhiriyya) founded in 1296/1878 in Damascus, the historical Archives and the Museum of Antiquities.

Article One of the constitution of 1928 describes the task of the Academy (*Madjalla*, xii [1932], 765) as being to guard and perfect the Arabic language, and to research into the history of Syria and the Arabic language. The *fuṣḥā* and its principles are to be a starting point and norm, since that is the noble language (*lugha sharīfa*) of the Ḳurʾān and of classical literature, and Arabic is the common patrimony of all Arabs. The aims of the Academy are more specifically:

i. To preserve the language (*al-muḥāfaẓa ʿalā salāmat al-lugha*), in particular from the dialectal language, foreign orthography, archaisms and incoherences;

ii. to protect the purity of the language (*al-muḥāfaẓa ʿalā faṣāḥat al-lugha*) against foreign (*dakhīl*) terms and style figures (*aʿdjāmī*); and

iii. to adapt the language to modern needs.

Bearing these aims in mind, the Academy can be of assistance to authors and translators as far as their use of language is concerned. Unlike the Academy in Cairo, the Academy in Damascus does not consider its decisions with regard to new general scholarly terms to be definite: they are preferences (*tardjīḥāt*) or propositions (*iḳtirāḥāt*) which are submitted to others. The articles in the *Madjalla* are published under the responsibility of their authors, not of the Academy.

Most of the work of the Academy is done in committees (*lidjān*), of which three have been in existence since the beginning: the administrative committee, the linguistic and literary committee (*ladjna lughawiyya adabiyya*), and the scientific and technical committee (*ladjna ʿilmiyya fanniyya*) which has as its task the spreading of science and the arts in Syria. Later, more specialised committees were added: for general principles (*al-uṣūl al-ʿāmma*), for the dictionary (*al-muʿdjam*), for the journal (*al-madjalla*), for the neologisms (*waḍʿ alfāẓ ʿarabiyya djadīda*), and for the dialects (*al-lahadjāt*). The committees work in closed sessions (*djalasāt khāṣṣa*), either according to a plan which is fixed at the annual meeting of the Academy, or in response to a particular problem. As an example of the latter, one could mention the project to enquire about words which are not found in the great Arabic dictionaries (*al-kalimāt ghayr al-ḳāmūsiyya*). Representatives of particular professions and groups can be consulted by the committees. Once a year, there is an annual general meeting, with both closed (*djalasāt ʿamal khāssa*) and plenary (*djalasāt ʿamal ʿāmma*) sessions where all members meet together with notable figures (*al-aʿyān*) and men of letters (*al-udabāʾ*). In 1960 the name of the *Madjalla* became *Madjallat madjmaʿ al-ʿarabiyya—Madjallat al-madjmaʿ al-ʿarabī sābiḳan*.

As to the work which has already been done, Rachad Hamzaoui characterises the attitude of the Academy as trying to maintain the status quo, while introducing reforms where needed. Subjects which have been treated include questions of orthography; (simplification of) grammar; and the banishing of dialectal Arabic. Important work has been performed on modernising the Arabic vocabulary by means of *istinbāṭ* (resurgence of pure ancient Arabic words), *ishtiḳāḳ* (derivation by means of *ḳiyās* or analogy conforming to given *awzān* or schemes), *naḥt* (composition of words) and *taʿrīb* (borrowing from foreign languages), in this order of precedence. No definite solutions have been offered for the problems of orthography, grammar and dialectal Arabic. The fact that the *fuṣḥā* was taken as norm could not but restrict in advance the possibilities and means of the modernisation of language as it was striven after.

(b) *Egypt*. On the initiative of King Fuʾād I and the Senate (*Madjlis al-Shuyūkh*), the Minister of Education in 1928 requested that three reports be submitted by Luṭfī al-Sayyid, Aḥmad Ḥāfiẓ ʿAwaḍ and ʿAbd al-ʿAzīz al-Bishrī concerning the creation of an official Academy, and this led to its foundation in 1932. This was accelerated by a previous suggestion made by King Fayṣal I of ʿIrāḳ (1883-1933)—who had already established the Academy of Damascus in 1919—presented by Nūrī al-Saʿīd to the Islamic Congress held in Jerusalem in December 1931, to establish an Islamic University in Jerusalem as well as an Academy of the Arabic Language in Cairo. The *Madjmaʿ al-lugha al-ʿarabiyya al-malakī* was then founded independently by a royal Decree of 14 Shaʿbān 1351/13 December 1932, when Muḥammad ʿĪsā Pasha was Minister of Education in the cabinet of Ismāʿīl Ṣidḳī Pasha, which had been in power since the promulgation of the Constitution of 22 October 1930. The text of the constitution of the *madjmaʿ* which was promulgated was modelled on the Académie Française, dating from 1629. Its specific tasks included guarding the integrity of the Arabic language and adapting it to the needs of present-day life. In order to achieve these aims, the Academy was to compose dictionaries and word lists, compile a historical dictionary of the Arabic language, carry out studies on Arabic semantics and study modern Arabic dialects in Egypt and other Arab countries. The Academy was also to treat all those subjects which the Minister of Education submitted to it with the aim of developing the Arabic language. There would be twenty active members on an international basis. The first active members would be nominated directly by the King. Subsequently new members would be elected and then nominated by royal decree, or by decree of the head of state. In addition to the active members, there would be corresponding members. The president of the Academy was to be selected by the Minister of Education from a list of three names chosen by a majority of the members, and then nominated by decree of the head of state.

A royal decree of 16 Djumādā II/6 October 1933 appointed the first twenty members: ten Egyptians, among them three Azharites, one Christian and one Jewish scholar, five European orientalists and five scholars from other Arab countries. Some opposition came from religious and conservative circles, and in particular, the presence of five orientalists on the list gave rise to fervent discussions. In the press, protests were made against both the methods and the results of the work of the *mustashriḳūn* with regard to the Arab-Muslim world; they were also thought to be collaborating with Christian missionaries against whose activities in Egypt a press campaign was carried out. As a result, A. J. Wensinck (1882-1939) was replaced as a member by E. Littmann (1875-1958). Authors like Muḥammad Farīd Wadjdī (*Nūr al-islām*, iv [1352 A.H.], 599-607) attacked Wensinck because of his articles on Ibrāhīm and the Kaʿba in *EI*[1] (cf. OM, xiii [1933], 594-5). Besides orientalists, Egyptian scholars like Ṭāhā Ḥusayn and ʿAlī ʿAbd al-Rāziḳ, who had opposed traditional conceptions of language, culture and religion, were also attacked. Seen in a wider perspective, attacks on orientalists reflect a zeal for total arabisation; though their vast knowledge was recognised, they were not seen as being loyal to the cause of Arabic language and culture and Arab self-affirmation in general during the period concerned. Such attacks notwithstanding, within the Academy the European orientalists—A. Fischer (1865-1949), H.A.R. Gibb (1895-1971), E. Littmann (1875-1958), L. Massignon (1883-1962) and C. A. Nallino (1872-1938)—worked together successfully with the arabophone scholars, although from 1962 onwards non-Arabs could only be corresponding members of the Academy.

The first session of the *Madjmaʿ* took place on 14 Shawwāl 1352/30 January 1934, after which the "house rules" were established and the chief officials were chosen. Presidents were successively Muḥammad Tawfīḳ Rifʿat Pasha from 1934 until 1944, Luṭfī al-Sayyid from 1945 until 1963, and Ṭāhā Ḥusayn as his successor until 1973. Permanent secretaries of the Academy were Manṣūr Fahmī (1886-1959) from 1934 until 1959, and Ibrāhīm Madkūr (b. 1902) from 1960 onwards. The administration is carried out by an administrative director (*al-murāḳib al-idārī*). After 1938, the name of the Academy was *Madjmaʿ Fuʾād al-Awwal li 'l-lugha al-ʿarabiyya*. In 1955, this was changed officially into *Madjmaʿ al-lugha al-ʿarabiyya*. As a result of the Egyptian-Syrian union of 1958, the two Academies of Cairo and Damascus were joined together in 1960. Their new constitution gave internal autonomy, a moral personality (*shakhṣiyya iʿtibāriyya*) and an autonomous budget to the Academy; the Minister of Education, however, became then the supreme president (*al-raʾīs al-aʿlā*) of the Academy. Its aims were extended toward unifying scientific terms in Arabic, reviving the Arab heritage of learning and stressing its links with the other cultural heritages of mankind, furthering the development of the language in general and in particular its orthography, and simplifying its grammar. The conclusions reached by the Academy should be applied and brought into practice by the Ministry of Education. Later, the Minister of Culture became Honorary President of the Academy. The number of its members rose to 60: 40 Egyptians and 20 representatives of other Arab countries. Apart from its committee meetings, the *Madjmaʿ* holds a weekly meeting for its Egyptian members and an annual conference which is also attended by corresponding members from elsewhere. Whereas the first generation of Academicians consisted of men of a broad culture in language and literature, following generations tended to be more specialised in particular fields such as the sciences, mathematics, law, medicine, *sharīʿa*, history, geography and psychology. As a result, later decisions taken by the Academy could imply more radical innovations. Besides the great general meetings, a *madjlis al-madjmaʿ* was established to carry out the decisions of the Academy and to divide the work to be done among the committees. The two Academies of Cairo and Damascus received a permanent secretariat in Cairo, *al-maktab al-dāʾim*. Notwithstanding the fact that the Académie Française is the model for the Egyptian Academy, there are some interesting differences: the Egyptian *Madjmāʿ*'s pan-Arab and also international character, its annual meetings, and its functioning as an Academy not only of language but also of arts and sciences make it comparable to the Institut de France. Its stress on the *fuṣḥā* implies that classical Arab humanism, as transmitted by the pure Arabic language, should be conserved.

Most of the actual work is done by special committees: of finances (*ladjnat al-māliyya*), of general principles (*l. al-uṣūl al-ʿāmma*), of mathematics (*l. al-riyāḍiyyāt*), of physical and chemical sciences (*l. al-ʿulūm al-ṭabīʿiyya wa 'l-kimiyya*), of biology and medicine (*l. ʿulūm al-ḥayāt wa 'l-ṭibb*), of social sciences (*l. al-ʿulūm al-idjtimāʿiyya*), of letters and arts (*l. al-ādāb wa 'l-funūn*), of the dictionary (*l. al-muʿdjam*), of the dialects (*l. al-lahadjāt*), of the journal (*l. al-madjalla*) and of the library (*l. khizānat al-kutub*). In their sessions, specialists in various fields can be invited as experts whenever the Academicians are not sufficiently competent. As the number of specialisations has grown, the number of committees has increased and sub-committees have been founded where needed, as well as technical committees. The committees submit annual reports to the President of the Academy; they should keep moreover records of their meetings (*maḥāḍir al-djalasāt*). The conclusions of the committees are provisional until they have been presented to and adopted by the general meeting of the *Madjmaʿ*. Members can publish their work outside the responsibility of their committee or of the Academy; a special part of the *Madjalla* is reserved for this purpose. The Minister of Education has always been very much alert as to the consequences of the decisions taken by the *Madjmaʿ* for schoolbooks.

Special mention should be made of the precious collection of cards (*djuzāzāt*) which have been prepared for the historical dictionary and for the dictionary of technical and scientific terms. Massignon used to lay great stress on this project and the need for a correct organisation of the cards, but it took some time before the system was introduced. August Fischer, whose project of a historical dictionary of the Arabic language was officially accepted by the Academy in 1938, made some 100,000 cards of his private collection available, which were transported from Leipzig to Cairo, but were neglected after his death in 1949. The cards for the scientific dictionary and for the historical dictionary have been differently organised; they have been placed in rooms not accessible for the public, and apparently they have been filled out only partially. In 1948 an office of registration (*maktab al-tasdjīl*) was established with the task of classifying all terms accepted by the Academy.

The Academy has acted as patron for certain works and book publications, and it has given awards to certain manuscripts of quality which could be published as a consequence. The Academy has an international audience and is represented at international conferences dealing with the Arabic language. It has contributed to the organisation of the Union of Arab Academies and to that of the Arab Scientific Union.

In its efforts to adapt the Arabic language to the demands and needs of modern times, it has paid attention primarily to problems of vocabulary and, in particular, to the creation of neologisms. Studies of grammar and especially of morphology serve in part to facilitate this work and to contribute to the making of modern dictionaries. Compared with this, studies on orthography, phonetics, dialects, syntax and stylistics have been less prominent. Work has concentrated on semantics and the grammar of the *fuṣḥā*; the more conservative members have always tended to defend at all costs the integrity and purity of the language. Members try to avoid an accumulation of synonyms. The rule has been established to prefer whenever possible one term to two or more if a neologism has to be made, or otherwise—if it is not possible to find one Arabic term—to proceed by means of a literal translation of the foreign term. Another rule is to study anything which could simplify Arabic writing as well as the rules of syntax and morphology. In particular, the Ministry of Education stresses the need for simplification of grammar. The interest taken in dialect studies derives from the desire better to know the *fuṣḥā*, so that a decision can be taken about the integration of the dialectal Arabic. Attention has been given to the transliteration of foreign words, starting with geographical names. Throughout the discussions, the history of Arabic grammar, the place of the Ḳurʾān as a norm for the Arabic language, and the role of linguistic norms as such, have come up again and again. Although some attempts have been made to propose a simplification of orthography for the purpose of printing, problems of writing and orthography, like those of phonetics, have hardly been dealt with. Most important has been lexicography (*al-muʿdjamiyyāt*) and the technical procedure of composing dictionaries; this has entailed, besides the creation of neologisms, the evaluation of data of classical lexicography. Through its discussions since 1934 the *Madjmaʿ* has established a sort of linguistic *idjmāʿ* for Arabic, though the discussions themselves have taken place in a non-systematic way.

In the conclusion of his study about the *Madjmaʿ al-lugha al-ʿarabiyya*, R. Hamzaoui observes two features by which it distinguishes itself from other academies. In contrast to the Academies of Damascus and Baghdād, it concentrates completely on the Arabic language, and in its decision-making it tries to arrive at a linguistic *idjmaʿ* of its members before giving any authoritative statement. As in the Academy of Damascus, the work of the Academy of Cairo takes its departure from the *fuṣḥā* and aims to ensure a cultural and linguistic continuity from the beginning of Arabic literature until the present day. This often leads to a purist stand, seeking to defend the *ʿarabiyya* against encroachments by foreign languages, in particular modern western ones. This approach to the modernisation of the Arabic language and of Arabic culture in general leads to compromise solutions and the rejection of any radical solutions which may be proposed.

Among the major publications of the *Madjmaʿ al-lugha al-ʿarabiyya* are *al-Muʿdjam al-wasīṭ* (2 vols., Cairo 1960-1) and *Muʿdjam alfāẓ al-Ḳurʾān* (3 vols., Cairo 1953) as dictionaries; five volumes of *Maḥāḍir al-djalasāt* (1936-48), four volumes of the subsequent *al-Buḥūth wa 'l-muḥāḍarāt* (1959-62) as reports on the work being done and papers read by Academicians; the *Madjmūʿat al-muṣṭalaḥāt al-ʿilmiyya wa 'l-fanniyya*, of which eight volumes appeared between 1959 and 1968, and specialised listings of neologisms created by the Academy for particular fields; finally, the *Madjallat madjmaʿ al-lugha al-ʿarabiyya* from 1934 onward as the regular journal of the Academy. One special volume was published of *al-Muʿdjam al-lughawī al-taʾrīkhī* (*Ḥarf al-hamza ilā abad*), the project of the historical dictionary initiated by August Fischer but later abandoned (Cairo 1387/1967, 53 pp.). Two specimen volumes were published of the great *al-Muʿdjam al-lughawī al-kabīr* meant to be an Arabic *Larousse Encyclopédique*: *Ḥarf al-hamza—akhi* (Cairo 1956, 519 pp.), and *Mawādd min ḥarf al-hamza* (Cairo 1381-2/1962-3, 155 pp. in typescript). Several studies on the Cairo Academy have been published, as is shown in the *Bibliography* below.

(c) *ʿIrāḳ*. The history of *al-Madjmaʿ al-ʿIlmī al-ʿIrāḳī* goes back to 1945 when a *ladjnat al-taʾlīf wa 'l-tardjama wa 'l-nashr* was established in the Ministry of Education in order to expand the sphere of scientific activities in ʿIrāḳ and to keep up with such activities in the more developed countries. Due to the initiative of Muḥammad Riḍā al-Shabībī and his collaborators, amongst them Fāḍil al-Djamālī, *al-Madjmaʿ al-ʿIlmī al-ʿIrāḳī* was founded by the government in 1947 and organised by the Ministry of Education. Its aims were more far-reaching than those of the preceding Committee as mentioned in Article 2 of the Regulations of the Iraq Academy (no. 62, 26 November 1947): *Madjalla*, i [1950], 10):

(i) to maintain the purity of the Arabic Language and seek to adapt it to the demands of the arts and sciences, and of the affairs of modern life;

(ii) to undertake research and writing in the fields of Arabic literature, the history of the Arabs, the history of the peoples of ʿIrāḳ, their languages, sciences, and civilisation;

(iii) to study the part played by the peoples of Islam in the propagation of Arabic culture;

(iv) to maintain in safe-keeping rare Arabic manuscripts and documents, and revive them by publishing them according to the latest scientific methods; and

(v) to undertake research in the modern arts and sciences, encourage original writing and translation in these fields, and promote the spirit of scientific enquiry in the country.

The *Madjmaʿ* clearly wanted to provide an impetus to the scientific *nahḍa* in ʿIrāḳ, as had been the purpose of the *Madjmaʿ* in Damascus, founded after World War I, for the scientific *nahḍa* in Syria. On 25 June 1949 (no. 40), ten Articles were promulgated as an Amendment to the Regulations. The first meeting of the *Madjmaʿ* was held on 12 January 1948 and up to 30 June 1950, 66 sessions were held as well as 150 committee sessions. At this stage, there were ten active members, all ʿIrāḳīs. At the beginning of 1949, the *Madjmaʿ* was considered to be a government body, and since by law the accumulation of ministrial or parliamentary functions with any other state positions was forbidden, several members had to leave the Academy; later that year Fāḍil al-Djamālī and Mattā ʿAḳrāwī left ʿIrāḳ on official duty and had to be replaced by

others, though they remained honorary members of the Academy. At this stage also, 28 corresponding members were elected, both among ʿIrāḳī and among Egyptian, Syrian and Lebanese scholars; four western orientalists also became corresponding members, A. Guillaume, H. A. R. Gibb, W. Marçais and L. Massignon.

The activities of the Academy in Baghdād consisted from the beginning both of purely internal activities and of activities directed towards the outside world: giving public lectures, bringing about publications, allocating funds in order to support the publication of books and awarding prizes for essays on particular subjects fixed by the Academy. Since 1950 it has published the *Madjallat al-madjmaʿ al-ʿilmī al-ʿirāḳī* on a yearly basis, to which Academicians and other scholars have contributed on a number of scholarly subjects. The public lectures organised by the Academy may be published in its *Madjalla* or separately. Each issue also contains a number of book reviews. In 1950 the Academy was able to acquire a printing-press. In its internal sessions, the Academy has established a number of new scientific and technical terms which are published in part in the *Madjalla* and in part on separate lists sent to various Ministries at their request. It should be noted that ʿIrāḳ during the early years did not yet possess a university, the University of Baghdād being established only in 1958. Well-known Presidents of the Academy have been Munīr al-Ḳāḍī as from 1949 onwards, Muḥammad Riḍā al-Shabībī from 1958 onwards, and ʿAbd al-Razzāḳ Muḥyī al-Dīn since the later sixties, Yūsuf ʿIzz al-Dīn being its permanent secretary since that time. The Law no. 49 of 1963 introduced certain changes in the Regulations of the Academy.

The Academy has continued to hold its regular sessions and committee meetings and also to give financial assistance to the publishing of books and to acquire books for its library as well as microfilms of manuscripts. In 1970 the library counted some 25,000 books, more than 300 periodicals and some 400 manuscripts on microfilm. It had developed a card-index system, assigned prizes to winners of poetry festivals and participated in inter-Arab conferences on cultural subjects. The Academy also gave its opinion on cultural treaties which ʿIrāḳ was concluding with other countries. The Academy was liberal in giving its publications to numerous official institutions and personalities in the country and abroad; it gave assistance to students and scholars, photographed manuscripts from public and private libraries. Members participated in Committees for the Protection of Monuments, for a Translation Programme, etc. At present the Academy has active members (not exceeding fifteen ʿIrāḳī scholars), associate members, honorary members and corresponding members, the last two categories including both ʿIrāḳī and other nationalities.

(d) *Morocco.* Although not a *madjmaʿ* in the formal sense of the word, a similar institution in Rabat may be mentioned. After the first International Congress on Arabisation held in Rabat in 1961, a Bureau Permanent de l'Arabisation was established in Rabat and recognised by the League of Arab States in 1968. Subsequently, this became the Bureau de Coordination de l'Arabisation de la Ligue des États Arabes à Rabat, which was integrated in the ALESCO (Arab League, on the pattern of a regional UNESCO) in 1971, its definite regulations being established in 1973. Since 1964 this Bureau has published *al-Lisān al-ʿarabī*, with lists of neologisms and further articles of linguistic interest; it also publishes specialised listings of terms in particular fields with the Arabic, French and English equivalents. The members of the Bureau participate in meetings of the Academies in Damascus, Cairo and Baghdād. In its work on the modernisation of the Arabic language, the Bureau de Coordination de l'Arabisation de la Ligue des États Arabes follows less conservative lines than the established Academies and appears to work more efficiently. Finally it should be noted that by a *ẓahīr* (dahir) of 24 Shawwāl 1397/8 October 1977, the king of Morocco created a royal academy (*al-Akādimiya al-malakiyya*), which consists of 60 members, 30 of which have the Moroccan nationality while 30 are foreign correspondents. The statutes of the academy have been published in *al-Baḥth al-ʿilmī*, xxviii (1398/1978), 125-44.

A Union of Arab Academies was founded in Cairo on 30 March 1957, by Decree no. 1329.

(ii) IRAN

The establishment of the first Iranian language academy (*Farhangistān-i zabān-i Īrān*) resulted from developments representing two separate but related types of concerns, both stemming from the advent of modernisation in the early 19th century, and resulting in the double nature of the activities of the two academies. These two sets of developments were: (a) the desire for purifying Persian from the foreign (mostly

Arabic) words, and (b) the need for new words created by the introduction of new concepts (technical and general). The history of the language academies and related events can be divided into five periods:

(1) Historical background (up to 1921).
(2) The immediate setting (1921-35).
(3) The first *Farhangistān* (1935-41).
(4) Between the two *Farhangistāns* (1941-70).
(5) The second *Farhangistān* (1970-).

(1) *Historical background* (*up to 1921*). Attempts to write in a Persian devoid of Arabic words go as far back as at least the 4th/10th century. In recent times, the opposition to foreign words was triggered by nationalism, and was strengthened by the relative loss of the status of Arabic as part of the educational curriculum. The first manifestation of this opposition in recent times appeared in the 19th century, when a number of writers and poets wrote in *Fārsī-yi sara* "pure Persian", and some of them promoted it through research on the subject. These efforts continued, and became increasingly more extensive as time went on. During the same century, a new factor was introduced by the need for words to designate concepts brought in by modernisation in ever-increasing numbers. When the two factors overlapped, a three-sided debate developed: Should the new concepts be called (1) by their European names; or (2) by Arabic names (already in use in the Arabic-speaking countries or Ottoman Turkey, or to be coined in Iran itself); or (3) by native Persian words (existing or to be coined)? In practice, (1) was used most often, and (3) least often, especially at the earlier stages. In addition, a number of loan translations were introduced.

(2) *The immediate setting* (*1921-1935*). Riḍā Shāh Pahlawī took over the government in 1921, and became king in 1925. Because of the encouragement of nationalism by the new régime, and the emphasis on the glories of ancient Iran, the debate on the foreign elements in Persian gained greater prominence. Opposition to loanwords grew and became more serious as their numbers increased. The debate spread to newspapers and journals. The government, and several of its agencies, also became involved, issuing public orders as well as internal memoranda, forbidding the use of European words and names, and even ordering that Persian writings on store signs should be made more prominent than anything in foreign scripts. Foreign words were considered "worse than a foreign army", their use a "literary disaster". The subject came up in parliamentary debates, and Riḍā Shah himself took a direct personal interest.

Riḍā Shāh launched a series of reforms, mostly in the outward aspects of life, and practically all conducive to the importation of Western objects and Western institutions. This resulted in a greater need for new words. The need for coining new terms, often in combination with the interest in purification, led to the formation of a number of groups, which differed in longevity, efficiency, and their impact on the language. The first such group seems to have been the *Andjuman-i ʿIlmī* (Scientific Society), formed in the 1920s. In November 1924, the Ministry of War, in consultation with the Ministry of Education, formed a group made up of several high-ranking officers from the *Shūrā-yi ʿĀlī-yi Niẓām* (Supreme Military Council), as well as civilians from both ministries, charged with coining military terms. The words *hawāpaymā* "airplane", *khalabān* "pilot", *furūdgāh* "airport", and others adopted by the group are now well-established in the language.

There were other groups. The longest-lived and best-organised was the *Andjuman-i Waḍʿ-i Lughāt wa Iṣṭilāḥāt-i ʿIlmī* (The Committee for Coining Scientific Terms), founded by Dr. ʿĪsā Ṣadīḳ at the *Dār al-Muʿallimīn-i ʿĀlī* (National Teachers' College), since renamed as *Dānishsarā-yi ʿĀlī*, of which he had just been appointed dean. This student committee, under a faculty sponsor, adopted a constitution, with a set of principles and guidelines. Active from February-March 1933 to September-October 1940, it adopted about 3,000 terms in all, of which some 400 are said to have become fully-accepted. This committee continued its work even after the establishment of the first *Farhangistān*.

In 1935, the Ministry of Education founded the *Ākādimī-yi Ṭibbī* (Medical Academy), whose membership was made up of a number of well-known physicians and scholars. The group passed a constitution which listed 10 types of activities for itself, including the coining of medical terms. It was this group which adopted the word *farhangistān* for "academy". (*Farhang*, originally meaning "politeness, knowledge, education", etc., and also "dictionary". In recent decades, it has come to be used also in the sense of "culture", and in the 1930s it replaced the Arabic *Maʿārif* in the name of the "Ministry of Education". More recently, in the name of the newly-founded "Ministry of Culture", it has been used in the sense of "culture", and the compound *Āmūzish wa Parwarish* has replaced it in the name of the "Ministry of Education".)

(3) *The first Farhangistān* (*1935-41*). By 1934, the efforts to purify Persian of its foreign element had acquired the proportions of a movement. Starting mostly in some periodicals, it soon spread to the various government offices, and to a major department of the Madjlis. A widespread hunt was on for "pure" Persian words to replace many common Arabic words. The words were found in dictionaries as well as other sources, including the *Shāh-nāma*. Articles written in *Fārsī-yi sara* were accompanied by glossaries, without which readers would have been at a loss, but nevertheless correspondence in this style was often unintelligible. Difficulties often arose in intra-governmental communication, since each person felt free to use "pure" Persian words which he had found, and there was little or no common ground among the many enthusiasts.

Riḍā Shāh Pahlawī visited Turkey in 1934, where a movement for purifying Turkish from Arabic and Persian words was afoot, supported by the government of Kemal Atatürk, on whose order the Turkish Linguistic Society had been founded on 12 July 1932 (see section 3. below). Upon Riḍā Shāh's return to Iran, approached by a number of purification supporters, he ordered a committee to be selected in the Ministry of War to adopt Persian equivalents for military terms. The Army Staff had already adopted native Persian equivalents for a large number of military terms, which had been reported to the king and put in use. These included the words *afsar* "officer" and *artish* "army", both now established terms (and both objectionable from the etymological point of view).

The Ministry of Education, which was opposed to the movement, tried to subvert the new committee. Within a few hours after the committee's first meeting, Prime Minister Muḥammad ʿAlī Furūghī, an experienced politician and a respected scholar, and unsympathetic to the cause of purification, recruited for the task by the equally unsympathetic Ministry of Education, suggested to the king that

a group of scholars be commissioned to study the matter, and to prepare the way for the establishment of an academy (*farhangistān*).

The idea of establishing a language academy was not entirely new. In 1903, the government decided to establish a *Madjlis-i Ākādimī*, which, however, did not last long. One of its coinages was *rāh-i āhan* "railway", a translation of French *chemin de fer*, now a well-established part of Persian vocabulary. The idea continued to come up from time to time, until Furūghī was permitted by the Shah to found an academy. Furūghī charged ʿĪsā Ṣadīḳ with preparing a plan for an academy. He drafted a constitution, based in part on that of the Académie Française. After some changes, it was approved by the Council of Ministeries on 19 May 1935, and sent to the Ministry of Education on 26 May 1935 for action.

Article II of the constitution specifies the responsibilities of the *Farhangistān* in twelve items. Items 1, 2, 4-7, deal with collecting, adopting, and coining words. Items 8-11 concern literature. Item 12 calls for "inquiry into the reform of the Persian script". References to purification of Persian are mild, and almost casual: Item 2 states that the words to be chosen "in all domains of life" should be Persian "as much as possible". Item 3 states the responsibilities of the *Farhangistān* as "pruning (*pīrāstan*) from the Persian language inappropriate foreign words".

The *Farhangistān* held its first meeting on 2 June 1935, chaired by Furūghī. Other ordinary (*paywasta*) members present included Muḥammad Taḳī Bahār [*q.v.*], ʿAlī Akbar Dihkhudā [*q.v.* in Suppl.], Abu 'l-Ḥasan Furūghi, Badīʿ al-Zamān (Furūzānfar), Ḥusayn Gulgulāb, ʿAlī Asghar Ḥikmat, Maḥmūd Ḥisābī, Saʿīd Nafīsī, ʿAbd al-ʿAẓīm Ḳarīb, Ghulam Riḍā Rashīd-Yāsimī, ʿĪsā Ṣādiḳ, Ṣādiḳ Riḍāzāda Shafaḳ, Ḥusayn Samīʿī, Ḥasan Wuthūḳ, and others. Among members added later were Ibrāhīm Pūr-Dāwūd, ʿAlī Akbar Siyāsī, ʿAbbās Iḳbāl Āshtiyānī, Muḥammad Ḥidjāzī, Muḥammad Ḳazwīnī, Aḥmad Bahmanyār and Djalāl al-Dīn Humāʾī. Among the associate (*wābasta*) members elected at various times were the Iranian novelist Sayyid Muḥammad ʿAlī Djamālzāda, and a number of foreigners, including Professors A. Christensen (Denmark), Henri Massé (France), Jan Rypka (Czechoslovakia) and Muḥammad Ḥasan Haykal (Egypt).

The *Farhangistān* adopted its internal by-laws on 4 August 1935, and later slightly modified them. Other by-laws were adopted later. The internal by-laws called for the establishment of seven committees. Although the designations of these committees, and the description of the tasks of the *Farhangistān* found in its constitution, set down a wide variety of tasks for it, in practice it spent all of its time and energy in adopting Persian words to replace foreign words.

According to its constitution, the officers of the *Farhangistān* consisted of a president, to be appointed by the king, and two vice-presidents and two secretaries elected for two years by a majority of the ordinary members. The first president was Premier Furūghī. He resigned as premier a few months later and after that did not attend its meetings. In March-April 1936, Ḥasan Wuthūḳ succeeded him.

Riḍā Shāh was dissatisfied with the speed with which the *Farhangistān* was progressing, and ordered it to be reorganised. This reorganisation took place on 28 April 1938. Several new members were added; and three members, including Wuthūḳ and Dihkhudā, were removed. The presidency of the *Farhangistān* was henceforth to be given to the Minister of Education. The first president under the new system was ʿAlī Asghar Ḥikmat. He was succeeded by Ismāʿīl Mirʾāt three months later. Mirʾāt's presidency lasted until September 1941. The committee structure also was changed. Of a total of eight committees, five were charged with coining terms. The work of the *Farhangistān* was now practically restricted, both officially and in fact, to the coining of terms.

Not everyone was in sympathy with the aims and the activities of the *Farhangistān*. Indeed, its founder, Furūghī, himself apparently became involved in it more to keep those whom he considered extremists from controlling it than to help the purification movement. In fact, in a public lecture he gave a few months after the *Farhangistān* began work, he tried to correct what he considered mistaken ideas about the organisation's work; e.g. the idea that it was a "word-manufacturing plant", and that its raison d'être was "purging Persian of Arabic words completely". In March-April 1937, the *Farhangistān* published an expanded version of this lecture under the title *Piyām ba-Farhangistān* ["Message to the *Farhangistān*"]. Throughout this message, he stressed the importance of Arabic for Persian, and preached moderation in the attempts to purify Persian, and patience in introducing new Persian words and reviving old ones.

The first *Farhangistān* was active for little more than six years (though it continued to exist on paper until *ca.* 1956). During this time, it invented, revived and adopted over 2,400 words. These words were widely circulated in the press and in book form. The largest number of the words were technical terms in banking, medicine, zoology, arithmetic, geology, physics, botany, geometry, and government. In addition, it adopted Persian equivalents for some 200 Arabic expressions used in Persian; e.g. *nawsāz* for *djadīd al-iḥdāth* "newly built". It also changed some place names, mostly from Arabic or Turkish to Persian; e.g. Muḥammara was changed to Khurramshahr, Anzalī to Pahlawī. In their forms, the words adopted by the *Farhangistān* fall into several categories: (a) simple words; *angal* "parasite"; (b) compounds, e.g. *pāyān-nāma* (from *pāyān* "end" + *nāma* "letter") "thesis, dissertation (for a college or university degree)"; (c) words made with affixes, e.g. *dādgāh* (from *dād* "justice" + *-gāh*, a suffix of place) "court"; *bāzdāsht* (from *bāz-*, a prefix comparable to the English prefix *re-* + *dāsht*, past stem of the verb "to have") "detention". A few of the *Farhangistān* words were European loanwords; e.g. *mīn* "mine" from French *mine*. Most of them, however, were made up of native Persian elements, and can be classified in several categories: (a) old words revived, e.g. *pizishk* "physician"; (b) old words given new or specialised meanings, e.g. *dāwar* (originally "judge") "arbitrator", *arz* ("value") "[foreign] exchange"; (c) assignment of different meanings to members of a doublet (or triplet, etc.), i.e. the different phonological forms of what was historically a single word, e.g. *āgāhī* "secret police": *āgahī* "advertisement"; (d) differentiation of meaning among a set of synonyms or near-synonyms, as in the geological terms *dawr* "epoch"; *dawra* "period"; *dawrān* "era"; *rūzgār* "age"; (e) in a few instances (mostly in place names), a slight change in the form of an existing word making it more Persian in appearance, e.g. from *ḳaranṭīna* to *ḳarantīn* "quarantine", from *ziyārāt* (orig. Arabic "pilgrimage") to *Ziyār* (an obsolete Persian masculine name); (f) in a few cases, Persianising the spelling of a word, mostly in place names,

e.g. from *ṭūfān* to *tūfān* 'storm', from Ṭihrān to Tihrān. Some *Farhangistān* words were loan-translations. There were three types of these: (a) a simple Persian word given a new (additional) meaning on the model of a foreign word, e.g. *čang*, meaning "clutch" given the additional meaning of "clutch" of a car; (b) a compound Persian word formed on the model of a foreign compound and given the meaning of that compound, e.g. *nakhust wazīr* "prime minister", modelled on the English *prime minister*; and the river named Siyāh Āb, from the Turkish Ḳara Sū, literally "Black Water"; (c) a word made with an affix in similar fashion, e.g. *bī-nām* "limited company", modelled on the French *anonyme*.

Many *Farhangistān* words have never been commonly accepted; e.g. *anbāra* "accumulator" (in physics), *bihindjār* "normal", *pūshina* "capsule". Some words, however, have clearly come into common use: terms dealing with governmental administration (including names of the various ministries, departments, etc.); names of cities and towns; and a few scientific terms.

A number of words coined by the *Farhangistān*, presumably from native Persian elements, are questionable, or clearly wrong from the points of view of semantics, grammar or etymological history, as pointed out by several scholars. Thus *ashkūb* "floor (of a building)" is Aramaic; *khāwar* "east" was used by classical writers in the sense of "west" as well as "east"; *dastgīr kardan* was chosen for "to capture, arrest", its derivative *dastgīrī* for "municipal assistance".All in all, some of the words coined by the *Farhangistān* show imprecision, unfamiliarity with, or disregard of, Persian grammatical rules, especially rules of word formation, and an absence of consistent principles and methods.

The *Farhangistān*'s words created problems for the people, partly because of the large numbers of new words introduced at short intervals, partly because they were not always fully explained, partly because of the inherent difficulty of substituting new (and often unfamiliar) words for those well-established in the language through centuries of use. Sometimes the new words were misused.

(4) *Between the two Farhangistāns* (1941-70). During the Second World War, Riḍā Shāh Pahlawī abdicated in September 1941, three weeks after Iran was occupied by the British and Russian forces. With the support of the powerful ruler removed, the *Farhangistān* lost its vigour. Its opponents now became active, denouncing it openly in the press. The *Farhangistān* reconsidered some of those of its adopted words to which objections had been made. The Ministry of Education issued a memorandum authorising the return to traditional mathematical terms which had been replaced with newly-coined words in school books.

After the occupation, Furūghī once again became the President of the *Farhangistān* in December 1941 or January 1942. He died on 26 November 1942, and the presidency went to Ḥusayn Samīʿī, Adīb al-Salṭana. After his death in January-February 1954, no successor was appointed to the presidency. The *Farhangistān* ceased to exist even on paper, despite continued occasional attempts to revive it. In the meantime, the need for new terms grew because of expanding education, increased translation activity, etc. After a time, a number of groups were organised was henceforth to be given to the Minister of Educa- for the purpose, but most were short-lived and non-productive.

The inactivity and later disappearance of the *Farhangistān* did not for long weaken the movement for purification. After Riḍā Shāh, the debate on purification was revived, with the opponents once again becoming active and vociferous. They included ʿAbbās Iḳbāl Āshtiyānī and Waḥīd Dastgirdī, whose journals, *Yādgār* and *Armaghān* respectively, published attacks on the *Farhangistān*. The major spokesman for the opposition was Sayyid Ḥasan Taḳīzāda [*q.v.*]. The chief advocate of language *reform*—not the same as *purification*—was Sayyid Aḥmad Kasrawī [*q.v.*], who, however, disagreed with the majority of the proponents of purification. Both of these men became active in this area during Riḍā Shāh's reign. They exerted their greatest influence after his abdication, however, and for this reason it is appropriate and convenient to discuss them at this point. Sayyid Ḥasan Taḳīzāda was a well-known, widely respected, influential politician, diplomat, and scholar. In 1935, he had attacked purification in an article published in the journal of the Ministry of Education. His reference to "the intervention of the sword in the work of the pen" as being "contrary to the taste and dignity of Iranians" was taken as an insult to the Shah, and the article was cut out of the issue and replaced. This paper was reprinted in 1942. On 24 February 1948, he gave a lengthy lecture entitled *Luzūm-i ḥifẓ-i Fārsī-yi faṣīḥ* ("The necessity of preserving eloquent Persian") at the *Dānishsarā-yi ʿĀlī* (National Teachers' College) in Tehran. Almost three-quarters of it is given to the question of Arabic words in Persian. Among the points he made were that many Arabic words in Persian had been "naturalised"; that expulsion of Arabic loanwords was a "malicious attempt on the Persian language and Iranian nationality" and would impoverish the language; that purifying Persian would gradually cut off Iranians from the neighbouring Muslim nations; that Arabic was an extremely rich language; that words for new concepts should preferably be borrowed from "the more familiar, easier Arabic words common in Egypt and Syria or . . . those common in old Persian books". Finally, he believed that choice of new words should be left to writers, and that "legal and coercive force must not enter it".

The major proponents of purification since the discussion grew serious in the 1930s included Dhabīḥ Bihrūz (d. 1971); Abu 'l-Ḳāsim Āzād Marāghaʾī (d. 1946); and Aḥmad Kasrawī Tabrīzī (1890-1946). Kasrawī was the most active of the purification advocates, and the most enduring. He was also the most relentless in ignoring the *Farhangistān* and its instructions even in its heyday during Riḍā Shāh's reign.

Kasrawī was a historian, a linguist, and a jurist. In the early 1930s he also became an advocate of far-reaching social change in all areas of culture. It was in close connection with his extensive writings and lectures on Iranian society and its ills that he pursued language reform. Kasrawī believed that, through the centuries, Persian had come to be a language fraught with problems in all its aspects, including grammar and semantics. The foreign element in it was only one problem. On this subject, he disagreed with those who advocated purification on nationalistic grounds, and those who opposed it on religious grounds. He argued that each language should have its independence, and that its borders should not be left open indiscriminately to foreign words, as Persian has for many centuries been left open to Arabic words. He believed that uncontrolled importation of Arabic words into Persian has been more responsible than anything

else for the current decayed state of Persian—both its vocabulary and its grammar; and this decadence has harmful psychological effects on the speakers of Persian. On the Arabic words in Persian, he believed that those Arabic words that were common in Persian, and for which no native Persian equivalents existed any longer should be retained; that, except for scientific terms, no words should be invented, but people's usage should be followed; that needed new words should be coined from Persian materials (by compounding and affixation); that Persian words selected should be correct; that they should be so formed as to make possible the derivation of other words from them; that there is no need to find a Persian equivalent for each and every foreign word, since many of the latter words were superfluous; that each word should have only one meaning; and that each meaning should always be expressed by the same words, thus eliminating synonymy. Furthermore, he repeatedly emphasised that the question of language reform was a scientific matter and that to undertake such a reform was a scientific endeavour, requiring certain qualifications.

Like Taḳīzāda, Kasrawī was opposed to the establishment of an academy. He felt that language reform should come about through the efforts of writers, who should improve their styles, and thus provide models for the people at large. Kasrawī, however, would permit the establishment of an organisation for coining and selecting scientific and technical terms.

(5) *The second Fārhangistān (1970-).* Kasrawī was assassinated in March 1946. For the next twenty years or so, there was a virtual lull in the debate on language purification and reform. The first break in the lull was a lecture by Dr. Muḥammad Muḳaddam of the University of Tehran in December 1963, and an interview with him published in 1966. Muḳaddam believed that Persian was poor in technological and scientific terminology, but was fully equipped to meet its needs; that Persians should not, as was frequently suggested, confine themselves to the language of their literary classics; that, contrary to the suggestion made by many, full use of analogy should be made in the coining of words; that Persian's own resources should be used for the purpose; that the otherwise very simple Persian language has become confused by the Arabic forms in it, resulting in numerous mistakes made even by university students; and that, again contrary to the claim of many, coining new words from Persian resources would not cut off Iranians from other speakers of Persian, since no one was advocating the replacing of Arabic words with Persian in the writings of the past—that, in fact, the other Persian-speaking peoples should welcome the new terms which Iranians would be making available to them.

Soon, discussions of language reform began to appear in the daily press (e.g. *Kayhān*), and in journals, such as *Waḥīd*, *Yaghmā* and *Talāsh*. In 1970, the Ministry of Culture and Art sponsored a conference for discussing the Persian language, held on October 28-30, in Tehran. At the opening session, a message was read from Muḥammad Riḍā Shāh Pahlawī, in which he announced that he had already approved the constitution of the Imperial Foundation for the *Farhangistān*s of Iran, which was to be established. He said that the constitution provided for a *Farhangistān-i zabān-i Īrān* ("Language Academy of Iran"). On the last day of the conference, the Minister of Culture and Art presented the members of that *Farhangistān* to the Shāh: Dr. Ṣādiḳ Riḍāzāda Shafaḳ, Ḥusayn Gulgulāb, Dr. Maḥmud Ḥisābī, Dr. 'Īsā Ṣadīḳ, Dhabīḥ Bihrūz, Djamāl Riḍā'ī, Muḥammad Muḳaddam, Yaḥyā Māhyār-Nawwābī, Muṣṭafā Muḳarrabī, Marshal 'Alī Karīmlū and Ṣādiḳ Kiyā, who was appointed president of the body by imperial order.

In his message, the Shah referred to the old *Farhangistān* and to the new one as an expansion of the old one. Four members of the new one (Gulgulāb, Ṣadīḳ, Ḥisābī and Shafaḳ) had been members of the old one also. Another member, Bihrūz, had served on one of its committees. President Kiyā had for many years been a collaborator with Muḳaddam in language-reform activities.

The new *Farhangistān* differed from the old one in that it was to be one of several such organisations. The *Farhangistān-i Hunar wa Adab* ("Academy of Art and Literature") was founded soon afterward. However, the Language Academy was the main focus, received the greatest financial support, and became very active.

The new body had an elaborate organisation, consisting of a Council, made up of the ordinary members; four *Puzhūhishgāh*s (Research Centres); a library; a phonetic laboratory; and a secretariat. The four *Puzhūhishgāh*s were: (1) *Wāzha-guzīnī* (Adoption of words); (2) *Wāzhahā-yi Fārsī* (Persian words), which was charged with "collecting Persian words and showing the capabilities of this language in making words"; (3) *Zabānhā-yi bāstānī wa miyāna wa guyishhā-yi Īrānī* (Old and Middle [Iranian] languages and Iranian dialects); and (4) *Dastūr-i zabān-i Fārsī* (Persian grammar). The first of these centres has been the most active. It began with 13 groups, each responsible for terms in a specific field or fields. By the end of 1975, they had proposed 30,000 Persian equivalents for some 15,000 foreign words.

One feature of the procedure followed by these groups is the publication of lists of words for which Persian equivalents are being sought, in monographs entitled *Pīshnihad-i shumā čist?* ("What do you propose?"). These monographs are distributed worldwide. The proposals received were to be considered when deciding on new terms, which were to be approved by the Shāh before becoming final.

As far as their forms and etymological histories are concerned, the words adopted by the second *Farhangistān* are by and large similar to those adopted by the first one. Several points are worth mentioning, however: (1) greater and bolder use of affixation and compounding; (2) greater consistency among the various adopted words; (3) greater tendency to revive obsolete or archaic words unknown to the majority of Persian speakers; (4) formation of words from Middle and Old Persian bases; e.g. *pardīz* "park" (cf. Mod. Pers. *firdaws* "paradise", and English paradise, and its cognates in other European languages); *pardīza* "campus" (related to the preceding); and (5) insistence on replacing some quite common words; e.g. *mihrāz* for *mi'mār* "architect"; *dāwkhwāh* for *dāwṭalab* "candidate"; *farhikhtārī* for *farhang*, *āmuzish-wa-parwarish* for *ta'lim-wa-tarbiyat* 'education'; *pargīr* for *muḥīṭ* and *pīrāmūn* "environment"; etc.

Conclusion

A brief comparison between the old and the new *Farhangistān* might be useful: (1) The new one is a far more serious undertaking—as evidenced in its elaborate organisation and procedures. (2) Its work is not

confined to word-making but covers the entire language. (3) Its members, as a group, believe in their work, while the old one was organised and at least at first controlled by people (e.g. Furūghī) not in sympathy with language purification. (4) Its members and those outsiders working with them are professionally more highly qualified than their predecessors, in linguistics and other relevant fields. (5) It is a more open operation, in that it consults the public, or at least the scholarly community. (6) Its work is more systematic, and its procedures more elaborate.

As for the future of the academy, and of language purification, it is difficult to predict after the February 1979 overthrow of the monarchy by a revolution with strong religious overtones. The *Farhangistān* is now inactive, if not in fact defunct. If the atmosphere prevailing during the first nine months of the new régime continues, any undertaking of his type would most likely discontinue, or at least be weakened and restricted. Under such conditions, the activities of any language academy would very likely be confined to the coining and adoption of technical terms.

Bibliography: A short history of the two language academies and similar organisations in Iran and of language reform is provided in M. A. Jazayery, *Farhangistān*: *la Academia Irania de la Lengua*, Mexico City (forthcoming), which contains a comprehensive bibliography. A shorter account, from a somewhat different perspective, will be found in his article *The modernisation of Persian vocabulary and language reform in Iran* (forthcoming). For a list of the persons writing in pure Persian from the earliest times, see ʿA. A. Ḥikmat, *Pārsi-yi naghz*, Tehran 1951, where examples of such writings are given. See also M. Ishaque, *Modern Persian poetry*, Calcutta 1943. Information on the various terminology and purification groups is found in Muḥammad Muḥīṭ-Ṭabāṭabāʾī, *Nigahbānī-yi zabān-i Fārsī*, in *Yaghmā*, xxiii (1971), 569-75; Muḥsin Shāmlū, *Taʾrīkhī az wadʿ-i lughat dar Īrān*, in *Waḥīd*, v (1968), 834-8; and in the Jazayery monograph cited above. On the committee at the *Dānishsarā-yi ʿĀlī*, see ʿĪsā Ṣadīḳ, *Yādgār-i ʿumr*, Tehran 1959-75, ii, 105 ff. The constitution and internal by-laws of the *Farhangistān*, lists of its members and committees, and of words adopted up to 21 March 1942, are found in *Wāzhahā-yi naw ki tā pāyān-i sāl-i 1939 dar Farhangistān padhirufta shuda ast*, Tehran 1973 (repr. of the original 1942). A brief analysis of the words approved by the two *Farhangistāns* is given in Jazayery's book and in A. Shakoor Ahsan, *Modern trends in the Persian language*, Islamabad 1976, 111-30. On the developments between the two *Farhangistāns*, see also *Luzūm-i ḥifẓ-i Fārsī-yi faṣīḥ*, in *Yādgār*, vi (1948), 1-40. On Kasrawī, see now (in addition to *Bibl.* in the article, s.v.), *Niwishtahā-yi Kasrawī dar zamīna-yi zabān-i Fārsī*, ed. Ḥusayn Yazdāniyān, Tehran 1979. For an analysis of Kasrawī's views on, and methods of, language reform, see Jazayery, *Yāddāshthā-yi dar pīrāmūn-i kūshishhā wa andīshahā-yi Kasrawī dar zamīna-yi zabān*, which appears on pp. 11-47 of that book in lieu of an introduction. On the second *Farhangistān*, see Jazayery's monograph and article cited at the beginning of this bibliography, the Ashan book cited, and the publications of the *Farhangistān* itself. The latter include *Farhangistān-i zabān-i Īrān*: *hadaf, sāzman, waẓīfa, rawish-i faʿʿāliyyat*, Tehran 1972, and the *Pishnihād-i shumā čist* monographs of which four were published, Tehran 1972-6. Samples of its adopted words are found in *Barābarhā-yi Fārsī-yi barkhī az wāzhahā-yi āmuzishī*, Tehran 1974.

(M. A. Jazayery)

(iii) Turkey

There are two academies in Turkey, the Society for Turkish History and the Society for the Turkish Language, both set up on the initiative of Mustafa Kemal Atatürk [*q.v.*], who supervised their work closely until his death in 1938, whereupon nearly all his estate was divided evenly between them. Both during and after his lifetime, these academies closely followed his views on the interpretation of Turkish history and the reform of the Turkish language respectively. In brief, they maintained that the Turks were an ancient people, connected with Anatolia since the oldest times, with a language of their own and responsible for major contributions to world civilisation. The operational results of this approach, which the academies were expected to foster, were to be an increase in pride among Turks regarding their past and their language and the will again to play a role in world civilisation through rapid modernisation.

The Türk Tarih Kurumu (TTK) or the "Society for Turkish History" had as its predecessor the Türk Tarihi Tetkik Heyeti or "Committee for Research into Turkish History", founded in 1930. In 1931, this was succeeded by the Türk Tarihi Tetkik Cemiyeti or "Society for Research into Turkish History", whose own name was changed to Türk Tarih Kurumu (meaning the same) in 1935.

The scope and goals of the TTK were to study the history of the Turks and of Turkey and to publish and disseminate the results of this research. The following methods were suggested for attaining these objectives: 1. Research and investigation of sources relating to the history of the Turks and of Turkey. 2. Translation (into Turkish) and publishing of these source materials. 3. Convening of congresses for discussion of new findings and other scholarly topics. 4. Despatch of scholars (individuals of groups) for investigation of documents which shed light upon the history of the Turks and of Turkey. 5. Cooperation with local and foreign scholarly institutions regarding the study and publication of relevant material.

The TTK, organised like other academies and learned societies throughout the world, is housed in its own building in Ankara, with an impressive library (including archival materials, 901 manuscripts, 189 microfilms, 172 photocopies of manuscripts, numerous local and foreign journals and 73,166 books and offprints, by late 1979) and its own printing press. It serves as the centre for the TTK's manifold activities, which include research, lectures, exhibitions and international congresses—convened approximately once every five years since 1932—as well as publication of the proceedings of these congresses under the title *Türk tarih kongresi sunulan bildiriler* (later renamed *Türk tarih kongresi bildirileri*), along with numerous other works. The TTK's conception of Turkish history is maximalist; one of its first publications was a four-volume textbook for secondary schools (*lise*), emphasising the overall history of the Turks (and Turkic peoples) throughout Asia and their contributions to world civilisation. The 347 scholarly books—many of which comprise several volumes—published

by the TTK up to late 1979 indicate the Society's wide-ranging interest in the history of the Turks and Turkey (and to a lesser extent, in world history as well). It has published critical editions of historical documents and other archival materials, as well as studies in archaeology and history, with emphasis on the Ottoman and Turkish periods and especially on Atatürk's role, although also considering the history of art and folklore in Turkey. A few of these books were intended for a general readership. In addition to its bibliographies of historical research, the TTK publishes a scholarly quarterly, *Belleten* (*1937-*) and a twice-yearly collection of documents, *Belgeler*: *Türk Tarih Belgeler Dergisi* (1964-).

The Türk Dil Kurumu (TDK) or the "Society for the Turkish Language" was preceded by the Dil Heyeti or "Language Committee", established in 1929 to coordinate and advance—on a more institutionalised level—the language reform which had commended one year earlier upon adoption of the Latin alphabet. In 1932, with the government's blessing, the Committee expanded and became the Türk Dili Tetkik Cemiyeti or "Society for Research into the Turkish Language" whose name was changed in 1934 to Türk Dili Araştırma Kurumu (meaning the same, but very obviously displaying the switch from Arabic to Turkish roots). In 1936, its name was finally abbreviated to Türk Dil Kurumu.

The scope and objectives of the TDK were revised several times. Their clearest expression may perhaps be found in the Society's 1943 statues: 1. To purify the language of foreign accretions and to Turkify it (*türkçeleştirmek*). 2. To collect Turkish words used in Turkey and elsewhere and publish them in dictionaries of the Turkish of Turkey and of Turkish dialects. 3. To prepare and publish relevant linguistic works along with the above dictionaries. 4. To examine ways and means of coining new words and to prepare a basic grammar of Turkish and a comparative grammar of Turkish dialects. 5. To draw up lists of technical terms for schools and universities and to prepare a dictionary of such Turkish terms. 6. To collect and publish popular proverbs. 7. To investigate the Turkish language from its earliest times and to compare it with other languages, in order to prepare etymological dictionaries. 8. To study documents relating to the Turkish language and the development of other languages, with special reference to their vocabularies and the coining of new words. 9. To study modern linguistic works and to translate them into Turkish.

The TDK, likewise organised similarly to other learned societies, has its own building in Ankara which houses its large library (about 25,000 volumes, 150 different periodicals, 600 manuscripts, 33 microfilms and over 100 volumes of photocopies of 48 books, in 1980) and serves as headquarters for its multifaceted activities in linguistic research. The best-known of these activities has most likely been the coining of new words and terms to replace those of Arabic or Persian origin. While many of these neologisms are indeed words of Turkish and Turkic origin, some are wholly original coinages. These new terms were subsequently filtered into the school system and the press. Since the end of World War II, however, this process has become more moderate. Starting with 1932, the TDK has convened scholarly congresses once every two or three years, which are attended by both local and foreign linguists and educators. The results have been published as *Türk Dili Kurultayı* (later known as *Türk Dil Kurultayı*). Other publications consist of 467 books and brochures (by July 1980) dealing with the following: studies and lectures on language "purification", new spellings, Turkish and general linguistics, Turkish dialects and proverbs, lists of new terms for various areas, dictionaries of Turkish (including a historical "Thesaurus") and certain other Turkic languages (Kirg͟hiz, Uyg͟hur, Yakut and Čuvas͟h), several biographies (of Atatürk and others), literary works and sources for the Turkish language, bibliographies and the following periodicals: *Türk Dili Araştırmaları Yıllığı-Belleten* (annual, 1953-), *Türk Dili*: *Türk Dili Tetkik Cemiyeti Bülteni*, renamed *Türk Dili Belleten* (monthly, 1933-50), superseded by *Türk Dili*: *Aylık Dergi* (monthly, 1951-).

By a law passed on 11 August 1983 (published in the *Resmi Gazete*, no. 18138, dated 17 August 1983), the Türk Tarih Kurumu and Türk Dil Kurumu, along with the recently founded Atatürk Kültür Merkezi (the Atatürk Culture Centre), have been united in a new, state-sponsored Academy, entitled Atatürk Kültür, Dil ve Tarih Yüksek Kurumu (the Atatürk Culture, Language and History Higher Organisation), located in Ankara.

(J. M. Landau)

(iv) India.

Under the auspices of the Muslim University, Aligarh, and in imitation of the Academies of Damascus, Cairo and Baghdād, the *al-Madjmaʿ al-ʿIlmī al-Hindī* was founded in 1396/1976, aiming mainly at expanding knowledge of Arabic in India; furthering studies on the literature, history, sciences and civilisation of the Arabs; publishing valuable manuscripts; publicising the work of Indian scholars; and stimulating the intellectual spirit of the country.

The Academy comprises twelve active members (*ʿāmilūn*) of Indian nationality, 28 corresponding members (*muzāmilūn*) representing the Arabophone countries (Syria, Saudi Arabia, Iraq, Jordan, Palestine [*sic*], Egypt, Lebanon, Morocco and Kuwayt) and 15 other corresponding members chosen from the Arabists of Iran, Pakistan, USSR, Germany, Great Britain, France, Hungary, Italy and the Netherlands.

It publishes twice-yearly a journal, *Madjallat al-Madjmaʿ al-ʿIlmi al-Hindī*, whose first issue, dated 1396/1976, appeared at the end of 1978 (see the review in *Hamdard Islamicus*, ii/2 [Karachi 1979], 105-12).

(Ed.)

MADJNŪN (a.), pl. *madjānīn*, possessed, mad, madman; the passive participle of *djanna*, "to cover, conceal", passive, *djunna*, "to be possessed, mad, insane".

Its meaning and usage have been closely related to belief in the Djinn [*q.v.*]. In pre-Islamic Arabia, soothsayers were believed to have received messages from the *djinn* during ecstatic experiences, after which they delivered oracles in short, enigmatic verses of rhymed prose called *sadjʿ* [see kāhin], and poets were believed to have been inspired by their individual *djinn*, similar to the Greek idea of Muses [see shāʿir]. Soothsayers and poets were both said to be *madjnūn*, literally "*djinn*-possessed" or "inspired by the *djinn*". The term *madjnūn* occurs eleven times in the Ḳurʾān, where its exact, original meaning is not certain, but its usage is significant for the later history of the term. It refers explicitly to Muḥammad seven times and probably alludes to him in the other contexts, where episodes in his life seem to be projected into stories about Moses (XXVI, 27, LI, 39) and Noah (LIV, 9) and into the general statement that each of God's Messengers was accused of being a sorcerer (*sāḥir*) or *madjnūn* (LI, 52). In four of the seven contexts where *madjnūn* refers explicitly to Muḥammad, it occurs in accusations against the Prophet quoted from his opponents: "O thou upon whom the Reminder has been sent down, thou art *madjnūn*" (XV, 6); "Shall we abandon our gods on account of a poet (*shāʿir*) *madjnūn*?" (XXXVII, 36); "They turned from him [i.e. Muḥammad] and said, 'One who is tutored, *madjnūn*'" (XLIV, 14); "When they hear the Reminder they say, 'Surely he is *madjnūn*'" (LXVIII, 51). In the other three contexts God responds to these accusations, assuring Muḥammad and his companions: "Thou art neither a soothsayer (*kāhin*) nor *madjnūn*" (LII, 29); "Thou, by the bounty of thy Lord, art not *madjnūn*" (LXVIII, 2); and "Your comrade is not *madjnūn*" (LXXXI, 22). In the Ḳurʾān the term *madjnūn*, always in the singular, functions sometimes as an adjective and sometimes as a noun. It occurs only in Meccan passages, only in the context of accusations made against Muḥammad by his opponents (and against earlier Messengers by theirs), and only in contexts involving the question of the source and process of revelation. The primary meaning of *madjnūn* in the Ḳurʾān seems to be "*djinn*-possessed/a *djinn*-possessed person (like the ancient Arabian soothsayer)" or "inspired by the *djinn*/a person inspired by the *djinn* (like the Arabian poet)". Muḥammad's opponents in Mecca, seeing the similarity between the form of his messages and the *sadjʿ* oracles of the soothsayers, argued that his messages were not revealed by God but were inspired by the *djinn*. In response to this charge, the Ḳurʾān develops some interesting counter-arguments. Identifying the alleged *djinn* inspirers as "satans" (*shayāṭīn*), the Ḳurʾān states in LXXXI, 25, that Muḥammad's messages are "not the speech of a pelted satan (*shayṭān radjīm*)", and XXVI, 210-12 adds: "The satans have not brought it down. It would not suit them, nor are they able. Indeed, they have been removed far from [even a chance of] hearing it." These two passages allude to the ancient Near Eastern shooting-star myth, the Ḳurʾānic versions of which deny that *djinn* or satans (both terms occur in these accounts) are able to obtain messages from the Heavenly Council to bring down to man. When they try to eavesdrop at the gates of heaven they are pelted and driven away with flaming stars (see XV, 16-18, XXXVII, 6-10, LXVII, 5 and LXXII, 8-11). On this myth, see Ibn Hishām, 130, tr. Guillaume, 90; P. A. Eichler, *Die Dschinn, Teufel und Engel im Koran*, Leipzig 1928, 30-1; and for *ḥadīth* references, Wensinck, *Handbook*, 59. Another Ḳurʾānic argument against the accusation that Muḥammad was *madjnūn* involves two accounts in which it is reported that *djinn* overheard him reciting the Ḳurʾān and became believers (XLVI, 29-32, LXXII, 1 ff.). That is, Muḥammad did not get his messages from the *djinn*; they received the Ḳurʾān from him (see Ibn Hishām, 281, tr. Guillaume, 193 f., and for *ḥadīth* references, Wensinck, *Handbook*, 59 f.).

Whether *madjnūn* had secondary meanings in the Ḳurʾān for Muḥammad and his contemporaries is difficult to say. In his English translation of the *madjnūn* passages, Richard Bell (*The Qurʾān*, Edinburg 1937-9) sometimes renders this term as "mad", "crazy", and "madman" (see, e.g., XXVI, 27 [v. 26 in Bell], XXXVII, 36 [v. 35 in Bell], and LI, 39), thus giving the term some of the various meanings it has in later usage. In the Ḳurʾān, madness is associated with "satans", in accordance with the ancient Semitic concept of demon-possession (see VI, 71), and, since evil or mischievous *djinn* are identified in the Ḳurʾān as satans, it is possible that *madjnūn* had this connotation for Muḥammad and his contemporaries. But the *madjnūn* contexts argue against this interpretation since they never respond to the accusation that Muḥammad was *madjnūn* by defending his sanity, but always by affirming that the revelation came from God and not from the *djinn* or satans. The classical commentators on the Ḳurʾān offer little assistance on this question, usually failing to explain the term altogether. Where al-Bayḍāwī does explain *madjnūn* he interprets it as "inspired by the *djinn*" (e.g. in his comments on LI, 39), or he at least connects it with the process of revelation (e.g. in his com-

ments on XV, 6 and LXVIII, 2). An analysis of cognate expressions in the Ḳur'ān also offers little new understanding of the concept *madjnūn*. In late Meccan and early Medinan contexts, *madjnūn* was replaced by the expression *bihi djinnat*ᵘⁿ (see VII, 184, XXIII, 25, 70, and XXXIV, 8, 46). This change of terms could be interpreted as a change or development of ideas within the Ḳur'ān, but this possibility is unlikely since the two expressions seem to be synonymous (cf., e.g., *mā ṣāḥibukum bi-madjnūn*, in LXXXI, 22, and *mā bi-ṣāḥibikum min djinnat*ⁱⁿ, in XXXIV, 46). In contexts where *madjnūn* functions as a noun (e.g. XLIV, 14, LI, 39, 52, and LIV, 9), its meaning seems to be identical with the expression *radjul*ᵘⁿ *bi-hi djinnat*ᵘⁿ in XXIII, 25, i.e. both seem to mean "a *djinn*-possessed person". Where al-Bayḍāwī explains *bi-hi djinnat*ᵘⁿ (e.g. in XXIII, 25) he simply gives the synonym *djunūn*, which has the same range of meanings (cf. al-Zamakhsharī on the same verse).

One striking fact about the history of the usage of *madjnūn* is that Muslims adopted the concept and gave it widespread currency, assuming it to be Islamic because it occurs in the Ḳur'ān, whereas in fact the term never occurs in the Ḳur'ān as an Islamic concept, but always as an idea of Muḥammad's Meccan opponents that is simply quoted and responded to there. (The frequency of occurrence of this pre-Islamic concept in the Ḳur'ān might be explained by the fact that in all cases except the Noah context it serves as a rhyme-word, and was thus a convenient term to use in contexts involving accusations made against Muḥammad by his Meccan opponents and in contexts involving affinities between Muḥammad's situation and that of earlier prophets.) Meccan parts of the Ḳur'ān frequently reflect pre-Islamic Arabian concepts, such as belief in the existence of *djinn* and deities other than Allāh. When the Islamic world-view developed within the Ḳur'ān, and when required Islamic beliefs and practices were introduced in a series of late Meccan and early Medinan credal statements, some of these pre-Islamic concepts, such as belief in the existence of deities other than Allāh, came to be explicitly rejected, while others, such as *madjnūn* and belief in the existence of the *djinn*, simply ceased to be mentioned in latter parts of the Ḳur'ān (see A. T. Welch, *Allah and other supernatural beings: the emergence of the Qur'anic doctrine of tawḥīd*, in *Jnal. of the American Academy of Religion*, xlvii/4 [1979], 733-53). Still, the concept *madjnūn*, along with magic, sorcery, soothsaying and other related phenomena that were a vital part of the Arabian world-view of Muḥammad's time, became part of popular Islamic belief and practice, and these have remained so in modern times (see e.g., E. W. Lane, *Manners and customs of the modern Egyptians*, London 1836, chs. x-xii; E. Doutté, *Magie et religion dans l'Afrique du Nord*, Algiers 1909; D. B. Macdonald, *The religious attitude and life in Islam*, Chicago 1912, lectures 1-5; E. A. Westermarck, *Ritual and belief in Morocco*, London 1926, i, chs. iv-xi; C. Snouck Hurgronje, *Mekka*, Leiden 1931, 99-103). The concept *madjnūn* occurs occasionally in the classical literature, with the same literal meaning as in the Ḳur'ān. In the *ḥadīth* literature, see al-Bukhārī, *Ṣaḥīḥ*, *I'tiṣām*, 16; Muslim, *Ṣaḥīḥ*, *Djum'a*, 46, and *Ḥudūd*, 22; and J. Robson, *Mishkat al-masabih*, Lahore 1965-6, 515, 1260 f. Al-Ṭabarī records an account in which Muḥammad is reported as saying he feared he had become either a poet or a *djinn*-possessed person (*madjnūn*), but then Gabriel appeared to him and informed him that he was a prophet inspired by God (*Ta'rīkh*, i, 1150; tr. A. Guillaume, *The life of Muhammad*, London 1955, 106). For a contemporary defence of belief in the *djinn* and their influence on man by the al-Azhar scholar, Sayyid 'Abd Allāh Ḥusayn, see his *al-Djinn fī dhikr djamī' aḥwāl al-djinn*, Cairo n.d. The Islamic philosophers and a few scholars such as Ibn Khaldūn rejected the concept *madjnūn* as related to the world of the *djinn* (see Macdonald, *Religious attitude*, 130 ff.). In later usage, the association of *madjnūn* with the *djinn* has sometimes been lost as this term has come to mean simply "mad" or "insane".

Lane, *An Arabic-English lexicon*, i/2, 462; and, for additional *ḥadīths* containing the term *madjnūn*, A. J. Wensinck, *Concordance et indices de la tradition Musulmane*, i, Leiden 1936, 374.

(A. T. Welch)

MADJNŪN LAYLĀ, "the Madman of Laylā", or Madjnūn Banī 'Āmir, the name given to the hero of a romantic love story, the original form of which could date back as far as the second half of the 1st/7th Century.

1. In Arabic literature

This imaginary character (acknowledged as such even by some Arab critics; see *Aghānī*, ed. Beirut, ii, 6, 11) has been furnished by the *ruwāt* with an *ism* and with a complete genealogy; Ḳays b. al-Mulawwaḥ b. Muzāḥim b. Ḳays b. 'Udas b. Rabī'a b. Dja'da b. Ka'b b. Rābī'a b. 'Āmir b. Ṣa'ṣa'a, but according to the evidence, although this filiation could be accepted from the starting point of Ḳays b. 'Udas, the latter does not have a son named Muzāḥim (see Ibn al-Kalbī-Caskel, *Djamhara*, Tab. 101, 102, 106). Furthermore, various other less common names have been given to him: al-Buḥturī b. al-Dja'd, Mahdī b. al-Mulawwaḥ, al-Aḳra' or Ḳays b. Mu'adh (*Aghānī*, ii, 8). Al-Djāḥiẓ splits the character into two parts by distinguishing between a Madjnūn of the Banū 'Āmir and a Madjnūn of the Banū Dja'da (*Bayān*, i, 385, iii, 224, iv, 22), where Dja'da is a descendant of 'Āmir. As for his loved one, she is given the following genealogy: Laylā bint Sa'd b. Mahdī b. Rabī'a b. al-Ḥarīsh b. Ka'b b. Rabī'a b. 'Āmir.

The content of the romance, insofar as it can be extracted from the ancient versions, is relatively simple and commonplace. However, from the start, two opposing traditions have been current: according to one version, the two young people spent their youth together, tending their flocks in the Djabal al-Tawbād (which belonged, however, to the Muḥārib; al-Iṣfahānī, *Bilād al-'Arab*, 182; cf. Yāḳūt, s.v.); according to the other, Ḳays meets Laylā by chance at a gathering of women, and the effect on him is devastating; he kills his camel as a contribution to the feast, but when a certain Munāzil arrives, the women turn their attention to him, and only Laylā, who shares his emotion, takes an interest in Ḳays. Subsequently he asks for her hand in marriage, but her father has already given her away in marriage to a certain Ward b. Muḥammad al-'Uḳaylī. Gripped by the most violent anguish, Ḳays loses his reason and sets out to wander half-naked, refusing nourishment and living among wild animals. His father takes him on a pilgrimage to make him forget Laylā, but his madness only inten-

sifies. He does, however, have moments of lucidity when he talks of his lady-love and composes verses which he recites to those curious people who have come to see him. Until his death, he encounters Laylā on only one further occasion.

It is difficult to establish the origin of the story. According to a remark in the *Aghānī* (ii, 7, 10), the initial author would be a young Umayyad who, under the pseudonym of Madjnūn, circulated some stories designed to introduce verses in which he sang of his ill-starred love for his cousin. This identification is, however, isolated, and in any case, the poet is anonymous. The fact that historical individuals such as Nawfal b. Musāḥiķ, governor of Medina in 83/702, are mentioned in the traditions relating to the adventures of Ķays, suggests that the latter came into existence at about this period, but this is all that can be said on the subject. The author, or rather the authors of the verses attributed to this Madjnūn and the introductory or explanatory tales, will always be unknown, and it may simply be supposed that these creations are owed to the desire of the Arabs of the North, represented by the ʿĀmir b. Ṣaʿṣaʿa, to show that unhappy love affairs were not the prerogative of those of the South, the ʿUdhra in this instance, and that they were capable of producing the equal of a Djamīl al-ʿUdhrī [*q.v.*].

From the moment that verses and *akhbār* concerning fictional characters achieved normative status, it is not hard to imagine the role played by inventive narrators and *ruwāt* whom al-Aṣmaʿī (in *Aghānī*, ii, 6) also accuses of having concocted this novel, which is included in a long series of imaginative works and fictionalised biographies of which the *Fihrist* supplies a detailed inventory (ed. Cairo, 425-6; cf. M. F. Ghazi, *La littérature d'imagination*, in *Arabica*, iv/2 [1957], 174-8). The story of Madjnūn and Laylā, like many tales of the Middle Ages, has never obtained a definitive form. It is true that transmitters of tradition like Ibn Daʾb, ʿUmar b. Shabba, Ibn al-Kalbī or al-Zubayr b. Bakkār, must at a quite early stage have set down in writing the more or less numerous and disparate elements, but independent *akhbār* continued to circulate orally and to be enriched according to the taste of the narrators. Evidence of this process is furnished by a study of the sources for the recension of the *Aghānī* (ii, 1-78) which, after that of Ibn Ķutayba (*al-Shiʿr wa 'l-shuʿarāʾ*, 355-64 = ed. Shākir, ii, 545-56), is the most ancient and the most developed. Abu 'l-Faradj, in order to bring a successful conclusion to his enterprise, which aspires to be a complete, if not coherent history, takes effective precautions to shield himself from the critics by citing opinions for and against the historicity of the character, then combines, without regard for chronological order, a series of oral and written sources which have been inventoried by I. Y. Kračkovskiy, in an article published in Russian in Leningrad in 1946 and translated into German by H. Ritter, in *Oriens*, viii/1 (1955), 1-50 (*Die Frühgeschichte der Erzählung von Macnūn und Lailā in der arabischen Literatur*; cf. Sezgin, *GAS*, ii, 390).

The story of Madjnūn and Laylā seems to have taken precedence over the majority of others of the same genre towards the end of the 3rd/9th century or the beginning of the 4th/10th; the fact that numerous verses taken from it were set to music, plus the importance attached to it by the *Aghānī*, leave no doubt that the vogue which it subsequently enjoyed was not an entirely new development.

In the Arabic literature subsequent to the *Aghānī*, the *akhbār* of Madjnūn recur in a number of works of *adab*, in particular in those which concern famous romances (like the *Tazyīn al-aswāķ* of Dāwūd al-Anṭākī, ed. Beirut 1972, i, 97-128), but little is known of independent monographs, apart from the *Dīwān* and two works which have yet to be edited: the *Nuzhat al-musāmir fī dhikr baʿd akhbār Madjnūn Banī ʿĀmir*, by Yūsuf b. al-Ḥasan al-Mibradī (d. 909/1503) and *Basṭ al-sāmiʿ al-musāmir fī akhbār Madjnūn Banī ʿĀmir*, by Ibn Ṭūlūn (d. 953/1546). It is remarkable, but not entirely unexpected, that the story of *Madjnūn wa-Laylā* should have inspired no literary work in Arabic in the Middle Ages; in fact, it is not until the present day that one sees the theme exploited by several dramatists: Ibrāhīm al-Aḥdab (J. M. Landau, *Études sur le théâtre et le cinéma arabes*, Paris 1965, no. 39), Salīm al-Bustānī (*ibid.*, no. 161), Abū Khalīl al-Ķabbānī (*ibid.*, no. 406), whose works do not seem to have been performed, or even printed; the *Riwāyat Madjnūn Laylā* by Muḥammad Mundjī Khayr Allāh, on the other hand, has been performed in Alexandria and published in 1898 (and 1904?; Landau, no. 304); the most celebrated work in this connection is the *Madjnun Laylā* by Aḥmad Shawķī (Landau, no. 517; tr. Arberry, Cairo 1933; see also R. Rubinacci, in *AIUON*, vii [1957], 9-66; A. Boudot-Lamotte, *Aḥmad Šawqī*, Damascus 1977, 275-82).

It is not known whether it is necessary to place at the end of the 2nd/8th century, since there is no mention of him in the *Fihrist*, a certain Abū Bakr al-Wālibī, to whom is attributed a recension of the *Dīwān* of al-Madjnūn of which a considerable number of manuscripts exists, containing or not containing *akhbār* (see Sezgin, *GAS*, ii, 392-3) and which has been the object of some fifteen mediocre publications and of one more scientific edition by Aḥmad Farrādj in Cairo (1958). It is evident that the content of this *Dīwān* cannot be considered as the work of a single poet, especially as there has been a tendency, as al-Djāḥiẓ observes (in *Aghānī*, ii, 10), to attribute to Madjnūn Laylā the verses of any unknown poet where reference is made to a Laylā; furthermore, the homonymy with Ķays b. Dharīḥ has certainly caused confusion. At all events, R. Blachère, who has analysed this *Dīwān* (*HLA*, iii, 658) considers that it "cannot be regarded as occupying an insignificant place in the study of archaic poetry".

2. In Persian, Kurdish and Pashto literature

The poems of Madjnūn and the tales of his love Laylā (commonly named Laylī in Persian) also became a part of the Persian literary tradition, where they were used in various ways. Quotations of Arabic lines of poetry ascribed to Madjnūn occur quite frequently in Persian prose works. He was reckoned to be one of the great poets of love (cf.

e.g. Manūčihrī, *Dīwān*, ed. Tehran 1347/1968, v. 1052) and was celebrated for his *ghazals*. References to him and Laylī appear already in the works of many poets before the time when Niẓāmī wrote his epoch-making poem on their love story. Manūčihrī [*q.v.*] (d. ca. 432/1040-1) compared in descriptions of nature the rain-clouds, "weeping meaningfully", to the eyelashes of Madjnūn and the lightning, "laughing without meaning", to Laylī's lips (v. 1727); the eyes of the former and the cheeks of the latter to two constellations (v. 1830). The two names were also associated with items of material culture; according to Anwarī [*q.v.*] (*fl.* middle of the 6th/12th century), a bench (*ṣuffa*) in the hall of one of his patrons had as many mad lovers as Laylī (*Dīwān*, i, Tehran 1347/1968, 345); Khāḳānī [*q.v.*] (d. 595/1199) saw in a harp (*čang*) the she-camel of Laylī uttering the complaints of Madjnūn (*Dīwān*, ed. Sadjdjādī, Tehran 1357/1978, 144, 476).

These examples show that, at least initially, the romance was not specifically related to mysticism, although, as we know, the Ṣūfīs used it as an *exemplum* from the 3rd/9th century onwards (cf. Ritter, in *Oriens*, viii [1955], 49 f.). To a religious poet like Nāṣir-i Khusraw (5th/11th century), the subject matter was reprehensible because it symbolised merely mortal love and frivolous poetry (cf. *Dīwān*, ed. Tehran 1348/1969, 355, 455). Its development into one of the most popular themes of the Ṣūfī tradition, dealt with in innumerable works written in Persian and in many other languages, needs still to be investigated. The growing importance of *ghazal* poetry and the theory of love to the mystics since the 5th/12th century has undoubtedly furthered this process. Yet Madjnūn and Laylī were also to the later poets just one pair of *exempla* out of several others like Maḥmūd and Ayāz, Farhād and Shīrīn (cf. e.g. Ḥāfiẓ, *Dīwān*, ed. Ḳazwīnī-Ghanī, Tehran 1320/1941, 29, 38), or the Greek lovers Wāmiḳ and ʿAdhrā (cf. e.g. Masʿūd-i Saʿd, *Dīwān*, Tehran 1339/1960, 198; Sanāʾī, *Dīwān*, Tehran 1341/1962, 495, 854). According to Djalāl al-Dīn Rūmī, Madjnūn belonged together with Farhād and others to the archetype of "lovers who took to the mountains and the desert because of love" (*Fīhi mā fīh*, Tehran 1348/1969, 30).

The *akhbār* were a rich source of illustrative anecdotes to writers and poets. It was drawn upon by Aḥmad-i Ghazālī (*Sawāniḥ*, ed. H. Ritter, Istanbul 1942, 42, 45) and subsequent writers on the theory of love. Among the authors of mystical *mathnawī* poems, Farīd al-Dīn ʿAṭṭār deserves special mention (cf. H. Ritter, *Das Meer der Seele*, Leiden 1955, 730 f.).

In 584/1188 Niẓāmī of Gandja composed at the request of the Shirwān-Shāh Akhsitān the *mathnawī* *Laylī u Madjnūn* in the metre *hazadj-i musaddas-i akhrab-i maḳbūḍ-i maḥdhūf* with about 5,000 *bayts*. This was the third part of the set of poems known as the *Khamsa* [*q.v.*]. The theme was chosen for the first time as the subject of a Persian narrative poem, but the precedent of the treatment of a similar subject of Arabic origin existed in ʿAyyūḳī's *Warḳa u Gulshāh*.

Niẓāmī states in the introduction to his poem that he accepted the assignment with some hesitation. At first, he doubted whether this tale of madness and wanderings through the wilderness would be suitable for a royal court (ed. Moscow 1965, 41 ff.). He adapted the disconnected stories to fit the requirements of a Persian romance. They were joined together into a coherent narrative which describes the development of a frantic love affair from the scene of the first meeting of the two lovers till the death of Madjnūn at the grave of Laylī. In some respects, the Bedouin setting of the original has been changed under the influence of urban conditions more familiar to the poet and his audience: the young lovers become acquainted at school; the generous Nawfal is a prince in the Iranian style rather than an Arab official. Niẓāmī added a second pair of lovers, Zayn and Zaynab, in whom the love between the main characters is reflected. It is Zayn who in a dream sees Madjnūn and Laylī united in paradise at the end of the romance.

Several other features mark this new adaptation of the romance. Specimens of nature poetry were used to emphasise, symbolically, important points in the development of the plot: a description of a palm bush in spring where Laylī sits in the flower of her youth; of the night at the moment of Madjnūn's deepest despair; of autumn at the time of Laylī's death. Much attention is given to Madjnūn's rôle as a poet. In several places, *ghazals* are quoted in the text, which in metre and rhyme are adjusted to the prosodic characteristics of the *mathnawī*. It is quite evident that, to Niẓāmī, the subject matter was not least interesting because of its emblematic possibilities. His poem is, therefore, a didactic work as well as a narrative. The former quality is noticeable in the frequent asides containing reflections on such themes as ascetism, the vanity of this world, death and, of course, love in its various aspects, including its transformation into mystical love. Didacticism is also the main element of the introduction and the epilogue.

This *Laylī u Madjnūn* was the starting-point of a long series of imitations which were written in almost any language of the area where the cultural influence of Persian literature made itself felt. The poets who tried to emulate the model set by Niẓāmī borrowed most of its contents and its metre but often also elements of its composition, e.g. the advice given to the son of the poet and the address to the cupbearer which both occur in Niẓāmī's introduction. Each of them, however, made an effort to produce an original work by making changes in the episodes of the romances, by the addition of new stories or through a shift of emphasis from one motif to another.

No more than a few of these imitations can be regarded as valuable literary works in their own right and have apparently enjoyed the interest of a wide public over a long period. The *Madjnūn u Laylī* of Amīr Khusraw Dihlawī [*q.v.*] written in 698/1299 and the very first among them, belongs to a complete imitation of the *Khamsa*. This poem is much shorter than the model (2,660 *bayts*) and puts less emphasis on didactic aspects. New elements of the narrative are among others the prognosis of Madjnūn's fate at the time of his birth and the wish expressed by both lovers to have their eyes picked out by the ravens who prey on the dead bodies left after the battle of the clans. Amīr Khusraw dedicated his work to his spiritual guide Niẓām al-Dīn Awliyāʾ and to the sultan of Dihlī. The much longer poem of Djāmī [*q.v.*] (3,860 *bayts*), completed in 889/1484, almost exhausts the contents of the original *akhbār*. The beginning of the love story (the meeting of the two lovers is not situated at school but at the camp of Laylī's clan) is also closer to the Arabic tradition. The mystical meaning attached to the romance cannot be mistaken, though the narrative as such is given its full due. In the song addressed to the cupbearer of the introduction, Djāmī commemorates

the Naḳshbandiyya shaykhs and the Tīmūrid rulers of the past. Contemporaries of Djāmī's were his nephew Hātifī and Maktabī of Shīrāz. The former's poem was a particular favourite with Ottoman poets and was translated into Turkish. The *Laylī u Madjnūn* of the latter continued to be read till recent times and was printed repeatedly both in Iran and India.

The great majority of the Persian imitators met, however, with little success. Their poems are at the most extant in few or even single copies. Some of them seem to have disappeared altogether. They have been listed in the following works: A. S. Levend, *Leylâ ve Mecnun hikâyesi*, Ankara 1959, 86-96; E. E. Bertel's, *Nizami i Fuzuli*, Moscow 1962, 275-300; A. Ateş, *IA*, *s.v.* "Leylâ ile Mecnûn"; A. Munzawī, *Fihrist-i nuskhahā-yi khaṭṭī-yi fārsī*, iv, Tehran 1351/1972, 3100-15.

Some poets of the post-classical period wrote, under the title *Čāh-i wiṣāl*, short *mathnawīs* which describe a reunion of Madjnūn and Laylī at the bottom of a pit (cf. Munzawī, *op. cit.*, 2753 f.). In a quatrain by Lisānī (9th/15th century), on a painter of miniatures, the emaciated body of Madjnūn as it is commonly represented in Persian art is used as a literary motif (cf. F. Meier, *Die schöne Mahsatī*, Wiesbaden 1963, 306).

In Kurdish literature, a number of versions of the romance exist which are partly adaptations of Persian or Turkish models and partly original works. To the written tradition belong the works by ʿAlī Bāpir Āghā (ed. Baghdād 1950), ʿAbd al-Djabbār Kānī (ed. Erbil 1969) and Ḥārith Bitlīsī, dated 1172/1758-59 (ed. by M. B. Rudenko, Moscow 1965). Folklore tales about "Leylî û Mecrûm (or Meclûm)" have been recorded in various regions. They show remarkable variants, e.g. the treatment of the romance as an astral myth (cf. Rudenko, *op. cit.*). Some versions have been written in the Gūrānī dialect of Persian and in a prosodic form characteristic of popular literature (cf. Ch. Rieu, *Catalogue of the Persian manuscripts in the British Museum*, ii, London 1881, 733; Kamal Fuad, *Kurdische Handschriften*, Wiesbaden 1970). In Pashto, Bāy Khān of Bunēr made a version in stanzas which have the form of *ghazals* (cf. A. Sprenger, *ZDMG*, xvi [1862], 789).

Bibliography: Niẓāmī's poem was edited by W. Dastgirdī in the annotated *Khamsa* edition, Tehran 1313-18/1934-9, and by A. A. Alesker-zade and F. Babaev, Moscow 1965; Amīr Khusraw's poem by T. A. Muharramov, Moscow 1975; Djāmī's poem by M. Mudarris-i Gīlānī in *Haft awrang*, Tehran 1337/1958, and by A. Afsahzoda, Moscow 1974; Hātifī's poem by Sir William Jones, Calcutta 1788; and the poem by Maktabī in a facsimile edition by M. Dj. Muʿinfar, Wiesbaden 1968. See further ʿA. A. Ḥikmat, *Ruma'ū wa Zhūliyat-i Shakispīr wa muḳāyasa ba-Laylī u Madjnūn-i Niẓāmī*, Tehran 1319/1940; ʿA. Nawā'ī, *Maktabī-i Shīrāzī* in *Yādgār*, ii/5 (1325/1946), 52-60; M. Gh. Hilāl, *Laylā wa-Madjnūn fi 'l-adabayn al-ʿArabī wa 'l-Fārisī*, Cairo 1954; M. Dj. Gelpke, *Liebe und Wahnsinn als Thema eines persischen Dichters*, in *Symbolon*, iv (1964), 105-18; Dh. Ṣafā, *Comparaison des origines et des sources des deux contes persans: Leylî et Madjnoun de Niẓâmî et Varqah et Golchâh de ʿAyouqî*, in *Colloquio sul poeta persiano Niẓāmī*, Rome 1977; Asʿad E. Khairallah, *Love, madness and poetry. An interpretation of the Mağnūn legend*, Beirut 1980, 97-133 (on Djāmī).

(J. T. P. de Bruijn)

3. In Turkish literature

The Turkish poets were fascinated also by the Madjūn Laylā theme, in the first place, and above all, because they were inspired by the classical version of Niẓāmī [*q.v.*]; and then later, when taking up a critical position *vis-à-vis* the versions of other Persian and Turkish poets. Because the theme itself, the combination of the motifs, and, for the greater part, the metre as well, were all fixed, Turkish poets were able either to aim at a more exciting elaboration of the external motivation, or else to try to draw out the "metaphorical" meaning of the story as included in the material. A comparative study of the poetical aims, which, because of the similarity of the theme, should also take into account *Warḳā u Gülshāh*, is still lacking.

Gülshehrī and ʿĀshıḳ Pasha [*q.v.*] had already taken up the theme in the *Manṭiḳ al-ṭayr* and *Gharīb-nāme*. The line of independent Turkish versions starts with the lengthy *methnewī* [see MATHNAWĪ] written by Shāhidī on behalf of Prince Djem [*q.v.*], and later plagiarised by a certain Ḳādimī. Already in Shāhidī's poem, as well as in *Madjnūn u Laylī* of the eastern Turkish prince of poets Mīr ʿAlī Shīr Nawā'ī [*q.v.*] written shortly afterwards; for the contents, see *Philologiae turcicae fundamenta*, ii, 1964, 341-3, Madjnūn's unrequited love is interpreted as a metaphorical road to the divine reality. At the end of the 9th/15th century, the Ottoman Aḥmed Sinān Bihishtī [*q.v.*], who lived for a time in Herat, wrote a mystically-inspired version influenced by Djāmī [*q.v.*], to which he added some important alterations in the motifs. At about the same time, Ḥamd Allāh Ḥamdī [*q.v.*] and Tütünsüz Aḥmed Riḍwān composed their arrangements. The 10th/16th century was particularly rich in Laylā-Madjnūn versions. Djelīlī Ḥamīd-zāde Bursalī (d. after 977/1569-70) wrote his version in 918/1512-13, more or less simultaneously with his drastically-shortened version of *Khusraw u Shīrīn*, apparently concentrated, like the latter, on the external aspects of the action. Two years later Sawdā'ī's arrangement appeared, in whose copy verses by Fuḍūlī [*q.v.*] have intruded. In 931/1524-5 the Ādharbāydjānī Ḥaḳīrī wrote a version, inspired by Niẓāmī and Hātifī [*q.v.*], which he transplanted to his native country (see *PhTF* ii, 643) and in which "chance plays an important rôle" (Levend, *op. cit.*, in *Bibl.* 235-6). Exemplary for Turkish poetry was the way in which Fuḍūlī treated the subject. In his version, finished in 942/1535-6, Madjnūn appears as the symbol of the religious ideology of love, whose task consists of freeing himself from the beloved. With this epic poem, which is strewn with *ghazals* [*q.v.*] and does justice also to the feelings of Laylā, who remains an earthly figure, Fuḍūlī created an impressive Turkish counterpart to the Persian models, which he now came to equal. In 950/1543-4 Ḥamdī of Laranda wrote a little-known version again inspired by Niẓāmī, Djāmī and Nawā'ī. In 962/1554-5 Ṣāliḥ b. Djelāl produced a version which slavishly follows Hātifī. Khalīfe (d. *ca.* 986/1578-9) copied passages from Fuḍūlī's work after having criticised him and Nawā'ī in his preface. An Ādharī poet by the name of ʿAṭāyī (11th/17th century?) transformed the story into a fairy-tale in which he inserted quotations from Dede Ḳorḳut [*q.v.*]. The version of Ḳāfzāde Fā'iḍī (d. 1031/1621-2) remained unfinished. The following

survey shows how popular the theme has remained until present times: ʿÖrfī Maḥmūd Agha (d. after 1186/1772-3) wrote a brief tale; the Turcoman poet ʿAndalīb Nūr Muḥammad Gharīb (d. 1179/1765-6) made a popular adaptation of the theme in prose and verse; the prince of Khokand, Muḥammad ʿAlī Khān (1822-42; see *PhTF*, ii, 392) produced an incomplete Čaghatay version; the Ādharbāydjānī Nākām (d. 1323/1905-6), the Ḳazakh narrator of epic poems Süyümbay (1837-95; see *ibid.*, ii, 749) and Djambul (1846-1945; see *ibid.*, 750) made each their adaptions; and finally, there is the first Ādharbāydjānī opera, based on Fuḍūlī, by the composer ʿÜzeyir Beg Ḥādjībeyli (1885-1948; see *ibid.*, ii, 686), and the opera-libretto of the Turcoman Ḳaradja Burunov, born in 1898 (*ibid.*, ii, 733).

Levend, *Arap, fars ve türk edebiyatlarında Leylâ ve Mecnun hikâyesi*, Ankara 1969; *Philologiae turcicae fundamenta*, ii, 1964; A. Bombaci, *La letteratura turca*, Milan 1969; *Leylā and Mejnūn by Fuzuli, Translated from the Turkish by S. Huri, with a history of the poem, notes and bibliography by A. Bombaci*, London 1970.

(B. Flemming)

4. In Urdu literature

The story came into Urdu literature via Persian, not direct from Arabic, and it is most frequently called "Laylā Madjnūn". It is found in three main forms: firstly, in casual reference to the lovers, especially in poetry; secondly, in narrative poems telling the story, generally in *mathnawī*; and thirdly as the plot for early Urdu dramas of the late 19th and early 20th centuries, mostly written for various Parsi theatrical companies in Bombay. However, failing the discovery of some hitherto unknown masterpiece, the theme seems to have inspired no work of major literary importance.

Casual references to the lovers are far too numerous to permit detailed discussion. They date from the earliest period of Urdu in the Deccan and Gudjarāt, and continued into the present century, though with decreasing frequency. Nor were they restricted to *ghazal*, or even to secular poetry. For example, Walī Dakanī [see MADĪḤ. 4. in Urdu], in a *ḳaṣīda* in praise of the Prophet (*dar naʿt Ḥaḍrat Khayr al-bashar*) includes Laylā and Madjnūn among several famous pairs of lovers, as a metaphorical representation of *fanāʾ fī Allāh*; Walī was, of course, a Ṣūfī (see his work cited in *Bibl.*, 361).

The narrative *mathnawī* was a favourite poetical form in Dakanī, the type of Urdu current in South India from the 15th to the 18th centuries. Several examples devoted to Laylā Madjnūn are extant; they were modelled on Persian works, particularly those of Hātifī, Niẓāmī and Djāmī, and perhaps also on that of Amīr Khusraw of Dihlī, composed around 700/1300. In any case, despite the Persian models, the atmosphere in these Urdu works is distinctly Indian, as can be seen, for example, in the *sarāpā* passages describing the heroine from head to foot. Hāshimī, Bāḳir and Djālibī mention *mathnawīs* by Aḥmad Gudjarātī and Muḥammad ʿAzīz, both poets of the Ḳuṭb-Shāhī period in Golconda. These were written in 1046/1636 and 1040/1630 respectively. A late Dakanī *mathnawī* is *Ḳiṣṣa Laylā wa Madjnūn*, composed by ʿUbayd Allāh Wāʿiẓ b. Isḥāḳ in Gudjarāt in 1196/1782. It is included in a collection of 12 early Urdu *mathnawīs* by an unknown editor, under the title of *Bāra ḳiṣṣa*. This collection was very popular, and was published several times both before and after 1857; the later editions, however, tend to modernise the language, bringing it into line with the contemporary Urdu of Northern India.

Dakanī Madjnūn Laylā *mathnawīs* are characterised not only by their Indian flavour, but also by their concentration on the story, which is told in simple, at times naïve, language. The story deviates considerably from the old Arabic versions. Thus Wāʿiẓ makes Madjnūn the son of a Ghaznawid king by an Arab woman whom he marries while on the *ḥadjdj*. The king has to return home before the boy is born, and an astrologer foretells the boy's future, and suggests the *laḳab* of Madjnūn for him. The boy's *murshid* recommends night prayer and Ḳurʾānic reading, and on the basis of the pun between *Laylā* and *layl*, Madjnūn falls in love with an imaginary Laylā and wanders in search of her, his mind affected. He hears of a Laylā who is the daughter of a *ḳāḍī* in Egypt. He goes there, and stays in the *ḳāḍī*'s house as his pupil. He meets Laylā, they fall in love, and then the story continue swiftly to its traditional conclusion with the death of the two lovers. The poem is, however, stretched to over 500 verses by a good deal of lamentation by the various characters; some philosophising in which the poet warns of the danger of love; an anecdote in which the Prophet explains God's inscrutability to ʿĀʾisha; and Madjnūn's refusal to accompany the Angel of Death until the latter, after consulting God, returns assuming the face of Laylā to take him away.

While the chief Urdu poets of Northern India in the 18th and 19th centuries do not appear to have written narrative poems on the story, it obviously remained popular at least into the 1860s, for Blumhardt (*op. cit.* in *Bibl.*, 117, 254, 350) records three *mathnawīs*, one anonymous published in Dihlī in 1864, one by Muḥammad Taḳī Khan Hawas (Lucknow 1862) and a third by Walī Muḥammad Naẓīr (Cawnpore 1886).

It was in the 1860s that theatrical companies proliferated in Bombay. Many of the early plays which they staged took their plots from familiar stories, whether Arab, Persian or Indian. The story of *Madjnūn Laylā* enjoyed a considerable vogue for about thirty years as the subject of verse dramas. It is not known who wrote the first, nor how original those published were, for a playwright employed by one company might be commissioned to revise or adapt an existing play, and there was no law of copyright to prevent the reviser from taking full credit for the play. The following wrote *Laylā Madjnūn* plays which are extant (unfortunately biographical information is almost non-existent): Nusrawān Djī Mihrabān Djī Ārām; Munshī Maḥmūd Miyān Rawnaḳ (1825-66), whose play was written 1857-8; Ḥusaynī Miyān Ẓarīf; and Ḥāfiẓ ʿAbd Allāh. Rawnaḳ's play—probably the best of these—was published in Bombay in 1880 in Gudjarātī script, with the double title *Andjām-i-ulfat, ʿurf Laylā Madjnūn*. Like the plays by the other three, it has now been republished in the Urdu script at Lahore.

These four plays are distinguished by a certain stagecraft and popular appeal rather than by literary merit. With this in mind, the famous Lucknow polymath and novelist, Mīrzā Muḥammad Hādī Ruswā (1859-1931) [see ḲIṢṢA. 5. In Urdu] wrote his *Muraḳḳaʿ-i-Laylā Madjnūn* ("the Album of Laylā Madjnūn"), published at Lucknow in 1885 and at Allahabad in 1887. He had seen plays performed by various touring Bombay companies in Lucknow, including doubtless Madjnūn Laylā plays. As he

writes in his introduction, he was dissatisfied with their language, which he found to be not that of Dihlī or Lucknow, but of the Bombay fish-market! (Ruswā, *tamhid*, 5). Encouraged by friends, he wrote this play to demonstrate how dramatic poetry should be. He employed different poetic metres to suit the characters and situations, and envisaged their being set to music, so that the result might be described as an Urdu opera. But no theatrical company would stage it, and critics generally regard it as a failure. ʿIshrat Raḥmān (cited in *Bibl.*, 279) remarks that it was entirely in verse at a time when prose was playing an increasing part in Urdu drama. The plot, he suggests, had been "worked to death" and had lost its appeal. As a poet of Lucknow who had seen the heyday of the *marthiya* [see MARTHIYA. 4. In Urdu], he was well equipped to write effective passages of melancholy and lamentation: in this respect, the play has much to commend it. But Ruswā was no dramatist; and the story does not lend itself easily to dramatic treatment.

At least one modern Urdu writer has brought Madjnūn Laylā up-to-date in a short story. Sayyid Sadjdjād Ḥaydar's collection of short stories *Khayālistān* includes one entitled *Ḥikāyat Laylā wa Madjnūn* (cited in *Bibl.*, 224-61). In it, the two lovers are reborn under modern conditions. Madjnūn follows Laylā about on a bicycle. Laylā is ordered electric shock treatment, and at the time of this treatment, Madjnūn has a fit. He is taken to Mecca to be relieved of his obsession, but prays only that his suffering may never be lessened. Thus ends this "whimsical and delightfully written story" (Suhrawardy, cited in *Bibl.*, 212), which forms a fitting conclusion to an account of Madjnūn Laylā in Urdu literature.

Bibliography: For Dakanī *mathnawīs* on the story, see Naṣīr al-Dīn Hāshimī, *Dakan mēṅ Urdū*⁶, Lucknow 1963, 62-3, 108-13 (including extracts); Djamīl Djālibī, *Taʾrīkh-i-adab-i-Urdū. i. Ḳadīm dawr*, Lahore 1975, 249-50; for the text of Wāʿiẓ, see *Urdū kē ḳadīm manẓūm dāstānēn*, ed. Khalīl al-Raḥmān Dāwūd, i, Lahore 1967, 1-10, 81-148 (a critical assessment is given by Muḥammad Bāḳir, *Urdū-i-ḳadīm Dakan awr Pandjāb mēṅ*, Lahore 1972, 77-85); the reference by Walī Dakanī to Madjnūn Laylā will be found in *Kulliyyāt Walī*, ed. ʿAlī Aḥsan Mārahrawī, Awrangābād 1927; J. F. Blumhardt, *Catalogue of Hindustani books in the Library of the British Museum*, London 1889, mentions *mathnawīs* published in Northern India in the 19th century. Plays on the story are listed by ʿIshrat Raḥmānī, *Urdū drāmā—tārīkh-o-tanḳīd*, Lahore 1957, 211-23. The *Laylā Madjnūn* dramas of Ārām, Rawnaḳ, Ẓarīf and Ḥāfiẓ ʿAbd Allāh are included in the volumes of collected dramatic works of these authors published by the Andjuman-i-taraḳḳī-yi Urdū in Lahore in recent years; the same society has published Mīrzā Muḥammad Ruswā's *Muraḳḳaʿ-i-Laylā Madjnūn*, ed. ʿIshrat Raḥmānī, Lahore 1963. This includes not only Ruswā's own preface, but a useful introduction by the editor which lists previous dramas on the theme. Sadjdjād Ḥaydar's *Khayālistān* was first published at ʿAlīgaṛh in 1932, and there is a Dihlī edition of 1946; Shāyista Akhtar Bānū Suhrawardy's brief account and assessment of his *Ḥikāyat Laylā wa Madjnūn* is in her *A critical survey of the Urdu novel and short story*, London 1945.

(J. A. Haywood)

MADJRĪṬ, mediaeval Arabic name of the city of Madrid (Spain). The Arabic sources seldom mention this place in the Muslim period. According to al-Ḥimyarī, the *ḥiṣn* of Madjrīṭ was built by the Umayyad *amīr* of Cordova, Muḥammad I (238-76/852-86). M. A. Makkī believes that its foundation may be dated between 252/866 and 257/871 in the reign of this *amīr*; the year 252/866 marks the beginning of the reign of Alfonso III of the Asturias, whose military activities had the effect of destabilising the region between Médinacéli and Toledo (*al-thaghr al-adnā*), which would then have been consolidated by the construction of the fortress of Madjrīṭ as an important element in the military disposition of the region, with a governor appointed by Cordova, ʿUbayd Allāh b. Sālim, who imprisoned and executed a rebel from Toledo named Ibn Balūsh.

From its foundation until the period of the *fitna* of al-Andalus (399/1009), the few facts supplied by the ancient sources on the subject of Madjrīṭ are indicative of its role as a frontier fortress (*thaghrī*). In 320/932, it was subjected to an attack by King Ramiro II of Léon, according to the Christian historian Sampiro. In 324/936, a party of citizens of Madjrīṭ undertook an expedition into Christian territory and, on their return, they were massacred by the enemy, according to Ibn Ḥayyān. The *ḥādjib* Ibn Abī ʿĀmir al-Manṣūr (Almanzor), in the course of his campaign against the fortress of La Muela in 366/977, met at Madjrīṭ the governor of Médinacéli, Ghālib (Ibn ʿIdhārī). Ibn Ḥazm supplies an interesting item of information concerning Madjrīṭ; the slave of a perfume-seller known by the name of al-Faṣīḥ led an insurrection in this town, pretending to be ʿUbayd Allāh al-Mahdī, but he was attacked and killed. J. Oliver Asín believed that this insurrection was inspired by Fāṭimids; on the other hand, M. A. Makkī reckons that the rebel wished to be recognised as the son of the short-lived Umayyad caliph of Cordova al-Mahdī (399/1009 and 400/1010). Thus the rebellion would have taken place in the time of the Umayyad caliph al-Mustakfī bi'llāh (414-16/1024-5).

In the period of the Taifas (*mulūk al-ṭawāʾif*), Madjrīṭ must have been attached to the kingdom of the Banū Dhi 'l-Nūn of Toledo. The king of Castile Alfonso VI took possession of Madjrīṭ as well as of other fortresses in the region, shortly before the fall of Toledo, in *ca.* 476/1083. It seems to have remained under Christian domination except for a very short period, at the time of the so-called Talavera campaign of the Almoravid *amīr* ʿAlī b. Tashfīn (Ibn Abī Zarʿ). But the Christian city retained a Muslim community (*mudejares*), concentrated in a particular quarter (Barrio de la Morería). There were also Moriscos in Madrid at the time of their official expulsion from Castile in 1610.

The only descripiton of Madjrīṭ preserved by Arab sources is that of al-Ḥimyarī. It is very short, stating that the place consists of a small town and an impregnable fortress, with a Friday-mosque. Also mentioned is the discovery of the skeleton of a gigantic beast in the moat of the town (large fossils are not rare in the valley of the Manzanares), and the extraordinary nature of the soil of Madrid, ideal for the manufacture of solid and durable cooking-pots.

The topography of Madjrīṭ can therefore only be reconstructed in a hypothetical fashion, by means of the archaeological and toponymic remains of a more recent period. It seems that the Arab *ḥiṣn* was situated on the heights of the Palacio Real, on a raised promontory dominating the Manzanares river. Oliver Asín considered that the entire hill must have been surrounded by walls, with the *ḥiṣn*

and other military constructions forming a citadel whose Arabic name was apparently *al-Mudayna* (*Almudena*), a name preserved by the church of Santa María de la Almudena, to the south-west of the hill, at the extremity of the Calle Mayor. It apparently had two gates, whose existence is known to us from Christian documents: the Puerta de la Vega, to the south-west of the hill, towards the valley of the Manzanares, and the Puerta de la Almudena, to the south-east, linking the citadel with the town or *madīna*. The latter probably had its own surrounding walls, in common with many other towns of al-Andalus. The Arab *madīna* must have extended towards the eastern end of the hill, covering a half of what is currently the Calle Mayor (Platerias), where the gate known as the Puerta de Guadalajara was situated. Its northern extremity was located to the south of the Plaza de Oriente and the theatre of La Opéra. On the other hand, the southern limits of the Arab Madjrīṭ are the object of greater controversy, since to the south the hill of the Palacio Real and the *madīna* overhang a ravine of considerable depth, which today is crossed by means of a viaduct and which opens on a small valley (Calle de Segovia) before climbing again towards other hills (Las Vistillas and San Andrés). Oliver Asín supported the hypothesis that the pre-Arab Madjrīṭ first grew up in this narrow valley and that the walls of the town must have enclosed the valley, on the descent from the hill of *al-Mudayna* and the rise towards those of Las Vistillas and San Andrés, as was the case with the mediaeval and modern surrounding walls (see the engraving of *Códice de Wingaerde*, 1563-70). But the archaeologist Basilio Pavón is not in agreement with this hypothesis about the southern limits of Madjrīṭ; he considers that the wall of the second enclosure skirted the northern ridge of the small valley, running parallel to the Calle Mayor, a hypothesis which had already been propounded by E. Tormo. It would be necessary to attribute an origin in the Christian period to the wall which encloses the valley, Las Vistillas and San Andrés, and which would have formed a third southern tier in the fortifications of Madrid. B. Pavón furthermore maintains that the citadel or first tier did not embrace entirely the hill of the Palacio Real; the southern section, currently occupied by the cathedral of the Almudena, would have formed a part of the second tier, as far as the Puerta de la Vega. Almudena or *al-Mudayna* would thus be a toponym designating not only the citadel, but the *madīna* or town with the sense of "small town", in accordance with the text of al-Ḥimyarī.

The site of the Great Mosque is also the subject of various hypotheses. It may have been on the former site of the church of the Almudena or that of the church of San Salvador, which has likewise disappeared and used to stand opposite the present-day Town Hall; it could also have been on the site where the *mudejar*-style church of San Nicolás now stands, a few metres to the north of the extremity of the Calle Mayor. The *Fuero de Madrid* of 1202 also mentions the existence of *azoches* (markets, bazaars), the most important of which was situated along the Calle Major. There was also an *almuzara* (*al-musārāt*), a promenade and place of recreation, as in other towns of the Muslim West; it was most probably located outside the walls.

But the most remarkable characteristic of Madjrīṭ, as also of mediaeval Christian Madrid, was its system of catchment and distribution of subterranean waters, this being the basis of the legend, documented from the 15th century onward, asserting that Madrid had been built on water. The hydraulic system of Madjrīṭ—and of Madrid until the 15th century—was based on the catchment of water by means of wells linked by large subterranean galleries (*ḳanāt* [*q.v.*], pl. *ḳanawāt*) descending from an elevated place towards the town, where they form new ramifications, on or below the surface, which emerge in public fountains, in gardens or in houses. It is highly probable that this technique was employed in various parts of the Iberian Peninsular in pre-Islamic times; but traces of it have only been preserved in Madrid, a huge complex which has lasted remarkably well over the centuries. This is perhaps a tribute to the quality of the soil of Madrid, noted by al-Ḥimyarī, which is such that even today some public fountains of the town are supplied by this system of water distribution. The *ḳanāt*s of Madjrīṭ have been studied by Oliver Asín: the two most important canals are the Alto Abroñigal and the Bajo Abroñigal, whose respective sources are situated in two hills which are still known as Canillas and Canillejas, toponyms whose Arabic etymology is to be found in *ḳanāt*, of which the plural form *aḳniya* is encountered in the Arabic of al-Andalus. The Alto Abroñigal came to an end by the site of San Nicolás, the church already mentioned, close to the citadel, in the heart of the Arab town. The Bajo Abroñigal terminated at the Puerta Cerrada, on the hypothetical third tier of the town's defences.

It is furthermore quite possible that the name of Madjrīṭ should be associated with this hydraulic system, according to a popular etymology which has it evolving from *madjrā*, canal or water-course. The origin of this name does not seem to have interested the Arab authors of the Middle Ages, but as soon as Madrid became the capital of the Spanish Empire at the end of the 16th century, many scholars tried to find Arabic origins for it, helped perhaps by the Moriscos: *mahdjara*, *madrasa*, *mashriḳ*, etc. Subsequently, an etymology of clerical origin prevailed: *Maioritum* (from the Latin *maior*), of which Madjrīṭ would be the Arabic transcription. In the 18th century, faced with numerous ill-founded theories, the Maronite priest Michel Casiri (al-Gaziri) was obliged to establish a compromise theory; the original name was the Latin *Maioritum*, but Madjrīṭ was a word of African origin signifying canal or conduit (*aquaeductum*).

In the 20th century, and in the light of modern philological studies, R. Menéndez Pidal has constructed a hypothtical Celtic name *Magerito* with the sense of "ford" or "long bridge". M. Gómez Moreno claimed to have discovered in Madjrīṭ a terminal *-īṭ* having its origin in the Latin ending *-etum*, collective of abundance. Oliver Asín proposed a brilliant hypothesis, that Madjrīṭ must be a hybrid formed from the Arabic word *madjrā*, canal, and from the Roman suffix *-it*, of abundance; Madjrīṭ would thus signify "place where canals are abundant". He considered, however, that the present name of the town comes not from the Arabic name Madjrīṭ, but from *Maṭridj*, a Roman toponym having its origin in the Latin *Matricem*, the primitive name of the small valley where the Calle de Segovia is currently situated, on the site of a pre-Arab settlement, according to this author. Finally, Joan Corominas has made some adjustments to this theory while retaining the connection between Madjrīṭ and *madjrā*. He rejects the possibility of the use of the collective *-etum* (*-īṭ*) other than in the sphere of plants, and he believes that Madjrīṭ is a

metathesis of the word of Latin origin *maṭridj* (from *matricem*), according to a popular etymology which seeks to link it with *madjrā*. He also considers that the current form of Madrid may derive from the Arabic Madjrīṭ, by means of an intermediary form *mazdrid* with an epenthetic *-d-*.

The best-known native of Madjrīṭ in the Muslim period is the astronomer and mathematician Abu 'l-Ḳāsim Maslama al-Madjrīṭī [*q.v.*], but other individuals of secondary importance who have been studied by Oliver Asín were also born there. Ibn Ḥayyān and other historical sources of al-Andalus supply some names of governors of Madjrīṭ in the Umayyad period, in particular numerous members of the family of the Banū Sālim, of Berber origin, firmly implanted in the central marches of al-Andalus and especially in the region of Médinacéli (*Madīnat Sālim*).

Bibliography: The Arabic sources on Madjrīṭ are: al-Ḥimyarī, *al-Rawḍ al-miʿṭar*, ed. E. Lévi-Provençal, Cairo 1938, and ed. I. ʿAbbās, Beirut 1980 (s.v.); Ibn Ḥayyān, *al-Muḳtabis min anbāʾ ahl al-Andalus*, ed. M. A. Makkī, Beirut 1973; *al-Muḳtabas*, ed. P. Chalmeta, Madrid 1979; Ibn ʿIdhārī, *al-Bayān al-mughrib*, ii; Ibn Ḥazm, *Naḳṭ al-ʿarūs*, Cairo 1948; Ibn Abī Zarʿ, *Rawḍ al-ḳirṭās*, Fez 1936. The *Fuero de Madrid* was edited in Madrid in 1932.

A seminal work which is still useful for Madjrīṭ (etymology, topography, canals and history) is that of J. Oliver Asín, *Historia del nombre de Madrid*, Madrid 1959; M. A. Makkī, *Madrid al-ʿarabiyya*, Cairo n.d. [1968] basically follows the preceding work, with a few historical novelties. On the topography of Madjrīṭ, reference may be made to E. Tormo's slightly out-dated work, *Las murallas y las torres, los portales y el alcázar del Madrid de la Reconquista creación del Califato*, Madrid 1945, in anticipation of *Madrid árabe* by P. Pavón, as yet unpublished. On the *almuzaras*: Oliver Asín, *Las dos almuzaras*, in *Al-And.*, xxvii (1962), 155-79. On the *ḳanāts*: Cornel Braun, *Teheran, Marrakesh und Madrid. Ihre Wasserversorgung mit Hilfe von Qanaten*, Bonn 1974, and H. Goblot, *Les qanats. Une technique d'acquisition de l'eau*, Paris-The Hague-New York 1979. On the etymology of Madjrīṭ: R. Menéndez Pidal, *La etimología de Madrid y la antigua Carpetania*, in *Revista de la Biblioteca, Archivo y Museum de Madrid*, xiv (1945); M. Gómez Moreno, *Le desinencia -it a proposito de Madrid*, in *ibid.*, xv (1946); Oliver Asín, *El nombre de Madrid*, in *Arbor*, xxviii (1954), 396-426; J. Corominas, *Etimologiá de Madrid*, in *Revista de Filología Española*, xliii (1960), 447-50.

(M. J. RUBIERA DE EPALZA)

AL-MADJRĪṬĪ, ABU 'L-ḲĀSIM MASLAMA B. AḤMAD AL-FARAḌĪ, mathematician and astronomer, born in Madrid in the mid-4th/10th century, died in Cordova in about 398/1007.

The facts which are known do not enable us to trace his biography in detail. He was clearly an important person since Ibn Ḥazm mentions him in his *Ṭawḳ al-ḥamāma* (ch. xiv). He clearly established himself at a very early age in Cordova, and was a pupil of the geometrician ʿAbd al-Ghāfir b. Muḥammad. It must be supposed that he maintained contact with the circle of Hellenists which came into being in the period of ʿAbd al-Raḥmān III al-Nāṣir. In 369/979 he carried out some astronomical observations, and it must have been at this time that he adapted the tables of al-Khwārazmī [*q.v.*] to the Cordova meridian. Some time later, he apparently brought the *Rasāʾil Ikhwān al-Ṣafāʾ* to public attention in al-Andalus. It is possible that he performed the duties of a court astrologer, since it is to him that one attributes the horoscope which, according to Ibn ʿIdhārī (*Bayān*, ed. E. Lévi-Provençal, iii, Paris 1930, 14-15) and Ibn al-Khaṭīb (*Aʿmāl*, 127-8, *apud* Hoenerbach, *Islam. Gesch. Spaniens*, 259), predicted and described the unfolding of the *fitna*.

His disciples included: al-Kirmānī (d. 458/1066), who introduced the *Rasāʾil Ikhwān al-Ṣafāʾ* to Saragossa and the frontier regions of the North; Abu 'l-Ḳāsim Aṣbagh b. al-Samḥ (d. 426/1035, see IBN AL-SAMḤ); Abu 'l-Ḳāsim Aḥmad b. al-Ṣaffāz (d. 426/1035, see IBN AL-ṢAFFĀZ); the astrologer Ibn al-Khayyāṭ (d. 447/1055), to whom so many elegies are dedicated in the *Memoirs* of the Zīrid king ʿAbd Allāh; al-Zahrawī [*q.v.*] and Ibn Khaldūn of Seville.

The authenticity and the number of works by Maslama al-Madjrīṭī have given rise to numerous discussions. As a general principle, we can be sure that the books of a magical or alchemical nature which are attributed to him do not belong to him, since the *ḳāḍī* Ibn Ṣāʿid does not mention them in his *Ṭabaḳāt*; they should be attributed to his quasi-temporary and compatriot Abū Maslama Muḥammad . . . al-Madjrīṭī (on whom see Sezgin, *GAS*, iv, 294-8) and to the latter's pupil Ibn Bishrūn al-Madjrīṭī (*GAS*, iv, 298). Among these apocryphal writings, the principal ones are the *Rutbat al-ḥakīm*, the *Ghāyat al-ḥakīm* (*Picatrix*) and the *Sirr al-kīmiyāʾ*.

Books which may be regarded as authentic works of Abu 'l-Ḳāsim Maslama al-Madjrīṭī are therefore as follows: (1) A textbook of commercial arithmetic (*Tamām ʿilm al-ʿadad* = *K. Thimār al-ʿadad* = *Muʿāmalāt*) which, according to Ibn Khaldūn dealt with sales, valuation and taxation and in which, apparently, arithmetical, geometrical and algebraic techniques are employed indiscriminately; (2) a very short *Treatise on the astrolabe* (not to be confused with that of Ibn al-Ṣaffār), which deals with the technical construction and use of this instrument (B.N. Arabic ms. 4821, fols. 76a-81b, ed. and tr. J. Vernet and A. Catalá, in *al-And.*, xxx [1965], 15-47); (3) An adaptation of the *Astronomical tables* of al-Khwārazmī to the Cordova meridian and to the Leginian Calendar; (4) An adaptation or emendation of some tables of al-Battānī [*q.v.*]; (5) Notes on the theorem of Menelaus (*shakl al-ḳaṭṭāʿ*), on which see M. V. Villuendas, *La trigonometria europea en el siglo XI . . .*, Barcelona 1979, and A. Björnbo and H. Suter, *Thabits Werk über den Transversalsatz*, Erlangen 1924, 23, 79, 83 and ms. ²Esc. 972, 2; (6) *Tasṭīḥ basīṭ al-kura*, which is an Arabic translation of the *Planisphere* of Ptolemy; the two originals are lost but Maslama's work is preserved (a) in a Latin version made from the Arabic text by Hermann of Dalmatia (1143) and edited in Basle in 1536 and in Venice in 1558, and (b) in a Hebrew version; the Arabic translation can be judged thanks to the Paris manuscript which contains Maslama's own commentary, *Taʿlīḳ ʿalā Baṭlamiyūs fī tasṭīḥ basīṭ al-kura*; and (7) a work of astronomy utilised by Ibn Ṭaybughā b. al-Madjdī (d. 850/1447) in *al-Durr al-yatīm* (see Sezgin, *GAS*, vi, 227, 4).

MĀDJŪDJ [See YĀDJŪDJ WA-MĀDJŪDJ.]

MADJŪS (coll., sing. *Madjūsī*), originally an ancient Iranian priestly caste (OP *magush*, Akk. *magushu*, Syriac *mgōshā*, Greek μάγος) but used in Arabic primarily for Zoroastrians.

This caste was closely identified with the ruling élite in Sāsānid Iran, where their faith was the official religion of the state and where they were organised in a social and religious hierarchy. The priests, called *mōbad*, *hirbad*, *dastūr*, or *rat* depending on context and function, had ritual, judicial and educational responsibilities. The priestly hierarchy with the *mōbadān mōbad* at its apex interlocked with the secular administration, and priests performed notarial duties in the courts, sealing documents and decisions. At the end of the Sāsānid period, *hirbads* appear to have been in control. The public cult with its royal political significance performed in fire temples involved rituals concerned with the fire itself, as well as with animal sacrifices and liturgical recitations. In addition to a hierarchy of village (*ādurān*) and provincial (*varhrān*) fires there were three especially famous temples: that of the Farnbag Fire, probably at Kāriyān in Fārs, for priests; the Gushnasp Fire at Shīz in Ādharbaydjān for soldiers; and the Burzēn-Mihr Fire in the mountains above Nīshāpūr for farmers. Other fires are mentioned on seals and in texts, and although fire temples were usually state property, they could be founded and endowed privately. At the personal level, the cult involved ceremonies at the hearth fire, and emphasised the maintaining of a state of ritual purity by performing ablutions with bull's urine (*gōmēz*) and cold water, by avoiding dead matter, by tying and untying the sacred cord (*kustī*), and by eating in a state of ritual silence (in *bādj*) with only murmuring (*zamzama*). The popular cult included food-offerings at fire temples, the veneration of sacred trees, and public seasonal feasts (*gāhambārs*) and dances. The bodies of the dead were exposed in the open. Elaborate private rituals contributed to social differentiation, with the standard of observance greatest among the upper classes and declining as one moved down the social scale among the majority of nominal Madjūs.

Although the Avesta had been written down in its 21 nasks, the texts were usually memorised and known only by those priests who specialised in specific rituals. Since the Avestan texts were imbedded in their commentary, there was no separate sacred book of scripture or closed canon in terms of authority. Nor was there any doctrinal orthodoxy. Monotheist, dualist, and polytheist expressions coexisted with choice of emphasis and interpretation depending on circumstances. The Zurvanite tendency to assert the ultimate primacy of the god of Time and Destiny appears to have been favoured in the Sāsānid period because of its authoritarian implications, and was associated with the ruling classes. Other monotheist expressions concerning the primacy of Ohrmazd appear in apologetic contexts with Jews and Christians. The most complete dualist expressions are found in the 3rd/9th century Pahlavi literature in a context of polemic with Islam, and these represent Ohrmazd and Ahriman as co-eternal antagonists and creators. Polytheist expressions having to do with the Yazatas as being deserving of worship tended to be reinterpreted by semantic arguments concerning the definition of deity and of worship.

An élitist social ethic honouring establishmentarian virtues provided ideological justification for the hierarchic society of the Madjūs. High values were placed on order, stability, legality and harmony among the functionally-determined divisions of society (priests, soldiers, bureaucrats, and workers, or else priests, soldiers, farmers, and artisans) so each would perform its specific duty towards the others. The justice of rewards and punishments was emphasised at the spiritual, political and social levels, while economic, legal, and religious sanctions were used to ensure the obedience of women and children. Consanguineous marriage (*khvētōdās*) was approved as a means of preserving the social exclusiveness, solidarity, and purity of descent of the upper classes. Material wealth was equated with the virtue and goodness inherent in the upper classes, whose destiny or fortune (*hvarnah*) it was to enjoy the good creation of Ohrmazd. Naturally anti-ascetic, their ethic equated poverty with the sin and evil inherent in the lower classes.

Consequently, the Madjūs were vulnerable to the loss of political support and to the rejection of authority and material success by alienated members of their own society. In the Sāsānid period their position was eroded by the internal ascetic, gnostic sectarian movements of Mani and Mazdak and by conversions to Christianity in the west and to Buddhism in the east. Bad religion (*ahramokīh*) was identified with antinomianism, social disorder, extremist behaviour and dissimulation by the Madjūs, who executed and disinherited unrepentant apostates.

Thus at the end of the Sāsānid period not all Persians were Madjūs, nor were Madjūs confined to Iran proper. They were to be found as administrators, landlords, and soldiers in non-Persian parts of the Sāsānid empire such as al-ʿIrāḳ, Baḥrayn, ʿUmān and Yaman, and there may have been Arab Madjūs in the tribe of Tamīm and in Yaman. Outside the Sāsānid empire, there were Madjūs in western India and China, probably as merchants, and local communities in Central Asia with local differences in cult which were not part of the Sāsānid organisation.

The fall of the Sāsānid state to the conquering Muslims drastically and permanently changed the status of the Madjūs from that of rulers to that of subjects. Fire temples were confiscated in Baḥrayn and al-ʿIrāḳ, while Madjūs were required to pay tribute (*djizya*) wherever they surrendered, at first in Yaman, ʿUmān, Baḥrayn, and al-ʿIrāḳ. At first their treatment was inconsistent, and in 20/641 Djazʾ b. Muʿāwiya began to break up the families of Madjūs and forbade the *zamzama* in the countryside near Baṣra until ʿAbd al-Raḥmān b. ʿAwf convinced the caliph ʿUmar I that Muḥammad had accepted *djizya* from the Madjūs of Hadjar. This provided a precedent, since there was no Ḳurʾānic basis for treating the Madjūs as *ahl al-kitāb*. Sūra XXII, 17 merely lists them along with *ahl al-kitāb* and *mushrikūn*, and it was eventually decided in Muslim theory that the Madjūs were intermediate between the *ahl al-kitāb* and *mushrikūn* since they had no real prophet or revealed scripture. Their women and the meat of animals slaughtered by them were forbidden to Muslims, and according to al-Shāfiʿī, their blood price was 1/5 that of Muslims. Nevertheless, Madjūs were employed in the administration at Baṣra and in Khurāsān under the Umayyads.

In Iran the Madjūs kept their fire temples, suffered little interference in their cult at first, and were allowed to pay *djizya*. In some places, such as Rayy, Ḳūmis and Shīz, the peace terms provided for the preservation of their fire temples. However, there was no recognition of the priesthood as the representatives of a religious community by the Muslim state, and since no unitary organisation or hierarchy of priests survived the conquest, leadership devolved on local priests and *dihḳāns*.

The loss of political power and support had several consequences for the Madjūs. First, the loss of members by conversion to Islam was added to continuing conversion to Christianity. The descendants of the Persian soldiers in Yaman (*Abnā'* [*q.v.*]) were converted to Islam in the lifetime of Muḥammad, as were the *marzbān* of Hadjar with some of his followers. A number of *dahāḳin* and units of the Sāsānid army became converted to Islam in al-ʿIrāḳ, and by the time of ʿUmar II (99-101/717-20), the Madjūs of al-Ḥīra had become Muslim. Generally, members of the Sāsānid establishment became converts in order to avoid paying *djizya*, to keep their property and position, and to join the Muslim army and administration. The Madjūs also lost many members through captivity, since children taken captive were raised as Muslims. Nevertheless, there is no evidence of early mass conversions in Irān. The governor of Sidjistān in 46/666-7, al-Rabīʿ, is said to have encouraged conversion by a combination of persuasion and force, and he required converts to learn the Ḳur'ān. Ḳutayba b. Muslim [*q.v.*] also encouraged conversion at Bukhāra in 94/712-13, built a Friday mosque on the site of the former fire-temple, and attracted converts among the poor by paying them two *dirhams* to worship there, although afterwards conversion was discouraged in order to preserve the tax base. Conversion was also discouraged by the Madjūs themselves, who treated apostates as legally dead, disinherited them, and required property to remain within their community. Converts were also subject to discrimination by local authorities, such as Bahrām Sīs who, when appointed *marzbān* by the Muslim governor of Khurāsān in 105/725 and charged with collecting taxes from the Madjūs, collaborated with the Christian and Jewish agents to make 30,000 converts to Islam pay the *djizya* and to exempt 80,000 non-Muslims.

Second, the advent of Muslim rule subjected the Madjūs to sporadic persecution. About 50-1/670-1 Ziyād b. Abīhi, the governor of al-ʿIrāḳ and the east for Muʿāwiya, sent his cousin ʿUbayd Allāh b. Abī Bakra to destroy the fire temples and to confiscate their property in Fārs and Sidjistān. Although ʿUbayd Allāh destroyed the fire temple at Kāriyān near Dārābdjird and killed the *hirbads*, the chief *hirbad* of Sidjistān, Shāpūr, escaped with his fire temple at Karkūya near Zarang because the local *dihḳāns* and Madjūs appealed to the caliph. There were later extinctions in a village at Ḳumm by al-Ḥadjdjādj and at Īdhadj on the border between Khuzistān and Iṣfahān in the time of Hārūn al-Rashīd (170-93/786-809). Al-Mutawakkil (232-47/847-61) is said to have had a famous ancient cypress tree reputedly planted by Zoroaster cut down in 247/861. In 282/895, the Turk Barun, who was governor of Ḳumm, destroyed a pre-Islamic fire temple in the village of Fardadjān near Iṣfahān, and in 288/901 destroyed the last fire temples in the village of Djamkaran at Ḳumm. Sometimes fire temples were converted into mosques in places where Arabs had settled or as the result of conversion, although afterwards the Madjūs often continued to venerate sites where fire temples had been.

Third, the Madjūs gave an apocalyptic meaning to the events at the end of the Sāsānid period, interpreting them as signs of the end of the millenium of Zoroaster and the beginning of the millenium of Oshedar, which calculations based on the *Letter of Tansar* would place about 41/661 but which was later identified with the beginning of the era of Yazdadjird in 10/631. The end of the millenium was signalled by the advent of Arab rule and destruction by them, and by the overturning of social classes and values, when the nobles would be powerless, separated from their families and forced to share their status with people of low origin, and when people would copy foreign customs. Predictions of the arrival of the liberator, Varhrān Vardjāvand, of the destruction of Muslim places of worship, and of a Roman invasion, may belong to the propaganda of Sāsānid restoration attempts. The Mahdist hopes associated with Abū Muslim have also been linked to Zoroastrian eschatology, the restoration of Zoroastrianism and the end of Arab rule in Khurāsān. It was against this background that a series of risings by Zoroastrian peasants provoked by fiscal oppression in eastern Iran in the 2nd/8th century served as the occasion for the emergence of new antinomian, anti-establishment Zoroastrian sects. This began with the peasant revolt near Nīshāpūr led by Bihāfarīd from 129/766-7 to 131/748-9, who claimed to be a new prophet with a book in Persian, abolished *zamzama*, the use of wine and meat, consanguineous marriage, and fire-worship, and limited dowries to 400 *dirhams*. Although the *mōbads* got Abū Muslim to suppress the rebellion, his sect could still be found near Marw in the 4th/10th century awaiting his return, even though *djizya* was not accepted from them. Madjūs also joined the rising of Sinbādh in 138/755, and followers of Bihāfarīd and Madjūs in Sidjistān and at Harāt and Bādghīs followed Ustādhsīs in 150/767; his sect also survived until the 3rd/9th or 4th/10th century. Muslim authors noted four sectarian divisions among the Madjūs. Al-Shāhrastānī lists the Kayūmarthiyya, Zarwāniyya, Zarādushtiyya, and Saysāniyya called Bihāfarīdiyya, while al-Baghdādī gives them as Zarwāniyya, Mashiyya, Khurramdīniyya and Bihāfarīdiyya, and says that *djizya* was only acceptable from the first two.

Fourth, the inability to execute sinners and apostates themselves produced a change in attitude towards nonconforming members of their own community. Persuasion replaced the threat of force lest sinners be tempted to convert. The nobility of the virtuous poor, whose good works cannot be stolen and who will be rewarded in heaven instead of on earth, appears as a theme in *andarz* literature. This was probably the result of the growing impoverishment of the priests and *dihḳāns* as well as an attempt to keep the loyalty of still poorer members of the community, and it reflects a degree of social levelling among Madjūs after the Muslim conquest, although the sincerity of the sentiment was questioned in the apocalyptic *Djāmāsp-nāma*.

Fifth, unavoidable contact with unbelievers and the loss of texts led to changes in cult and custom. The more elaborate aspects of ritual purity went unobserved. Madjūs were allowed to sell animals to non-Zoroastrians when survival depended on it, and they began to expose their dead inside an enclosure (*dakhma*) out of the sight of unbelievers. They did not consider it a sin to steal property from non-

Zoroastrians that had been stolen from them. Although they learned to be content with compromises that could not be avoided, they also exerted themselves to maintain their rituals whenever they could.

In spite of their decline in status and in numbers, the 3rd/9th and early 4th/10th centuries appear to have been a time of relative recovery, stability and consolidation for the Madjūs. Part of the fire at Kāriyān had been taken to Fasā for safe-keeping during the Muslim conquest, and from it the fire temple at Kāriyān, destroyed in the 1st/7th century, was restored. Fire was exported from Kāriyān and Shīz to new temples and al-Muʿtaṣim (218-27/833-42) permitted the restoration of fire temples at Iṣṭakhr and in Farghāna. What remained of the old religious literature was collected and preserved by Āturfarnbag-i Farrukhzātān, *mōbad* of Fārs in the reign of al-Maʾmūn (198-218/813-33). A new didactic, apologetic and polemic literature was produced by Mānushčihr, the leading *mōbad* of Fārs and Kirmān in the second half of the 3rd/9th century, by his brother Zātspram, the *mōbad* of Sirkān, by Mānushčihr's nephew, Emēt-i Ashavihishtān, *mōbad* over much of southern Iran in the first half of the 4th/10th century and by his successor, Āturpāt-i Ēmētān about the middle of the 4th/10th century. The main Pahlavi texts which were produced in this period sought to forestall conversion through intellectual arguments against monotheism and gnosticism, and through using that part of the legal tradition that concerned social behaviour and personal status in order to preserve their distinction from unbelievers and to draw social boundaries more closely around themselves. But authority and solidarity within the community, which depended on the priest's appointment of the heads of households responsible for carrying out family law, was undermined by the facts that the priests themselves were too few and poorly trained, had taken up crafts in order to survive, and had been replaced by those less qualified. In these circumstances, educated laymen were allowed to substitute for them when necessary.

Despite these problems, the testimony of Muslim geographers indicates that Madjūs were still widespread and fairly numerous in Iran and the east as late as the 4th/10th century. There were many villages of Madjūs on the Aras River in Ādharbāydjān and the fire temple at Shīz survived as late as 333/943. Madjūs were numerous in al-ʿIrāḳ and had a large fire temple on the west bank of the Tigris opposite al-Madāʾin. There were still a few Madjūs in Khuzistān, with several fire temples at the sacred village of Hudidjān. They were numerous in al-Djibāl, where they could be found at Rayy and in villages near Ḳumm, while there were still fire temples near Iṣfahān. Madjūs were more numerous in Fārs than anywhere else, with fire temples in nearly every village, town, and district, and they were employed as local governors there by the Būyids. However, pressures for conversion, such as the activities of *Shaykh* Abū Isḥāḳ al-Kāzarūnī (d. 426/1034) and his followers, led to conflict and the outbreak of a Muslim-Madjūs riot at Shīrāz in 369/979. Madjūs could be found in Ḳūhistān, and remained numerous and influential at Kirmān until the late 3rd/9th century. There were Madjūs in the Caspian provinces as late as the 5th/11th century, although in the late 3rd/9th-10th century most of those in Daylām had been converted by Zaydī Shīʿīs and those in Gīlān were converted by Ḥanbalīs. Madjūs still lived in the city of Zarang in Sidjistān in the early 4th/10th century, while the fire temple at Karkūya survived as late as the 5th/11th century. There were several sects of Madjūs in Khurāsān, where there were fire temples at Nīshāpūr, Harāt and near Ṭūs, there was a village of Zoroastrian donkey-drivers near Marw, although the Karrāmiyya sect [*q.v.*] were converting Madjūs to Islam at Nīshāpūr. To the east, there were fire temples at Balkh, Bukhārā, and Farghāna in the 3rd/9th century, and Madjūs in villages in Turkish territory and in China in the 4th/10th century. There were also new groups of Madjūs settled in northwest India and along the west coast, mainly engaged in trade, from the 2nd/8th century on. By the 4th/10th century there was a fire temple and *dakhma* at Broach, while towards the end of the century Zoroastrian merchants at Cambay came into violent conflict with the Hindus and were driven out.

Although outstanding public differences such as the exposure of the dead and the refusal to use heated baths remained between Madjūs and Muslims, a resonance developed between Islam and Zoroastrianism in the form of common features shared by both traditions. In many cases it is impossible to prove that similarities were the result of the influence of one religion on the other or, if so, which way the influence went. Such are the shared belief in creation, the torment of the grave, the weighing of deeds at the judgment of the soul, rewards and punishments in Heaven and Hell, angels and demons, the end of the world, the coming of a messianic hero and resurrection. Such also are the practice of five daily times of worship, the requirement of an intention to worship in order for it to be acceptable, the recitation of scripture for the dead and a common aversion to idolatry. In both traditions, authoritarian appeals to the interdependence of religion and state were challenged by the antinomian extremism of sectarian rebels. There was a shared philosophical vocabulary and use of rational arguments between the Madjūs and the Muʿtazila, who argued the same issues from opposite sides, the Madjūs insisting that if there is only one creator he must also be responsible for evil, and arguing for a dualist solution to preserve God's goodness, mercy, and justice, along with human responsibility, at the expense of God's omnipotence. There is also a similarity between the archetypal religious man (*Zaratōshtrōm*) of the Madjūs and the Muslim concept of the *Insān al-Kāmil*, while the belief of the Madjūs in the need to follow the religious example of a learned *dastūr* who is the mediator for the age resembles the concept of the *Imām* of the age and the function of the *mudjtahid* among Shīʿīs.

Other similarities are more likely to be the result of Islamic influence. Zoroaster came to be described as a prophet whose revelation was the *Dēnkart* and whose miracle was the *Avesta*. Sometime after the 5th/11th century, *khvētōdās* became marriage between maternal or paternal first cousins. Dowry was approximated to Muslim *mahr*. Madjūs began to establish *waḳf*s, but in ways similar to the old endowments for fire-temples. By the 6th/12th century they had adopted the custom of beginning actions such as slaughtering an animal or writing with the phrase "in the name of God" (*pa nām i yazdān*). Shrines to the *yazata*s were preserved and protected by rededicating them to daughters of Yazdadjird, who disappeared into the mountainside like Shīʿī *Imāms*, as early as the 4th/10th century at Rayy, or later by giving them Muslim form as Shīʿī *imāmzādas*, making pilgrimage to them and slaughtering animals there. Madjūs also began to visit Muslim

shrines on the pretext that they had replaced former fire temples.

Customs of Zoroastrian origin can also be found among Muslims, sometimes in secularised form such as the Iranian solar calendar, the celebration of the festivals Nawrūz and Mihradjān, or astrology. The fires lit at Iṣfāhān about 313/935 to celebrate Muḥammad's birthday seem to have been inspired by Zoroastrian winter fire festivals. Symbols associated with Zoroastrians such as the cup of Djamshīd, wine, the tavern, the old *mōbad*, and the youth came to represent those things forbidden by Islam in Persian poetry with *malāmatī* Ṣūfī connotations. It is sometimes suggested that so many similarities as these may have made conversion from Zoroastrianism to Islam easier, although it might also be suggested that many common features were the result of conversion.

The history of the Madjūs in Iran after the 4th/10th century is little-known. They are presumed to have survived as local minorities suffering general disasters with the rest of the population, while their traditions were preserved in priestly and learned lay families. In particular, they preserved and transmitted their religious texts which have survived in India, and manuscript colophons indicate the presence of *hirbads* at Nīshāpūr and in Sidjistān in the 7th/13th century. A copy of the *Vidēvdād* made in Sidjistān in 601-2/1205 was taken back to India by a Zoroastrian named Māhyār from Uch in the Pandjāb who was instructed in the religion by the *hirbads* of Sidjistān for six years. The copy of this text made at Cambay in 723/1323 is the source of the oldest known manuscript of this work. We are also told that in the early 8th/14th century the *varas* ceremony for making the mouth-masks worn by priests attending the fire was abandoned at Yazd because there was no one left who knew the ritual.

At the same time, Zoroastrians were spreading in Gudjarāt and the Pandjāb, beginning in the 6th/12th century as farmers, weavers, artisans, toddy dealers, and merchants in the coastral trade. By then they had returned to Cambay, and by 537/1142 there were Madjūs at Navsari, at Anklesvar by 666-7/1238, and at Thana about 720/1320. By the 8th/14th century, Gudjarāt was divided into five religious districts (*panthaks*). The sole first-rank fire, the *Ātāsh Bahrām* at Sandjan, was an object of pilgrimage, while daily rituals were carried out at hearth fires in homes. The oldest secondary type of fire temple or *Dār-i Mihr* was at Navsari from about 536-7/1142 onwards, but did not have a permanent fire; the priest attending it brought embers from his own hearth fire every day. There was another *Dār-i Mihr* at Broach in the late 6th/12th century. By the 7th/13th century, vernacular Gudjarātī versions of Avestan and Middle Persian texts began to be made.

Important changes in the Indian community began with new pressures from Muslims and the Portuguese towards the end of the 9th/15th century. The Zoroastrians who joined the Hindus in the unsuccessful defence of Sandjan against Muslim attack in about 895/1490 left, taking the *Ātāsh Bahrām* with them in a metal vessel, and eventually settled at Navsari in 922/1516, where a layman (*behdīn*) called Čanga Shāh, who was the local tax farmer (*desai*), persuaded the Muslim ruler to exempt local *behdīns* from the *djizya*. The 10th/16th century saw the rise of the Bhagaria priesthood at Navsari, based on fees for performing rituals, gifts of endowed property and Mughal patronage. In order to control income from fees, in 987/1579 the chief priest at Navsari, Dastūr Mehrdji Rānā, required his personal permission for other priests to perform rituals. The priests from Sandjan were only allowed to attend the *Ātāsh Bahrām*, and became increasingly impoverished as their numbers grew. The *desai-gir* of Navsari remained in the family of Čanga Shāh until 1003-4/1595, when Kaykobād the son of Mehrdji Rānā combined it with the priesthood. This concentration of priestly authority and control, as well as a greater degree of organisation, signals the formation of the Parsī community. To give it a backbone of uniform and authoritative content, from the time of Čanga Shāh onwards questions on doctrine and ritual were sent to the priests at Yazd and Kirmān. Their answers survive in the form of letters (*Rivāyats*), the earliest in 883/1478 and the latest in 1187/1773, which provide precious evidence for the circumstances of Zoroastrians in Ṣafawid Iran.

By the end of the 9th/15th century, Yazd and Kirmān had become the spiritual if not numerical centres of Iranian Zoroastrianism. The *Rivāyats* reveal the presence in 916/1510 of 500 *behdīns* as Yazd, with 400 more in the villages of Turkabād and Sharīfabād, 700 at Kirmān, 2,700 in Sidjistān and 1,700 in Khurāsān. These figures must represent the minimum adult male population, for we also hear of a group of 3,000 *behdīns* at one place in Khurāsān, while 21 *behdīns* from Khurāsān had their own congregation at Kirmān in 966/1559. There was also a Gushnasp Fire at Kirmān, and Zoroastrians could still be found in Fārs. Local communities appear to have been under the joint leadership of *dastūrs* and *behdīns*. In the late 9th/15th century there were only four or five *hirbads* well-versed in Pahlavi at Yazd, who performed all the rituals. The priests complained of being unable to get *behdīns* to give them the tithe of their income, although the meat offerings at *Dār-i Mihrs* were shared by their owners and the *dastūr* recognised by the offerer. Relations with non-Zoroastrians were rather ambivalent. *Behdīns* were urged to keep their promises and to pay their debts to non-Zoroastrians, and the testimony of a non-Zoroastrian was accepted in a case between two Zoroastrians before a Zoroastrian judge. However, the robbery and murder of unfriendly non-Zoroastrians were condoned and there are references to forced conversions to Islam both in Iran and in India. There was a reliance on the apotropaic function of rituals performed to repel powerful enemies, the tyranny of rulers, the loss of property, conversion and disease, as well as to gain worldly advantages such as wealth, happy marriages or royal favour. Anxious *behdīns* were exhorted to exert themselves and to hope for the best. Although the year 1000 in the era of Yazdadjird fell in 1040/1631, expectations of the arrival of the millenium and of the saviour Bahrām Vardjāvand or of Oshedar were expressed throughout the period, including in 883/1478, 939-40/1533, 957/1550, 982/1574-5, 1036/1627, 1051/1641-2 and 1083/1672.

In the 11th/17th century, the Zoroastrians of Iran are described as farmers, labourers, fullers, manufacturers of carpets and, especially at Kirmān, of woollen cloth, and they used their own dialect of Persian called *Dari* among themselves. Men wore undyed garments and women wore red and green clothing. In *ca.* 1017/1608, Shāh ʿAbbās I (995-1038/1588-1629), who is remembered as a just king, brought 1,500 peasant families from Kirmān to Iṣfahān as labour and settled them across the Zanda Rūd near Djulfa at Gabrābād. In 1027/1618 their district consisted of about 3,000 plain, single-storied

houses along several long, wide, straight, tree-shaded streets, and the people worked as labourers and craftsmen in Iṣfahān and the countryside nearby. There was a *da<u>kh</u>ma* outside their settlement where they placed their dead fully clothed. Most of them returned to Kirmān when ʿAbbās I died, and ʿAbbas II (1052-77/1642-66) turned the district into a suburban resort with palaces, mosques, markets, and baths and moved the remaining Zoroastrians to the other side of <u>D</u>julfa. Tavernier estimated the Zoroastrian population of Kirmān at over 10,000 in 1064/1654, many of whom were involved in the wool industry. In 1054/1644 a new *<u>kh</u>āna-yi mihr* was built at Kirmān by a *behdīn*, and there are references to pilgrimage to the shrines of <u>Kh</u>ātūn Bānū in Fārs in 1036/1625 and to the shrine of Pīr-i Sabz north-west of Yazd at mid-century. Conditions appear to have worsened towards the end of the Ṣafawid period, when their fire temple at Iṣfahān was destroyed and many of them were killed there. Zoroastrians migrated to India to escape persecution and forced conversion.

The attraction of India as well as the possibilities for the religious integration of Zoroastrians had already been demonstrated by the syncretistic mystical movement of Azar Kaywan (939-40 to 1027/1533-1618) and his followers in Patna, Lahore and Kashmir in the first half of the 11th/17th century. Their allegorical interpretation of Zoroastrianism allowed them to combine it with Hindu asceticism and Ṣūfī Neo-Platonism. Half of the group were Zoroastrians, including several *mōbads* and a *dihḳān*. Their nucleus came from Fārs and had been formed in <u>Sh</u>īrāz, where other Zoroastrians from Harāt and Iṣfahān had joined them before they went to India; there they attracted a pair of Zoroastrian merchants in northern India and one from Surat. Some of the Persian Muslims who joined the group may have been recent converts from Zoroastrianism.

Meanwhile, increasing numbers of the largely rural Parsī community in 11th/17th century Gu<u>d</u>jarat were being drawn to Surat and Bombay, by new opportunities in commerce as artisans, merchants and as brokers for the Portuguese, French, Dutch and English. One of the most important representatives of this new commercial class at Surat was Rustom Manak (1044-5 to 1131/1635-1719), broker for the Portuguese and Dutch, who was instrumental in securing a grant of land from Awrangzīb (1067-1119/1657-1707) for the English factory at Surat in 1070/1660, achieved the abolition of the *<u>d</u>jizya* at Surat in 1083/1672 and served as main broker for the East India Company at Surat from 1111-12/1700 until 1128/1716. The rise of wealthy and influential Parsī merchants, whose reputation for honesty generated credit, encouraged the revival and application of the traditional Zoroastrian work ethic that gave religious significance to worldly success. They also allowed the conversion of household slaves to Zoroastrianism in order to be able to eat what they served. The growth of the urban, commercially-oriented part of the community changed its internal power structure. Beginning in the late 11th/17th century, the authority and control of the Bhagaria priests and *desais* resting on Mu<u>gh</u>al patronage was challenged by the *behdīns*, with their connection with European interests, in a series of religious disputes. In 1084/1673, in order to break the monopoly of the Bhagaria priests on endowments and on the fees foı performing rituals, the *behdīns* of Navsari asserted the right to have family rituals performed by priests of their own choice. This issue led to violence in 1097/1686, but the *behdīns* successfully boycotted the Bhagaria priests by establishing secondary fire temples (*Dār-i Mihrs*, *Agīārīs*) accessible to laymen for the second-rank fire (*Ātā<u>sh</u> Ādarān*) encouraged in the *Rivāyats* where they had their rituals performed. In 1102/1691 the San<u>d</u>jana priests joined the *behdīns*, and *Dār-i Mihr*s spread in the port cities of Surat, Balsar, and Bombay. By the 12th/18th century, *Dār-i Mihr*s were founded in the settlements of Parsī merchants outside Bombay. This quarrel finally ended when the *Ātā<u>sh</u> Bahrām* was removed from Navsari and permanently established at Udvada in 1155/1742.

The internal conflict, however, was continued in the 12th/18th century in a controversy over the ritual calendar at Surat, which was in economic decline in the 1140s/1730s with trade shifting to Bombay, while Marāṭhā control of rural areas deprived the traditional élite of its former sources of income. In 1149/1736 an Iranian *behdīn* encouraged the laymen of Surat to adopt the old-style *Ḳadīmī* calendar used by Zoroastrians in Iran instead of the Parsī calendar which had fallen one month behind it. This issue tended to pit artisans led by merchant brokers for the French and English against the older merchant oligarchy with its ties to the Dutch, and is an early example of the use of religious reform as a way to attack more conservative authority. In the same year that the calendar dispute broke out, the priests of Surat refused henceforth to marry their daughters to laymen in order to avoid losing their wealth through dowries and inheritance. The Parsī community split permantly into two sects: a <u>Sh</u>āhān<u>sh</u>āhī majority and a Ḳadīmī minority, with separate fire temples and no intermarriage. The process of separation was marked by outbreaks of violence between them in 1158/1745, 1196-7/1782-3, 1824 and 1840. In a related issue, the agitation started in 1191/1777 when laymen in Bombay refused to marry their daughters to priests only subsided after 1823.

In the course of the 12th/18th century, the rising Parsī merchant class reduced the grip of the former élite of priests, *desais*, and *<u>d</u>jāgīrdār*s formed in the early Mu<u>gh</u>al period, secured the right to choose any priest they wished to perform rituals, acquired a share in communal leadership through a series of sporadic, short-lived *pančayat*s that held the power of excommunication, and began to establish secular ties of dependence by redistributing their wealth through charities, private endowments, and by building *da<u>kh</u>mas* and rest-houses. At the same time, Parsīs became increasingly involved with the British as other Europeans were forced out by them. By the middle of the 12th/18th century, Parsī merchants supplied British garrisons and field armies. By the early 19th century, Bombay had replaced Surat as the main Parsī centre and the number of Parsīs at Bombay increased from 3,000 in 1194/1780 to 50,000 by 1864. From the late 12th/18th century onwards, Parsī shipping expanded outside India to Burma, Indonesia, China, South Arabia and East Africa. Parsī merchants who made fortunes in the China trade from 1810 to 1842 began to reinvest them in industries such as ship-building and railroads.

The emergence of secular leadership in the Parsī community is reflected in the composition of the *pančayat* appointed at the request of the British by the Parsī An<u>d</u>joman in 1201/1787 which contained six *behdīns* and six priests, both Ḳadīmī and <u>Sh</u>āhān<u>sh</u>āhī, while the *pančayat* of 1818-36 had twelve *behdīns* and six priests. In addition to controlling

community charities, the latter *pančayat* issued behavioural codes aimed at increasing conformity and eliminating popular syncretism and participation in non-Zoroastrian customs. The code of 1819 forbade Parsī women to attend Hindu or Muslim places of worship, to wear their charms or to perform their rituals. The code of 1823 forbade child marriage and costly rituals at weddings and funerals, while the Parsi Marriage and Divorce Act of 1865 ended polygamy.

In the 19th century, religious reform was an important means by which the new élite of urbanised, educated, westernising laymen, prominent in British and native administration, business and the professions, aimed to control the rest of the community, although they had growing cultural differences with the poor, rural, conservative majority of Parsīs. Reform was also a reaction to the threat of conversion by Christian missionaries, which provided the immediate impulse for the foundation of the Rahnumai Mazdaysnan Sabha by a group of young, wealthy, educated laymen in 1851 for the purpose of encouraging a return to the original ideals of Zoroastrianism. The same interests led to the foundation of a school in Bombay in order to train the sons of priests for the priesthood in 1854. Modernist reformers and apologists were attracted to the theories of Martin Haug, that the original monotheistic religion of Zoroaster had been corrupted afterwards into ritualistic dualism by the priests. Haug's theories were used to counter Christian criticism by intellectuals who were also attracted to the Theosophical Society. Reformers who favoured rational explanations for the cult objected to the use of texts that no one understood in rituals, while conservative priests insisted on the effectiveness of ritual liturgies and on the importance of purification from pollution, preserving a way of life increasingly limited to themselves and ignored by laymen. These issues became involved in the collision between reformers and conservatives over the role and income of priests called the *fravas͟hi* controversy, which mainly involved opposition to expensive, repeated ceremonies for the dead and which is still current and unresolved.

Nevertheless, the Parsī community multiplied in the 19th century. By 1881 they numbered 85,000 in India with 3,000 more abroad, about 10-15,000 of whom were Ḳadīmīs. Although intermarriage between the sects was allowed by the 19th century, objections to accepting non-Zoroastrians into the community as converts increased because of fears that lower caste Hindus would be attracted by Parsī charities. Parsīs also emerged as the leaders of the world's Zoroastrians as the result of changes in both India and Iran.

Although estimates of the Zoroastrian population of Iran in the early 12th/18th century that range from 100,000 to one million seem exaggerated, there can be no doubt that their numbers declined disastrously due to the combined effects of massacre, forced conversion and emigration in that century. Having suffered massacre and forced conversion at the hands of the Ṣafawī army that repelled the first Afg͟hān invasion in 1133/1720, the Zoroastrians of Kirmān and Yazd joined Maḥmūd's Afg͟hān army during the second invasion in 1135/1722 and also served as officers in the army of Nādir S͟hāh (1149-60/1736-47). The sack of Kirmān by the Afg͟hāns after the death of Nādir S͟hāh, one repeated by the Ḳād͟jārs in 1209/1794, left the Zoroastrian district in ruins. By the end of the century, almost none of the 12,000 Zoroastrians at Kirmān survived, and the Zoroastrian population of Iran is estimated to have fallen to about 50,000 and then to about 30,000 in the reign of Muḥammad S͟hāh (1834-48); of these, some 8,000 were at Yazd.

The late 12th/18th and early 19th centuries seem to have been a time of unprecedented insecurity, poverty, and discrimination for the Zoroastrians of Iran. The intensity of the oppression they suffered then appears to have been more a reflection of contemporary social problems in Iran, where they served as scapegoats for the frustrations of their Muslim neighbours, than to have been characteristic of centuries-long conditions. However, Zoroastrians were vulnerable to robbery and kidnapping while their murder went unpunished. Although they were required to wear honey-coloured clothing and were officially forbidden to build new or to repair old houses, to wear new clothing, to ride horses, to travel outside of Iran or to engage in skilled crafts or professions that might bring them into contact with Muslims, sumptuary rules were enforced in the usual selective way and exceptions can be found to many of them. Forms of economic discrimination that prevented them from accumulating wealth were probably more effective than social pressures. Zoroastrian merchants were subject to extra taxes, newly-acquired property was taxed up to one-fifth of its value and houses were liable to be looted. The actual total *d͟jizya* on the community usually amounted to about 2,000 *tūmān*s, which by mid-century was paid by 1,000 adult males, for whom the individual tax of two *tūmān*s amounted to ten day's wages for a labourer. The S͟hīʿī legal provision that favours a Zoroastrian convert to Islam over other Zoroastrian heirs encouraged conversion and resulted in the loss of property. During the 19th century, forced conversions created a population of half-Zoroastrian, half-Muslim *d͟jadīd al-Islām* at Yazd with distinctive clothing and a separate cemetery.

For self-preservation, the Zoroastrian community turned inwards. The style of fire temples and homes provided a maximum of protection and concealment from unfriendly intruders. The exterior of fire temples resembled private houses, while inside was a confusing maze of rooms, passages, and low doors with the fire chamber behind a blank wall and inaccessible even to *behdīn*s. A succession of defensible doorways guarded the entrance to homes, while access over the rooftops was restricted by covering the courtyards to protect the women, children, and valuables. Only property endowed as *waḳf* for the benefit of the benefactor's soul was respected by Muslims. In spite of general illiteracy, religious learning was preserved among priestly families that provided local readership, especially in the villages. From the late 12th/18th century onwards, refugees who escaped to India became objects of Parsī aid and concern and helped to develop trade connections between Yazd and Bombay.

In 1854 the Persian Zoroastrian Amelioration Society in Bombay sent Manakd͟jī Limd͟jī Hataria (1813-90) to Iran, where he found the Zoroastrian community had shrunk to 7,725 people. Yazd was the main surviving centre, with 6,658 Zoroastrians in the city and 24 surrounding villages. Most of them were farmers, but there were also about one dozen merchants at Yazd, while the poorest were artisans, weavers, bricklayers and carpenters. Each spring a group of several hundred Yazdīs went to Tehran to work as gardeners, even in the royal

palace, and returned in the fall, travelling together for protection. In addition to these seasonal workers there were about 50 Zoroastrian merchants in Tehran in 1854. The community at Kirmān amounted to 932 people, while a few Zoroastrians could be found at Būshīr, Shīrāz and Kāshān. With Parsī aid, fire temples and *dakhmas* were built or restored and traditional councils of elders were transformed into elected *andjumans* of *behdins* at Kirmān, Yazd and their villages, whilst rest houses were built at shrines and in Tehran. Schools providing a secular education were started by Manakdjī at Yazd and Kirmān in 1857, and some students were sent to Bombay. In 1882 joint Parsī and British pressures finally secured the abolition of the *djizya*. Parsī efforts improved security, freedom of worship, respect and opportunities for the Zoroastrians of Iran, although they were still subject to random violence. Parsī aid also introduced modernising social and religious reforms from Bombay. Manakdjī revived abandoned rituals, forbade animal sacrifice, the eating of beef and camel meat, and he discouraged polygamy, the use of cosmetics and Muslim clothing styles as too immoral. The sons of priestly families took advantage of the opportunity for a secular education in the village schools and left for the cities in order to become physicians, teachers, engineers, bankers and merchants.

While villagers at Yazd remained engaged in the transport of goods from the Gulf across central Iran as camel-drivers and owners until the early 20th century, by the end of the 19th century many Yazdīs were going to work in Bombay and the women they left behind often put themselves under Muslim law to claim a share of their inheritance. Zoroastrians from the provinces were also employed by the Indo-European Telegraph and by Tehran banks in the last two decades of the 19th century. Yazdī merchants grew wealthy through their contacts with India by the end of the century, while their children invested in land and the import-export trade, re-investing their profits later in industry. Their numbers rose again to about 8,500 in 1879, over 9,000 in 1892 and about 11,000 in 1902, with the largely rural majority still at Yazd and Kirmān. However, modernising changes, new opportunities and wealth had begun to transform the Zoroastrian community by the late 19th century, breaking down village and communal ties and undermining the position of the priests, whose authority began to be challenged by the creation of a new secularly-educated élite of laymen.

The position and even existence of the village-based priesthood has been drastically affected by the increasing urbanisation of Zoroastrians in the 20th century. As a falling water table, rural impoverishment and the lure of employment in cities drew Zoroastrian peasants from the villages south of Kirmān early in this century, Muslims began to move into them. In these newly-mixed villages the remaining Zoroastrians were at a disadvantage in conflicts over water, and moved to Kirmān to escape increasing oppression. By 1962 Zoroastrians had entirely deserted the villages south of Kirmān and lived entirely inside the city, where they numbered 2,385 in 1963 in spite of emigration to Tehran. The villages around Yazd have also become increasingly Muslim as the result of immigration and conversion. The urbanisation of Zoroastrians is still transitional, with the labour force living and working, often seasonally, outside the villages in cities and provincial towns but keeping up some joint family ties and sending part of their income back to support the women, children and old people who remain behind to manage the land. People who have moved to Tehran still keep their houses in Yazd and return for the annual ceremonies for the dead.

Religious usages have been affected by strong Parsī influences, modernisation and changes in social context. Although a bull was sacrificed annually at Yazd until the late 19th century and sheep fat was offered to the fire until the early 20th century, most Zoroastrians in Iran have abandoned animal sacrifices since 1900 and object to calling those animals slaughtered and eaten at seasonal festivals sacrifices. Nor has *gōmēz* been used since the middle of the 19th century, although offerings to water are still made. New Indian-style fire temples open to laymen were built in Tehran in 1908, in Kirmān in 1923 and in Yazd, and the fire now burns in silver vessels, Indian-fashion, instead of on stone altars. Old festivals such as *Sada*, 100 days before Nawrūz, have been revived and new ones such as the birthday and death of Zoroaster on 6 Farvardin and 5 Dey respectively have been created. While rituals that survive have their meaning subject to reinterpretation, the elaborate details of purification have been observed only by priests since the early 20th century. Unable to live on the fees for rituals, the priesthood has declined in number. There are now only 15 Iranian priests left, all of whom are middle aged or older and no young Iranian priests are being trained. Since they are too few to serve all the fire temples, these are now sometimes kept up by laymen, and since the 1940s communal leadership has developed on the *andjuman* in Tehran.

Several issues currently divide younger, educated, modernised Zoroastrians from the older, more conservative generation. The younger generation objects to inbreeding through marriage between cousins, because of the high incidence of hereditary diseases within the community and favours intermarriage with non-Zoroastrians, the acceptance of converts, and the re-admission of recent converts to Islam and the Bahā'ī Faith. Their opponents wish to preserve racial purity, and fear that to encourage apostasy from Islam would provoke Muslim violence against them. Although the influence of the Bahā'īs is credited with improving their own security, most Zoroastrian families have lost members as converts to the Bahā'ī Faith because of its appeal to young people impatient with priestly authority. The practise of interring the dead on a metal stretcher in a grave with cement walls and cover, instead of exposure in a *dakhma* was started at Tehran and Kirmān in the 1930s and was begun at Yazd in 1965. By 1975 a *dakhma* was used only at the village of Sharīfābād. The sects formed during the calendar dispute still exist. Iranian Zoroastrians adopted, in 1939, a seasonal calendar beginning at the vernal equinox, which is close to the Iranian secular calendar, although the community at Yazd reverted to the Ḳadīmī calendar in 1940.

After receding slightly to about 10,000 in the 1920s, the Zoroastrian population of Iran rose to 16,800 by 1938 and by the 1970s to between 20,000 and 25,000, with 19,000 in Tehran and other cities. The younger generation has taken advantage of the opportunities in management and in the professions provided by the economic growth in Iran in recent decades. In the 1960s and 1970s the five major Zoroastrian firms in Iran were all leaders in their fields and Iranian Zoroastrians were encouraged to

return from India. However, the Iranian revolution of 1979 has created anxiety in the Zoroastrian community and uncertainty about the future.

The relative circumstances of the two communities have been reversed in the 20th century, which has been a period of retrenchement for the Parsīs. The Ilm-i khshnūm movement began at Surat in 1902 as a combination of Theosophical ideas with ritual purity which was justified as being the esoteric meaning of the Avesta. In a victory for the conservatives, membership was restricted to descent from Parsī families in 1909, the only exception being the child of a Zoroastrian man by a non-Zoroastrian woman. The communal welfare system, supported by the benevolence of the members of the few very wealthy families, leaders in Indian commerce and industry, and providing schools, hospitals, and the cost of marriages and funerals, as well as fire temples and *dakhmas*, became increasingly inadequate to care for the growing numbers of the poor created by rural flight to Bombay. Social and economic changes since independence have eroded the economic base of the community still further. Increasing industrialisation has brought more management opportunities for other Indians than for Parsīs: support for communal charities has been reduced by taxation to pay for the state's socialist and welfare programs; and Parsīs have been hurt by the effect of prohibition on the toddy industry, which began in Gudjarat in 1937, and of land tenure acts on Parsi landlords with Dobra labour. The Parsī population has fallen from its peak of nearly 115,000 in 1941 to approximately 87,500 in India, Pakistan, and Sri Lanka by 1976 because of the combined effects of emigration, a rising marriage age and declining birth rate. The community was shocked to discover in 1967, that 40% of its members were impoverished and that 2,000 Parsīs in rural Gudjarāt were on the point of starvation. Zoroastrian rituals are still observed in India, although the number of priests in Bombay was declining by the late 1970s. In addition, the quality of priests has been questioned because appointments to fire temples have been controlled by the patronage of the businessmen who endowed them. To deal with this problem, a programme has been started to train priests at the Cama Aethornana school in Bombay, to pay them salaries and to appoint them on merit.

Bibliography: A complete listing of all the literature on Zoroastrianism is impossible because of its volume, and inappropriate because much of it concerns pre-Islamic issues. General introductions with references to the sources and scholarship are provided by A. Bausani, *Persia religiosa*, Milan 1959; J. Duchesne-Guillemin, *La religion de l'Iran ancien*, Paris 1962; M. Boyce, *A history of Zoroastrianism*, Leiden-Cologne 1975; and idem *Zoroastrians, their religious beliefs and practices*, London, 1979. For the Sāsānid period, L.C. Casartelli, *The philosophy of the Mazdayasnian religion under the Sassanids*, tr. F. J. Jamasp Asa, Bombay 1889, is still a useful introduction to doctrinal issues, while H. W. Bailey, *Zoroastrian problems in the ninth-century books*, Oxford 1943, is a seminal work that also identifies much of the older scholarship. A key to the Arabic sources is provided by H. S. Nyberg, *Sassanid Mazdaism according to Muslim sources*, in *Jnal. of the K. R. Cama Oriental Institute*, xxxix (Bombay 1958), 1-63. The most important work on Zurvanism has been done by R. C. Zaehner, *Zurvan, a Zoroastrian dilemma*, Oxford 1955; idem, *The dawn and twilight of Zoroastrianism*, London 1961. An introduction to Sāsānid religious organisation is given by J.-P. de Menasce, *L'Église mazdéenne dans l'Empire sassanide*, in *Cahiers d'Histoire Mondiale*, ii (1955), 554-65; idem, *Feux et fondations pieuses dans le droit sassanide*, Paris 1966, and by M.-L. Chaumont, *Recherches sur le clergé zoroastrien: le hērbad*, in *RHR*, clviii (1960), 55-80, 161-79. For religious art, see J. Duchesne-Guillemin, *Art et religion sous les Sassanides*, in *La Persia nel Medioevo*, Rome 1971, 377-88.

For the treatment and *djizya* status of Zoroastrians during and after the Muslim conquest, see Abū Yūsuf, *K. al-Kharādj*, Cairo 1382/1962, 67, 122-4, 129-31, 134, 189-90, 206-7; Ibn Saʿd, vii/1, 94; Ibn Sallām, *K. al-Amwāl*, Cairo 1969, 30, 44-6; Balādhurī, *Futūḥ*, 69, 77-8, 85, 200, 318, 325-6, 388; Bukhārī, *al-Djāmiʿ al-ṣaḥīḥ*, v, Cairo 1390/1971, 238; and Sarakhsī, *Sharḥ Kitāb al-siyar al-kabīr li 'l-Shaybānī*, Cairo 1971-2, 146-9.

For examples of the destruction of fire temples, see Djāḥiz, *Ḥayawān*, iv, 479-81; Balādhurī, *Ansāb al-ashrāf*, i, Cairo 1959, 494; Ibn al-Faḳīh, *Mukhtaṣar Kitāb al-buldān*, 256-7; and anon., *Taʾrīkh-i Sīstān*, Tehran 1314/1935, 92-4. For early conversions to Islam, see Abū Yūsuf, 131-2; Balādhurī, *Futūḥ*, 69; Ṭabarī, ii, 1462; Narshakī, *Taʾrīkh Bukhārā*, tr. Frye, Cambridge, Mass. 1954), 47-9; and *Taʾrīkh-i Sīstān*, 91.

Much of the material on the condition and conversion of Zoroastrians is presented in B. Spuler, *Der Verlauf der Islamisierung Persiens*, in *Isl.*, xxix (1949-50), 63-76; idem, *Iran und der Islam*, in *Die Welt als Geschichte* (1952), 227-32; and idem, *Iran in früh-islamischer Zeit*, 183-204. Internal evidence from Zoroastrian literature is provided by de Menasce, *Problèmes des Mazdéens dans l'Iran musulman*, in *Festschrift für Wilhelm Eilers*, Wiesbaden 1967, 220-30. The most up-to-date treatment is now that of R. N. Frye, *The golden age of Persia*, London-New York 1975, which also has information on the Sāsānid period. The most important Pahlavi sources are identified in de Menasce's ch. *Zoroastrian Literature after the Muslim conquest*, in *Cambridge History of Iran*, iv, 543-65. Apocalyptic questions may be approached through K. Czeglédy, *Bahrām Čōbīn and the Persian apocalyptic literature*, in *AO Hung.*, viii (1958), 21-43. Muslim information on Zoroastrian sects may be found in Baghdādī, *al-Farḳ bayn al-firaḳ*, ed. Kawtharī, 117, 153, 171-2, tr. Walker, 115-6, 131, 183; Murtaḍa b. al-Dāʿī al-Rāzī, *Tabṣirat al-ʿawāmm*, ed. Tehran 9-14; and Shāhristānī, *K. al-Milal wa 'l-niḥal*, ii, Cairo 1387/1968, 35, 38-49. The standard treatment of sectarian movements is that of G. H. Sadighi, *Les mouvements religieux iraniens au IIe et au IIIe siècle de l'hégire*, Paris 1938. The information from Arabic geographers is collected in B. M. Tirmidhi, *Zoroastrians and their fire temples in Iran and adjoining countries from the 9th to the 14th centuries*, in *IC*, xxiv (1950), 271-84.

Comparisons between Islam and Zoroastrianism go back to I. Goldziher, *Islamisme et Parsisme*, in *Revue de l'histoire des religions*, xliii (1901), 1-29, and idem, *The influence of Parsism on Islam*, in *The religion of the Iranian people*, ed. C. P. Tiele, tr. G. K. Nariman, Bombay 1912, 163-86, followed by S. P. Osztern, *Zum Problem Islam und Parsismus*, in *ArO*, vi (1934), 150-60, 342-52. The most extreme case has been made by H. Corbin, *Les motifs zoroastriens dans la philosophie*

de Sohrawardi, Tehran 1946, and idem, *Spiritual body and celestial earth. From Mazdean Iran to Shīʿite Iran*, tr. N. Pearson, Princeton 1977.

The most important sources for the Ṣafawid period are the *Rivāyat*s edited by M. R. Unvālā, *Dārāb Hormazyār's Rivāyats*, Bombay 1922, and tr. B. N. Dhabhar, *The Persian Rivayats of Hormazyār Framarz*, Bombay 1932. See also J. J. Modi, *A Parsee High Priest (Dastur Azar Kaiwan, 1529-1624 A.D.) with his Zoroastrian disciples in Patna, in the 16th and 17th C.A.C.*, in *Journal of the K. R. Cama Oriental Institute*, xx (1932), 1-85. D. Menant, art. *Gabars*, in *ERE*, vi, 147-56 identifies references by European travellers.

The earliest standard treatment of the Parsis is D. F. Karaka, *History of the Parsis*, London 1884. Among the more useful subsequent treatments are D. Menant, *Les Parsis*, Paris 1908; S. H. Hodivala, *Studies in Parsi history*, Bombay 1920; and J. J. Modi, *The religious ceremonies and customs of the Parsees*, Bombay 1937. P. Balsara, *Highlights of Parsi history*, Bombay 1963 is a useful summary of the traditional type. Among the more useful monographs are J. J. Modi, *The Parsees at the court of Akbar and Dastur Meherjee Rānā*, Bombay 1903; J. F. Bulsara, *Parsi charity, relief and communal amelioration*, Bombay 1935; S. P. Davar, *The history of the Parsi Punchayat of Bombay*, Bombay 1949; and F. M. Kotwal, *Some Observations on the history of the Parsi Dar-i Mihrs*, in *BSOAS*, xxxvii (1974), 664-9. For 20th century problems, see S. F. Desai, *Parsis and eugenics*, Bombay 1940; idem, *A community at the cross-road*, Bombay 1948; and M. P. Mistry, *Report of the survey of Gujurat Parsis (rural)*, Bombay 1967.

In spite of her tendency to minimise premodern change, the most important work on modern Iranian Zoroastrians and the history of the Zoroastrian cult is that of M. Boyce, *The fire temples of Kerman*, in *AO*, xxx (1966), 51-72; eadem, *Bibi Shahbanu and the lady of Pars*, in *BSOAS*, xxx (1967), 30-44; eadem, *The Zoroastrian villages of the Jupar Range*, in *Festschrift für Wilhelm Eilers*, 148-56; eadem, *On the sacred fires of the Zoroastrians*, in *BSOAS*, xxxi (1968), 52-68; eadem, *The pious foundations of the Zoroastrians*, in *BSOAS*, xxxi (1968), 271-89; eadem, *Maneckji Limji Hataria in Iran*, in *K. R. Cama Oriental Institute Golden Jubilee Volume*, Bombay 1969, 19-31; eadem, *Rapithwin, Nō Rūz, and the Feast of Sade*, in *Pratidānam. Indian, Iranian and Indo-European studies presented to F. B. J. Kuiper*, The Hague-Paris 1968, 201-15; eadem, *Some aspects of local farming in a Zoroastrian village of Yazd*, in *Persica*, iv (1969), 121-40; eadem, *On the Calendar of Zoroastrian Feasts*, in *BSOAS*, xxxiii (1970), 513-39; eadem, *The Zoroastrian houses of Yazd*, in *Iran and Islam, Studies in memory of V. Minorsky*, Edinburgh 1970; and eadem, *Zoroastrian Bāj and Drōn*, in *BSOAS*, xxxiv (1971), 56-73, 298-313. The most original and innovative recent treatment of contemporary Zoroastrians from the viewpoint of social anthropology is by M. Fisher, *Zoroastrian Iran between myth and praxis*, Ph.D. diss., Univ. of Chicago 1973, unpublished. (M. MORONY)

AL-**MADJŪS**, the term used by Arabic historians and geographers writing about the Maghrib and Muslim Spain with the sense of Northmen, Vikings, denoting the participants in the great Viking raids on Spain. These raids were manned from Scandinavia, sc. from Norway, Denmark and to a certain extent also from Sweden, the raiders leaving Denmark, Norway and Ireland, where Norwegian Vikings from the end of the 830s had gained a firm footing and had founded some minor tributary states towards the beginning of the second millennium A.D. In western Latin and Spanish sources they are called, *inter alia*, *Normanni*, *Nortmanni*, *Lordomani*, *Lormanes*, *Almajuzes*, *Almozudes* and *Almonides*.

1. The first attack by the Vikings on Muslim Spain took place in 230/844. As early as 1 Dhu 'l-Ḥidjdja 229/20 August 844, 54 Viking long ships (the Norwegian Gokstad ship from the latter half of the 9th century, the biggest ever found, was 23.8 m. long, 5.1 m. broad amidships, had 16 oars and 32 shields on each side, and could take 70 men, *The Viking*, London [1966], 254) appeared, and the same number of smaller ships, in the estuary of the Tagus, anchored there and fought three fierce battles against the defenders. After thirteen days they re-embarked and sailed southwards. The governor Wahb Allāh b. Ḥazm had informed the *amīr* ʿAbd al-Raḥmān II, who advised his commanders to be on their guard. Part of the crew disembarked on the coast of the province of Shadhūna (Sidona) and occupied the harbour of Cadiz, but the main part of the fleet sailed up the Guadalquivir and encamped on a large island in the river about 20 km. south of Seville. A few days later, on 1 October 844, the inhabitants of the city caught sight of the fleet with their brown sails on the river. They tried to organise resistance, but as the city had no defences, could do nothing. The few ships they sent against al-Madjūs were attacked with showers of arrows and were set on fire. The pirates went ashore in the city, where the main part of the citizens had fled precipitately. Those left behind were killed, even old and disabled people; women and children were taken prisoner; and they tried to set the mosque on fire, without success. The sack continued for seven days. ʿAbd al-Raḥmān sent troops against the invaders, inflicting on them heavy casualties. In the decisive battle to the south of the city on 11 November 844, more than a thousand of the pirates were killed and four hundred others were taken prisoner; these were killed before the eyes of the others, who in great haste fled to the ships and set sail southward. Thirty abandoned Viking ships were set on fire. The defeat of al-Madjūs was proclaimed all over the country, and ʿAbd al-Raḥmān even informed the Berber *amīrs* in Morocco and the Khāridjī *imām* in Tāhart. The Viking fleet steered north towards Aquitania after some attempts at landing at Niebla, on the coast of Algarve and in Lisbon; in the meantime, a few Scandinavian ships had made a brief landing on the coast of Aṣīlā (Arcila [see AṢĪLA]) in northwestern Morocco, about 50 km. below Tangier. On the dating of the descent on Aṣīlā and the foundation of the town, see A. Melvinger, *Les premières incursions des Vikings en Occident d'après les sources arabes*, Uppsala 1955, 51-5.

ʿAbd al-Raḥmān II ordered defences and an arsenal to be built in Seville, watch-posts to be set up along the Atlantic coast, and warships to be built in greater numbers, according to Ibn al-Ḳūṭiyya. Hence when in 244/858 another Viking offensive, comprising 62 ships, was launched, the Muslim squadrons patrolled along the west coast of the peninsula up to the French coast. Two of the Viking ships sailing in advance were captured off the coast of Algarve, with their cargoes of silver and gold, prisoners and supplies. The rest of the ships sailed on towards the Guadalquivir estuary, but on discovering that a Mus-

lim army was advancing along the river valley, they sailed on to Algeciras (al-Djazīra al-khaḍrā᾽ [*q.v.*]), where they disembarked, took the town and burnt down the great mosque. They were soon driven away, but advanced along the coast of Tudmīr (near Murcia) and pushed forward up to the fortress of Uriyūla (Orihuela, 23 km. north-east of Murcia). From Algeciras, some of the ships sailed to the northern coast of Morocco, where they took the town of Nakūr, some 20 km. south of Alhucemas Bay, for eight days sacking and taking prisoners all those who did not flee, among those some members of the princely house, later ransomed by the ruler in Cordova. As to the timing of the attack on Nakūr, there is varying information among the Arab authors, mentioning the occurrence (see the long discussion in Melvinger, *op. cit.*, 151-77), but the exact date cannot be established, since it has not been possible to investigate what Ibn al-Khaṭīb in his still-unpublished part of *Aʿmāl al-aʿlām* relates about Nakūr. After the attack on Uriyūla, the Viking fleet sailed towards the French frontier, invaded the country, took rich spoils and numerous captives and passed the winter in the Camargue. Then they returned to the Spanish coast, but were met and attacked by Muḥammad I's ships, which set fire to two of the unbelievers' ships and took two more as spoils. More than 40 of their ships had now been lost. The rest joined another Viking fleet which had harried the Balearic Islands, and a few smaller ships found their way up the Ebro valley or via the River Bidassoa and its valley from Irun on the Bay of Biscay, so that a contingent arrived at Banbalūna (Pampeluna) [see BANBALŪNA] and in 245/859 captured the *amīr* of the Basques, Gharsiyya b. Wannaḳo (Garcia Iniguez), who had to ransom himself for 70,000 gold coins (E. García Gómez-E. Lévi-Provençal, *Textos inéditos del "Muqtabis" de Ibn Ḥayyān sobre los origenes del reino de Pamplona*, in *Al-And.*, xix [1954], 309). After this Viking raid, which probably lasted till 247/861, it was more than a century before Muslim annals tell us about further attacks from al-Madjūs.

On 1 Radjāb 355/23 June 966, the caliph al-Ḥakam II received from Ḳaṣr Abī Dānis (Alcacer do Sal, 94 km. south of Lisbon) a message that a Viking fleet of 28 ships had been seen in the neighbourhood. The Muslims marched on them when, after ravaging the coast, they reached the plain round Lisbon; many were killed in the battle on both sides. The Seville fleet left and found the enemy ships in the mouth of the River Silves, put several of them out of action, rescued the captured Muslims, whom they found on board, killed a great number of the unbelievers and put the rest to flight. News continued to reach Cordova from the west coast about the movements of al-Madjūs, until they disappeared. During the same year, al-Ḥakam II ordered Ibn Fuṭays to keep the fleet ready in the Cordova River (sc. the Guadalquivir) and to build ships of the same type as those of the Vikings, in the hope that they would come near the ships.

2. At the beginning of Ramaḍān 360/end of June 971, alarming rumours spread abroad about movements at sea by al-Madjūs al-Urdumāniyyūn (on this term, see below). Al-Ḥakam II immediately sent the admiral of the fleet to Almeria to make it ready to leave for Seville and to sail with all the naval forces to the western coastal district, but we hear nothing this time about any landing operation. Ibn Ḥayyān mentions (in A.A. el-Hajji, *Andalusian diplomatic relations with western Europe during the Umayyad period (A. H. 138-366/A.D. 755-976)*, Beirut 1970, 163, also in *Hespéris-Tamuda*, viii [1967], 74 f.) that at the end of 360/971 the Vikings made an attack on the west coast but that the Muslim fleet was able to repel them. The last thing we hear in Arabic sources about Viking raids on Muslim territory is a notice by Ibn Ḥayyān (Lévi-Provençal, *Hist. Esp. mus.*, ii, 171 n. 2) about a summer campaign by land to Algarve in Ramaḍān 361/June 972; the Muslim army advanced up to the town of Santarém to the north-east of Lisbon and returned to Cordova in the middle of September 972.

In all the previous texts except one, the word *al-Madjūs* is used about the Vikings, but in the text of 971 the phrase *al-Madjūs al-Urdumāniyyūn* is used. The last two texts in Ibn Ḥayyan's *al-Muḳtabis* have only been available to the present writer in *Anales palatinos del califa de Córdoba al-Hakam II, por ʿĪsā ibn Ahmad al-Rāzī (360-364 H. = 971-975 J.C.)*. Trad. por E. García Gómez, Madrid 1967, 76, 88, 101, 116-7. The translation has on p. 76 *los Mayūs*, on pp. 88 and 101 *los Mayūs Normandos*, and in the events of 17 September 972 on pp. 116-17 first *los Mayūs Normandos* and then only *los Normandos*. So there is a certain doubtfulness here. It is no longer a question about al-Madjūs in its earlier sense. This fits well in with the fact that, in this case, the attackers came from Normandy. The Vikings had, after the treaty of St. Clair in 911, been given the territory in northern France which got its name Normandy from them, and had settled there. They no doubt soon accepted the Christian faith, at least officially, but they sometimes received heathen reinforcements from their original fatherland. In the early 960s, one of these bands of reinforcements arrived from Denmark at the request of Duke Richard I of Normandy, who was in conflict with Count Thibaud de Chartres. When peace was made between them, the Vikings' presence was no longer desired in France. They gradually returned to the northern lands, but encouraged by Duke Richard, they made an expedition against Muslim Spain, in the course of which they also attacked Christian Galicia and in 970 occupied Santiago de Compostela, which they held for some time. It was these troops from Normandy, partly heathen and partly Christian, who are here quite logically described by the double name.

3. Only the term *al-Urdāmāniyyūn* (= Normans) is used by Ibn ʿIdhārī in his account of the capture of the town of Barbastro [see BARBASHTURU] in 456/1064, when the inhabitants were treated in a very barbarous way by the Christian army, in which Normans were included. The later geographer Ibn ʿAbd al-Munʿim al-Ḥimyarī uses in a summary account of this same capture of Barbastro the word *al-Rudhmānūn* for "Normans" instead (Melvinger, *op. cit.*, 68 f.).

4. The Spanish-Arabian author Ibn Diḥya (d. 632/1235) relates in his anthology *al-Muṭrib min ashʿār ahl al-Maghrib* that ʿAbd al-Raḥmān II (206-38/822-52), after the disembarkation of the Vikings in 844, was said to have had relations with them and sent an ambassador to their country to come to an agreement with them. Ibn Diḥya's report is founded on what this envoy told the vizier Tammām b. ʿAlḳama (d. 283/896) on his return twenty months later. The ambassador Yaḥyā b. Ḥakam al-Bakrī al-Ghazāl (d. 250/864) [see AL-GHAZĀL], who had led a mission to Byzantium in 840, does not give us any details from his journey to the country of al-Madjūs which confirm the authenticity of his report. But even if the journey never in reality took place, it is nevertheless probable

that we have here the contemporary Hispano-Arabic view of al-Madjūs. The Viking king's residence, it is related, was situated on a large island in the ocean. There are Madjūs there in great numbers, and in the neighbourhood of this island there are many other islands, big and small, where all the inhabitants are Madjūs ... They used to be Madjūs, but now they profess Christianity, after having forsaken the worship of fire and the religion they had before and adopted Christianity, except the inhabitants of some isolated islands in the sea. These last have stuck to their old religion, with its worship of fire, and they continue to marry their mothers or sisters [a trait attributed likewise to the Persian Magians] and practise other infamous deeds. They fight them and make them slaves (Melvinger, *op. cit.*, 58-61, with refs.; here it must be stressed that —*pace* p. 60 n. 1., the information about marriage with a near relative seems suspicious, and must be due to a misunderstanding on the Arabic side).

The reason why the Vikings and the peoples or groups of peoples living on the northern fringes of civilisation were described by the Arabs as Madjūs was evidently the fact, as appears from the account by Ibn Diḥya, that their religion reminded the Arabs of that of the Persian Magians. According to Islamic sources, Madjūs denotes "die Einwohner des alten Persiens, vor allem in ihrer Eigenschaft als Feuerverehrer" (S. Wikander, ***Feuerpriester in Kleinasien und Iran***, Lund 1946, in *Skrifter utg. av K. human. vet.-samf. i Lund*, xl, 28). The religion of the Scandinavians and other Germanic peoples was essentially the same. Al-Masʿūdī mentions in his *Murūdj al-dhahab*, written between 944 and 947 (Melvinger, *op. cit.*, 47-8) that in 330/941-2 in Fusṭāṭ in Egypt he had come across a book written by Bishop Ghudmār (Godmar) of Gerona, dedicated to [Prince] al-Ḥakam (II, 350-66/961-76). He states "In that book it is said that the first king of the Franks Ḳulūdwīh (Chlodovech) was first a Madjūsī and that his consort Ghurṭild (Chrodechild) made him a Christian." According to western sources he was baptised in 496. It is not asserted in the text that he embraced the unspecified heathendom *al-djāhiliyya*. The same author relates in another place (*ibid.*, 49): "Before the year 300/912-3, ships with thousands of men arrived at al-Andalus and sacked its coasts, and the inhabitants there thought that it was a people of al-Madjūs, appearing every two hundred years ... But I think ... that it was al-Rūs [see RŪS], whom we have dealt with before in this work." In his *K. al-Buldān* (written 276/889), 354, the historian and geographer al-Yaʿḳūbī names those who in 229/843 invaded and sacked Seville as "al-Madjūs who are called al-Rūs" (*al-Madjūs allādhīna yuḳālu lahum al-Rūs*). Thus even very early Arabic authors linked the Madjūs with the Rūs, and both the above-mentioned authors were widely-travelled and knew from personal experience the conditions not only in the Middle East but also the western parts of the Mediterranean countries (A. A. Vasiliev, ***The Russian attack on Constantinople in 860***, in ***The Mediaeval Acad. of America***, *Publs.*, xlvi, Cambridge, Mass., 1946, 3-4 with refs.). The author al-Waṭwāṭ (d. 718/1318) assigns in his scientific and geographic encyclopaedia (Melvinger, *op. cit.*, 63) "to Yāfit's (Japhet's) descendants, al-Rūs ... They believe in the Madjūs religion and burn their dead in fire." The Persian Magians, on the other hand, did not burn their dead. The Spanish-Arabic historian and geographer Ibn Saʿīd al-Maghribī (d. 672/1274) writes in *Basṭ al-arḍ fī ṭūlihā wa 'l-ʿarḍ* (Melvinger, *op. cit.*, 62-3) about the great Ṣaḳlab Island, "whose length is about 700 *mīl*s (one *mīl* = 4000 *dhirāʿ*) and its extent across the middle about 330 *mīl*s. There are mountains, rivers, towns, built-up areas and a numerous population. It is said that they still adhere to the Madjūs religion and worship fire, as they consider nothing more important than this (sc. fire), because the cold is so severe there." (As is well-known, the Muslims in Spain used the term al-Ṣaḳāliba as a general word for slaves, procured to Spain from different parts of Europe; since many of them were of Germanic origin or from Scandinavia, in that way the Germanic tribes became known as al-Ṣaḳāliba; cf. A. A. El-Hajji, *op. cit.*, 207, n. 1, with refs. and ṢAḲĀLIBA). The geographer al-Idrīsī (d. 561/1166) says in his *Nuzhat al-mushtāḳ* (Melvinger, *op. cit.*, 57): "The fourth section of the seventh zone comprises the majority of the provinces in al-Rūsiyya (Russia), the provinces in Finmārk (Finnmarken or Finland), the country of Ṭabast (Tavastland), the country of Astalānda (Estonia) and the country of al-Madjūs." R. Ekblom (***Idrīsī und die Ortsnamen der Ostseeländer***, in *Namn och bygd*, xix [1931], 65-6) writes: "***Maǵūs*** ... ist in früheren arabischen Quellen die gewöhnliche Bezeichnung der nordischen Wikinger, die ... mit einem gewissen Recht als Feueranbeter bezeichnet werden konnten. Sie verehrten Thor, den Gott des Donners, sie verbrannten vielfach ihre Toten, und das Feuer spielte eine grosse Rolle bei ihnen ... Um die Mitte des 12. Jahrhunderts waren die Skandinavier christlich ... Das einzige Gebiet in Europa, das zu dieser Zeit nicht unter nennenswerten Einfluss des Christentums gekommen war, waren, wenn man vom innern Russland absieht, die Länder östlich der Ostsee. Bei den hier wohnenden finnischen Völkern spielte jedoch das Feuer keine hervorragende Rolle im Kultus. Ganz anders verhielt es sich mit den baltischen Stämmen. Bei diesen war das Feuer heilig, sie verehrten den Donnergott Perkūnas, und Leichenverbrennung war bei ihnen noch im 12. Jahrhundert nicht ungewöhnlich. Was ist natürlicher, als dass die arabischen Geographen die Bezeichnung ***Maǵūs*** auf sie übertrügen. Das Land der ***Maǵūs*** ist bei Idrīsī meiner Ansicht nach das baltische Gebiet, ungefähr das jetzige Lettland und Litauen ..." In al-Marwazī's text it says (22, l. 15, tr. 35) concerning al-Ṣaḳāliba: "The Slavs ... burn their dead, for they worship Fire" (V. Minorsky, ***Sharaf al-Zamān Ṭāhir Marvazī on China, the Turks and India***, Arabic text (*ca.* A.D. 1120) with an English translation and commentary, London 1942). In his commentary, Minorsky writes (116 f.): "... Eastern Slavs are usually confused with the Rūs, I. Kh., 154 ... The naïve indication that the Slavs burn their dead 'because they are fire-worshippers' may explain why the Arab historians call the Rūs *al-Madjūs*. Yaʿḳūbī, ***Buldān***, 354, calls the raiders who plundered Seville in 229/843: *al-Majūs allādhina yuqālu lahum al-Rūs*. In a famous passage I. Faḍlān as an eye-witness describes the cremation of a Rūs, and the argument may have been reversed: 'the Rūs were fire-worshipping Magians, for they burnt their dead', cf. Minorsky, *Rūs*, in *E.I.* ..." (cf. Melvinger, *op. cit.*, 81-5 and Corr. to p. 81.) In a review of Dunlop's *History of the Jewish Khazars*, in *Oriens*, xi (1958), 136, Minorsky says: "P. 189 ... Nor can the term *majūs* applied to the Northmen of Spain refer to their 'Zoroastrianism', but to the popular explanation of their custom of cremating their dead, see Minorsky, *Rūs* in *E.I.*, Ṭāhir Marvazī. ..."

5. R. Brunschvig put forward the hypothesis, that, as the law school of al-Awzāʿī [*q.v.*] declared as Madjūs all heathen with whom they wanted to become to an agreement, this was the reason why the Vikings harrying in Spain have been called Madjūs in Arabic; "dès leur première apparition sur les côtes d'Espagne en 844, il y a eu entre eux et l'émir de Cordoue des tractations de paix" (*Ibn ʿAbdalh'akam et la conquête de l'Afrique du Nord par les Arabes. Étude critique*, in *AIEO Alger*, vi [1942-7], 112; reprinted in *Al-Andalus*, xl [1975], 133 f.). But this hypothesis is groundless. There is no certain proof of relations between the Vikings and the Muslim rulers, and in any case, al-Awzāʿī's *madhhab* had been pressed back in Spain by that of Mālik towards the end of the 2nd/8th century (Melvinger, *op. cit.*, 74-7).

6. Ibn ʿIdhārī relates (*ibid.*, 116 f. with ref.) that the ruler Hishām I in 177/793 sent ʿAbd al-Malik b. ʿAbd al-Wāḥid b. Mughīth on a summer campaign to the Rūm country. This expedition is famous in history and one of the most important. He came to Ifrandja (Gerona), besieged the town and made a breach in its walls by using catapults. And he got nearer to the land of al-Madjūs, marched through the enemy's land and stayed there several months, burning villages and destroying strongholds. He attacked the town of Arbūna (Narbonne). It was a great victory, where the value of one-fifth of the prisoners amounted to 45,000 in minted coins. In 179/795 Hishām I b. ʿAbd al-Raḥmān, according to the same author (*ibid.*, 14 f.) sent out a commander on a summer campaign against Galicia. The latter was informed that Idhfunsh (Alfonso II el Casto) had asked al-Bashkunish (the Basques) for help and the people in this neighbourhood, viz. al-Madjūs and others. Ibn al-Athīr (*ibid.*, 10 ff.) speaks about his neighbours the Basques and those of al-Madjūs who lived near them and the people round there. In Ibn Ḥayyān's *al-Muḳtabis* (Garcia-Gómez-Lévi-Provençal, *op. cit.*, 296 f.) it is related about a summer campaign in the year 200/816 against the Prince of Pampeluna that in a battle lasting thirteen days many were killed, among others Ṣaltān, the leader (*el mejor caballero*) of al-Madjūs. Ibn Ḥayyān (Lévi-Provençal, *Hist. Esp. mus.*, i², 204) is the only one to mention a campaign against Alava, commanded by the *ṣāḥib al-ṣawā'if* ʿUbayd Allāh, who invaded the district in August 825/Rabīʿ II 210, caused devastation and finally met with the Asturian forces. "Une violente bataille se déroula au pied d'une montagne que le chroniqueur appelle Djabal al-Madjūs, 'la montagne des adorateurs du feu', ou peut-être 'des Normands'. Elle se termina par la défaite des Chrétiens, et l'on appela par la suite en Espagne musulmane cette campagne 'l'expédition de la victoire' (*ghazwat al-fatḥ*)." It is probably here a question of the same peoples who were mentioned in 793, 795 and 816; the territories where they are said to have lived, are not too distant from each other. Of course there can never have been genuine Zoroastrians in those regions, but at present we do not know anything about these so-called al-Madjūs in the neighbourhood of the Basques (cf. Melvinger, *op. cit.*, 116-28, 9-22, 86-115). Lévi-Provençal states (*Du nouveau sur le royaume de Pampelune au IX*ᵉ *siècle*, in *Bulletin hispanique*, lv (1953), 8) that some of the Basques were evidently still pagan at the beginning of the 9th century, and Cl. Sánchez-Albornoz (*Invasiones normandas a la España cristiana durante el siglo IX*, in *Settimane di studio del centro italiano di studi sull'alto medievo. XVI. I Normanni e la loro espansione in Europa nell'alto medioevo 18-24 aprile 1968*, Spoleto 1969, 370) considers it certain that these al-Madjūs were Basque idolaters, maintaining that the name *Zaldūn* (thus correctly instead of Ṣaltān) is a purely Basque word.

7. As we have seen, the term al-Madjūs was used for tribes living in the north, even when we know for certain that it does not apply to the Vikings (all the textual *loci probantes* are not recorded here). In such cases, the Arabic authors were thinking about the religion in which fire in some from played a prominent part.

8. Al-Madjūs was used in the West as a name for Vikings, evidently because they did not know of, nor did they use, the correct term al-Rūs, which was used by the Arabic Persian authors. Besides, the latter knew the difference, as far as religion was concerned, between the Rūs on one hand and on the other the Madjūs (= Zoroastrians), who never burnt their dead. The Arabs in the West did not know the crucial difference between Vikings and Zoroastrians in the use of fire for funeral ceremonies, but mostly paid attention to the dominant element of the fire itself. And since the Vikings were neither Christians nor Jews, they were consequently assimilated to the Madjūs because of the role of fire in their religious culture.

Bibliography: in addition to the works mentioned in the text: R. Dozy's monograph *Les normands en Espagne*, in his *Recherches*³, ii, 250-371 and Appendix XXXIV, deals with the various attacks by the Madjūs in Spain. At the beginning of this survey, references are given to earlier literature by Werlauff, Mooyer, Kruse and Kunik. Dozy, Melvinger and El-Hajji have abundant references, Dozy and Melvinger also some Arabic texts; see also A. K. Fabricius, *La première invasion des Normands dans l'Espagne musulmane en 844*, in *Actes du X*ᵉ *Congrès international des Orientalistes*, Lisbon 1892. A. Seippel has mentioned all the texts known to him, also dealing with other peoples than the Madjūs, in *Rerum normannicarum fontes arabici. E libris quum typis expressis tum manu scriptis coll. et ed.*, Oslo 1896-1928, Norwegian tr. in *Det Norske Videnskaps-Akad. i Oslo. Skrifter.* II. *Hist.-filos. kl.* 1954, no. 2 by H. AL-**MADJŪSĪ**. [See ʿALĪ B. AL-ʿABBĀS AL-MADJŪSĪ.]

MAḌMŪN (A.), passive participle of *ḍamina* "to be liable"), a legal term meaning the thing for which one is liable or responsible. It occurs in the following connections: *maḍmūn bihi* "thing pawned"; *maḍmūn ʿanhu* "debtor"; *maḍmūn lahu* or *ʿalayhi* "creditor". Liability (*ḍamān* [*q.v.*]) plays an important role in the law of obligations; the rules which

are applied to the parties involved and to the legal institutions are enumerated in the chapters on contracts.

Liability and obligation to restore may arise from the non-performance of a contract, if the object has perished, or from *taʿaddī* "transgression" i.e. from illicit acts, when the object is lost or damaged by the unlawful act. The obligation to restore depends on the division of things (*māl*), which are divided either into fungibles (*mithlī*) i.e. things that can be measured (*makīl*) or weighed (*mawzūn*) or counted (*maʿdūd*), or secondly, are divided into things (*mukawwamāt*) with a special value (*ḳīma*) and individuality i.e. they are *ʿayn* species.

MADRAS, a major port and city on the Coromandel coast of southeastern peninsular India, in lat. 13°4′ N. and 80°15′ E., formerly a governorship of the presidency of the same name (the latter comprising the eastern coast of India from Cape Comorin to Lake Chilka in present-day Orissa, as well as a large part of the interior of the Deccan, and the northern Malabar coast); since independence the capital of the Indian Union State of Tamil Nadu.

1. Nomenclature. The origin of the name "Madras" has been much debated. Perhaps the two most plausible explanations are offered by *Hobson Jobson* and the Madras glossary. The former (532) points out that the "earliest maps" of the region show Madrasapatanam as a Muslim settlement, and "having got so far we need not hesitate to identify it with Madrasa, a college . . . That there was such a Madrasa in existence is established by the quotation from Hamilton, who was there about the end of the 17th century. Fryer's map (1698, but illustrating 1672-73) represents the governor's house as a building of Mahomedan architecture, with a dome. This may have been the Madrasa itself. Lockyer (1711) also speaks of a college of which the building was very ancient, formerly a hospital, and then used apparently as a residence for young writers". The *Manual of the administraiton of the Madras Presidency* (ii, 91) dismisses this idea, however ("*Madrissa*, a Mahommedan school, has been suggested, which considering the date at which the name is first found seems fanciful"), and vol. iii of this work, the *Madras glossary* (144), offers the alternative explanation that "Madras", in Sanskrit *Mandarājāpaṭṭana*, is derived from the Telugu *Mandarādzu*, the name of a local ruler.

Until the early 11th/17th century Madras was a small fishing village. It is not mentioned by Ibn Baṭṭūṭa, who landed in Maʿbar [*q.v.*] at the "large and fine city of Fattan" (thought to have been Kaveripattanam, Gibb, *op. cit.* in *Bibl.*, 263-4) in *ca.* 739/1338. Marco Polo, however, writes at some length of the shrine of St. Thomas, built at Malaipūr, "the name of which is still applied to a suburb of Madras about 3½ miles south of Fort St. George" (Yule, *The Book of Ser Marco Polo*, ii, 354-9).

2. History. In March, 1639, Francis Day of the East India Company "obtained a piece of ground five miles long, and one broad" (*Manual of the administration of the Madras Presidency*, ii, 279) at the small village of Madras, on which to build a town and fort. The land thus purchased, formerly a part of the waning Vijayanagar Kingdom, was to become the nucleus of the modern city of Madras.

Called originally by its founders Fort St. George, Madras remained subordinate to the Chief of the Settlement of Bantam in Java until 1653, when it was raised to the rank of an independent presidency. In 1702 Dāwūd Khān, a general in the service of the Mughal Emperor Awrangzīb [*q.v.*], blockaded the settlement for a few weeks, but without success. In 1741 the town was again attacked, this time by the Marāṭhās [*q.v.*], once again unsuccessfully. Fort St. George was expanded and strengthened in 1743, but this failed to prevent Labourdonnais from bombarding and capturing it in 1746. The city, by this time the largest in southern India, was restored to the British in 1748 by the treaty of Aix-la-Chapelle, although the Government of the Presidency did not return to Madras until 1752. The French made a second, unsuccessful attempt to take the Madras in 1758; the city was occupied, but the French, under Lally, failed to take Fort St. George. After two months the French were forced to withdraw by the arrival of a British fleet in the Madras roads. From this time the city, although threatened in 1769 and again in 1788 by the approach of Ḥaydar ʿAlī [*q.v.*] of Mysore's cavalry, was to remain in British hands until independence in 1947.

At the time of the 1971 *Census of India*, Madras, the third most important port and fourth largest city of India, had a population of 2,469,449 (*Census of India*, series 19, part X-B); of this number 210,083 (comprising 116,444 males and 93,639 females) were Muslims (*Census of India*, series 19, part II-C-i). The *Census of India* figures are not divided to show sectarian affiliations, but the great majority of Madrasi Muslims are Tamil-speaking, either Rawther or Labbai [*q.v.*], Sunnī Muslims of the Ḥanafī *madhhab* who do not claim Arab ancestry and who predominate in the interior of Tamil Nadu; or else Marakayar and Kayalar, Sunnī Muslims of the Shāfiʿī *madhhab* who claim some Arab ancestry and who predominate along the Coromandel coast.

(A. D. W. Forbes)

MADRASA, in modern usage, the name of an institution of learning where the Islamic sciences are taught, i.e. a college for higher studies, as opposed to an elementary school of traditional type (*kuttāb*); in mediaeval usage, essentially a college of law in which the other Islamic sciences, including literary and philosophical ones, were ancillary subjects only.

I. The institution in the Arabic, Persian and Turkish lands

1. Children's schools.

The subject of Islamic education in general is treated under TARBIYA. Here it should merely be noted that the earliest, informal institutions of learning in the Islamic world were probably children's schools, such arrangements doubtless going back to the pre-Islamic period. In Medina, the teachers were often Jews (see al-Balādhurī, 473 below; cf. the name *rabbānī* for the teacher: Ḳur'ān, III, 79; V, 44. 63; Bukhārī, *ʿIlm, bāb* 10; Yaʿḳūbī, ii, 243); but ability to write was not so common here as in Mecca. After the battle of Badr, several captured Meccans were released to teach writing in Medina (al-Mubarrad, *Kāmil*, ed. Wright, 171). A contemporary of ʿUmar's, Djubayr b. Ḥayya, who was later an official and governor, was a teacher (*muʿallim kuttāb*) in a school in Ṭā'if (Ibn Ḥadjar, *Iṣāba*, Cairo 1325, i, 235). Muʿāwiya, who had acted as the Prophet's amanuensis, took a great interest in the education of the young. They learned reading, writing, counting, swimming and a little of the Ḳur'ān and the necessary observances of religion. Famous men like al-Ḥadjdjādj and the poets al-Kumayt and al-Ṭirimmāḥ are said to have been schoolmasters. (Lammens, *Moʿâwia*, 329 ff., 360 ff.). The main subject taught was *adab*, so that the schools of the children were called *madjlis al-adab* (*Aghānī*[2], xviii, 101), and the teacher was called *mu'addib*, also *muʿallim* or *mukattib* (al-Makkī, *Ḳūt al-ḳulūb*, i, 158, l. 8), in modern times *fiḳih* (see Lane, *Manners and customs*, 61). The teacher was as a rule held in little esteem, perhaps a relic of the times when he was a slave, but we also find distinguished scholars teaching in schools; thus Daḥḥāk b. Muzāḥim, the exegist, traditionist and grammarian, who died in 105/723 or 106/724 had a school in Kūfa, said to have been attended by 3,000 children, where he used to ride up and down among his pupils on an ass (Yāḳūt, *Udabā'*, iv, 272-3). As language was of the utmost importance, we find a Bedouin being appointed and paid as a teacher of the youth in Baṣra (*ibid.*, ii, 239). School spread during the Umayyad period, and instruction was also given at home in the houses (see Haneberg, *Schul- und Lehrwesen*, 4 f.).

For the subsequent development of children's schools, see KUTTĀB.

2. Islamic studies in the mosque: the early period.

The *madrasa* is the product of three stages in the development of the college in Islam. The mosque or *masdjid*, particularly in its designation as the non-congregational mosque, was the first stage, and it functioned in this as an instructional centre. The second stage was the *masdjid-khān* complex, in which the *khān* or hostelry served as a lodging for out-of-town students. The third stage was the *madrasa* proper, in which the functions of both *masdjid* and *khān* were combined in an institution based on a single *waḳf* [*q.v.*] deed.

The *masdjid* [*q.v.*] appears early in Islam as a centre for instruction, above all for the inculcation of the sacred texts and scriptures. Within the *masdjid*, the focus of learning was the *madjlis* [*q.v.*], from *djalasa* "to sit up" in contradistinction to the near-synonymous verb *ḳaʿada*, which means "to sit down". Learning took place in the *masdjid*, a place of worship, specifically a place of prostration (from *sadjada*, "to prostrate oneself") in prayer before God. From the prostrate position of the prayer, the teacher and his students would then "sit up", and the class, or *madjlis*, would begin. (From the near-synonymous verb *ḳaʿada*, the *ism makān*, sc. *maḳʿad*, is a bench, upon which one sits from a standing position).

In the new studies associated with the mosque, the learning by heart and the understanding of the Ḳur'ān formed the starting-point and next came the study of *ḥadīth*, by which the proper conduct for a Muslim had to be ascertained. The Prophet was often questioned on matters of belief and conduct, in or outside the mosque (al-Bukhārī, *ʿIlm, bāb* 6, 52; 23, 24, 26, 46). After the death of the Prophet, his Companions were consulted in the same way and scientific study began with the collection and arrangements of *ḥadīth*s. This process is reflected in the *ḥadīth*s themselves. According to them, even the Prophet in his lifetime was asked about *ḥadīth*s (*ibid.*, *bāb* 4, 14, 33, 50, 51, 53); the Prophet sits in a mosque surrounded by a *ḥalḳa* and instructs this hearers; the latter repeat the *ḥadīth*s three times until they have learned them (*ibid.*, *bāb* 8, 30, 35, 42). The Prophet sent teachers of the Ḳur'ān to the tribes, and so did ʿUmar in the year 17 (*ibid.*, *bāb* 25). The necessity of *ʿilm* is strongly emphasised. Jewish influence is perhaps to be recognised when learning is compared with the drinking of water (Bukhārī, *ʿIlm, bāb* 20; cf. *Proverbs*, xviii, 4; *Pirḳē Aboth*, i, 4, 11) and the teachers are called *rabbāniyyūn* (al-Bukhārī, *ʿIlm, bāb* 10). A special class of students, *ahl al-ʿilm*, was formed who spread the knowledge of traditions throughout Muslim lands (*ibid.*, *bāb* 7, 12). They collected people around them to instruct them in the most necessary principles of the demands of Islam. In this simple form of instruction, which was indistinguishable from edifying admonitions, lay the germ of Islamic studies. The knowledge imparted was *ʿilm* or *ḥikma* (*ibid.*, *bāb* 15).

It was from the study of the Ḳur'ān and of *ḥadīth* that a science of jurisprudence began to develop, since the principles which were to be followed by the faithful did not always come ready-made from the mere reading of scripture. Although the early religious scholars, the *ʿulamā'* [*q.v.*] (sing. *ʿālim*), were usually the experts on the Ḳur'ān and were called *al-ḳurrā'* (sing. *ḳāri'*) [see ḲUR'ĀN. 3 and ḲURRĀ'], on the *ḥadīth* [*q.v.*], and were called *al-muḥaddithūn* (sing. *muḥaddith*), and on Ḳur'ānic exegesis and were called *al-mufassirūn* (sing. *mufassir*) [see TAFSĪR], yet the 1st century of Islam saw the development of the jurisconsult-doctor of the law, the *muftī-faḳih*. The turn of the century was later commemorated as "the Year of the Jurisconsults", *sanat al-fuḳahā'*, because of a number, generally considered to be seven, who died in and around that time (J. Schacht, *Origins*, 243, and see AL-FUḲAHĀ' AL-SABʿA in Suppl.).

We hear of a *madjlis* for studies in the Medina

mosque in the 1st century A.H. (*Aghānī*, i, 48; iv, 162-3). Yazīd b. Abī Ḥabīb, sent by ʿUmar b. ʿAbd al-ʿAzīz as *muftī* to Egypt, is said to have been the first to teach in Egypt (Suyūṭī, *Ḥusn al-muḥāḍara*, i, 131); he is mentioned along with another as teacher of al-Layth (al-Kindī, *Wulāt*, 89) and the latter, upon whose pronouncements *fatwās* were issued, had his *ḥalḳa* in the mosque (*Ḥusn*, i, 134). ʿUmar II had before this sent al-Nāfiʿ, the *mawlā* of Ibn ʿUmar, to Egypt to bring them the *sunan* (*ibid.*, 130). He also sent an able reciter of the Ḳurʾān to the Maghrib as *ḳāḍī* to teach the people *ḳirāʾa* (*ibid.*, 131). Education was arranged for by the government by allowing suitable people to give instruction in addition to their regular office. The first teachers in the mosques were the *ḳuṣṣāṣ*, as a rule *ḳāḍīs*, whose discourses dealt with the interpretation of the Ḳurʾān and the proper conduct of divine service. Their *mawʿiẓa* was the direct continuation of the moral instruction given by the old Companions (cf. al-Bukhārī, *ʿIlm*, *bāb* 12). The instruction started in the mosque of ʿAmr was continued for centuries. In the 2nd/8th century, al-Shafiʿī taught various subjects here every morning till his death (204/820) (al-Suyūṭī, *Ḥusn al-muḥāḍara*, i, 134; Yāḳūt, *Udabāʾ*, vi, 383). It was after this time that the study of *fiḳh* came markedly to the front and the great teachers used at the same time to give *fatwās* (cf. *Ḥusn*, i, 182-3).

Arabic philological studies were ardently prosecuted in the mosques. The interest of the early Arabs in rhetoric survived under Islam; the *faḳīh* Saʿīd b. al-Musayyab (d. 95/713-4; cf. al-Ṭabarī, ii, 1266) discussed Arabic poetry in his *madjlis* in the mosque in Médina; but it was still thought remarkable that poems should be dealt with in a mosque (*Aghānī*, i, 48; iv, 162-3). In the year 256/870, al-Ṭabarī by request dictated the poems of al-Ṭirimmāḥ beside the *Bayt al-Māl* in the Mosque of ʿAmr (Yāḳūt, *Udabāʾ*, vi, 432). In the chief mosque of Baṣra, the *aṣḥāb al-ʿarabiyya* sat together (*ibid.*, iv, 135). In Baghdād, al-Kisāʾī gave his lectures in the mosque which bears his name. At quite an early date we read of special appartments (which were certainly also lecture-rooms) for authorities on the Ḳurʾān, for, according to al-Wāḳidī, ʿAbd Allāh b. Umm Maktūm lived in Medina in the *dār al-ḳurrāʾ* (*Ḥusn al-muḥāḍara*, ii, 142).

As is evident from the examples quoted, studies were not only prosecuted in the chief mosques but also in other mosques. In Egypt, not only the Mosque of ʿAmr but also the chief mosques of later date were important centres of study. As soon as the Mosque of Ibn Ṭūlūn was founded, a pupil of al-Shāfiʿī began to lecture in it on *ḥadīth* (*Ḥusn al-muḥāḍara*, ii, 139). During the Fāṭimid period this was continued. In the year 361/972, the Azhar [*q.v.*] Mosque was finished. Soon afterwards, the new Shīʿī *ḳāḍī*, ʿAlī b. al-Nuʿmān, lectured in it on *fiḳh* according to his school; in 378/988 al-ʿAzīz and his vizier Yaʿḳūb b. Killis founded 35 lectureships, and in addition to their salaries the lecturers were given quarters in a large house built beside the mosque (al-Maḳrīzī, iv, 49; Sulaymān Raṣad al-Ḥanafī, *Kanz al-djawhar fī taʾrīkh al-Azhar*, 32 ff.).

Thus the *masdjid* continued to be used for the teaching of one or more of the Islamic sciences, or their ancillaries among the literary arts, well into the 3rd/9th century of Islam. The turning-point in its use came after the *miḥna* [*q.v.*] or Great Inquisition. Begun in the last year of al-Maʾmūn's caliphate, 218/833, the *miḥna* extended across the caliphates of al-Muʿtaṣim and al-Wāthiḳ to the second year of al-Mutawakkil's caliphate, 234/848, a period of fifteen years. The upshot of the *miḥna* was the political bankruptcy of its authors, the rationalist forces represented by the philosophical theologians, and the correlative triumph of the traditionalist forces, its victims, the doctors of the law, a triumph due in great measure to the heroic endurance of Aḥmad b. Ḥanbal [*q.v.*].

After the *miḥna*, more and more *masdjids* came to be founded for legal studies, i.e. as colleges of law. Since the *masdjid* could not serve as a lodging place for teaching staff and students—the exceptions being the wayfarer (*ibn al-sabīl*) and ascetic, pious men who had given up all wordly goods (*zuhhād*, sing. *zāhid*)—*khāns* were founded next to the *masdjids* to serve as lodging for students from out-of-town. The outstanding example of this type of arrangement was the extensive network of *masdjid-khān* complexes founded in the lands of the eastern caliphate during the 4th/10th century by Badr b. Ḥasanawayh (d. 405/1014), governor of several provinces under the Buwayhids [see ḤASANWAYH]. Such men of power and influence needed the good offices of the *ʿulamāʾ*, their sole sure link with the masses of the faithful. To establish this connection, such men founded for the *ʿulamāʾ* institutions wherein they could teach the Islamic sciences. Besides currying favour with the *ʿulamāʾ*, the powerful founders were performing highly meritorious acts of charity endearing them to the masses and the *ʿulamāʾ* alike.

The terminology for legal studies developed before the flourishing of the *madrasa* in the 5th/11th century. It derived from the radicals *d-r-s*. The second form of the verb, *darrasa*, used without a complement, meant "to teach law"; *tadrīs*, its verbal noun (*maṣdar*), meant "the teaching of law", the function as well as the post of professor of law; the plural, *tadārīs*, or "professorships of law", was of later development, when the holding of several professorships by one doctor of the law became a common practice. The term *dars*, meant "a lesson or lecture on law"; *mudarris*, the active participle, meant "the professor of law". It must be kept in mind that these terms had these significations in reference to law, especially when used in the absolute, without a complement. The verb *faḳḳaha* is of rare occurrence, and was not commonly used to designate the teaching of law. The term *faḳīh* was used in the sense of "doctor of the law", or "student of law", particularly "a graduate student", in contradistinction to *mutafaḳḳih*, used to designate "the undergraduate". The accomplished *faḳīh* was eligible to become a *mudarris* and a *muftī*; for as a *faḳīh* who had successfully defended his theses in disputations (*munāẓara*), he obtained his licence to teach and to issue legal opinions (*idjāza li 'l-tadrīs wa 'l-iftāʾ*).

The college of law therefore began as a *masdjid* and was soon joined by the *khān* or hostel for out-of-town students. The lodging place next to the *masdjid* was especially necessary for the student of law as distinguished, for instance, from the student of the *ḥadīth*. Jurisprudence was by now a science whose rudiments had to be learned in a period of years, usually four, and these usually under the direction of one master. After this basic undergraduate training, if he was successful and chosen by his master as a *ṣāḥib* or fellow, he went on to graduate studies that lasted an indefinite period of time, some follows working as repetitors (*muʿīd*) under their masters for as many as twenty years before

acquiring their own professorial chair. In contrast, the student of *ḥadīth* travelled from one place to another, acquiring rare *ḥadīth*s, and collections of *ḥadīth*s, from *ḥadīth*-masters who often were the last link in the chain of transmitters, holding alone the authorisation to pass on their collections authoritatively to others. The *ḥadīth* student travelled therefore from place to place and collected as many authorisations, *idjāza*s, as possible from as many masters as he could reach. The law student was interested in an authorisation covering a field of knowledge, that of law, in one *idjāza*; the licence to teach law and issue legal opinions, *idjāzat al-tadrīs wa 'l-fatwā*, which he obtained from one master-jurisconsult. The *khān*, founded near the *masdjid*, was therefore necessary as a lodging-place for law students away from home.

3. The library as an adjunct to the mosque and other institutions of higher learning.

In the descriptions of the larger mosques the libraries are often mentioned. These collections were gradually brought together from gifts and bequests, and it was a common thing for a scholar to give his books for the use of the *muslimūn* or *ahl al-ʿilm* (e.g. al-Khaṭīb al-Baghdādī: Yāḳūt, *Udabāʾ*, i, 252; cf. iv, 287). Many other libraries were semi-public. These often supplemented the libraries of the mosques, because they contained books in which the mosques were not much interested, notably on logic, *falsafa*, geometry, astronomy, music, medicine and alchemy; the latter were called *al-ʿulūm al-ḳadīma* or *ʿulūm al-awāʾil* (cf. Goldziher, in *Abh. Pr. Ak. W.* [1915], phil. hist. Kl. no. 8, Berlin 1916). The academy, *bayt al-ḥikma* [*q.v.*], founded by al-Maʾmūn (198-218/813-33) in Baghdād, deserves first mention. It recalls the older academy founded in Gundeshāpūr to which al-Manṣūr had invited Georgios b. Gabrīʾēl as head of the hospital; he also translated works from the Greek (Ibn Abī Uṣaybiʿa, i, 123-4). In the new academy there was a large library, and it was extended by the translations which were made by men qualified in the above-mentioned fields; there was also an astronomical observatory attached to the institution, in which there were also apartments for the scholars attached to it (*Fihrist*, ed. Flügel, 243; cf. Ibn al-Ḳifṭī, *Taʾrīkh al-Ḥukamāʾ*, 98). When the caliph al-Muʿtaḍid (279-89/892-902) built himself a new palace, he had apartments and lecture-rooms in an adjoining building for men learned in every science, who received salaries to teach others (al-Maḳrīzī, iv, 192 ff.; *Ḥusn al-muḥāḍara*, ii, 142).

Private individuals of wealth continued benefactions on these lines. ʿAlī b. Yaḥyā, who died in 275/888 and was known as al-Munadjdjim, had a palace with a library, which was visited by those in search of knowledge from all lands; they were able to study all branches of learning in this institution, called *khizānat al-ḥikma*, without fee; astronomy was especially cultivated (Yāḳūt, *Udabāʾ*, v, 467). In Mawṣil, Djaʿfar b. Muḥammad al-Mawṣilī (d. 323/935) founded a *dār al-ʿilm* with a library in which students worked daily at all branches of knowledge and were even supplied with free paper. The founder lectured on poetry in it (*ibid.*, ii, 420). In the 4th/10th century, al-Maḳdisī visited in Shīrāz a large library founded by ʿAḍud al-Dawla (367-72/977-83) to which people of standing had access. The books were arranged in cases and listed in catalogues and the library (*khizānat al-kutub*) was administered by a director (*wakīl*), an assistant (*khāzin*) and an inspector (*mushrif* (al-Muḳaddasī, 449). Similar institutions are known in Baṣra, Rām-Hurmuz, Rayy and Karkh (*ibid.*, 413; Yāḳūt, *Udabāʾ*, ii, 3-5; Ibn Taghrībirdī, ed. Popper, ii, 51-2).

In Cairo, they were well-known under the Fāṭimids. In their palace, they had a library which was said to be the largest in Islam. It had about 40 rooms full of books and all branches of knowledge were represented; they had for example 1,200 copies of al-Ṭabarī's *History* and 18,000 books on the "old learning" (al-Maḳrīzī, ii, 253-5). The vizier Yaʿḳūb b. Killis founded an academy with stipends for scholars and spent 1,000 *dīnār*s a month on it (Yaḥyā b. Saʿīd, ed. Tallquist, fol. 108a; Ibn Khallikān, *Wafayāt*, Cairo 1310/1892-3, ii, 334; cf. al-Maḳrīzī, iv, 192). It was overshadowed by the "House of Knowledge" (*dār al-ʿilm* or *dār al-ḥikma*) founded by al-Ḥākim in 395/1005. It contained a library and reading-room as well as rooms for meetings and for classes. Librarians and assistants, with their servants, administered it, and scholars were given allowances to study there; all branches of learning were represented—astronomy, medicine, etc., in addition to the specifically Islamic subjects. Al-Ḥākim built similar institutions in al-Fusṭāṭ (al-Maḳrīzī, ii, 334 ff.). The whole institution was closely associated with Shīʿa propaganda, which is obvious from the fact that it was administered by the *dāʿī 'l-duʿāt*, who held conferences with the learned men there every Monday and Thursday (al-Maḳrīzī, iv, 226; al-Ḳalḳashandī, *Ṣubḥ al-aʿshāʾ*, iii, 487; see also MADJLIS. 2. In Ismāʿīlī usage). A similar missionary institute (*dār al-daʿwa*) was built in Aleppo in 507/1113-14 by the *amīr* Fakhr al-Mulk (Ibn Taghrībirdī, ed. Popper, ii, 360). We may assume that these buildings were also arranged for the performance of the *ṣalāt*.

With the *dār al-ḥikma*, Islam was undoubtedly continuing Hellenistic traditions. Al-Maḳrīzī mentions a *dār al-ḥikma* of the pre-Islamic period, where the learned men of Egypt used to work (iv, 377); Ibn Abī Uṣaybiʿa also mentions pre-Islamic seminaries in Egypt where Hellenistic learning was cultivated (*dār al-ʿilm*, i, 104), and the similarity with the Alexandrine *Museion*, which was imitated in Pergamon and Antioch, for example, is apparent (J. W. H. Walden, *The universities of ancient Greece*, New York 1919, 48-50). Al-Ḥākim's institution was finally closed with the end of the Fāṭimid dynasty (567/1171). Ṣalāḥ al-Dīn had all the treasures of the palace, including the books, sold over a period of ten years. Many were burned, thrown into the Nile, or thrown into a great heap, which was covered with sand so that a regular "hill of books" was formed. The number of books said to have disposed of varies from 120,000 to 2,000,000, but many were saved for new libraries (al-Maḳrīzī, ii, 253-5; Abū Shāma, *Kitāb al-Rawḍatayn*, Cairo 1287/1870, i, 200, 268).

4. The origin and spread of the *madrasa* proper.

Although the *madrasa* proper now began to evolve, there was for a long time much overlapping between

the mosque and the *madrasa*, for even after the appearance of *madrasas*, the regular mosques remained school as before.

Ibn Baṭṭûṭa, who travelled in the 8th/14th century, in the period when *madrasas* flourished most, attended lectures on *ḥadīth* in the Djāmiʿ of Shīrāz and in the Djāmiʿ of al-Manṣūr in Baghdād (ii, 83, 110). In Damascus in 580/1184, Ibn Djubayr refers to rooms in the Umayyad Mosque, which were used for Shāfiʿī and Mālikī students, who received considerable stipends (*idjrāʾ*, *maʿlūm*) (*Riḥla*, 272, above). In Egypt in the time of al-Maḳrīzī (9th/15th century), there were 8 rooms for *fiḳh* studies in the Mosque of ʿAmr (al-Maḳrīzī, iv, 20, 21). In al-Azhar in the 7th/14th century, and later, after the earthquake of 702, many lecture-rooms with paid teachers were built (*ibid.*, 52), likewise in the Mosque of al-Ḥākim (*ibid.*, 57).

When a particular room was set apart for teaching purposes in a mosque, this was often called a *madrasa*; for example six of the Damascus *madrasas* were in the Umayyad Mosque (*JA*, ser. 9, iii, 410, 432, 437; iv, 262, 270, 481; others: vii, 230). The *madrasas* were often also built close beside the large mosques so that they practically belonged to them. This was the case in Mecca (*Chron. Mekka*, ii, 104 ff.; cf. Ibn Baṭṭûṭa, i, 324).

Though the *madrasa* was an independent institution, the distinction between the *madrasa* and ordinary mosque was very slight, all the less as sermons were also preached in the *madrasa*. In the Niẓāmiyya in Naysābûr, services were held as soon as it was finished (by ʿAbd al-Raḥīm: Wüstenfeld, *Schâfiʿī*, iii, 285) and the Niẓāmiyya in Baghdād had a *minbar* (Ibn Djubayr, 219). In Egypt from 569/1174 to 665/1267 there was only one Friday *khuṭba*, but after this time there was usually a *minbar* in the larger *madrasas*.

It was only natural that the *madrasas* should also be called *masdjid* (cf. Ibn Djubayr, 48). Ibn al-Ḥādjdj in the 8th/14th century still wants to distinguish between *masdjid* and *madrasa* and to give more importance to the former (*Madkhal*, ii, 3, 48). The distinction remained, however, quite an artificial one, and this is also true of the distinction between *madrasa* and *djāmiʿ*. The name *madrasa* was decided by the main object of the institution and the special style of the building. The name *djāmiʿ* was only given if the Friday service was held in it.

The connection between mausoleum and mosque was also found with the *madrasa*. The tomb of the founder was placed in Nūr al-Dīn's *madrasa* in Damascus (Ibn Djubayr, 284-5), and during the Mamlūk period it was the regular custom for the founders of a *madrasa* to be buried under a *ḳubba* [*q.v.*] in it.

On education and the *madrasa* in general, cf. also F. Wüstenfeld, *Die Akademien der Araber und ihre Lehrer*, Göttingen 1837; von Kremer, *Culturgeschichte*, Vienna 1877, ii, 479 ff.; Haneberg, *Abhandlung über das Schul- und Lehrwesen der Muhammedaner im Mittelalter*, 1850; van Berchem, *Corpus inscr. arab.*, i, 252-69; G. Gabrieli, *Manuale di bibliografia musulmana*, i, 1916, 109 ff.; Johs. Pedersen, in *IC*, iii (1929), 525-37; A. Talas, *La Madrasa Nizamiyya et son histoire*, Paris 1939.

While the institutions called the *dār al-ʿilm* developed in Fāṭimid countries into centres of Shīʿī propaganda, the *madrasa* grew up in the east out of similar Sunnī institutions. It is interesting to note that in 395/1005 al-Ḥākim built a Sunnī *dār-al-ʿilm* in Cairo (Ibn Taghrībirdī, ed. Popper, ii, 64, 105, 106). But after these years, this institution was abolished and its two learned teachers executed. With the growing strength of the Sunna, especially in the Shāfiʿī and Ḥanafī forms, many educational institutions arose in the east which had a pronounced Sunnī character (al-Muḳaddasī, 232, 365, 415). Many teachers built houses of their own, where they dictated *ḥadīths* and held lectures on *fiḳh*, e.g. a teacher who died in Marw in 420/1029 (Wüstenfeld, *Schâfiʿī*, 232). Abū Ḥātim al-Bustī, born in 277/890, founded in his native town a school with a library with apartments and allowances for the maintenance of foreign students (*ibid.*, 163; cf. 204, 245).

In Naysābûr especially, where studies were vigorously prosecuted in the mosque (e.g. Wüstenfeld, *op. cit.*, 236), many such institutions arose. Thus a special school was built for the Shāfiʿī *fiḳh*-scholar al-Ṣāʾigh al-Naysābūrī (d. 349/960; *ibid.*, 156; cf. 160). Abū ʿAlī al-Ḥusaynī (d. 393/1003) himself founded a school in which to teach *ḥadīth*, and it was attended by 1,000 scholars (*ibid.*, 203). Ibn Fūrak (d. 406/1015-6; *ibid.*, 216) did the same, likewise Abu 'l-Ḳāsim al-Ḳushayrī in 437/1045-6 (*ibid.*, 284); and for Rukn al-Dīn al-Isfarāʾinī (d. 418/1027) a school was built which surpassed all others (*ibid.*, 229). As early as the 4th/10th century, we find al-Muḳaddasī praising the very fine *madāris* of Īrānshahr (*BGA*, iii, 315). In the first half of the 5th/11th century, there were four especially famous *madrasas* in Naysābûr: al-Madrasa al-Bayhaḳiyya, founded by al-Bayhaḳī (d. 458/1066), when he became a teacher in Naysābūr in 441/1049-50 (Wüstenfeld, *op. cit.*, iii, 270); al-Saʿīdiyya founded by the *amīr* Naṣr b. Sebüktigin (governor of Naysābūr in 389/999); one built by Abū Saʿd Ismāʿīl al-Astarābādī; and another built for the teacher Abū Isḥāḳ al-Isfarāʾinī. A Niẓāmiyya was also built here by Niẓām al-Mulk for the Imām al-Ḥaramayn al-Djuwaynī (al-Maḳrīzī, iv, 192; *Ḥusn al-muḥāḍara*, ii, 141-2). It was an event of great importance when Niẓām al-Mulk (456-85/1064-92 vizier of the Saldjūḳ sulṭāns Alp Arslān and Malik Shāh) founded the celebrated *Madrasa Niẓāmiyya* in Baghdād; the building was begun in 457/1065 and on 10 Dhu 'l-Ḳaʿda 459/22 September 1067 it was consecrated. It was founded for the Shāfiʿī teacher Abū Isḥāḳ al-Shīrāzī.

The Muslim historians are in some doubt about the history of the *madrasa*. Niẓām al-Mulk is given the credit of having founded it, but al-Maḳrīzī and al-Suyūṭī point out that *madrasas* were already in existence before him and mention the four above-named ones; but, as we have seen, even they were not innovations. Al-Subkī thinks (says al-Suyūṭī) that the new feature was that Niẓām al-Mulk endowed scholarship for the students. This again, however, was nothing new. But the enthusiasm and energy of Niẓām al-Mulk marked the beginning of a new period of brilliance for the *madrasa* (cf. G. Makdisi, *Muslim institutions of learning in eleventh century Baghdad*, in *BSOAS*, xxiv [1961], 1-56; A. L. Tibawi, *Origin and character of al-Madrasah*, in *BSOAS*, xxv [1962], 225-38; H. Halm, *Die Anfänge der Madrasa*, in *ZDMG*, Suppl. III, 1, XIX, Deutsche Orientalistentag [1977], 438-48). The sultan and men of high rank were now interested in it, and the type evolved by Niẓām al-Mulk, a school in which the students were boarded, became the prevailing one after his time. We may presume that the older schools also had a place for prayer in them, i.e. they were a kind of mosques. The type of school

known to us is built as a complete mosque. Since even the older mosques contained living-rooms which were frequently used by students, there is no difference in principle between the school and the ordinary mosque; only the schools were especially arranged for study and the maintenance of students. This character is expressed by the name *madrasa*, plural *madāris*; it is a genuine Arabic formation from the word *darasa*, "to read", "to study", taken from Hebrew or Aramaic.

In the time of Niẓām al-Mulk and immediately afterwards, the *madrasa* spread in ʿIrāḳ, Khurāsān, al-Djazīra, etc. He was not content with the two he founded in Naysābūr and Baghdād. There was also a *Madrasa Niẓāmiyya* in Balkh (Wüstenfeld, *Schâfiʿī*, 240); in Mawṣil (*ibid.*, 319); in Harāt, to which al-Shāshī (d. 485/1092) was called from Ghazna (*ibid.*, 310); and in Marw (Yāḳūt, iv, 509). The great vizier's rival Tādj al-Mulk (d. 486/1093) founded a *Madrasa Tādjiyya* in Baghdād (*ibid.*, 311). In Naysābūr, other *madrasas* were founded at the same time, for example one by al-Manīʿī (d. 463/1070-1; *ibid.*, 277) and a Shaṭbiyya (*ibid.*, 327).

The prosperity of the *madrasas* stimulated by Niẓām al-Mulk in the 5th/11th century survived for a long time in the east. In the 6th/12th century Ibn Djubayr (580/1184) mentions some thirty *madrasas* in Baghdād, all in the eastern part of the town, the most notable being the Niẓāmiyya, renovated in 504/1110-11 (*Riḥla*, 229). In 631/1234, the caliph al-Mustanṣir founded the magnificent Mustanṣiriyya as a school for the four rites, each with a teacher and seventy-five students and a teacher for Ḳurʾān and one for *ḥadīth*, as well as a physician. Attached to it were a library, baths, hospital and kitchens; there was a clock at the entrance; beside it was a garden where the caliph had a pavilion (*manẓara*) from which he could survey the whole building (cf. Le Strange, *Baghdad*, 266-7; Wüstenfeld, *Akademien der Araber*, p. iv and 29).

The Niẓāmiyya and the Mustanṣiriyya survived the destruction of Baghdād by Hūlāgū; both are mentioned at the beginning of the 8th/14th century by Ibn Baṭṭūṭa (ii, 108-9), and the building of the latter still exists. Ten others are known of the 8th-9th/14th-15th century, all of which were founded for Shāfiʿīs, Ḥanafīs and for the study of Ḳurʾān and *ḥadīth* (L. Massignon, *Les Medresehs de Bagdâd*, in *BIFAO*, vii [1909], 77-86; the inscriptions, idem, in *MIFAO*, xxxi [1912]). Although the Tatars in 699/1300 destroyed many *madrasas* (Quatremère, *Hist. des sult. maml.*, ii/2, 163-4). Ibn Baṭṭūṭa shows that in the 8th/14th century there were still flourishing schools in the east. The Mongols also built *madrasas*; Hūlāgū's mother built two *madrasas* in Bukhārā where 1,000 students studied daily in each (*JA*, ser. 4, xx, 389; Quatremère, *Hist. sult. maml.*, i/1, 56). The period of greatest prosperity of the *madrasas* in Central Asia was under the Tīmūrids, notably in Samarḳand, where Tīmūr built a *djāmiʿ* "in the Indian style", and his wife a *madrasa* (Ibn ʿArabshāh, *Vita Timuri*, ed. Manger, 1767, 444 ff.; see also Diez, *Kunst der islam. Völker*, 99-100).

In the towns of Mesopotamia and Syria, the movement spread from the 5th/11th century onwards.

In Damascus the two rulers Nūr al-Dīn b. Zangī (541-69/1146-63) and Ṣalāḥ al-Dīn (570-89/1174-93) displayed a munificent activity in this direction, as did their *amīrs* and relatives. This activity was continued into the 7th/13th to 9th/15th centuries, so that al-Nuʿaymī (d. 927/1521; *JA*, ser. 9, iii-vii) can give the following totals: seven *dār al-Ḳurʾān*, sixteen *dār al-ḥadīth*, three for both Ḳurʾān and *ḥadīth*, 60 Shāfiʿī, 52 Ḥanafī, four Mālikī and ten Ḥanbalī *madrasas*, also three *madāris al-ṭibb*, all of which belong to the 7th/13th century. The founders were mainly rulers and *amīrs*, but also included merchants and quite a number of men of learning, and a few women also.

Ṣalāḥ al-Dīn introduced the *madrasa* into Jerusalem. According to Mudjīr al-Dīn (d. 927/1521), there were 31 *madrasas* and monasteries (which were in part used in the same ways as *madrasas*) in direct connection with the Ḥaram area, 29 near it, and 16 at some distance. Of these, some 40 are especially called *madrasa*, one a *dār al-Ḳurʾān* and one a *dār al-ḥadīth* (Sauvaire, *Hist. Jérus. et Hébr.*, Paris 1876, 139 ff.; van Berchem, *Corpus*, ii, 1; cf. for Ṣalāḥ al-Dīn: Ibn Khallikān, *Wafayāt*, ii, Cairo 1310/1892-3, 402-3).

Next to Niẓām al-Mulk, Ṣalāḥ al-Dīn has the greatest reputation as a builder of *madrasas*. He owes this mainly to the fact that his great activity as a builder lay in countries which became of great importance in the Muslim world, Syria with Palestine, and Egypt. Even before the fall of the Fāṭimids, in the year 566/1171: he had founded in Cairo the Nāṣiriyya for Shāfiʿīs and the Kambiyya for Mālikīs; for Shāfiʿīs also the Sharīfiyya and notably the great Ṣalāḥiyya or Nāṣiriyya (for the identity of the two, cf. al-Maḳrīzī, iv, 251, with *Ḥusn al-muḥāḍara*, ii, 142-3), beside al-Shāfiʿī's mausoleum (*Ḥusn al-muḥāḍara*, ii, 141-2; al-Maḳrīzī, iv, 192 ff.; Ibn Khallikān, ii, 402-3). Those around him emulated this activity.

During the period of the Ayyūbids and Mamlūks, the number of *madrasas* increased to an extraordinary degree. In the street called Bayn al-Ḳaṣrayn there were two long rows of *madrasas* on the site of the old Fāṭimid palace in Cairo (cf. P. Ravaisse, in *MMAF*, i, 1889, 409 ff., pl. 3). Al-Maḳrīzī (d. 845/1442) mentions 73 *madrasas*, 14 for Shāfiʿīs, four for Mālikīs, ten for Ḥanafīs, three for Shāfiʿīs and Mālikīs, six for Shāfiʿīs and Ḥanafīs, one for Mālikīs and Ḥanafīs, four for all four rites, two exclusively used as *dār al-ḥadīth*, while the rite of 25 is not mentioned and four remained unfinished. Of these *madrasas*, according to him, about 13 were founded before 600, 20 in the 7th century, 29 in the 8th century and two after 800.

In Ṣalāḥ al-Dīn's time, the *madrasa* was also introduced into the Ḥidjāz. In the year 579/1183-4 the governor of Aden built in Mecca a *madrasa* for the Ḥanafīs, and in the following year a Shāfiʿī *madrasa* was also founded there (*Chron. Mekka*, ii, 104). Up to the beginning of the 9th/15th century, 11 *madrasas* are mentioned (*ibid.*, 104-7), but others were added (*ibid.*, iii, 177-8, 211-12, 225-6, 351 ff., 417). In the 12th/18th century, they ceased entirely to be used for their original purpose (see Snouck Hurgronje, *Mekka*, ii, 229 ff.). *Madrasas* were also built in Medina (Wüstenfeld, *Medina*, 58, 98, 112).

In Asia Minor, *madrasas* spread under the Saldjūḳs; the oldest known date from the 7th/13th century (Cl. Huart, *Konia*, 1897, 156, 160, 178; Fr. Sarre, *Reise in Kleinasien*, 1896, 48-9, 51-2; R. Hartmann, *Im neuen Anatolien*, 1928, 106 ff.).

In Tunis, many *madrasas* were erected under the Ḥafṣids (625-941/1228-1534), the oldest being the Madrasat al-Maʿraḍ in about 650/1252. In the *Chronicle of Tunis* (al-Zarkashī, *Chronique des Almohades et des Hafsides*, tr. E. Fagnan, in *Rec. Not. et Mém. Soc. Arch. Const.*, xxi [1895], see index)

11 are mentioned. The first *madrasa* in the Maghrib was, according to Ibn Marzūḳ's *Musnad*, the Madrasat al-Ṣaffārīn built by the Marīnid Abū Yūsuf Yaʿḳūb b. ʿAbd al-Ḥaḳḳ (656-85/1258-86) in Fās in 684/1285 (also called al-Ḥalfāʾiyyīn; see the edition by Lévi-Provençal, in *Hespéris*, v [1925], 34 [Arabic] = 44 [French]). Other Marīnids and their successors continued the building of *madrasas* in Fās, Tilimsān and other cities (cf. Bel, *Inscriptions de Fès*, in *JA*, ser. 11, x [1917], xii [1918]; G. Marçais, *Manuel d'art musulman*, ii, 1927, 465 ff.).

In Spain, according to Ibn Saʿīd (7th/13th century), there were no *madrasas*; instruction was given in the mosques (al-Maḳḳarī, *Analectes*, i, 136); in the following century, however, a large *madrasa* was founded in Granada by the Naṣrid Yūsuf Abu 'l-Ḥādjdjādj in 750/1349 (Almagro Cardenas, in *Boletin de la Real Acad. de la Hist.*, xxvii, 490; Marçais, *op. cit.*, 516-17).

Ibn Khaldūn (808/1406) testifies to the spread of *madrasas* in Tunis and the Maghrib but laments the decline in education. In al-Andalus, Muslim culture was dying out and after the decline of Ḳurtuba and al-Ḳayrawān, education in the Maghrib was on a low level, while the old schools in ʿIrāḳ were no longer of importance. Cairo was a centre of learning to which all made their way, and studies also flourished in Persia (*Muḳaddima*, *faṣl* 6, no. 2). This decline in interest in learning soon became general. The learning of the time lacked vitality, and international scholarship was affected by political conditions. In 1517 A.D., Leo Africanus [*q.v.*] says that the lecture-rooms in Cairo were large and pleasant but the numbers who attended them were small. Some still studied *fiḳh*, but very few the arts (*Desc. de l'Afr.*, iii, 372, in *Rec. de Voy. et de Doc.*, ed. Schefer, Paris 1896-8).

5. The constitution of the madrasa.

We have seen that, already in the 4th/10th century, there were a number of *madrasas* outside Baghdād, the cultural centre of the Islamic world, but we have also noted the impetus to *madrasa*-building which took place in the next century and is associated especially with Niẓām al-Mulk. Even so, as further noted, earlier types of educational institution continued to flourish.

The *madrasa*, combining the functions of the *masdjid* and its nearby *khān* in one architectural unit, brought nothing new to legal studies as such. Nor was the student body more numerous in the *madrasa* than it was in its predecessor; the number in either type of college of law was usually twenty. Nor did the new *madrasa* put an end to the *masdjid* as a college; these last continued to be established as charitable foundations. Indeed, many *ʿulamāʾ* deplored the innovation of the *madrasa* which provided for all the needs of the student, including room and board, and encouraged, according to the *ʿulamāʾ*'s complaints, the worthy and unworthy alike to pursue knowledge for the wrong kind of motivation, a parasitic life of ease, instead of learning for the greater glory of God. Thus the *masdjid-khān* type of college continued to be founded, and many professors of law continued to teach there, as for instance, within the Ḥanbalī *madhhab*, whose first *madrasa* was founded only in the first part of the 6th/12th century. This lingering preference for the *masdjid* is not surprising, given the place of the mosque in the Muslim community and the encouragement of the faithful to build mosques: "The Apostle of God ordered ... that *masdjids* be built" (*amara rasūl Allāh ... bi-bināʾ al-masādjid*, Abū Dāwūd, *Sunan*, *ṣalāt*, 13; al-Tirmidhī, *Djāmiʿ*, *djumuʿa*, 65; see also Muslim, *Ṣaḥīh*, *masādjid* 288; al-Tirmidhī, *op. cit.*, *daʿawāt*, 82; al-Dārimī, *Sunan*, *ṣalāt*, 60).

One should not attach undue importance to the fact that the *madrasa* developed especially in the eastern lands of the caliphate, in ʿIrāḳ, Persia and Transoxania; this does not imply a cultural swing away from Arab Baghdād towards Persian Khurāsān, especially towards Naysābūr, which would be a misreading of cultural history due to anachronistic nationalist sentiment. Since there was no change in the curriculum, or in the teaching staff or students, and since the final product of the two types of colleges was exactly the same, that is, the *muftī-faḳīh*, the reason for the change in institutional typology must be sought elsewhere and may be found in the legal status of the two institutions concerned, the *masdjid* and the *madrasa*.

Relevant here is the fact that the legal status of the *madrasa* allowed the founder to retain complete control over the administrative and instructional staff of the institution, and therefore the retention of the power of patronage. For government officials, such as a *wazīr*, it permitted him to attract the support of the rank and file through their religious leaders employed by the founder. For these men, as well as for men of lesser power, the law of *waḳf* permitted them to place their wealth where it could be secured against confiscation.

Moreover, the *masdjid* and the *madrasa* were charitable foundations based on *waḳf*. The founder, the *wāḳif*, was free to found the one or the other type of institution. He could, in his deed of foundation, make any stipulations he wished regarding any aspect of his foundation, whether it be a *masdjid* or a *madrasa*, with only one limitation to his freedom of choice: none of his stipulations were to contravene the tenets of Islam. Legally speaking, he could not appoint the *imām* of the *masdjid*. If the *masdjid* had a professor in addition to the *imām*, the founder could appoint the professor. The *imām*, or the professor-*imām*, was appointed by the caliph alone, or by the caliph with the consent of the people of the quarter where the *masdjid* was located. A *madrasa*, as such, had no *imām*, unless the foundation was a complex including a *madrasa* and *masdjid*. The fundamental difference between the two institutions was that the *masdjid*, once the *waḳf* deed was signed, became a *waḳf taḥrīr*; that is to say, a foundation whose legal status is assimilated to the manumission of a slave. As the master, once he freed his slave, had no further rights over him, the founder, once the deed of his *masdjid* was signed, had no further rights over it, other than those legally-valid stipulations in his deed pertaining to the instructional aspects of his foundation.

Thus between the two great patrons of learning mentioned previously, Badr and Niẓām al-Mulk, the difference is that, while the former founded *masdjids* over which he had limited control, the latter founded *madrasas* over which his control was complete. Niẓām al-Mulk retained for himself and his progeny complete control over his network of *madrasas*. In Baghdād, where professorial tenure was usually for life in the *masdjid*-college of law, Niẓām al-Mulk hired and fired professors, some after a tenure of a month or even of a day. The introduction of *madrasas* in Baghdād may therefore be viewed as an encroachment upon the patronage of the caliph, whose control over *masdjid*- and *djāmiʿ*-mosques did not extent to the *madrasa*.

After the *masdjid* and *madrasa*, other institutions came into existence, especially the *dār al-ḥadīth* [*q.v.*], the first of which was, as already noted above, founded by Nūr al-Dīn b. Zangī in Damascus. In this institution, the *muḥaddith* was raised to the level of the *mudarris* in the *madrasa*. The *madrasa* founded for one *madhhab* tended to be divisive, since only those students who chose to belong to that *madhhab* were admitted for the study of law and the ancillary sciences. The *dār al-ḥadīth* served to bring together students of all *madhhabs*, and may thus be seen as a further manifestation of the triumph of traditionalism over the forces of rationalism represented by the *dār al-ʿilm* [*q.v.*] institutions, which soon disappeared from the scene. The *dār al-ḥadīth* must not be confused with either *dār al-tadrīs* or *dār al-sunna*, occasional terms that referred not to the study of *ḥadīth* but of *fiḳh*, and were used as terms of traditionalism opposing the rationalism of *dār al-ʿilm*.

Education in Islam was religious in nature and an obligation incumbent upon the *ʿulamāʾ*, the men of religious science. The caliph as the successor to the Prophet made it possible for teachers to teach in the Friday mosques where *ḥalḳas* [*q.v.*], study-circles, provided instruction in the various religious sciences and their ancillaries. Private individuals endowed institutions of learning, *masdjids* and *madrasas*, which they specified for one or the other of the *madhhabs* as they chose. Muslim institutions of learning, based on the law of *waḳf*, were endowments made by individual Muslims, of their own free will, without interference from the governing power. Even when the founder was a caliph, a *sulṭān*, a *wāzir*, or other official, he endowed his foundation as a Muslim individual, instituting his own private property as *waḳf* for a public purpose. These institutions were not public in the sense that anyone was entitled to attend them. They were set aside for restricted use in accordance with the *waḳf* stipulations of the founder, restricting admission to one or the other *madhhab*.

Founded at first for only one *madhhab*, *madrasas* were later founded for more than one. In the latter case, the students of each *madhhab* were taught separately. The system was as individualistic as the law itself: one *madrasa*, one *madhhab*. There were double, triple and quadruple *madrasas*, meaning that two, three or four *madhhabs* were involved; but the students of each *madrasa* within the compound were kept separate, each student body following the *madhhab* of its choice.

Madrasas were usually Ḥanafī, Shāfiʿī or Ḥanbalī, with very few for the Mālikīs. Spain, predominantly Mālikī, had no *madrasas* as late as the 7th/13th century; as noted above, the earliest *madrasa*, said to be that of Granada, was not founded till the following century. Their sparseness throughout the Islamic world can be explained by the Mālikī law of *waḳf*, which prohibits Mālikī founders to retain control of the trusteeship of their institution. This discouraged founders from endowing *madrasas* as means of sheltering their wealth against confiscation, by retaining control of their institution for themselves and their progeny to the end of their line. Mālikī *madrasas* were founded in North Africa by the sovereigns, whose motives differed from those of private individuals; they were motivated by the prestige brought by their foundations to themselves and to their realms.

Besides the *djāmiʿ* and its study-circles, the *masdjid*, the *madrasa*, the *dār al-ḥadīth*, there were also the *dār al-Ḳurʾān*, the *ribāṭ* [*q.v.*] and other conventional establishments (*khānḳāh*, *zāwiya* [*q.vv.*]), in which learning took place in the Islamic sciences. ʿAbd al-Laṭīf (d. 629/1231) lectured in a *ribāṭ* in Baghdād on *uṣūl*, *ḥadīth*, etc. (Ibn Abī Uṣaybiʿa, ii, 203) and a *Ribāṭ al-Khātūnī* is mentioned here, which had a library (Ibn al-Ḳifṭī, ed. Lippert, 269). There are other references to libraries in monasteries (see for Marw: Yāḳūt, iv, 509). In the *Khānaḳāh Shaykhū* founded in 756/1355, an extensive course of lectures, *fiḳh* according to all four *madhāhib*, *ḥadīth* and *iḳrāʾ* (al-Maḳrīzī, iv, 283) was given. In the *Ribāṭ al-Āthār* in the 8th/14th century, instruction was given in Shāfiʿī *fiḳh* (*ibid.*, 296); the Ḥanafī *madrasa* al-Djamāliyya (730/1430) was also a *khānaḳāh* (*ibid.*, 238 above); they had a common director. There were also institutions of learning consisting of a combination of two or three of the institutions mentioned; as, for instance, a *madrasa-ribāṭ-dār al-ḥadīth*. In the 8th/14th and 9th/15th centuries, this combination of the two institutions became quite frequent, for example in the Niẓāmiyya in Cairo of the year 757/1356 (Van Berchem, *Corpus*, i, 242 ff.) and in the mausoleums of Barsbāy, 835 (*ibid.*, 365-6; cf. Ibn Iyās, ii, 21, 22, 41), of al-Malik al-Ashraf Ināl, 855-60/1451-6 (*ibid.*, no. 271 ff.) and of Ḳāʾit Bāy, 879 (*ibid.*, 431 ff.). In the east, Ibn Baṭṭūṭa found the same relationship, for example in Shīrāz and in Karbalāʾ (ii, 78-9, 88, 99), and this is what he means when he says the Persians call the *zāwiya* the *madrasa* (ii, 30, 32). In the west, he lauds his own sovereign, who had built a splendid *zāwiya* in Fās (i, 84); here also learning and Ṣūfism were associated (see the quotation in Dozy, *Supplément*, s.v. *zāwiya*) and the *zāwiya* still plays an important part in North Africa.

Learning further took place in the hospitals (*māristān*, from the Persian *bīmāristān* [*q.v.*]) which were also used as schools of medicine, as well as in the private homes of scholars and elsewhere.

6. Courses of instruction and personnel.

As already explained, in the earliest period the principal subjects studied in the mosque were Ḳurʾān and *ḥadīth*, to which was added the study of the Arabic language. In al-Bukhārī (*Kitāb al-ʿIlm*), *ʿilm* still means *ḥadīth* but, with the development of the systems of law and theology, these were also taught in the mosques. In the mosque of al-Manṣūr in Baṣra, al-Ashʿarī heard al-Djubbāʾī expound the Muʿtazilī *kalām* (Wüstenfeld, *Schâfiʿî*, 131); closely connected with this was methodology (*al-mudhākara wa 'l-naẓar*: cf. Yāḳūt, *Udabāʾ*, vi, 383). But many different subjects could also be taught. Al-Khaṭīb al-Baghdādī, who taught in al-Manṣūr's *Djāmiʿ* in Baghdād, lectured on his history of Baghdād (Yāḳūt, *Udabāʾ*, i, 246-7). Philosophy proper, however, disappeared from the mosques. In Spain, we are told, *falsafa* and *tandjīm* were only cultivated in secret, as those who studied them were branded as *zindīḳs*, and even stoned or burned (al-Maḳḳarī, *Analectes*, i, 236). The *madrasas* were mainly established to teach the systems of *fiḳh*, and originally each school was intended to represent only one *madhhab*. Where the four *madhhāhib* are represented in one school, one can speak of four *madrasas*, e.g. *al-Madāris al-ṣāliḥiyya* (al-Maḳrīzī, iv, 209, 282).

The ordinary *madrasas*, however, included other subjects beside the study of *fiḳh* alone. Special mention is made of *naḥw* (al-Ṣāḥibiyya; al-Maḳrīzī, iv, 205). In the Niẓāmiyya in Baghdād and in other

madrasas in the east, philological studies were prosecuted (cf. Yāḳūt, *Udabā'*, v, 423-4; vi, 409). The custom, often occurring before Niẓām al-Mulk's time, of founding a *dār al-ḥadīth* was continued after him, e.g. in Cairo and Damascus. In 604/1207 al-Malik al-Muʿaẓẓam built beside the Ṣakhra mosque a *Madrasa naḥwiyya*, exclusively for Arabic linguistic studies (Sauvaire, *Hist. Jér. et Hébr.*, 86, 140), and schools for special subjects were not rare (cf. al-Subkī, *Muʿīd al-niʿam*, ed. Myhrmann, 153). Al-Subkī mentions, in addition to the special *ḥadīth* schools, also *madāris al-tafsīr* and *madāris al-naḥw*.

In his *Muḳaddima* (*faṣl* 6, nos. 4 ff.), Ibn Khaldūn gives a survey of the divisions of Islamic studies. They are divided into *ʿulūm ṭabīʿiyya* and *naḳliyya*. The former are based on observation by the senses and deduction and are therefore also called *falsafiyya* or *ʿaḳliyya*; the latter are dependent on revelation by the lawgiver (*al-wāḍiʿ al-sharʿī*), and are therefore based on special transmission. The *ʿulūm naḳliyya* therefore comprise all branches of knowledge which owe their existence to Islam, namely Ḳur'ān, i.e. *tafsīr* and the seven *ḳirā'āt* (no. 5), *ḥadīth* with the sciences auxiliary to it, including *al-nāsikh wa 'l-mansūkh*, *muṣṭalaḥ al-ḥadīth* (no. 6), *al-fiḳh* with special emphasis on *al-farā'iḍ*, the law of inheritance (nos. 7-8), *uṣūl al-fiḳh* with the principles of law including methods of deduction and the differences between the *madhhāhib* (no. 9), *al-kalām*, theology, which is *naḳliyya* in as much as it is really a further development of *īmān* which comes under the head of religious duties, but is *ʿaḳliyya* in its nature since it is entirely based on abstract proofs (no. 10), *al-taṣawwuf*, something like practical theology (no. 11) and *taʿbīr al-ru'yā*, interpretations of visions (no. 12).

Linguistic sciences are related to the study of Ḳur'ān and *ḥadīth* (cf. nos. 4, 37 beginning), which are divided into 4 parts; *al-naḥw*, *al-lugha*, *al-bayān* and *al-adab* (no. 37), and in the last named category comes the whole study of Arabic literature.

The *ʿulūm ʿaḳliyya* are variously classified, usually into 7 main sections (no. 13), and are *al-manṭiḳ*, logic which is the foundation of all others (no. 17), *al-arithmāṭīḳī*, arithmetic, including *ḥisāb* etc. (no. 14), *al-handasa*, geometry (no. 15), *al-hay'a*, astronomy (no. 16), *al-mūsīḳī*, the theory of tones and their definition by number etc. (see no. 13); then there is *al-ṭabīʿiyyāt*, the theory of bodies at rest and in motion—heavenly, human, animal, plant and mineral; among its subdivisions, special mention is made of *al-ṭibb*, medicine, and *al-falāḥa*, agriculture (nos. 18-20; cf. no. 29). The seventh main head is *ʿilm al-ilāhiyyāt*, metaphysics (no. 21). Magic, talismans, mysterious properties of numbers, etc., also form branches of Muslim learning (nos. 22 ff.).

Medicine was not only taught in special schools but also in the mosques and the *madrasas*; about 600/1203-4, ʿAbd al-Laṭīf lectured in the Azhar Mosque, but it is not quite clear whether his instruction in *ṭibb* was also given there (Ibn Abī Uṣaybiʿa, ii, 207) and in any case the "philosophical sciences" were cultivated outside the mosques.

The method of teaching was by lecturing and learning by heart (*talḳīn*). The first task was to learn the Ḳur'ān by heart and then to acquire as many traditions as possible. The *ḥadīth* was repeated three times so that the student could remember it (Bukharī, *ʿIlm*, *bāb* 30). Lecturing soon became dictation (*imlā'*), when the student wrote down what was said, except in the case of the Ḳur'ān (approved: al-Bukharī, *ʿIlm*, *bābs* 34, 36). The method was the same for linguistic or literary subjects as for *ḥadīth*, *tafsīr*, etc. The philologists not only used to dictate their grammatical works, as for example Ibn Durayd (Wüstenfeld, *Schâfiʿî*, 127) or Muḥammad b. ʿAbd al-Wāḥid (d. 345/957), who dictated from memory 30,000 folios on *lugha* (Yāḳūt, *Udabā'*, vii, 26), but also the text of the poets, like al-Ṭabarī, who lectured on al-Ṭirimmāḥ in the Mosque of ʿAmr in 256/870 (*ibid.*, vi, 432). Dictation was especially important in the case of *ḥadīth*, as the exact establishment of the text was the first necessity. It is therefore always said "he dictated *ḥadīth*" (*Ḥusn al-muḥāḍara*, ii, 139; Yāḳūt, *Udabā'*, i, 246). The class of a teacher is therefore *madjlis al-imlā'* (*ibid.*, ii, 243; vii, 74), and his famulus among the students is *al-mustamlī* (cf. *ibid.*, vi, 282; vii, 74). Problems of *fiḳh* were also dictated (so Abū Yūsuf, Ibn Ḳuṭlūbughā, ed. Flügel, no. 249).

All this meant that reliance on the memory, for the learning above all of the Ḳur'ān and *ḥadīth*, was highly prized, and repetition much cultivated. Jurisconsults were quoted as saying that in their student days they used to repeat each law lecture fifty times or more in order to imbed it in the memory. A school exercise was developed, whereby students quizzed one another as an aid to learning their lesson and as a contest to see who knew more than the other. The term used for the exercise was *mudhākara* ("a calling something to mind with another, conferring with another"). However, the importance of understanding was also recognised, above all as legal studies developed, and this is the lexical meaning of the term *fiḳh* [*q.v.*], which comes to have the technical meaning of "positive law". This shift of emphasis to both memorisation and comprehension is illustrated by the saying that "learning is a city, one of whose gates is memory and the other is understanding" (*al-ʿilm madīna, aḥad bābayhā al-riwāya, wa 'l-ākhar al-dirāya*).

But the most important method developed for legal studies was the method of disputation (*munāẓara*, *ṭarīḳat al-naẓar*), the legal school exercise par excellence. It consisted of (1) a thorough knowledge of *khilāf*, that is, the divergent legal opinions of jurisconsults; (2) a thorough knowledge of *djadal*, dialectic; and (3) *munāẓara*, disputation. The disputant had to know by heart as extensive a list as possible of the disputed questions of law (*al-masā'il al-khilāfiyya*) and have ready answers for them. It was his skill at disputation which earned for him the licence to teach law and to issue legal opinions (*idjāzat al-tadrīs wa 'l-fatwā*). The licence he obtained after a long period of study, usually four years of basic studies of law, followed by an indeterminate period of fellowship (*ṣuḥba*), during which he was apprenticed as *muʿīd* or repetitor of his master or otherwise made himself useful to the younger students, sometimes called *mufīd* ("one who imparts useful knowledge") and holding the post of *ifāda*.

During the *ṣuḥba* stage of his learning, the graduate student wrote a *taʿlīḳa*, which was a compilation of notes from the lectures of his master, often including notes taken from the latter's writings. When such a compilation was original in nature, as to its arrangement and the treatment of the subject-matter, it came to be known by the name of its compiler. The term *taʿlīḳa* is also applied to a compilation of the master, a syllabus on law, from which the master taught his disciples. Some of these *taʿlīḳas* consisted of many volumes, as many

as fifty in one case. Masters who had no *taʿlīḳas* used those of others.

The class (*dars*) began with the recitation of the Ḳurʾān by a *ḳāriʾ*, with blessings on the Prophet, and other religious formulae (*Madkhal*, i, 56; cf. Mez, *Renaissance des Islams*, 172-3). At the present day, the teacher as a rule simply pronounces the *basmala* himself. Dictation alone was not everywhere the custom. In time, there came to be so many copies of the chief texts that the students were able to get copies for themselves. The text was in this case read aloud and the teacher gave his comments and emendations on the text (Yāḳūt, *Udabāʾ*, i, 255). It was only natural that the dictation of texts was first abandoned in philology; it is said to have been dropped as early as the 4th/10th century (Mez, *Renaissance*, 171). This does not mean that dictation was completely abandoned, for the teacher still made his pupils write down his comments; for example, Muḥammad b. ʿAbd al-Raḥmān (d. 584/1188) dictated his lessons (Yāḳūt, *Udabāʾ*, vii, 20) and the method of having a text read aloud, while the lecturer explained only any remarkable phrases, was used as early as by the teacher of *ḥadīth*, Ibn Kaysān (d. 299/912; *ibid.*, vi, 282).

Ibn Khaldūn laments that so few teachers in his time understand the correct methods of teaching (*ṭuruḳ al-taʿlīm*). They put difficult questions at once to the pupil instead of arranging the *talḳīn* so that it is always combined with explanations, and it is a fundamental principle that the pupil should not mix the different subjects. They laid too much stress on learning by heart (*ḥifẓ*) (*Muḳaddima, faṣl* 6, no. 2, 29, 30; cf. al-Subkī, *Muʿīd al-niʿam*, 151-2). Mechanical learning by heart is recognised for the Ḳurʾān. When the above-mentioned Ibn Ḳaysān expounded *ḥadīths*, he also asked his hearers about their, meaning. Conversely the class was at liberty to ask questions of the teacher. Al-Shāfiʿī used to sit in his great *ḥalḳa* in Mecca and say: "Ask me what you want, and I will then give you information on the Ḳurʾān and *sunna*" (*ibid.*, vi, 391; cf. al-Muḳaddasī, in *BGA*, iii, 379). The teacher was sometimes overwhelmed with questions (Yāḳūt, *Udabāʾ*, v, 272). Ibn Djubayr saw written questions being handed to a teacher in the Niẓāmiyya in Baghdād (219-20). Both practices are still in vogue, and even in large classes the student may interrupt with questions.

7. The scholastic community: the teachers.

The general designation for master was *shaykh*. When used with a complement, the term designated the master of various fields; as, for instance, *shaykh al-ḥadīth*, *shaykh al-ḳirāʾa*, for the professor of *ḥadīth* and the professor of Ḳurʾānic studies respectively. The term *ustādh* was a kind of honorary title (see Yāḳūt, *Udabāʾ*, i, 113, 209, ii, 271, v, 353, 354, 358, 448); it has continued in use till the present day, and in contemporary Arabic usage is the equivalent of the Western term "professor", "holder of a professorial chair". But in distinction from these more general terms, the professor of law had a designation all his own, a term used without a complement, sc. *mudarris*. He was not referred to as *shaykh al-fiḳh*. The term *mudarris* with a complement was sometimes used to designate other professors. *Shaykh al-ribāṭ* was used to designate the director, or abbot, of a monastery. The *mudarris*, like the *ḳāḍī*, was entitled to have a deputy, a *nāʾib mudarris*, who taught during his absence, The *mudarris* could, in fact, have several *nāʾibs*. This happened when the professor of law held several poets (*tadrīs*, pl. *tadārīs*); he would teach in one or the other of these posts and hire deputies to teach in the others. Thus, as the chair for the professorship of law could be divisible, the professorships could be multiple.

The term *raʾīs* was applied to any scholar who had reached the summit of his field in his locality. It was used especially in the field of law; biographical notices often express it by saying that "leadership in the school of law ended up with him" (*intahat ilayhi riyāsat al-madhhab*). The terminology used in these notices is indicative of the competition that existed among the jurisconsults: *baraʿa fi 'l-fiḳh* ("he excelled in the field of law"; *la yushaḳḳu ghubāruh* ("his dust cannot be penetrated"—comparing the legal scholar to a thoroughbred so swift that other horses in the race fail to keep him in sight, the dust of his hoofs having settled by the time they get to where he was); *kāna ḳāṭiʿ al-nuẓarāʾ* ("he was the annihilator of his peers"); etc. The titulature is also indicative of this competition to gain the heights, not only in learning but also in the military and in government: *amīr al-umarāʾ* ("prince of princes"), *malik al-mulūk* ("king of kings"), *sulṭān al-salāṭīn* ("sultan of sultans"), *ḳāḍī 'l-ḳuḍāt* ("judge of judges"), *ʿālim al-ʿulamāʾ* ("scholar of scholars"), and even of the term *raʾīs* itself, *raʾīs al-ruʾasāʾ* ("leader of leaders").

In places where the term *raʾīs* designated a post, as for instance in Naysābūr, where there was also a *nāʾib raʾīs*, a sub-leader, or deputy-leader, the post appears as one requiring, besides the qualification of leadership, that of non-partisanship, someone capable of acting as peace-maker, a moderator between opposing factions among the scholars. This, however, was not the head of a guild of masters. Such an organisation was unlikely in a system highly individualistic in character. The concept of a guild or corporation based on juristic personality was unknown to mediaeval Islam, where juristic personality belonged to the natural physical person alone.

It has often been said that teachers were organised into a guild, and the usual argument advanced for this assertion is an anecdote cited in Yāḳūt, *Udabāʾ*, i, 246 ff., according to which al-Khaṭīb al-Baghdādī (d. 463/1071 [q.v.]) had to have the permission of *naḳīb al-nuḳabāʾ* in order to teach *ḥadīths* in Baghdād's Mosque of al-Manṣūr. The function of the *naḳīb al-naḳabāʾ* was also confused with the term *raʾīs*, further adding to the concept of a head of a guild of masters. No one has claimed to know how the guild worked, which is no surprise, since there was none. The *naḳīb* was the marshal of the nobility, the *ashrāf*. His function was to investigate all claims to descent from the Prophet's family and to keep rolls of the legitimate descendants of the Prophet, for they were entitled to a lifetime pension. There were two *naḳībs*: one for the Sunnīs, *naḳīb al-hāshimiyyīn*; and one for the Shīʿīs, *naḳīb al-ṭālibiyyīn*.

The above-mentioned anecdote has to do with the *naḳīb al-hāshimiyyīn*. The Mosque of al-Manṣūr was located in the quarter of Bāb al-Baṣra, on the west side of the city, the stronghold of the constituency of the *naḳīb*. This constituency was made up of traditionalist *ashrāf* and an overwhelming majority of Ḥanbalīs. Al-Baghdādī had been a Ḥanbalī, had changed over to the Shāfiʿī school of law, but was suspected of Ashʿarism, to which the Ḥanbalīs were highly hostile. Al-Bāghdādī asked the caliph's permission to lecture in the Mosque, for

it was his declared, lifelong ambition to do so, the Mosque being known as the institution with the highest reputation for the science of *ḥadīth*. The caliph, aware of the hostility of the people of the Bāb al-Baṣra to the lecturer, called on the *naḳīb*, as the Marshal of the Sharīfs of the Bāb al-Baṣra quarter, to see to it that the event would not produce a riot. The *naḳīb* agreed to do so, but reluctantly, since he felt that he did not have enough men to control the assembly if it should get out of hand. An incident did occur, bricks were thrown at the speaker, and turbans were snatched, but the *naḳīb* succeeded in limiting the damage.

Thus permission to lecture in the Great Mosque was sought from the caliph, who alone made appointments to the teaching posts, the *ḥalḳas*, of the great mosques (there were, at the time, six of these) in Baghdād. The *naḳīb* was not the head of a guild of masters, such as the *universitas magistrorum* of the Latin West; there was no such guild in mediaeval Islam.

In spite of all flexibility, a certain stability developed in the teaching staff of the mosques. This was connected with the question of pay. It was for long in dispute whether it was permitted to accept payment for giving instruction. In the collections of *ḥadīth* the practice is both supported and condemned, and it is said that the teacher may accept money, but not demand it, and avaricious teachers are strongly condemned. There are continual references to people who gave lecturers without payment (al-Bukhārī, *Idjāza, bāb* 16; Abū Dāwūd, *Buyūʿ*, *bāb* 36; Ibn Mādja, *Tidjārāt, bāb* 8). The custom of the older Jewish scholars of exercising a handicraft was not common among the Muslims, but was found occasionally. Among men of learning we find shoemakers, locksmiths and sandal-makers (Wüstenfeld, *Schâfiʿî*, 227, 231, 267; cf. also Mez, *Renaissance des Islam*, 179). It was the rule, however, for the teacher to be paid for his work. This might be a wholly personal donation from a prince or other rich man: for example al-Ṭabarī was given a sum of money when he taught in the Mosque of ʿAmr (Yāḳūt, *Udabāʾ*, vi, 428; cf. the remarks above on wandering scholars). It was as a rule, however, a regular salary which was paid out of endowment, so that the position was a regular professorial chair; this was especially the case in the *madrasas*. The salaries of the teachers (*maʿlūm*, also *djawāmik*, *djāmakiyya*; see Dozy, *Supplément*, s.v.) varied considerably, according to the endowment. According to al-Maḳrīzī, learned men might have 50 *dīnārs* a month in all in addition to allowances in kind (iii, 364). On ceremonial occasions, they often were given special marks of distinction, such as gifts in money and robes of honour.

There were a very large number of teachers in the great mosques. In the *madrasa* at first only one was appointed. A *madrasa* frequently took its name from a distinguished teacher (e.g. the Ghaznawiyya in Cairo; al-Maḳrīzī, iv, 235; Sharīfiyya, originally the Nāṣiriyya; *ibid.*, 193; cf. the Masdjid al-Kisāʾī in Baghdād). In the larger *madrasas*, however, several teachers were appointed; Ṣalāḥ al-Dīn appointed 4 lecturers to the Ḳamḥiyya in Cairo (*ibid.*, 193); in this case a definite number (20) of students was allotted to each teacher (cf. *Chron. Mekka*, ii, 105-6).

It is easily understood that the conditions in the older mosques, where every one could come and go, were freer than in the *madrasas*, which were built for particular teachers and students. There was probably as a rule no official recognition of the teachers in the earliest period. After textbooks had come into use, the certificate of qualification was the *idjāza*, and so it has remained to modern times. Anyone who had studied with a teacher could get permission from him to teach from the book, which he had copied out and studied from his dictation; the teacher wrote this permission (*idjāza*) in the book (e.g. Yāḳūt, *Udabāʾ*, i, 253; ii, 272). A teacher could also give an *idjāza ʿāmma*, which permitted the individual concerned to teach from all his works (Ibn Baṭṭūṭa, i, 251). It was the usual thing for a travelling scholar to collect numerous *idjāzāt*; thus ʿAbd al-Laṭīf had certificates of this kind from teachers in Baghdād, Khurāsān, Egypt and Syria (Ibn Abī Uṣaybiʿa, ii, 202). There were special formulae for the *idjāza* for *tadrīs* and *futyā* (al-Ḳalḳashandī, *Ṣubḥ al-aʿshā*, xiv, 322 ff.). Some scholars only gave occasional lectures, and others only dealt with a very limited subject; thus one was appointed to the Niẓāmiyya to lecture in al-Bukhārī's *Ṣaḥīḥ* because he had attended lectures on this from a celebrated teacher. There were however many learned men who devoted themselves mainly to teaching and taught several subjects; often they taught many hours every day (e.g. Yāḳūt, *Udabāʾ*, vi, 282, 383; vii, 176), and pious teachers even spent the night in the mosque in prayer (Wüstenfeld, *Schâfiʿi*, 258). Sometimes a young teacher began by dictating *ḥadīth* and later received a post with a wider scope in a mosque (*ibid.*, 239).

The distinction between teacher and taught was not absolute; any one could have an *idjāza* in one subject while he was still a student in others, and even men of ripe scholarship attended the lectures of notable teachers. This led students to travel from one seat of learning to another, just as they used to travel in early days to collect *ḥadīths* (al-Bukhārī, *ʿIlm, bāb* 7, 19, 26). All the biographies of learned men give examples of this; the old Hellenistic custom was thus continued (cf. Walden, *The universities of ancient Greece*), and royal courts still played the same part; at them learned guests received donations, which enabled them to appear as teachers in the mosques (e.g. Ibn Baṭṭūṭa, ii, 75 ff.; Ibn Khaldūn, *Kitāb al-ʿIbar*, Būlāḳ 1284, vii, 452; Ibn Abī Uṣaybiʿa, ii, 205; cf. Mommsen, *Römische Geschichte*, vi, 589). Distinguished scholars were of course much visited by lovers of learning; of one of the latter, it is said *ruḥila ilayhi* or *ilayhi kānat al-riḥla* "they used to travel to him" (Yāḳūt, *Udabāʾ*, vii, 174; *Ḥusn al-muḥāḍara*, i, 207; cf. 141).

The blurring of the distinction between the teachers and the taught only really applied to fields were the authoritative transmission of a text was involved. This occurred especially in *ḥadīth*. In this field one remained, in a sense, a student all one's life, collecting authorisations (*idjāza*) from the transmission of one or more *ḥadīths*. There were many instances where an accomplished scholar of *ḥadīth* would seek the authoritative transmission of a collection of *ḥadīths*, or even of a single *ḥadīth*, from one many years younger than he but who had the *idjāza* to transmit the *ḥadīth*(s), and was, most likely, the last to receive that authority from its last holder. This situation was due to the oral character of authoritative transmission. The perennial preoccupation of the conscientious *ḥadīth* scholar was to travel in search of those rare *ḥadīths*, whose rarity was due to the ever-decreasing number of transmitters duly authorised to transmit them. Biographical notices sometimes tell of the authorised transmitter

who had made a collection of such *ḥadīth*s and had waited until he had survived all other authorised transmitters before making them available, at which time he could exact his own price for them. This practice was, of course, condemned. There are well-known *ḥadīth*s not only encouraging the gathering and spreading of knowledge but also condemning those who would gather and conceal it.

On the other hand, the distinction between teacher and taught in the field of law was quite clear. To obtain the licence to teach law, one had to study many years under a professor of law, become proficient in the scholastic method of disputation and build up as vast a répertoire of disputed questions of law as possible, together with solutions to these questions; then one had successfully to defend one's thesis or theses against the adversary, often one's own master. This long process could take place under one master alone; but it sometimes took place under two, one for the basic four years, another for the graduate, apprentice, period. More rarely, a law student could study under as many as five professors, but the process was always the same: the defence of a thesis or theses which learned him the licence to teach and to issue legal opinions, a licence attesting to his competence in the law as a field of knowledge.

Islamic law is individualistic; this may be seen in the function of the *ḳāḍī*, the *muftī* and the *mudarris*, or professor of law, as well as in the *madrasa*, the college of law. The *ḳāḍī* was alone responsible for his legal decision; the *muftī* was alone responsible for his legal opinion, based on *idjtihād*, and individual, personal activity of research in the sources of the law. Likewise, every *madrasa* represented one *madhhab*; a double *madrasa* represented two *madhhab*s where students were kept separate; so also with the triple, and quadruple *madrasa*; and every *madhhab* was represented by one professor of law, who might have under his direction one or several *muʿīd*s and *mufīd*s. Some instances in history illustrate this unicity of the professorial chair in the college of law. In 483/1090, a few months after the appointment of Abū ʿAbd Allāh al-Ṭabarī to the Niẓāmiyya's chair of law in Baghdād, Abū Muḥammad al-Fāmī arrived with orders to occupy the chair. Both professors were made to share the chair, and taught law according to an alternating schedule, one teaching one day, the other, the next. A variation on this solution later became standard procedure in some colleges of Damascus, where the professorial chair was assigned to two, three and four professors of law, each retaining a half (*niṣf*), a third (*thulth*) or a fourth (*rubʿ*) of the post and being paid accordingly.

The teacher had his particular place in the mosque, often beside a pillar: this was his *madjlis*, which was inherited by his successors (*Ḥusn al-muḥāḍara*, i, 135; cf. 181 below, 182; al-Maḳrīzī, iv, 5; Yāḳūt, *Udabāʾ*, iv, 135; Wüstenfeld, *Schâfiʿī*, 239). The outward appearance of the class did not alter through the centuries. His hearers sat in a circle (*ḥalḳa*: the listeners *taḥallaḳū*; al-Maḳrīzī, IV, 49, ll. 17-50; cf. on the word, Quatremère, *Hist. sult. maml.*, i/2, 197 ff.) on the ground before the lecturer. The teacher sat on a carpet (*sadjdjāda*; cf. Yāḳūt, *Udabaʾ*, i, 254) or skin (*farwa*). This was described as a symbol of his dignity in his *waṣiyya* (al-ʿUmarī, *Taʿrīf*, 134). We often find in large audiences that the teacher had a raised seat (for the older period, see Ibn Baṭṭūṭa, i, 212).

It was not the custom for teachers to live in the mosque. Of course, a teacher, like any other pious individual, could stay in the mosque and even have a room there; al-Ghazālī for example lived in the mosque of the Umayyads, where Ibn Djubayr saw his room. But these were exceptions; al-ʿAzīz built a dwelling-house for the teachers in the Azhar near the mosque (al-Maḳrīzī, iv, 49). The earlier *madrasa*s founded by Niẓām al-Mulk often had lodgings for the teacher, especially as the teacher sometimes made his lodging his classroom, and this is also found later. Thus in the Salāḥiyya, the head of the college had his home within the buildings (Ibn Djubayr, 48).

Of the teachers, many were also *ḳāḍī*s (as in their day were the *kuṣṣāṣ*, who were in a way the predecessors of the teachers). The *ḳāḍī*s frequently were able to accumulate a considerable number of offices. The chief *ḳāḍī* Ibn Bint al-Aʿazz (*ca.* 700/1300-1) had 17 offices (Quatremère, *Hist. Sult. Maml.*, ii/1, 137-8). The teacher could also be a *muftī* (e.g. Yāḳūt, *Udabāʾ*, iv, 136).

The professor of law was assisted by the "repetitor", *muʿīd*, as drill-master. The professor of law was also assisted by the *mufīd*, a sort of "scholar in residence" who imparted "useful information", *fāʾida*, pl. *fawāʾid*, to the students of the institution. The post of *mufīd* was also used in the field of *ḥadīth*, for the same general purpose. There were usually two *muʿīd*s for each teacher. The *muʿīd*'s duty was to read over with the students the lecture after the class and explain it to the less gifted students. The celebrated *faḳīh* al-Bulḳīnī began as a repeater with his father-in-law in the Kharrūbiyya (al-Maḳrīzī, iv, 202); it was also possible to be an independent teacher in one school and a repeater in another (al-Naṣīr, d. 669/1270-1; *Ḥuṣn al-muḥāḍara*, i, 189). The Ṣalāḥiyya, which ought to have had 4 teachers with 2 repeaters, was run for 30 years by 10 repeaters and no teachers (al-Maḳrīzī, iv, 251; cf. also 210; al-Subkī, *Muʿīd al-niʿam*, 154-5; al-Ḳalḳashāndī, *Ṣubḥ al-ʿshāʾ*, v, 464, and Haneberg, *Schul- und Lehrwesen der Muhammedaner*, 25; Wüstenfeld, *Die Akademien der Araber und ihre Lehrer*, 1837). As noted above, the counterpart of the *muʿīd* in law was the *mustamlī* in *ḥadīth*, whose function it was to repeat the *ḥadīth* dictated by the professor of *ḥadīth* to a class that could often run into the hundreds and thousands. In the case of such large classes, several *mustamlī*s relayed the *ḥadīth* to those who were not within earshot of the professor.

Other posts in the various institutions included the grammarian or *naḥwī*, who taught grammar and the other literary arts generally, and the various preachers. These comprised *al-khaṭīb* [*q.v.*], who preached the Friday sermon in the *djāmiʿ*; *al-wāʿiẓ* [*q.v.*], who preached the academic sermon and taught the art of the sermon; and the popular preachers called *al-ḳāṣṣ* [*q.v.*] and *ḳāriʾ al-kursī*. Other holders of posts included *al-imām*, who led the five daily prayers in the mosques; the elementary school teacher of the *maktab* and *kuttāb*, called variously *al-muʿallim*, *al-muʾaddib* and *al-faḳih* (colloquially, in Egypt, esp., *al-fiḳī*); the monitors, *al-ʿarīf*, *kātib al-ghayba*; the copyists of manuscripts, *al-nāsikh* and *al-warrāḳ* (the latter term was also used for the bookseller; it would seem that the *warrāḳ* copied books for sale and hired the *nāsikh*, pl. *nussākh*, to copy for him); the corrector of copied manuscripts, *al-muṣaḥḥiḥ*; the collator of copied manuscripts, *al-muḳābil* or *al-muʿāriḍ*; and the servitor, *al-khādim*, a manservant who worked for a professor or a rich student while pursuing his own

studies. Most of these functions were performed by students working their way through college.

8. The scholastic community: the students.

Every one was absolutely free to join a *ḥalḳa* in the mosque in order to hear a teacher. Al-Muḳaddasī for example tells us that the learned men of al-Fārs used to sit from early morning till midday and from ʿ*aṣr* to *maghrib* for the common people (*li 'l-ʿawāmm*) (*BGA*, iii, 439). But as soon as the teachers developed into a regular class of society, the students (*ṭalaba*, *tullāb*, sing. *ṭālib*) who were systematically training in the Muslim sciences also became a recognised section of the community. Together with the teachers, they formed the guild of the educated, *aṣḥāb al-ʿimāma* (now *ahl al-ʿimme* in Egypt). They were able to select their teachers as they pleased; the most celebrated teachers had therefore large numbers of students. Many never finished studying, for they could always find new teachers to study under up to their old age, even if they themselves also taught. The ambitious would only study under (*darasa ʿalā*) great teachers and therefore travelled about the Muslim world a great deal (cf. al-Muḳaddasī, 237). This travelling, partly as teacher and partly as student, for the sake of *ṭalab al-ʿilm* was long kept up in Islam.

When the student had completed his teacher's course, the teacher declared his knowledge mature in the particular subject and the student was able to regard himself as perfect in it (*takharradja ʿalayhi*). The relation of student to teacher is patriarchal and the student kisses his hands. This does not prevent quarrels breaking out, and in such cases the teachers might be treated very disrespectfully (cf. Sulaymān Raṣad, *Kanz al-djawhar*, 141 ff., 192 ff.).

The *madrasas* introduced an innovation into the relationship of teacher to student, when a definite number of students (as a rule, twenty) was allotted to a particular teacher. Instruction was thus organised on more systematic lines. But even then irregular students were also admitted. It is only in quite modern times that the instruction has been really properly organised.

We hear exceptionally of women students; one was a member of al-Shāfiʿī's *madjlis* (*Ḥusn al-muḥāḍara*, i, 181, below). In the early centuries it cannot have been unusual, for it is several times mentioned in *ḥadīths*, which reserve special days for women (al-Bukhārī, *ʿIlm*, *bāb* 32, 36, 50).

In the *madrasas* and some mosques, students were offered lodging and certain allowances in addition, food, bread (*djarāya*) and money.

A student living in a mosque is called *mudjāwir* (al-Maḳrīzī, iv, 54), a word which is also applied to Meccan pilgrims (Ibn Djubayr, 122) and to anyone living in a mosque. The students' apartments are divided into *arwiḳa*, usually according to nations, a word which is derived from the fact that they originally lived in the colonnades. Each *riwāḳ* is under a *shaykh*. Many students live in *khānaḳāhs*, other in private houses.

9. Conclusion.

The Muslim system of education in the Middle Ages was based on the *waḳf*, which, as already mentioned, gave the founder a free hand in determining the course of his foundation, as long as his stipulations were in keeping with the tenets of Islam. The historian must be circumspect about generalising for one institution on the basis of the particulars of another. The history of Muslim education must therefore be written on the basis of the deeds of *waḳf*, of which few are extant, and are in any case mostly late in date, as well as on the basis of biographical literature and the chapters on *waḳf* in the *fatwā*-works. These are the main sources to be consulted for the history of institutionalised education; that is, that education which took place in the *djāmiʿ*, the *masdjid*, the *madrasa*, the *dār al-ḥadīth*, the *dār al-Ḳurʾān*, the *ribāṭ*, the *khānḳāh*, the *zāwiya* and the various combinations of these.

For the relation between Muslim institutions of learning and those of the mediaeval Latin West, see the *Bibl.*

(J. Pedersen - [G. Makdisi])

II. In Muslim India

The *madrasas* in Muslim India were institutions of higher learning similar to those in other parts of the Islamic world. Their principal function was to train personnel for government service, more particularly, for the administration of justice. They were either founded and subsidised by the state or established by private individuals. The education provided in them dealt mainly with religious subjects, and was offered by well-qualified teachers.

The real foundations of Muslim education in India may be traced back to the establishment of the Dihlī Sultanate in 1206 and the emergence of Dihlī as an important seat of Islamic learning. Evidence points to the existence of two major *madrasas* in Dihlī in the early years of Muslim rule. One of them was the Muʿizziyya, an institution probably founded by Iltutmish (607-33/1211-36), and named after Muḥammad Ghūrī's title Muʿizz al-Dīn. The other

madrasa, known as Nāṣiriyya, was built by Balban while he was working as chief minister to Nāṣir al-Dīn Maḥmūd (644-64/1246-66), from whom the *madrasa* took its name. As the Mongols overran the heartlands of Islam, many refugee scholars from Central Asia and Persia took shelter in Dihlī, and their presence gave further momentum to educational activities in the capital. Early Muslim education found a strong champion in Fīrūz-Shāh Tughluḳ (752-90/1351-88) who, according to Firishta, built no less than 30 colleges in various parts of his kingdom. The sultan is also noted for having restored a large number of *madrasas* which had fallen into disrepair. Among the institutions founded by him the most outstanding was the Madrasa-yi Fīrūz-Shāhī, constructed in Dihlī in 753/1352-3. It was the biggest *madrasa* in the capital, with residential facilities for both teachers and students. It stood on the southern bank of the Ḥawḍ-i Khāṣṣ, an enormous tank built by ʿAlāʾ al-Dīn Khaldjī in 695/1296. It was a double-storeyed building with arched galleries on all sides and projecting windows overlooking the tank, and its façade presented an impressive mixture of Hindū and Muslim architectural elements.

Other important educational centres, besides Dihlī, included Badāʾūn [*q.v.*], a city approximately 150 miles east of the capital. Under the Sayyid dynasty (817-55/1414-51), it rose into prominence as a seat of learning with many schools and colleges. In Āgra [*q.v.*], which acquired importance during Sikandar Lodī's reign (894-923/1489-1517), the latter founded a *madrasa* famous throughout northern India. In addition, he established non-religious schools where Hindūs also could enrol themselves to learn Persian, which now replaced Hindī as the language of lower administration. This, in turn, led to the growth of a parallel school system distinct from the regular *madrasas*.

Education received encouragement in the regional kingdoms which sprang up in different parts of the country during the 8th/14th and 9th/15th centuries. Under the rule of Sultan Ibrāhīm Sharḳī (804-44/1402-40), Djawnpūr [*q.v.*] acquired distinction as an intellectual centre of considerable importance having many educational institutions. Likewise, the Bahmanī kingdom of Deccan was known for its patronage of learning and learned men. Some of its kings, such as Tādj al-Dīn Fīrūz (800-25/1397-1422) and Muḥammad Shāh III Lashkarī (867-87/1463-82), were great benefactors of education. Maḥmūd Gāwān (d. 886/1481 [*q.v.*]), minister of Muḥammad Shāh, founded in 877/1472 a *madrasa* in Bīdar [*q.v.*] which acquired fame as a great institution. It was a magnificent building equipped with living quarters for students and teachers, and had an attached library containing a large number of books. Though severely damaged during Awrangzīb's campaign against Bīdjāpūr towards the later part of the 11th/17th century, its surviving remains bear sufficient witness to its superb architecture.

Under the Mughals, educational activities continued to find an important place in the policies of the government. Bābur (932-7/1526-30 [*q.v.*]), during his brief reign, founded a *madrasa* in Dihlī where, in addition to traditional subjects, special provision was made for the teaching of mathematics, astronomy and geography. He also charged the Department of Public Affairs (*Shuhrat-i ʿĀmm*) with the task of establishing schools and colleges in the kingdom. The vicissitudes of Humāyūn's (937-47, 962-3/1530-40, 1555-6) fortunes were, no doubt, responsible for the paucity of educational activities seen during his reign. But under his successor, Akbar (963-1014/1556-1605), numerous *madrasas* were founded by the state as well as by private individuals. Akbar built a big college in his new capital Fatḥpūr Sīkrī [*q.v.*], and, in Dihlī, his wet-nurse, Māham Anga, founded a *madrasa* in 969/1561-2, which was noted for its architecture. Akbar also laid down that the curriculum of the *madrasas* should include subjects such as ethics, mathematics, agriculture, geometry, astronomy, physics, logic, natural philosophy, theology and history. In response to Akbar's policy of religious accommodation, non-sectarian institutions increased in number, providing common education to Hindūs and Muslims alike.

During Djahāngīr's reign (1014-37/1605-1627), many *madrasas* which had ceased to function or had fallen into decay were restored and revived. The ruler issued an ordinance which required that if a wealthy person or a traveller died without an heir, his property should revert to the state and be utilised for the building and maintenance of the *madrasas*. Shāhdjahān's (1037-68/1628-57) name is associated with the imperial *madrasa* attached to the congregational mosque built by him at Dihlī in 1060/1650. Under Awrangzīb (1068-1118/1658-1707), special emphasis was placed of the diffusion of Islamic learning. The foundations of the famous seminary in Lucknow, known as Farangī Maḥall [*q.v.* in Suppl.], were laid during this time. The name actually referred to the building granted by Awrangzīb, towards the end of the 11th/17th century, to a a family of scholars who made Farangī Maḥall a leading centre of Islamic learning. Mullā Niẓām al-Dīn, author of *Dars-i Niẓāmī*, the syllabus named after him, used to teach at this place. Another well-known institution, opened in Dihlī during Awrangzīb's reign, was the Madrasa-yi Raḥīmiyya. Founded by the noted divine and father of Shāh Walī Allāh (1115-75/1703-62), Shāh ʿAbd al-Raḥīm, this *madrasa* specialised in the teaching of exegesis and traditions, and was the forerunner of the modern seminary of Deoband [*q.v.*].

Little is known about the organisation and working of the *madrasas*. The emphasis on religious subjects in their curriculum seems to have remained consistent throughout their history. An attempt was made during Akbar's time to give importance to the instruction of mediaeval rational sciences such as logic, mathematics, medicine and astronomy, but it is doubtful whether this was followed by every *madrasa*. The *Dars-i Niẓāmī*, after its introduction in the mid-12th/18th century, was adopted by the *madrasas* all over the country, thus standardising the syllabus for traditional education. It included Arabic grammar and syntax, logic, philosophy, mathematics, rhetoric, jurisprudence, principles of jurisprudence, scholastics and dialectics, exegesis and traditions.

The cause of traditional Muslim education received a setback in the years following the decline of the Mughal rule. It suffered further reversal with the expansion of English education and spread of Western knowledge and ideas. Nevertheless, many *madrasas* continued to flourish in later times. The oldest among these was the *madrasa* at Farangī Maḥall; another important *madrasa* was that of Deoband, a small town north of Dihlī. It was founded in 1867 by Mawlānā Muḥammad Ḳāsim Nānotawī (d. 1879) in conjunction with other *ʿulamāʾ*. The last of the traditional institutions to be mentioned is the Nadwat al-ʿUlamāʾ of Lucknow established

in 1894. Among its founders was the reputed scholar Shiblī Nuʿmānī (1857-1914), who remained actively associated with it from 1904 to 1913. All the above *madrasas* have survived up to the present time, despite their limited financial resources and meagre enrolments.

(MUNIBUR RAHMAN)

III. ARCHITECTURE

The *madrasa* was a response to the specific needs of the Muslim community; it was a custom-built structure tailored to serve an institution which was itself a deliberate innovation. Moreover, the *madrasa* was the creation of a self-confident, well-established civilisation near the peak of its achievement: the earliest *madrasas* recorded are those of eastern Iran in the early 4th/10th century, and evidence unearthed by modern historians working on the pre-Saldjūḳ period in eastern Iran suggests that the "prehistory" of the *madrasa* can be traced for at least one and a half centuries before the official Saldjūḳ adoption of the institution. It is, however, highly unlikely that these earlier *madrasas* were substantial public buildings. Their very number argues against it. By 416/1025-6 there were twenty *madrasas* in the modest provincial region of Khuttal [*q.v.*], and each was fully endowed with *awḳāf*. The missionary Karrāmiyya movement [*q.v.*] which was so strong in eastern Iran in the 4th/10th and 5th/11th centuries had a strong educational and polemical bias, and both *khānaḳāhs* [*q.v.*] and *madrasas* were built in quantity by the adherents of this sect. The Ghaznavids also used *madrasas* endowed with *awḳāf* in order to establish Islam in the stubbornly pagan territory of Ghūr, possibly through the intermediary of missionaries from the Karrāmiyya.

Above all, such foundations should be seen within the context of a well-established tradition of building *madrasas* in the large cities of the eastern Iranian world. The best documented case is Nīshāpūr, where no less than 38 *madrasas* predating the great Niẓāmiyya of that city (founded *ca.* 450/1058) are recorded, though none of them survive; for further details, see above, section i, 4.

The apparently eastern Iranian origin of the *madrasa* makes that the obvious area in which to seek the architectural origins of the institution. Two major possibilities present themselves, and these are not mutually exclusive. The first, espoused by Bartold over sixty years ago, would link the *madrasa* with the Buddhist *vihāra* as attested in Central Asia and Afghānistān. This area had been saturated in Buddhism in the centuries immediately preceding the Muslim conquest and it seems not surprising that a Buddhist institution combining the functions of worship, education, communal life and burial should have flourished in the almost very area associated with the earliest *madrasas*. Bartold's prescience was confirmed by the discovery of one such site at Adzhina-Tepe just across the Oxus to the north-east of Balkh. This consisted of a monastery and stupa complex, the whole comprising two equal halves joined by a gangway and each measuring some 50 m square. Both elements use a four-*īwān* plan focused on a central courtyard. The monastery element consisted of temple structures, cells for the monks, and a large assembly hall, plus various ancillary rooms. All this was linked by corridors. In its essentials, and even more in its four-*īwān* plan, this 7th-8th century monument comes remarkably close in spirit to a *madrasa*, though the Muslim emphasis on education is somewhat more marked. Numerous other Buddhist sites have been excavated in Soviet Central Asia over the last two decades, among them Ak-Beshim, Airtam, Kalai-Kafirnigan and Kuba, while perhaps the most important Buddhist site in the Iranian world was just south of the Oxus—the Nawbahār of Balkh.

The other architectural source which has been proposed for the Iranian *madrasa* is the typical Khurāsānī house. Godard, the champion of this theory, was forced at the outset to assume an unbroken continuity of tradition between the mediaeval and the modern houses of the area. He then compared this domestic form with that of later *madrasas* and concluded that it was the private structure that had generated the public one. While the literary evidence gives ample warrant for the functions of a *madrasa* being carried out in private houses, no such houses which can be shown to have served this function have survived. Neat as Godard's theory is, it cannot be more than speculative.

The formal, as distinct from the informal, history of the *madrasa* is commonly taken to begin in 460/1067 when the great Niẓāmiyya madrasa was inaugurated in Baghdad. In short succession a whole series of state-sponsored and largely state-financed *madrasas* sprang up throughout the Saldjūḳ empire (see above, section i, 4). Two related factors deserve special emphasis here. One is the wholehearted state support for these buildings, which is reflected in the name Niẓāmiyya which they bore. They represent, in short, a state investment of the first magnitude. The other is their carefully calculated location in the major cities of the Saldjūḳ realm. From this one may deduce that each was designed to serve as a provincial centre with a wide catchment area embracing the smaller towns and villages of the region. Such a function presupposes buildings of considerable scale and capacity.

The reasons behind this sudden spate of building activity, which significantly enough was confined to the Saldjūḳ empire, are probably to be connected with the resurgence of Sunnī orthodoxy, spearheaded by the Saldjūḳs after their entry into Baghdād in 447/1055, as a counter to the propaganda efforts of militant Ismāʿīlī Shīʿism organised by the Fāṭimids from al-Azhar (founded in 359/970) [*q.v.*] and other

centres (see above, section i, 3). In fact, the Sunnī orthodox *madrasa*-building activity soon stimulated a Twelver S͟hīʿī counterpart movement, for according to the *Kitāb al-Naḳd* the later 6th/12th century saw S͟hīʿī *madrasas* appear in Ray, Ḳum, Kās͟hān, Āba, Warāmīn, Sabzawār and elsewhere. One of the *madrasas* at Sāwa had indeed been found as early as the mid-5th/11th century. The form of these *madrasas* is as obscure as that of their Sunnī counterparts, but to judge by the later consonance between Sunnī and S͟hīʿī *madrasas* in the Iranian world, there was probably no formal distinction between them.

The number of *madrasas* erected within a short space of time throughout the Saldjūḳ empire at the order of Niẓām al-Mulk and by others is itself a clear indication that some kind of blueprint had been developed for this purpose. Unfortunately, none of these early Iranian *madrasas* has survived; in fact, the earliest extant Iranian building of this type is the Madrasa-yi Imāmī of 725/1325 in Iṣfahān. It is a compact structure (some 92 m × 72 m at its widest extent) employing the standard Iranian 4-*īwān* plan, but the modifications to the traditional layout are significant. The *īwāns* no longer rear above their flanking arcades; the roof-line is now unbroken. This simple change entirely reverses the traditional pattern, in which the *īwān* was the dominant feature and dwarfed the flanking arcades. Two stories of continuously niched façades, behind which the cells for student accommodation were located, form the principal accent of the elevation and engulf the central *īwān* on each side. The question is, of course, whether such massy, cliff-like façades also characterised the elevations of the first Niẓāmiyyas. The example of the Madrasa Imāmī, the known Saldjūḳ predilection for the 4-*īwān* plan, and the need to accommodate substantial numbers of students living in the building as distinct from visiting it, all combine to suggest that the first official Iranian *madrasas* were indeed fairly similar to their Il<u>kh</u>ānid descendant.

So far the discussion has assumed that the more important of these early *madrasas* were purpose-built structures intended solely for the students accommodated in them. Other possibilities have, however, been aired. Perhaps the most extreme is that the buildings generally accepted as the major urban mosques of the Saldjūḳ period—those of Ardistān, Qazwīn, Gulpāyagān and so on—were actually *madrasas*. This theory runs counter to common sense, for it does not account for the resultant absence of Friday mosques in these centres. More intrinsically likely is the proposition that the larger mosques contained an inbuilt *madrasa* element in the provision of a second storey around the courtyard. On occasion, the niched façades of these upper storeys could indeed lead to separate chambers, but the extremely diverse functions discharged by a Friday mosque in a large city means that a wide range of other purposes can be suggested for such rooms. Elsewhere in the Islamic world such joint foundations were labelled as such; cases of mosque-*madrasas* (see above, section i, 2) or mosque-mausolea and various other combinations abound in Mamlūk Cairo. A further argument against the *madrasa* function of the upper storeys of large urban mosques in the Iranian world is provided by the well-documented practice of adding self-contained *madrasas* to established mosques (e.g. Iṣfahān and Mas͟hhad). There would have been little need for such new foundations if the mosques in question were already serving *inter alia* as *madrasas*. If one bears in mind the noted imprecision of the Arabic terminology of building types, and also the virtual interchangeability of these types, it will be clear that no firm conclusion as to the form of the pre-Mongol *madrasa* in Iran is warranted. Rather does the evidence suggest that the forms of the *madrasa* were scarcely less varied than those of the mosque itself. But the sad lack of standing buildings hangs like a cloud over any discussion of these early *madrasas*. Their organisation, personnel, curricula and financial arrangements can be followed up in minute detail in the literary sources; but the all-important question for the student of architecture, namely the precise material form which they took, remains obscure.

With such a plethora of literary evidence available, it is ironic that Iran should retain not one pre-Mongol *madrasa* that is universally accepted as such. Two Saldjūḳ buildings have been identified by some as *madrasas*, but others deny this. The more controversial of them is a mud-brick ruin at <u>Kh</u>ārgird [*q.v.*] whose damaged inscription specifically identifies it as a foundation of Niẓām al-Mulk. Its principal surviving feature is a broad and deep *ḳibla īwān* with at least one room of comparable depth flanking it on either side. Little sense can be made of any other part of the structure, but the dimensions of the courtyard in front of the *īwān* might well be about 22 × 28 m. In favour of the identification as a *madrasa* may be cited the very fact that Niẓām al-Mulk is cited in the inscription as the official founder, although a mere *s͟hayk͟h* actually carried out the work of supervising construction. Why should this august personage, the pivot of the Saldjūḳ state, take an interest in <u>Kh</u>ārgird? The family of Niẓām al-Mulk hailed from Sabzawār, and he himself was born in Ṭūs, so there can be no question of explaining his connection with this monument by his desire to erect a public building in his native town. <u>Kh</u>ārgird was a small town of secondary importance. Moreover, this structure is, as Herzfeld noted, very small for a courtyard mosque of its period, and the row of windows high up in the *ḳibla īwān* would make much better sense in the context of the cells on the first floor of a *madrasa* than as an element of mosque architecture. These various factors suggest that the most natural interpretation of the ruins is to see them as the sole surviving trace of Niẓām al-Mulk's extensive programme of building *madrasas*, though against this it must be admitted that the presence of supplementary *miḥrābs* does suggest a mosque rather than a *madrasa*. The flanking halls have also been cited as evidence that this is a mosque, but this feature occurs consistently in Anatolian Saldjūḳ *madrasas*. To summarise, the evidence seems to incline towards interpreting the <u>Kh</u>ārgird structure as a *madrasa*, but without fresh evidence there is no clinching the matter.

The other putative *madrasa* is a shoddily-published structure found in excavations at Ray in the late 1930s. Godard himself, the source of all the information available, at first expressed himself with reserve as to its function but eventually shed such caution and treated the identification as a certainty. Nevertheless, he produced no arguments to offset his earlier qualms about the eccentric orientation of the structure and its equally atypical emphasis—by means of the differential size of the *īwāns*—on the east-west rather than the north-south axis. It must also be admitted that the 16 habitable spaces which together parcel out the ground plan do not correspond in their layout to any known *madrasa*. All this being

admitted, it would be still more accurate to say that no mediaeval house of this kind is known either; that 10 of the ground floor spaces could well have functioned as cells accommodating one or several students, to say nothing of the capacity of an upper floor; and that cases of the faulty orientation of religious buildings are legion in mediaeval Islam and that the difficulties of that kind presented by this building disappear if one assumes that the west *īwān* is intended to function as if it faced south-west, the direction of the *ḳibla*. Finally, and most significantly of all, the presence of a *miḥrāb* is not easily explained away. Unfortunately, Godard's plan does not mark it, so that to identify it as a *miḥrāb* is itself somewhat hazardous. Nevertheless, despite the fact that in its present form, on display in the Tehran Museum, it is largely a figment of the restorer's imagination, the published photograph of it *in situ* shows clearly enough the Ḳur'ānic Kūfic inscription which it bore. The presence of a *miḥrāb* with a Ḳur'ānic inscription in a private house takes somewhat more explaining than does the eccentric orientation of a *madrasa*. Even so, it may be felt that the building at Ray presents rather more problems of identification than does its counterpart at Khārgird. Whatever conclusion is reached, it is regrettable that the undoubtedly seminal role of Iran in the early development of the *madrasa* is so unjustly obscured by the lack of early surviving specimens whose claims to be *madrasas* are not disputed.

It is with some relief, therefore, that one turns to an examination of the surviving *madrasas* whose identification as such is incontrovertible. The earliest of these, the *madrasa* of Gümüshtigīn in Boṣrā, bears a disappointingly late date—530/1136—and is located in Syria, an area which has not yet entered the discussion. It is followed in brisk succession by some fourteen surviving *madrasas* in Syria all dated or datable before 700/1300, and the literary evidence confirms that these are only a fraction of what was built in this period and has since vanished—82 *madrasas* are mentioned in the detailed chronicle of mediaeval Damascus, for example, and 46 in the more summary account of mediaeval Aleppo (see above, section i, 4).

These numbers, impressive though they are, need not, however, be interpreted as confirmation of the primacy of Syria in the architectural development of the *madrasa*. Nor, *pace* Creswell, can this honour be claimed by Egypt without further ado. He lists some 29 *madrasas* in Cairo dated before 700/1300, and of these a scant four have remained. From the undoubted fact that the latter group includes the first cruciform four-rite *madrasa* to survive he has built an elaborate edifice of argument designed to establish the innovatory role of the Egyptian *madrasa*.

As will shortly be apparent, however, the area with the largest number of surviving *madrasas* datable before 1300 is Saldjūḳ Anatolia, which boasts no less than 50 examples, 9 of them datable to the 6th/12th century. Egypt and Syria together cannot match the latter tally, and indeed have only a third as many *madrasas* datable before 700/1300. Yet these buildings figure not at all in Creswell's history of this architectural type. Common sense dictates that the Anatolian *madrasas*, built in an area culturally dependent on Iran and geographically close to it by patrons who themselves sprang from Great Saldjūḳ stock would be likely to reflect the Saldjūḳ *madrasas* of Iran, whose decisive role in the formation of the genre has never seriously been questioned. Iranian influence may in any case readily be detected in the plan types, brickwork and tile decoration of much of Rūm Saldjūḳ architecture. The historical background outlined above encourages the assumption that it is precisely in these unfortunately vanished Iranian Saldjūḳ *madrasas* that the essential original lineaments of the official *madrasa* are to be sought. Hence the paramount historical importance of the Anatolian Saldjūḳ *madrasas* as the closest surviving relatives of the Iranian type. Many of their features are duplicated in contemporary Syrian *madrasas*, which may be seen as a parallel and coeval group.

Returning to the Boṣrā *madrasa*, one notes that, like most Syrian *madrasas*, it is diminutive; for all that its patron was a senior *amīr* serving the Atabegs of Damascus, its external dimensions do not exceed 20 × 17 m. On this tiny scale, there is scarcely room for a proper courtyard, and the space which would normally be designated as such is domed, a feature which was to recur a century later in some of the Saldjūḳ *madrasas* in Konya and elsewhere. Two lateral *īwāns* open off this space, while a prayer hall and a kind of narthex to the south, the latter reached by narrow entrance vestibules to east and west, fill up most of the remaining area. In this single-storey building, the only space left over is the area flanking the prayer hall, which yields two rooms per side. Since these each average less than 4 m square, the total number of students accommodated in this *madrasa* can scarcely have exceeded a dozen. Such a building will simply not fit the popular image of officially sponsored *madrasas* located strategically throughout the Saldjūḳ empire and serving, at least in part, significant political ends.

Later Syrian *madrasas* rejected many of the solutions found in the example at Boṣrā. Perhaps the most distinctive local characteristic was to be the laterally developed prayer hall entered by a triple archway and vaulted in a variety of ways (*Dār al-Ḥadīth* [*q.v.*], Damascus, between 549/1154 and 569/1174; Madrasa Khān al-Tutun, Aleppo, 564/1168-9; Madrasa of Nūr al-Dīn, Damascus, 567/1172; and Madrasa of Shādbakht, Aleppo, 589/1193 among others). Sometimes the central bay of the *muṣallā* is domed, with groin vaults covering the flanking bays (Shāfiʿī Madrasa, Maʿarrat al-Nuʿmān, 595/1199) though tunnel vaults for these bays are commoner; but in other examples all three bays are groin-vaulted (ʿĀdiliyya Madrasa, Damascus, completed 619/1222-3) or domed (Ẓāhiriyya Madrasa, Aleppo, 616/1219-20; Djāmiʿ and Madrasa of al-Firdaws, Aleppo 633/1235-6). Recurrent features of these buildings include a *miḥrāb* which projects on the exterior of the *ḳibla* wall, a mausoleum or on occasion even two, occupying an angle of the building, a tank in the centre of the courtyard, and utilitarian accessories like wells and air-shafts. Most of these *madrasas* have one *īwān* but only one—the example at Boṣrā—has a pair of *īwāns* facing each other across an empty space. Altogether exceptional is a joint foundation: the *djāmiʿ-cum-madrasa* of al-Firdaws, Aleppo, which not only has two large *īwāns*—back-to-back but also two small but self-contained courtyard units, each with a pair of *īwāns* facing each other across the court, an intimately domestic arrangement encountered earlier in palaces and caravanserais.

The emphasis on one rather than several *īwāns* may reflect the fact that the great majority of these buildings—all but seven of the 128 *madrasas*

in Damascus and Aleppo which pre-date 700/1300 and are recorded in the literary sources—were erected to serve a single *madhhab* and therefore required only one location for teaching. But this is purely supposition, for the two-*īwān madrasa* at Boṣrā was built to serve the Ḥanafī *madhhab* alone, while the two-rite Sulṭāniyya *madrasa* at Aleppo (620/1223-4) has no *īwāns* at all. It therefore seems equally possible that any causal connection between the number of *īwāns* in a Syrian *madrasa* and the number of *madhhabs* which it served is more apparent than real. This conclusion seems all the more appropriate when it is remembered that neither Anatolian nor Iranian *madrasas* attest any consistent connection between the number of *īwāns* in a *madrasa* and the number of *madhhabs* which it serves. Against this wider perspective the Egyptian cruciform four-rite *madrasa* is nothing short of freakish, reflecting perhaps a conciliatory religious policy on the part of the founder. Not surprisingly it remained very rare; the overwhelming majority of mediaeval *madrasas* throughout the Islamic world were built to serve a single *madhhab*.

A cursory examination of the Syrian *madrasas* is enough to establish that the provision of student accommodation was not a major priority. The information available on this score is unfortunately not very precise, for most of these buildings are long since disaffected and modern houses have encroached on them. But the Boṣrā *madrasa*, as noted above, suggests in the gross disproportion between public and private space that the structure was purpose-built to accommodate no more than a handful of students, and that its catchment area was probably no wider than Boṣrā itself. Nūr al-Dīn's *Dār al-Ḥadīth* in Damascus also seems to have had no more than four rooms, and although the other surviving Syrian *madrasas* are more generously provided with student cells, not one of them approaches the larger Maghribī *madrasas*, let alone those of Iran, for capacity. The Khān al-Tutun *madrasa* in Aleppo probably had ten cells, while the Nūr al-Dīn *madrasa* in Damascus, and the Ẓāhiriyya *madrasa* in Aleppo, had 16 disposed in two stories. If so, they had the most generous housing capacity to be found in surviving contemporary Syrian *madrasas*. The most unusual solution of all, however, as noted above, was the introduction of two minute courtyard houses, each one complete with several irregularly shaped cells, on either side of the great double *īwān* of the *djāmiʿ-cum-madrasa* of al-Firdaws, Aleppo. But even this very carefully designed building leaves inexplicably little space in the layout for student cells. One is driven to the conclusion, therefore, that the patronage directed towards the building of *madrasas* in Syria was deliberately kept on a small scale, possibly because nearly all of them were built to serve (exclusively?) a single *madhhab*, or else, they might have been meant more as oratories for the daily use of the local population than as *madrasas tout court*, a practice recorded in Maghribī *madrasas*.

Some or all of these factors may well have been operative in Ayyūbid Syria. But they are scarcely enough to account for the phenomenon of such large numbers of small *madrasas*. The answer seems rather to lie in local circumstances. To begin with, the topography of these *madrasas* is itself revealing. They are crammed into the nooks and crannies of ancient, densely populated cities, where building space was at a premium. There could be no question here of a state-inspired blueprint imposed regardless of local conditions. Sociologically, too, the picture differs from that presented by Iran, ʿIrāḳ or Anatolia. The patrons are not the sultans themselves but lesser *amīrs*, their wives or mothers, or local notables. Such people were well-to-do but not necessarily rich or with free access to public funds. Thus the buildings had, so to speak, a wider social base than their equivalents elsewhere in the Islamic world. Sometimes the endowment even specified the conditions of use: for example, that the teacher appointed was forbidden to teach anywhere else. This individual approach is reflected in the very varied layout of these *madrasas* which show the architect grappling with a unique site. For Ayyūbid patrons, it seems, small was beautiful. Small was also functional. Since *madrasas* were built by the score in the larger cities it would have been wasteful to give them a large capacity, just as it would have been wasteful to decorate them lavishly. What decoration there is, however, maintains a high level of quality and is set off by the consistently fine stereotomy of Syrian tradition. The stone vaulting of the time deserves particular commendation. Thus these *madrasas* were firmly rooted in a topographical, sociological and artistic context which depended little on external influence.

Perhaps the main distinguishing feature of these Syrian *madrasas* is the inclusion of a mausoleum (*ḳubba* [*q.v.*] or *turba*). Indeed, it is doubtful whether the connection between the *madrasa* and the mausoleum was ever closer than it was in Ayyūbid Syria. Once again, epigraphy provides a clue for this, for inscriptions in the Sulṭāniyya and Atābakiya *madrasas*, located in Aleppo and Damascus respectively, refer to the recitation of the Ḳurʾān there. Provision was made for this recitation to be unceasing—an Islamic parallel for the Christian custom of paying for masses to be said for the souls of the dead. Burial in a *madrasa*, then, was —like burial in the neighbourhood of a saint— intended at least in part to confer *baraka* upon the dead. It was in Syria rather than in Egypt that the exaltation of the mausoleum at the expense of the *madrasa* proper can first be traced; time and again it is the mausoleum which has the favoured site of the street façade, with the *madrasa* modestly tucked away virtually out of sight. In sheer surface area, the mausoleum is apt to rival, if not exceed, the *madrasa*. Small wonder, then, that it has even been suggested that the terms *turba* ("mausoleum") and *madrasa* were interchangeable in this period. On the other hand, the notion of ensemble which underlies a modern term like "funerary *madrasa*" is belied by the epigraphic evidence, which suggests that the *turba* element and the *madrasa* element both had their own foundation inscriptions. This practice has often obscured the original intention of the founder, for it has resulted in many now free-standing *turbas* being identified as simple mausolea rather than as part of a funerary *madrasa* (e.g. Farrukh-Shāhiyya and Amdjadiyya *turbas*, Damascus). Conversely, it sometimes happens that the inscription of a *turba* may mention the *madrasa* of which the mausoleum was part, and may indeed be the only surviving evidence that such a *madrasa* ever existed (ʿIzziyya *madrasa*, Damascus).

The intimate symbiosis of *turba* and *madrasa* is epitomised by a curious joint foundation in Damascus. The Farrukh-Shāhiyya *madrasa*, with the mausoleum of ʿIzz al-Dīn Farrukh-Shāh attached, dates from 578 or 579/1182-3. A generation later, in 628/1230, another *madrasa* was built beside it and this

too was provided with a mausoleum, which housed the son of ʿIzz al-Dīn, al-Malik al-Amdjad. Father and son, then, are buried in adjacent *turbas*; the *turba* of the former is, perhaps appropriately, the larger of the two. Similar pairs of tombs survive in Damascus and later in Mamlūk *madrasas*. If the *madrasas* of Ayyūbid Syria were analysed from the purely formal point of view, with no backward glance at their eastern origins, the obvious conclusion would be that a major, if not indeed the primary, purpose of the institution was to contain a monumental mausoleum. Is it fair to assume, then, that the term *madrasa* did not have a consistent meaning throughout the mediaeval Islamic world? Certainly, Ayyūbid Syria provides evidence suggesting that the term did not connote one single type of building. Thus the *Dār al-Ḥadīth* or al-Ashrafiyya in Damascus (634/1237) is called a *madrasa* in its foundation inscription, and in its sequence of entrance vestibule, prayer hall and *turba* conforms to the standard type of contemporary *madrasa* as illustrated by the Murshidiyya *madrasa* in Damascus. Conversely, the Ḳilidjiyya, also in Damascus, is defined in its foundation inscription as an institution for teaching *ḥadīth*, but is identical in form to the Murshidiyya. As in Iran and Egypt, it was common for a private house to be converted into a *madrasa*, but more ambitious conversions are also recorded and it is these that testify yet again to the loose boundaries between mediaeval Islamic building types. Thus the Ḥalāwiyya *madrasa* in Aleppo was successively a church and a mosque before it became a *madrasa*, while the Marīdāniyya served in turn as a *madrasa*, burial ground and mosque. Thus the mere fact that a structure was founded with a given purpose in mind was no guarantee that it would continue to function as such, especially if the value of its endowment fell; it might easily shed some functions or acquire additional ones. The absence of any sign of student cells in many of these admittedly half-ruined Ayyūbid *madrasas* invites speculation that at least some of these foundations were never intended to be residential.

If the Syrian *madrasa* tradition, as it developed during the scant century of its heyday, is analysed as a whole, the sheer variety of types encountered cannot fail to make an impression. It is hard to avoid the conclusion that these differences are not casual or contingent on the local topography, but rather reflect a basic uncertainty about the ideal form such buildings should take. For a long time, Syrian architects were sidetracked by the influence exerted by the mosque. The prestige of that long-established model helps to explain why ideas derived from mosque design permeate these *madrasas*. They were after all religious buildings. The Shādbakhtiyya *madrasa* in Aleppo (589/1193) is essentially a mosque writ small, especially in its laterally developed domed *muṣallā*, and to judge by the plan alone, the teaching function of the building is plainly secondary.

Since Fāṭimid Egypt was officially Shīʿī, it was impossible for the explicitly Sunnī *madrasa* movement to establish itself there, or for that matter anywhere else in the Fāṭimid domains, before the fall of that dynasty in 565/1170. Within five years of that date, however, under the militant orthodoxy of Ṣalāḥ al-Dīn there were already as many *madrasas* in Cairo, swiftly to be followed, no doubt at least partly for propaganda reasons, by examples at Mecca and Medina. However, the long start which Syria had enjoyed in building *madrasas* seems to have resulted in a more lavish provision of these buildings in that area than in Egypt, where the total recorded before 700/1300 is only 31, about a third of the comparable figure in Anatolia or in Damascus alone. These figures are enough in themselves to cast doubt on the supposed primacy of Egypt in the architectural development of the *madrasa*.

The building of *madrasas* in Cairo gathered new momentum with the coming of the Mamlūks. The largely vanished Ẓāhiriyya *madrasa* (660-2/1262-3) of Sultan Baybars was a gigantic 4-*īwān* structure with a stalactite portal probably of Syrian inspiration, a theme repeated in the deep niches with *muḳarnas* hoods which articulated its façade. This building inaugurates, if indeed it was not preceded by some comparably magnificent earlier *madrasa*, the distinguished tradition of Cairene *madrasas* with splendid façades and interiors to match. Anatolia was about a generation earlier in this development, so far as surviving evidence indicates, while Syria lagged behind.

This notable degree of splendour can be explained on both political and economic grounds. Mamlūk *madrasas* in Cairo are overwhelmingly the product of royal or high official patronage, a fact consistently reflected in the names they bear and in their lavish decoration. Outward splendour would be the natural corollary of such patronage. But it would be inaccurate simply to treat these buildings as instances of conspicuous consumption, even though the lengths to which an *amīr* or sultan would go to secure a fashionable site with ample street frontage do suggest such a conclusion. Many of them were endowed far more generously than their size and therefore the scope of their activities dictated, and while these endowments (*awḳāf*) were inalienable under Islamic law, that same law permitted any surplus from an endowment to be applied to the benefit of the descendants of the original endower. The more lavish the endowment, therefore, the more such a foundation would approximate to an investment. Not surprisingly it was among the first concerns of an *amīr*, upon reaching power, to found some charitable institution, nor was there any bar to his adding piecemeal to its endowment over the years.

Perhaps the most ambitious of these multi-purpose Mamlūk foundations, and the one which seems to have set the fashion for such institutions, is the *māristān* tomb and *madrasa* of Sultan Ḳalāwūn, the whole built in a mere thirteen months (683-4/1284-5). As in the case of the Ṣāliḥiyya (639/1242), its internal arrangements are at odds with its façade, which at nearly 70 m is exceptionally long and to which in a sense the whole building is subordinated. Mausoleum and *madrasa* are sundered by a long corridor which led to the now largely-vanished hospital. It is no doubt significant that the Mausoleum, now enlarged by a functionally dispensable courtyard, occupies a far larger proportion of the combined tomb and *madrasa* portion of the ensemble than it did in the Ṣāliḥiyya. The *madrasa* itself has a generous courtyard with two *īwāns* on the longitudinal axis and cells disposed laterally. Its most notable feature is without doubt the *ḳibla īwān* which is divided into three naves and therefore explicitly associated with the traditional architecture of the mosque. Interestingly enough, Ḳalāwūn's son, al-Nāṣir Muḥammad, himself built a mausoleum-*cum-madrasa* cheek by jowl with his father's great foundation, and in this later ensemble (695-703/1295-1303), the mausoleum is relegated to a subsidiary role beside a substantial 4-*īwān* *madrasa*.

This latter building has the peculiar distinction of being the first known cruciform *madrasa* intended to serve all four *madhhab*s.

By common consent, the masterpiece among these Mamlūk ensembles, (150 × 68 m.), and certainly the largest of them was the mosque, *madrasa* and mausoleum of Sulṭān Ḥasan (757-64/1356-63). Its lofty portal, originally designed to have flanking minarets, and with a spacious vestibule behind it, bears the unmistakable imprint of Anatolian Saldjūḳ architecture, but most of the detailing within is typically Cairene. At first sight, the layout seems familiar enough, focussed as it is on an ample 4-*īwān* plan. But—and here again foreign influence, this time from Iran, must be taken into account—this cruciform plan is employed, exceptionally in the case of Egypt, for a mosque, while each *madhhab* has its own *madrasa* in one of the corners between the arms of the cross. The sultan's own mausoleum, a gigantic dome chamber, extends the full width of the *ḳibla īwān* and is placed (emphatically not in Iranian fashion) directly behind the *ḳibla* wall. It therefore usurps the position of the domed sanctuary in the classical Iranian mosque. The building thus epitomises the vitality and versatility of the traditional 4-*īwān* formula.

Several prestigious Mamlūk buildings in Cairo, such as the various funerary *madrasa*s of Sulṭān Shaʿbān and his family, followed the lead of the Sulṭān Ḥasan ensemble. But its principal impact on later buildings was through its 4-*īwān* schema, which henceforth was to be repeatedly used for mosque architecture until the Ottoman conquest. In other words, the architecture of the *madrasa* had now come to influence that of the mosque; indeed, the unprecedented expansion of the *ḳibla īwān* into a full-scale *muṣallā* in later Mamlūk buildings (e.g. the Ḳāʾit Bay complex) can only be explained by such a process. Presumably the decisive factor was that the mosque thereby gained a large unbroken space for the *muṣallā*, which—unlike mosques with arcaded or columned *muṣallā*s—allowed all the congregation to see the *imām*. This inherent advantage of the *īwān* schema had not been seized at the time that the Ḳalāwūn ensemble was built, and thus the *ḳibla īwān* there is treated like a traditional *muṣallā* and parcelled up by arcades, a device continued in the mosque-*madrasa* of Barḳūḳ (786-8/1384-6). Moreover, even as late as the funerary *madrasa* of Barḳūḳ (801-15/1399-1412), a set of domed bays forming miniature compartments take up the areas normally reserved for *īwān*s. The liturgical distinction between the *ḳibla īwān* and the subsidiary ones was expressed in architectural terms too. The former was vaulted, and thereby given the illusion of still greater spaciousness, while the scale of the latter was reduced and their ceilings were now flat.

For the *madrasa* to influence mosque design was indeed a momentous change; it signalled a new relationship between the two buildings. Earlier, the dependent status of the *madrasa* had been vividly expressed by the way it had been tacked on, very much in the manner of an afterthought, to the parent structure. Examples abound; they include the *madrasa* of 507/1113-14 beside the Great Mosque of Urfa and a trio of *madrasas*—those of the *amīrs* Ṭaybars (709/1309-10), Aḳbugha (740/1340) and Djawhar (before 844/1440)—attached to the Azhar mosque in Cairo. Henceforth, however, these two institutions could combine their functions within a single building (which was highly desirable given the chronic shortage of space in Cairo) and with minimum trespass of one upon the other. For it is noticeable that in the Sulṭān Ḥasan complex a novel solution for the *madrasa* has been devised: not only does each *madhhab* occupy a corner of the building, but certain aspects of the traditional full-scale *madrasa* are retained even on this miniature scale. The cells for students are clustered on two sides of a diminutive courtyard, except in the case of the Mālikī *madrasa* situated in the western corner, where the exigencies of the site bisected the space available. Since the Mālikī rite enjoyed relatively less popularity than the other three (though the Mālikī professor was allotted the prestigious *ḳibla īwān* in the funerary *madrasa* of al-Malik al-Nāṣir), this solution was not as unjust to that *madhhab* as might at first appear. Furthermore, the small size of the student cells meant that their numbers and dimensions could be readily adjusted to fill the space available, thereby obviating the need to encroach on the mosque proper. Presumably, however, the four *īwāns* were used for teaching purposes outside the hours of prayer; the association between *īwāns* and teaching had been rooted for a good two centuries in Syria and thence Egypt; thus the Mamlūk historian al-Maḳrīzī, in his description of the mausoleum and *madrasa* of al-Nāṣir Muḥammad, lists the four lecturers—one from each *madhhab*—who were first appointed to teach there, and specifies the *īwān* allotted to each one. The lack of subsidiary *miḥrāb*s in the lateral *īwāns* is sufficient indication that their role as places for prayer was not paramount.

At the mosque-*madrasa* of Barḳūḳ, built a generation later (786-8/1384-6) the emphasis is reversed in favour of the *madrasa* without any fundamental change in plan. Thereafter, while true 4-*īwān* mosques or *madrasas* remained the exception rather than the rule in Egypt (e.g. the foundations of Djamāl al-Dīn of 811/1408 and Sulṭān Ināl of 860/1465), the principle that the same building could serve both functions was unassailable. It is not surprising, therefore, to discover in 7th/13th and 8th/14th century Mamlūk architecture a marked propensity to use *īwāns*, though the combinations varies widely—one, two or three *īwāns* may be used in conjunction with courtyards, halls, mausolea or sets of smaller chambers; acute shortage of space was no doubt a contributory factor in these developments.

The diminutive scale of many Circassian Mamlūk foundations necessarily excluded ample accommodation for students, but to make up for the difficulties inherent in lateral expansion many of these foundations extended upwards instead, comprising two or even—in the case of the 4-*īwān* funerary *madrasa* of Amīr Surghatmish (757/1356)—three stories which, in the latter example, all contain cells for students. The case of the tiny but elegant *madrasa* of the Amīr Mithḳāl, datable to the period between 762/1361 and 776/1374, and measuring a mere 20 m per side, shows that the practice of allocating separate stories to the functions of worship and to those of teaching and/or accommodation had already established itself in pre-Circassian times. Relieved of the requirement to fit student cells into the ground floor of a cramped, awkward site, the architect could create an ordered and even ample layout by expanding the 4-*īwān* plan to take up virtually all the available space, with special emphasis on a laterally placed *muṣallā* which stretches the full width of the building. Without a comparably bold solution such a building would be undesirably cloistered, indeed claustrophobic. An airshaft

(*malkaf*) is another means of countering the unduly inward-looking quality of such buildings. In the Mithkāliyya, store-rooms take up what little area remains on the ground floor, while the two upper floors are reserved for living and lecture rooms and a library. The mezzanine floor is not continuous but is confined to the lateral *īwāns* which have wooden ceilings at their springing and above this are closed by *mashrabiyya* grilles giving into the rooms behind. Thus was created the so-called "hanging *madrasa*", a natural development from earlier "hanging" or "suspended" mosques in the same city. The funerary *madrasa* of Zayn al-Dīn (697/1298) may have been a forerunner of this type. Like many other Mamlūk *madrasas*, the Mithkāliyya was sited close to the private quarters of its patron—indeed, as at Nīshāpūr centuries earlier, a private house (*kā'a*) was frequently turned into a *madrasa* after its owner's death and named after him (e.g. the still-surviving *Madrasa al-Ghannāmiyya* in Cairo, dated 774/1372-3, and this case can be supplemented by a dozen literary references). In both types of building, the two-*īwān* plan is normal though not mandatory. The interdependence of private house and *madrasa* is highlighted by the absence of staircases between ground and first floor in the original composition. It seems, therefore, that the *madrasa* proper can only have been reached via such private quarters as adjoined it, presumably those of the *amīr* himself. The *madrasa* in turn would have provided access for buildings behind it.

Among the surviving *madrasas* in Cairo one type is clearly predominant—the funerary *madrasa*. So traditional was this kind of building in Cairo that (to judge by surviving structures) it was the *madrasa tout court* that remained exceptional. In the earlier funerary *madrasas*, the mausoleum occupied such a significant portion of the ensemble that it is appropriate to describe such structures as joint foundations. Five such monuments survive dated between 697/1298 and 715/1315 alone, and they were only gradually superseded by foundations of still wider scope. It is hard to avoid the conclusion that the *madrasa* was a convenient means of justifying the mausoleum —for the latter building type of course flouted Islamic orthodoxy. An early example of this process is the vanished *madrasa* built in conjunction with a magnificent mausoleum near the grave of the Imām al-Shāfi'ī (d. 204/820) in 572-5/1176-80. This ensemble conferred an implied legal recognition on the cult of mausolea; after all, if a funerary *madrasa* could be erected in honour of the founder of one of the four major *madhhabs*, the practice could henceforth safely be regarded as unimpeachable. Nevertheless, the mausoleum continued to provide the true *raison d'être* of such monuments, and visually it almost invariably usurps pride of place. This is particularly evident when the ensemble includes two mausolea instead of one (funerary *madrasa* of Sālār and Sandjar al-Djāwulī, 703/1303-4), although later in the century such double mausolea appropriately enough take second place to the *madrasa* itself (*madrasa* of Khwānd al-Baraka, also known as that of Sha'bān, 770/1368-9). The inclusion of minarets, which by this time were too common in the city for fresh ones to be anything but redundant, may also have been designed to ward off pious disapproval. Even so, it was the minaret and the mausoleum, not the *madrasa* itself, which gave these buildings their distinctive stamp externally. Perhaps the competition of these already well-established building types was one of the factors which prevented the *madrasa* from developing its own instantly recognisable form. A modest edifice in the name of al-Malik al-Djakandār (719/1319), described as a *masdjid* in its inscription, even though the now demolished rooms on the roof, the striking resemblance to the slightly later Mithkāliyya and the historical evidence all point to its being a *madrasa*, epitomises the simplicity and austerity of the *madrasa* once shorn of such parasitic structures. It is the first Cairena *madrasa* to have the *saḥn* roofed in the Anatolian manner. This feature continues in later *madrasas* and results in the courtyard shrinking to the level of a large room (*madrasa* of Kā'it Bay, 880/1475).

These remarks should not be construed to suggest that Cairene *madrasas* served exclusively educational, religious or funerary proposes. A casual reminiscence set down by al-Makrīzī indicated that the *madrasa*-mausoleum of the Amīr Karasunkur was used as a hostel by couriers of the *barīd* service preparing for their return journey to Syria and elsewhere. The same source mentions a *ribāṭ* for women attached to the *madrasa* and mausoleum of the Amīr Sunkur Sa'dī (715/1315). But above all, the *madrasa* provided a focus both for the relentless emulation of the Mamlūk *amīrs* in architectural projects and for their desire to make financial provision for their descendants.

Just as the *madrasas* of Syria in the 6th/12th and early 7th/13th centuries yield valuable data not available from Egypt as monuments, so reciprocally do Mamlūk Egyptian *madrasas* fill the information gap in Syria. The sudden decline in *madrasa* building in Syria after 648/1250 can safely be associated with the fall of the Ayyūbid dynasty, whose power was centred there.

This decline is not reflected solely in *madrasas*; it is a widespread characteristic of later mediaeval architecture in Syria, and is only to be expected given the henceforth provincial status of the area. After the death of Baybars, whose own early career adequately explains his interest in Syria, it was very rare for a Mamlūk sultan to undertake an important building project in the province. Jerusalem, on the other hand, by virtue of its exalted status in the Islamic world, continued to benefit from the architectural patronage of the Mamlūk sultans right up to the death of Kā'it Bay.

Syrian *madrasas* of the Mamlūk period, then, are significantly below the level of contemporary work in Cairo. Moreover, they were built in significantly smaller numbers than under the Ayyūbids, for under the Mamlūks the emphasis of patronage shifted to mausolea and funerary mosques. Even so, it is well-nigh impossible to draw a clear line of demarcation between either of these categories and the *madrasa*; there is no significant difference in layout between the tomb of Shaykh Nakhlawī (730/1330), the funerary mosque of Sīdī Shu'ayb (*ca.* 800/*ca.* 1400) and the funerary *madrasa* of Shaykh Ḥasan Rā'ī al-Himma, all in the same city (863/1459). Single-tomb structures combined with a much larger laterally developed *muṣallā*, sometimes with a vestibule, continued to be built, and these could equally well bear the name mosque (Turuziyya, Damascus, 825/1423) or *madrasa* (Djakmakiyya, Damascus, rebuilt and enlarged 822/1419). Thus in Mamlūk as in Ayyūbid times, the term *madrasa* did not connote exclusively one kind of building or one particular function. Other continuities may readily be noted. The Ẓāhiriyya *madrasa* in Damascus, for example, dated 767/1277-8 and containing the

mausoleum of Baybars, is essentially still in the Ayyūbid architectural tradition. Its steep narrow portal, focussed on a *muḳarnas* vault ending in a scallop-shaped niche, does however find its natural parallels in other Baḥrī Mamlūk buildings in Cairo. Some *madrasas*, such as the Turūntā'iyya in Aleppo (794/1392) had two such portals, neither in any way integrated with the principal features of the building. This *madrasa*, incidentally, combines in a new way many of the standard features of earlier Syrian *madrasas*: around its spacious central courtyard are disposed a *muṣallā* extending the entire width of the *ḳibla* side, arched colonnades with rooms above on the two long sides and a huge *īwān*, presumably for teaching, occupying all the north side. The role of mosque played by many Mamlūk *madrasas* in Syria is advertised by the addition of a minaret (Madrasa Saffāḥiyya built by the *ḳāḍī* Ibn al-Saffāḥ in 869/1464 and Madrasa Anṣāriyya, both in Aleppo).

Attention so far has been focussed on the Mamlūk *madrasas* of Damascus and Aleppo, and the evidence cited makes it clear enough that these buildings fall substantially below the standards set by contemporary Cairene *madrasas*. Another local school flourished in Tripoli (*madrasas* of al-ʿAdjamiyya (766/1365) and al-Khātūniyya (774/1373-4), but this too could not rival Cairo. As noted above, it is in Jerusalem that most of the best provincial Mamlūk architecture is to be found, and this is as true of *madrasas* as of any other building type. Particularly worthy of note is the sparse but exquisite applied and architectonic decoration of these buildings, including stellar vaulting (Madrasa al-Dawādāriyya, *ca.* 697/1297), niches with radial or *muḳarnas* vaulting (Khātūniyya, 784/1383 and Salamiyya, *ca.* 700/*ca.* 1300 respectively) and entrance recesses with trefoil heads (Tashtīmūriyya, *ca.* 785/*ca.* 1384; Muẓhiriyya, 885/1480-1). These and other Jerusalem *madrasas* (e.g. the Djawhariyya, 844/1440 and even the early Ottoman Risāsiyya, 947/1540) concentrate attention upon the entrance. This feature is easily explained. Streets were very narrow and the buildings bordering them constituted a succession of cliff-like façades. No one building, however, had a street frontage of any substantial length. Thus the custom developed of leaving most of the façade plain and confining applied and architectonic ornament to the entrance and perhaps the windows. The doorway itself tended to be much smaller than the slender, lofty entrance recess into which it was set, and was normally crowned by a *muḳarnas* composition enclosing the inevitable epigraphic panel trumpeting the name and titles of the founder.

The self-same shortage of space which had conditioned the characteristic local exterior façade ensured that in residential *madrasas* the cells were disposed on two or even three stories. There is even a case of a *madrasa* being extended over the roof of an adjoining *ribāṭ* (Djawhariyya *madrasa*, 844/1440). In such cramped conditions it is not surprising to find that the 4-*īwān* plan used on more spacious sites in contemporary Cairo is apt to be reduced, for example by the suppression of lateral *īwāns* as in the Muẓhiriyya *madrasa*. Here the portal gives on to a vestibule which leads into an *īwān* facing a courtyard, probably once covered, with a *ḳibla* *īwān* opposite.

There can be little question that the most important of these Mamlūk *madrasas* built outside Cairo is the Ashrafiyya erected in Jerusalem by Ḳā'it Bāy in 887/1482. This was the third extension and rebuilding of the monument, which was already a major institution staffed by an indefinite number of shaykhs, *fuḳahā'* and 60 Ṣūfīs, all salaried. Several reasons combine to lend it special distinction. To begin with, it attests the patronage of the sultan himself, a rare occurrence—as already noted—in provincial Mamlūk *madrasas*. Secondly, its location in a favoured site along the inner façade of the Ḥaram al-Sharīf would confer *baraka* on it to an unusual degree. Earlier in the Mamlūk period, several *madrasas* had been erected along the Ḥaram, but the visual impact of the Ashrafiyya is much greater. Ḳā'it Bay's patronage must however be assessed against a wider context than the purely local ambience of the Ḥaram, or indeed of Jerusalem itself. A short time previously, he had erected *madrasas* within the precinct of the Ḥaram in Mecca (882-4/1477-9) and the Mosque of the Prophet in Medina. Like his foundation in Jerusalem, these buildings are so designed that their windows look out upon the sacred enclosures in each case. Thus the Ashrafiyya falls into place as one component in a religio-political master plan expressing imperial Mamlūk involvement in the holy places of Islam. The foundations of al-Walīd I nearly eight centuries before provide an obvious parallel. Finally, the Ashrafiyya possesses intrinsic distinction on account of its architecture alone. Seen as a whole, the inner façade of the Ḥaram emphasises the motif of arcading above all others. The architect of the Ashrafiyya was therefore constrained to reject the model presented by earlier Mamlūk *madrasas* in the city, with their emphasis on high blank façades and block-like design. An open-arcaded façade had no functional justification in a *madrasa*. But this device did permit the Ashrafiyya to blend fairly naturally with its surroundings; not content with the prime site which the *madrasa* already occupied, as close as practicable to the Dome of the Rock, Ḳā'it Bāy took the major step of sanctioning the extension of the *madrasa* façade, which until then had remained flush with the open arcade fronting the inner side of the Ḥaram enclosure, so that it projected well beyond the arcade. It was a brutally simple way of drawing attention to his new foundation. Earlier *madrasas* bordering the Ḥaram enclosure and indeed forming with the Ashrafiyya a continuous band of monuments, such as the Tankiziyya (729/1328), the Baladiyya (782/1380) and the ʿUthmāniyya (840/1437), had by contrast all respected the extant portico. The Ashrafiyya was regarded in its time as one of the three jewels of the Ḥaram al-Sharīf, with the Dome of the Rock and the Aḳṣā mosque, a distinction expressed in symbolic fashion in 882/1477 when, like these other two buildings, it was specially illuminated to celebrate the visit of a Mamlūk *amīr* to Jerusalem. Nor is this all. A detailed analysis of the building shows that its silhouette was very carefully designed to make an impact from a few selected viewpoints; it would be interesting to look for comparable evidence of sensitivity to the urban skyline on the part of Islamic architects elsewhere. The immediate source for this unwonted emphasis on the skyline, as for the presence of a minaret which is exceptional in the Syrian context, is likely to be Cairo. Cairo, too, as will be shown below, provides the fullest context for the recast, not to say deformed, cruciform *īwān* schema encountered at the Ashrafiyya.

The ensemble takes an unusual form which is due only in part to the exigencies of the site. At ground floor level it comprises three elements. The most important of these is a large assembly hall (*madjmaʿ*)

whose capacity and spatial extent are much reduced by the architect's decision to retain in his remodelling (the original piers of) the arcade enclosing the Ḥaram. Here congregated the judges, *fuḳahā'* and other notables connected with the *madrasa*. Behind the hall is a series of three adjoining square or rectangular rooms whose western walls abut the Baladiyya *madrasa*; they neatly subdivide an awkward lateral corridor of space. The third component of the ground floor layout is the entrance complex, which comprises a vaulted porch open on all four sides and leading to the entrance itself flanked by stone benches (*maṣṭabas*), which opens into a tripartite vestibule within. The first floor is ingeniously and tightly planned to serve as a self-contained *madrasa*. As such it immediately recalls, for example, the Djawhariyya *madrasa* in Jerusalem itself, which like the Ashrafiyya is intimately dovetailed with a pre-existing structure, or the Mithḳāliyya *madrasa* in Cairo. The first-floor unit divides naturally into two areas, one north of the minaret above the staircase and the other west of it. The latter area consists of an L-shaped open-air terrace (*sāḥa*) with twenty rooms, disposed roughly as uneven pairs, to the south and five identical rooms plus a washroom (*mutawaḍḍa'*) to the west. Even if the larger rooms are excluded and only symmetrically repetitive chambers are identified as student cells, the number of resident students which were catered for here can scarcely have been less than twenty. Its sister foundation in Mecca had (according to one account) forty students attended by four lecturers (*mudarrisūn*) plus a jurisconsult (*faḳīh*), Ḳur'ān reciters (*ḳurrā'*) and, somewhat surprisingly, muezzins. The area north of the minaret comprises another open-air terrace to the west, lavatories with a reservoir, and a remarkably compact cruciform *madrasa* adjoining the terrace to the east and thus placed directly above the *madjma'*, comprising a rectangular hall some 22.7 × 12.1 m. in area. The east *īwān* of this takes pride of place among the others since it is the one which looks out on to the Ḥaram. It has in effect been transformed into an open loggia offering spectacular views over the Ḥaram. This architectural form, known as *maḳ'ad* or *ṭārima*, has a wide distribution in domestic architecture throughout the Near East, and may parenthetically be compared with similar forms in contemporary Renaissance architecture; it underlines yet again the deep roots of the *madrasa* in domestic prototypes. But this development, for all its domestic flavour, also had religious implications, for the view from this loggia was over one of the holiest sites in the Islamic world. A note of luxury is struck by a huge stained glass window and is echoed throughout the complex—in the two-tone (*ablaḳ*) masonry, the polychrome marble flooring of the *īwāns* and inner courtyard (a practice frequently encountered in late Mamlūk Cairene *madrasas*), the veneered wooden ceilings of the *īwāns*, the lead sheeting of the roof and in its carpets and lamps, whose beauty, in the words of a contemporary historian, was "unequalled elsewhere". In short, there is ample evidence that the Ashrafiyya was a metropolitan import into the local architecture of Jerusalem.

In the earlier part of this section the discussion focussed on literary references to the earliest *madrasas*. This emphasis was dictated by the lack of surviving structures. It is unlikely that future excavations will substantially illuminate this crucial early period. After all, the written sources indicate clearly enough that the early, pre-Saldjūḳ, *madrasas*, in keeping with their private and non-official character, were of a domestic nature. Frequently a house became a *madrasa* without, it seems, any structural alteration, or served impartially as house and *madrasa* by turns. It follows that excavated ground plans will not be enough in themselves to prove that a given pre-Saldjūḳ structure functioned as a *madrasa*. Even in the Saldjūḳ period itself, the two Iranian buildings identified by some as *madrasas* (the ruined structures at Khārgird and Ray) have aroused a controversy still not laid to rest. In this situation it seems sensible to accept that the architectural history of the *madrasa* before 530/1136 (the date of the example at Boṣrā) is irretrievably lost, no matter how rich the documentation of its character as an institution may be.

Such a conclusion inevitably confers particular evidential value on the earliest considerable group of *madrasas* to survive, namely the examples in Saldjūḳ Anatolia, where 50 surviving examples permit a more searching and reliable analysis of trends than do 15 Syrian ones. These Anatolian buildings have been quite unjustifiably neglected in the history of the genre; Creswell's obsession with absolute chronology and his bias towards material from Syria, Palestine and Egypt led him to over-estimate the role of this area in the development of the *madrasa*, and his views have dominated subsequent discussion. However, the Anatolian *madrasas* are the best available guide to the nature of the building in Saldjūḳ Iran; thanks to the work of Kuran and Sozēn, they are much better known as a group than any others in the Islamic world. Some 80 of them datable before 905/1500 survive, and this figure can be supplemented by a further 58 vanished buildings of the same period recorded in the literary sources. In both categories, incidentally, the numerous Ottoman buildings, which form a separate study, are excluded; the grand total of Anatolian *madrasas* surviving or recorded in this period is probably about 200. The preponderance of surviving over vanished buildings is highly unusual in the mediaeval Islamic world and is unlikely to reflect the true state of affairs. But the two sets of figures do complement each other significantly. They confirm what may be deduced from other sources—that building activity was most concentrated in the 7th/13th century, that is, under the Saldjūḳs of Rūm. Forty-one surviving and 27 vanished *madrasas*, that is almost half of the entire recorded output of Anatolia in the period 1100-1500, date from this century. The comparable figures for the 8th/14th century, are 22 and 15, comprising about a quarter of the output of the period as a whole. The Ḳaramānids [*q.v.*] were the principal patrons responsible for new *madrasas* in this period. In the 9th/15th century the rate of construction declined still more sharply by a further 70%. Even the 6th/12th century saw more construction than this, with nine surviving buildings and a further six so far recorded in the literary sources; but of course the decline of Beylik *madrasas* in the 9th/15th century directly mirrors the growth of Ottoman power. Indeed, the earliest Ottoman *madrasa* to survive, that of Sulaymān Pasha at Iznik, predates 759/1358 and was itself preceded by a now vanished *madrasa* at Bursa. With the 9th/15th century, Ottoman *madrasas* began to be erected over much of Anatolia.

The turbulent political history of 6th/12th century Anatolia is perhaps sufficient explanation for the

slow spread of the *madrasa* in this area and period. But with the consolidation of Rūm Saldjūḳ power, the movement gathered such momentum that it long outlasted the disintegration of the Saldjūḳ state. Clearly, it had deep roots in the society which it served.

Not surprisingly, therefore, and in contrast to the situation in Egypt, Palestine and Syria, and for that matter in the Maghrib, these mediaeval Anatolian *madrasas* were not confined to a few large cities. The surviving examples alone are distributed among 39 cities, towns and villages throughout the length and breadth of the land, while the literary sources add a further dozen localities. In the fullest sense, therefore, this was a popular movement. Naturally this did not exclude a concentration of *madrasas* in a few key centres. Konya, as the Saldjūḳ capital, obviously took pride of place, though only seven of its 24 *madrasas* have survived. Next comes Mardin, the Artuḳid capital, where surprisingly enough 11 of the recorded 13 *madrasas* remain; similarly, Kayseri retains 9 of its 11 recorded *madrasas*. These are without doubt the three major centres of the time. However, quite a number of towns had between four and six *madrasas* erected in this period—Sivas, Sivrihisar, Akşehir, Tire, Aksaray, Erzurum, Diyarbakir and Karaman. Thus there is ample evidence to indicate that the intensive building activity of a few centres was complemented by provision in depth at a good many more. Finally, seven sites are recorded with two or three *madrasas* apiece. Such a remarkably even spread of facilities throughout the land may best be explained by the interaction of two complementary trends: a centralised building programme and—though probably to a lesser degree—a popular fashion for the *madrasa* as an institution, or at any rate as a suitable object of modest architectural patronage.

It is in fact these Anatolian buildings which provide the best evidence of the multi-functional nature of the mediaeval *madrasa*. In so doing, they are a reminder that the form of these buildings is not an infallible guide to their function. Many a building now conventionally termed *madrasa/medrese* (and subsumed in the present discussion) was actually intended to serve as a medical school, a mental hospital, an *ʿimāret* or an observatory, and it frequently allotted substantial space to a mausoleum. The two former functions may be combined in the sense that each is discharged in separate but adjoining premises, as in the Čifte Mināre *madrasa* at Kayseri or the Kaykāwūsiyya at Sivas, though the mental hospital (*bīmārkhāne*) of Melike Yīldīz Khātūn at Amasya is a single self-contained foundation. Nothing in its layout would exclude its identification as a *madrasa*. In the case of long-disaffected, anepigraphic buildings, therefore, a *madrasa*-type layout should not automatically be taken to signify that the building really was a *madrasa*.

The rich quantity of Anatolian material available prompts a variety of conclusions. The most important of these is perhaps that no single type of arrangement was dominant. This in turn invites speculation that the evolution of the genre was by no means complete. In some *madrasas* (Tokat, Karahisar), a whole cluster of rooms of varying shapes and sizes mirror the uncertainties of the architect. In many of these buildings, too, the notional purpose of a *madrasa* —to house students seeking a theological education as a first step to joining the *ʿulamāʾ*—obviously comes a poor last to such other functions as providing a place of prayer, an elaborate façade, a mausoleum (or even two, as at the Boyalıköy *madrasa*), a minaret, a bath, a fountain or halls for public gatherings. Not surprisingly, the cells are usually tiny, a scant three paces per side. But it is their paucity that is most striking. Even the most splendid of all domed Anatolian Saldjūḳ *madrasas*, that built in Konya in 611/1215 by the vizier Djalāl al-Dīn Ḳaratay and bearing his name, has no more than a dozen cells. The most capacious *madrasa* of the period, on the other hand—the Čifte Mināre in Erzurum, which at 35 × 48 m is the largest Anatolian *madrasa* of the period—still has a mere 19 cells on each of its two stories and therefore lags far behind the larger *madrasas* of the Maghrib or ʿIrāḳ. In the 8th/14th century, the capacity of the average Anatolian *madrasa* declined still further. Saldjūḳ Anatolia shows just as clearly as do Syria, Egypt or Iran the growth of the multi-purpose foundation, and several Anatolian *madrasas* were built in conjunction with structures serving another purpose altogether. Thus the *madrasa* at Čay bears the same date (677/1278) as the caravansarai which adjoins it. Presumably as in the case of similar though later joint foundations (those of Amīr Mirdjān in Baghdād, 756-9/1356-9 and Shāh Sulṭān Ḥusayn in Iṣfahān, 1105-35/1694-1722), the revenues of the commercial establishment were intended to finance the running costs of the *madrasa*. It was common enough, too, for a *madrasa* to adjoin a mosque (Zindjiriyya *madrasa*, Diyarbakir, 595/1198; Ḥādjdjī Ḳīlīč *madrasa*, Kayseri, 647/1249-50). This fact is not necessarily mirrored in the plan of the *madrasa*, however, for the Khwānd Khātūn *madrasa*, Kayseri (635/1237-8) provides the usual facilities for prayer even though there is a mosque right next door. Perhaps the most diverse group of buildings erected by a single Anatolian patron in one building campaign is the complex of Ibrāhīm Beg at Ḳaramān (836/1433) comprising mosque, *ʿimāret*, *dār al-ḳurrāʾ*, *madrasa*, *tābkhāne* and mausoleum, though the complex of Ismāʿīl Beg at Kastamonu (*ca.* 880/1475) runs it close comprising as it does a *madrasa*, mosque, tomb, *ʿimāret*, caravansarai and bath. Such buildings make most sense in an Ottoman context.

Any attempt to characterise the mediaeval Anatolian *madrasa* must therefore reckon with this very varied background, but encompassing and overriding all these no doubt individually significant variants are two broad categories into which the entire body of mediaeval Anatolian *madrasas* may be fitted. These are the open type, with a courtyard; and the closed type with a domed area replacing that courtyard. Of the 53 surviving *madrasas* in good repair, 38 are of the open type and 15 are domed. The 28 ruined *madrasas* are deliberately excluded from these calculations because most of them are too fragmentary to be placed with confidence in either category. Even so, here too the predominance of the open plan is unmistakable, for of the ruined *madrasas* whose original layout can indeed be established, eight are open and only two are closed. That the open plan should dominate is only to be expected, given the popularity of this form in non-Anatolian *madrasas* and the fashion for courtyard houses in the mediaeval Iranian world which produced the earliest *madrasas*. The closed, domed *madrasa*—which may have anything from one to four *iwāns*, very occasionally has two stories (Ḳaramān, *madrasa* of Ibrāhīm Bey), and may or may not have a portico around the central space—is not so easily explained. Its *raison d'être*, incidentally

a more rewarding subject than its architecture, therefore deserves separate consideration.

The most convenient explanations—that the form is dictated by function or by climate—will obviously not do. After all it is the domed, not the open, *madrasa* that is exceptional in Anatolia. Nor can regional preferences be invoked, for the type occurs with tolerable consistency throughout the country. An important factor in its genesis may well have been that interchangeability of building types so typical of mediaeval Islamic architecture. The association of the *madrasa* with burial and worship would make it natural for the forms of mausoleum and mosque to be integrated into the structure of the *madrasa* —as indeed happens—and eventually to exert influence upon its form. Moreover, it can scarcely be coincidence that it is precisely the *madrasa*s of smaller surface area which attest the domed type. If very few students were to be accommodated in the building, the need for a substantial courtyard would diminish. In such a situation, the building would gain extra dignity and monumentality by the placing of a dome over the central space, while the memory of the courtyard would be retained by means of a skylight and/or a fountain. This ablutions fountain or *s̲h̲ādirwān* readily brings to mind the *impluvium* of the *atrium* in a Roman house, and thus underlines yet again the domestic origins of the *madrasa*. The integrating power of a central dome may also have been a relevant factor in the growing popularity of the domed *madrasa*. Two further considerations, which are perhaps only at first sight mutually exclusive, may be borne in mind. First, the compact *madrasa* with large central dome and smaller domed or vaulted areas surrounding it cannot fail to recall the standard type of mid-Byzantine church which was widespread in Anatolia at the time of the Turkish conquest. Nor is this resemblance simply a matter of external silhouette; the rear *īwān* flanked by dome chambers in the domical *madrasa*s of Konya brings to mind a Byzantine church apse flanked by *diaconicon* and *prothesis*. Secondly, when these domed *madrasa*s are seen not simply in their contemporary context but against the later background of Ottoman architecture, especially mosques, their emphasis on an integrated multi-domed and -vaulted space may be recognised as prophetic. Indeed, some of these domed *madrasas*, such as the Inče Mīnāreli *madrasa* in Konya or the Ṭās̲h̲ *madrasa* in Akşehir, actually incorporate earlier mosques in their structure. This close link with mosque architecture is incidentally not to be seen in the courtyard *madrasa*, which in Anatolia at least developed quite separately; but whatever the origins of the idea, its development was formidably consistent right up to the Ottoman culmination.

Anatolian courtyard *madrasas*, like those of domed type, do not readily fall into formal sub-categories, although attempts have been made to analyse the buildings on the basis.

Certain generalisations about these buildings may be made. It is clear, for example, that the typical rectangular *madrasa* kept the façade short in relation to the sides. This had the advantage of concentrating student cells on the long sides and separating them physically from the rooms serving other functions. Most cells had a fireplace and a cupboard, but sanitary facilities were communal and there was usually no provision for meals to be cooked on the premises. Equally characteristic is a tripartite division of the building parallel with the major, that is the longitudinal, axis, as in contemporary caravansarais. At the far end of that axis, marking the *ḳibla* and continuing the major chord first sounded by the portal, is a wide *īwān* or dome chamber serving as the mosque and frequently flanked by a subsidiary vaulted or domed room on either side. Evidently some honorific intent lies behind this placing, though it must be conceded that the mosque was sometimes located elsewhere in the *madrasa* (for example, next to the entrance vestibule at the Čifte Mīnāre *madrasa*, Erzurum). When the *madrasa* form was used for an observatory (Wād̲j̲idiyya *madrasa*, Kütahya, 714/1314), a small opening in each of the lateral dome chambers served for star-gazing. In a true *madrasa*, these two chambers most likely functioned as classrooms and for the library; smaller rooms flanking the entrance perhaps accommodated the professors. In 4-*īwān* plans the *ḳibla īwān* is typically the broadest and the most richly decorated of all, and it has a similar pre-eminence in two-*īwān madrasas*, in which the *īwān*s, as in Iranian Sald̲j̲ūḳ building of that type, are confined to the longitudinal axis. However, the form of the *īwān* within these buildings—as distinct from their exteriors—does not follow Iranian precedent, in that its façade comprises the arch alone without a framing *pīs̲h̲ṭāḳ*.

The discussion so far has by implication highlighted the originality of these Anatolian *madrasas*, but the dearth of contemporary comparative material from elsewhere forbids any very positive statement on this score. Even so, one may set against the occasional echo of Syrian *madrasa*s or of Iranian buildings, a growing sense of confidence in forging a local style. Imported ideas are rapidly given Anatolian garb, as the fate of Persian elements shows. Minarets become stumpier and stockier than in Iran, with tiers of well-articulated balconies; in 4-*īwān* plans, the *īwān*s are diminished and subordinated to the emphasis on continuous arcades surrounding the courtyard, and a pronounced longitudinal axis —at odds with the centralising function of the 4-*īwān* plan—makes itself felt. It should also be pointed out that the first four-rite *madrasa* to survive is in all probability not, as is often thought, the Mustanṣiriyya in Bag̲h̲dād but the Masʿūdiyya in Diyarbakir, founded in 590/1193-4. Such a detail symbolises the central importance of mediaeval Anatolia to an understanding of *madrasa* architecture.

Ottoman *madrasa*s inevitably look somewhat tame when measured against the output of the preceding centuries, but what they lost in unpredictability they amply made up for in symmetry and scale, characteristics hitherto undervalued. Long, uncluttered façades are preferred, and this change is symptomatic of the severity which was to replace the luxuriant idiom of Sald̲j̲ūḳ and Beylik architectural ornament. But it is more than a matter of stylistic preference. The typical Anatolian Sald̲j̲ūḳ and even Beylik *madrasa* was a self-contained foundation, even if its *raison d'être* was as often funerary as educational. Exceptions are not hard to find, but they are distinctly recognisable as such. With the advent of the Ottomans to supreme power, the joint foundation—typically a mosque-*cum-madrasa*, but frequently a still larger complex—becomes commonplace, and sometimes several *madrasa*s cluster around a mosque; such an ensemble is conceived as an architectural unity and often executed in a single building campaign.

These changes left their mark on the *madrasa*. Its function as a place of prayer was now positively subordinated to its role as an educational institution, and this change is swiftly mirrored in its architecture.

The *īwān* is demoted and by degrees removed, and in its place appears the dominant dome chamber; the Čelebi Meḥmed *madrasa*, Merzifon (817/1414), illustrates an intermediate stage of this process, with its compact, square layout focussed on a central courtyard, ideally adapted to a cruciform *īwān* plan; but the *īwān*s no longer dominate the arrangement, for behind each of them rises a powerful, foursquare domed unit.

The closer relationship between mosque and *madrasa* in this period was to have still more far-reaching results. There was less need to provide ample facilities for prayer, so the *masdjid* or *muṣallā* occupies a smaller proportion of the surface area. Innovations in mosque design are swiftly reflected in the planning of *madrasas*—for example, in the provision of a mediating cloister, each bay domed, between courtyard and cells. Above all, the *madrasa* was now readily conceived as a mosque writ small with proportions reserved. Thus the domed *muṣallā* shrinks to a few metres square, although it is symbolically singled out by virtue of its isolation at the far end of the courtyard or even by its projection from the rest of the *madrasa*, as at the *madrasa* of Bāyazīd II at Edirne and, still earlier, the Murādiyya and Yeshil *madrasas* in Bursa. Instead, the courtyard enclosed by cells on three sides takes pride of place. The resultant U (or reversed U) shape soon became standard in the Ottoman *madrasa*

Perhaps the most important change of emphasis in Ottoman *madrasas* vis-à-vis their predecessors lies in the hugely increased numbers of student cells. The designer had a free hand and did not have to tailor his plan to an awkward and immutable site, so that as a result, perhaps, space is used quite prodigally; the cells are now domed, and often have two windows apiece. The courtyard has not only a central pool or fountain but is also planted with trees, possibly in an attempt to minimise the sense of regimentation which the plan exudes (*madrasa* of Bāyazīd II, Istanbul). In their size, their internal logic, their simple square or rectangular silhouettes, these Ottoman *madrasas* bear the unmistakeable imprint of imperial patronage; hence their architects had no need to grapple with the intractable sites that had put earlier architects on their mettle.

The recognition that the form of the Ottoman *madrasas* gradually stagnated should not blind one to their visual impact. It is a truism that an instinctive feeling for space permeates the buildings of the period, and *madrasas* are no exception. This explains why they are so often sited so that they can be viewed from all sides, and why the domed *masdjid* is set apart from the rest of the building by some device or other. It also explains why in so many *madrasas* at least half the surface area is wasted —from the narrowly utilitarian point of view—by a vast empty courtyard, why the cells are placed only on the ground floor, and why domed cloisters lead from cells to courtyard. Clearly it was less important to cram the *madrasa* full of students than to ensure that those who lived there had room to breathe. Consequently, when an Ottoman sultan, such as Meḥemmed Fātiḥ, wished to accommodate students on the grand scale, he built no less than 16 *madrasas*, even though the total number of rooms was only 230. This can fairly claim to be the first Turkish university. Architecturally speaking, the culmination of this trend may be seen in the Sulaymāniyya complex, whose 18 buildings are conceived as a single entity and, perched on one of the city's highest hills, command a matchless view.

The sheer size of these Ottoman *madrasas* departs decisively from the Arab tradition. It finds its natural counterpart, however, in the later *madrasas* of the eastern Islamic world. Their origins pose insoluble problems. In the early part of this section, the remarkable dearth of Iranian *madrasas* datable before 751/1350 was emphasised. Their absence from the tally of surviving monuments is all the more puzzling since representatives of nearly all the other major building types have survived in abundance, and since *madrasas* are plentiful among the standing monuments of Syria and Anatolia from the 6th/12th century onwards. This situation suggests that Iranian *madrasas* may indeed have survived—but not under that name. It is well known that throughout the mediaeval period and throughout the Islamic world the function of teaching was frequently discharged within the mosque (see above, section I, 2). This is not to say, of course, that many of the Iranian mosques of this period were *madrasas*; and even those which might have been centres of religious instruction could clearly never have functioned as residential *madrasas* because their design did not include cells for that purpose. Perhaps, then, it is a mistake to assume that a *madrasa* must connote a residential as well as an educational function. Indeed, since *madrasas* were apparently built all over the country in large numbers, the majority of them might be expected to cater for local students who would not require accommodation within the building. Only the largest and most prestigious institutions, whose reputation would attract students from far afield—like the Baghdād Niẓāmiyya or the Mustanṣiriyya—would need to make ample provision for students in residence.

The difficulty, of course, lies in identifying such "hidden" *madrasas*. Inscriptions might provide the requisite clues; in fact, Sauvaget interpreted the Ardistān *djāmiʿ* as a *madrasa* on the strength of a Ḳurʾānic inscription in the *ḳibla īwān* mentioning the ways (*madhāhib*) of reaching God. But this is to go too fast. Rather would it be justifiable to infer from that inscription that at least the *ḳibla īwān* of this mosque may have been used for teaching purposes in the Saldjūḳ period. Such Iranian mosques as have rooms of various kinds on the first floor might be regarded as *prima facie* candidates for residential *madrasa* status, in addition to their primary role as communal places of worship; but unfortunately, published plans are virtually without exception confined to the ground floor and give no hint as to the disposition of the upper level. The lack of formality which characterised mediaeval Islamic teaching methods enabled virtually any mosque to perform the teaching and religious functions of a *madrasa*; special lecture rooms were not required. This close functional correspondence between mosque and *madrasa* clearly favoured composite foundations, or at any rate the use of one building for several distinct purposes, and such a concept was of course widespread in other categories of Islamic architecture.

Enough has been said to highlight the difficulties of matching the physical and literary evidence about the early history of the *madrasa* in the Iranian world. In this area the earliest *madrasa* identified as such by inscription is the example dated 571/1175-6 at Shāh-i Mashhad in north-western Afghānistān. Ruined as it is, it nevertheless yields much useful information. To begin with, its splendid ornament proclaims it to be a monument of the very first importance, and in size alone, the building is re-

markable for its time, measuring as it does some 44 m. per side. This far exceeds the dimensions of 6th/12th century *madrasas* further west, but it was to find many subsequent parallels in the Iranian world. Nothing on such an ambitious scale survives from the following two centuries, and the obvious question is why this exceptionally large and expensive building was erected in an area which was always remote. The minaret of Djam [see GHŪRIDS] may provide the necessary clue. The role of that tower as a beacon of Islam in a context which until recently had been pagan goes far to explain its site, size and epigraphy; and the *madrasa* of Shāh-i Mashhad, with its fifteen inscriptions, may have been intended in similar vein to stamp an Islamic presence on a stubbornly pagan countryside.

Ilkhānid *madrasas* are on an altogether smaller scale, but before they are considered, one building from an area hitherto neglected—ʿIrāḳ—deserves notice. Already in the late 6th/12th century, Ibn Djubayr [*q.v.*] had recorded some thirty *madrasas* in Baghdād alone, all of them in the eastern sector of the city. All of them, however, were eclipsed by the Mustanṣiriyya *madrasa* there, widely regarded in its own time and subsequently as the exemplar of the genre and its fullest, finest expression. Its endowments (*awḳāf*), too, exceeded those of other *madrasas*. To a later age, it is the obvious symbol of the rejuvenated late ʿAbbāsid caliphate, and several factors suggest that this symbolism was deliberately intended at the time. The *madrasa* was built in Baghdād, which for six centuries had been the spiritual and intermittently the political centre of the Islamic world. It proclaimed the essential unity of orthodox Islam. Its patron was the caliph himself, who lent his name to the building. It was the first *madrasa* specifically designed to serve each of the four major *madhhabs*, as well as containing facilities for the two fundamental ancillary disciplines taught in a *dār al-ḥadīth* and a *dār al-Ḳurʾān*. Each *madhhab* had its own place of worship. Thus the building explicitly claimed universal status. The long band of foundation text, inscribed in letters a foot high, that unfolds, in defiance of Islamic custom, across its exterior façade, advertises this claim for all to see. In size alone the building was unprecedented: an oblong of *ca.* 105 × 44 × 49 m. The solemn festivities of its inauguration in 630/1233 after six years of construction set the seal on its pre-eminent status among the *madrasas* of the Islamic world, whilst architecturally speaking, the monument is a triumph of technique. It is built according to a complex system of proportional relationships and modular units. Both the ground plan—a modified four-*īwān* layout—and the elevation were based on a grid of 10 and 30 Byzantine feet respectively. Thus the unit of measurement (one Byzantine foot = 31.23 cm.) used for Hagia Sophia was still employed seven centuries later in the heart of the Islamic world, an astonishing tribute to the tenacity of Hellenistic influence in Muslim science. In addition to providing accommodation on two floors for a large staff and for some 300 students, the *madrasa* included a celebrated library (as did several Saldjūḳ *madrasas* in Marw), a kitchen, a *ḥammām* and a hospital.

The original layout of the Mustansiriyya was increasingly obscured in later centuries by numerous modifications, but the study of a closely related building has clarified most of these problems. The building in question, the so-called "ʿAbbāsid palace", is in all probability the Bishriyya *madrasa* of 653/1255 and seems—to judge by the manifold improvements of detail which it incorporates—to be the work of the same architect as was responsible for the Mustanṣiriyya. The fragmentary state of this later building is all the more regrettable in view of the ambitious scale of what survives.

The variety of forms attested by the few surviving Ilkhānid *madrasas* suggests that no one type predominated in this period. To judge by Tīmūrid and Ṣafawid buildings, it was the Madrasa-yi Imāmī (already discussed) and the custom-built *madrasa* added to the Friday Mosque of Iṣfahān from 768/1366-7 that best expressed the officially approved layout of such buildings, the latter being a two-*īwān* courtyard structure. The *madrasa* of Ḍiyāʾ al-Dīn in Yazd, otherwise known as the Zindān-i Iskandar and datable to the 8th/14th century, is of substantially lower quality than the two Iṣfahān *madrasas*; indeed, it is constructed of mud brick. Despite subsequent modifications, enough survives of the original layout to suggest that the *īwāns* on two adjoining sides of the courtyard were complemented by another pair opposite. Apart from this, there is little observable regularity in the plan; its rooms are indiscriminately oblong or square, broad or narrow, multi-recessed or with unbroken walls, and are bundled together with outright carelessness. The Shamsiyya *madrasa* of *ca.* 766/1365, also in Yazd —indeed, the literary sources record the names of about a score of 8th/14th century *madrasas* built in that city—is an incomparably more soigné variation on the same theme. Here the design is tauter and fully integrated, each half a mirror reflection of the other; the portal *īwān* announces the major axis, which continues without interruption until it terminates in the square mausoleum which adjoins the *madrasa* proper but projects well beyond it; and long lateral halls flank the portal *īwān* in a foretaste of Tīmūrid buildings at Khargird and Gāzur Gāh in Harāt.

The Tīmūrid period was unquestionably the golden age of the Iranian *madrasa*. Khurāsān and Transoxiana were the forcing-ground for new developments, though competently-designed *madrasas* were also built in southern Iran, and features from that area are sometimes incorporated into the monuments of the north-east, like the *bādgīr* [*q.v.* in Suppl.] at Khargird. The four-*īwān* type predominated and was executed on a scale consistently more spacious than had earlier been the norm anywhere in Islam. This ambitious scale often generated comparably ambitious decoration; the finer *madrasas* of the period yield nothing in the quality of their ornament to contemporary mosques, and occasionally even strike out in new directions, as in the murals with trees, streams and birds in the *madrasa* of Tūmān Āghā at Kihsan (844/1440-1). Such was the prestige acquired by this kind of *madrasa* that it became the model for nearly all the notable *madrasas* erected in the Iranian world in subsequent centuries; numerous *madrasas* in Ṣafawid Iṣfahān, Shaybānid Bukhārā and even Mughal India, illustrate this dictum.

It was in the Tīmūrid period, then, that the consonance between mosque and *madrasa* became so marked that there is little to distinguish them so far as external and internal façades are concerned. What goes on behind the façades, however, is very different in the two cases. Within the general format of the four-*īwān* plan, there was ample room for experiment in the placing of mosques, mausolea, lecture halls and residential accommodation. A side-

effect of the greatly expanded size of these foundations was that room could now be found for a wide range of ancillary units, such as libraries and *khānaḳāhs* for example, and for differentiated summer and winter chambers. Sometimes—as at Ghudjduwān, Khārgird and in the Ulugh Beg *madrasa* at Bukhārā—the complex contained a mosque, and often a lecture-hall as well. Sometimes both units were mosques (as at Turbat-i Djām) or lecture halls. In other *madrasas*, such as that of Ulugh Beg at Samarḳand, dated 820-3/1417-20, the mosque extended the full length of the *ḳibla* side opposite the portal *īwān*. By contrast, a trio of *madrasas* in the Mashhad shrine (Dū Dar, Parīzād and Bālā Sar) have the mosque situated in one of the courtyard *īwāns*—indeed, the Dū Dar *madrasa* even has a second mosque in a corner of the building. There was no general rule governing the siting of the mausoleum in these royal Tīmūrid *madrasas*, but the examples of the Gawhar Shād and Sulṭān Ḥusayn Bayḳarā *madrasas* in Harāt, and that of Fīrūzshāh at Turbat-i Djām, show that they could be the single dominant feature of the entire complex. Indeed, the fashion of the time firmly favoured the incorporation of mausolea into *madrasas*, and free-standing mausolea of high quality are exceptional. As a curiosity, the siting of a diminutive *madrasa* in the entrance complex of the Ziyāratgāh Djāmiʿ is noteworthy. In smaller *madrasas*, such as those of Mashhad, the incorporation of mosques and mausolea seriously overbalanced the ensemble and cut down the space available for student cells. But these cases are somewhat unusual, since the architects had to make do with a site which was already heavily built up and therefore had to sacrifice symmetry to expediency.

The new emphasis on scale implied almost by definition a corresponding emphasis on external façades. Minarets are used to mark the corners—e.g. the Ulugh Beg *madrasa* at Samarḳand and numerous later examples such as the Mīr-i ʿArab *madrasa* at Bukhārā, 942/1535-6; and the portal is now apt to be recessed and thus streamlined with the curtain walls of the façade rather than projecting from it. Sensitivity to the setting of the monument made it natural to group such buildings together, notably in the Rīgistān at Samarḳand (Ulugh Beg, Shīr Dar and Tilla Kari *madrasas*) or the Lab-i Ḥawḍ complex at Bukhārā.

As in Ottoman times, again, there was a tendency for these very large *madrasas*, all endowed by royal patrons or high officials of state, to cluster together in the major cities. Thus the original plan conceived by Niẓām al-Mulk, whereby *madrasas* would be built in large numbers but distributed evenly over a wide geographical area, was reversed. In Iran proper, Ḳum, Mashhad and Iṣfahān account for nearly all the significant post-Ilkhānid *madrasas*, while similar concentrations may be observed in Samarḳand, Bukhārā, Harāt and Khīwa. The latter city, with its quartet of highly traditional *madrasas* erected between 1810 and 1910 (Pahlawān Maḥmūd, Allāh Ḳulī Khān, Amīn Khān and Islām Khwādja) shows how fossilised the Tīmūrid manner had become.

A more appropriate envoi to the *madrasa*, however, is provided by the buildings of Ṣafawid Iṣfahān. Several *madrasas* of medium size were erected there in the course of the 11th/17th century, such as the Madrasa-yi Nadda Kūčik, built in 1058/1648 by the grandmother of Shāh ʿAbbās II and with accommodation for 67 students, the Madrasa-yi Ṣadr, and those of Mullā ʿAbd Allāh (1088/1677) and Kasangarān (1104/1693). But these are only of secondary interest when set beside the two *madrasas*, which flank the great dome chamber of the Masdjid-i Shāh, let alone the great Madrasa-yi Mādar-i Shāh (1118-26/1706-14). The two *madrasas* in the Masdjid-i Shāh are longitudinally conceived, and with their miniature garden courtyards make a delightfully bijou impression; and they exploit the available space to the full for student cells. The Madrasa-yi Mādar-i Shāh, sited in an originally idyllic environment fronting the Čahār Bāgh, injects a new dynamism into the traditional four-*īwān* layout by means of a large extra dome chamber in each of the diagonals, and the cells, too, are unusual in their tripartite division: a vestibule and a terminal recess bracket the cell itself. The main prayer chamber here is not easily distinguishable from that of the Masdjid-i Shāh, and the continued intermingling of the two forms in Iran is attested by several joint foundations in Ḳādjār times.

Although dependence on Andalusia is a constant of Maghribī architecture, little trace of Spanish influence can be detected in the ground plans of the local *madrasas*. Indeed, since the *madrasa* movement was primarily an eastern Iranian one which by degrees moved westwards, it would be only logical to assume that in this particular genre of building it was atypically the Maghrib that influenced Andalusia. The only surviving physical evidence of the Andalusian *madrasa* confirms this supposition. This is the structure built by the Naṣrid monarch Yūsuf I in 750/1349, sc. in the golden age of the Marīnid *madrasa*. Though largely demolished in the 18th century, the prayer hall was excavated and restored from 1893 onwards; it has nothing to differentiate it from its Marīnid contemporaries in Morocco. Of the *madrasas* built by the Almohad ruler Yaʿḳūb al-Manṣūr (580-95/1184-99) in Spain as elsewhere in his dominions, nothing survives, nor is there any record of further Naṣrid *madrasas*, so the question of reciprocal influences between Andalusia and the Maghrib in this genre cannot be regarded as finally settled. Valuable as this literary evidence is, its very paucity is instructive, for it suggests the virtual absence of one of the major Islamic building types in Muslim Spain. Yet that area was unquestionably the foremost centre of Islamic art west of Egypt. In fact, however, this dearth can easily be explained. By the time that the *madrasa* had established itself in the eastern Islamic world, the great days of the Cordovan caliphate were long over, and the fate of Muslim Spain sealed. The cities of the north, Toledo, and even Cordova itself, had been lost. With the splendid exception of the Alhambra, significantly a secular rather than a religious monument, little architecture of note was erected in the Iberian peninsula in the last three centuries of the Muslim presence there.

Although, as already noted, the *madrasa* genre is first recorded in the eastern Islamic world in the late 3rd/9th century, it was not for another 150 years and more that the full weight of official backing had resulted in *madrasas* being erected in most major towns of the area. Theoretically, the fashion could have spread to the Maghrib around that time. Yet it is doubtful whether the Almoravids had at their disposal the necessary administrative expertise to launch and execute a programme comparable to that of Niẓām al-Mulk. It seems that the Maghrib in any case produced only a tithe of the buildings erected in Iran during the same period, and in the

context of such limited building, *madrasas* would obviously have claimed less priority than mosques. Moreover, the Almoravids—as their name itself indicates—were noted primarily for building *ribāṭs* [*q.v.*]. Not only is there no mention of their building *madrasas*; it seems, rather, that it was precisely in these *ribāṭs* that some of the teaching functions later performed by the *madrasa* were carried out. The consonance of plan between the two institutions leaps to the eye. Moreover, the early and marked association of the *madrasa* with the Shāfiʿī *madhhab*, and to an only slighter lesser extent with the Ḥanafī and Ḥanbalī ones, would perhaps not immediately have struck a chord in the predominantly Mālikī Maghrib. Ironically enough, the first recorded *madrasa* (in late 3rd/9th century Nīshāpūr) was in fact Mālikī, but in subsequent centuries that *madhhab* noticeably lagged behind the others in the number of *madrasas* allotted to it. It is perhaps relevant that the religious message preached by Ibn Tūmart, the ideological founder of the Almohad dynasty, was disseminated in mosques rather than in special educational institutions. Hostile as he was to the prevailing orthodoxy of his time, it is not surprising that he did not use the *madrasa* as an instrument for his preaching, since that institution was itself the very emblem of orthodoxy by his time. Finally, one may perhaps adduce the generally conservatism of Maghribī society as a reason for the late spread of the *madrasa* movement to this area.

Thus the fashion for building *madrasas* probably reached the Maghrib late—too late, for example, to make an impact on Andalusia. The references to the late 6th/12th century *madrasas* built by the Almohad ruler al-Manṣūr are somewhat unspecific—indeed, the statement of Ibn Saʿīd that there was no *madrasa* in 7th/13th century Spain partially contradicts them—and the first securely dated *madrasa* in the Maghrib, the Shammāʿiyya, was built in Tunis by the Ḥafṣid Abū Zakariyyāʾ in 647/1249, and within a decade was followed by the Maʿriḍiyya *madrasa* built by his widow. Neither has survived, and thus the Ṣaffārīn *madrasa* in Fās, founded by the Marīnid sultan Abū Yūsuf in 670/1271, is the earliest Maghribī example to survive. Its location may be seen as prophetic, since for some reason the institution of the *madrasa* took deepest root in Morocco, and specifically in Fās, where most of the round dozen Maghribī *madrasas* predating 1700 are situated. Moreover, the majority of these *madrasas* are the work of the Marīnid sultans and were erected between 670/1271 and 757/1356. Several Algerian *madrasas* belong to the same group. This sudden efflorescence of a building type which had hitherto been virtually unknown in the area demands some explanation. Perhaps the answer lies in the fact that the Marīnids, unlike their more illustrious predecessors the Almoravids and Almohads, were not swept to power by a wave of religious fervour. Their uncomfortable consciousness of this deficiency may have led them to make restitution of a kind by providing the patronage for religious buildings. *Madrasas* fitted the bill admirably. They were much less expensive than mosques, a very relevant factor since the Marinid empire was much smaller than that of their predecessors. Marīnid mosques would have suffered by comparison with those of the Almohads; Marīnid *madrasas*, being effectively a new genre, were safer from such unwelcome comparisons. Moreover, they underlined the orthodoxy of their patrons and thus provided a counterweight not only to Shīʿism and to the Almohad movement but also to the increasingly popular Ṣūfism. Indeed, a crucial epigraphic document indicates that the Marīnid sultans were actuated by motives which had much in common with those of Niẓām al-Mulk over two centuries earlier. The very first surviving *madrasa* in Morocco, the Ṣaffārīn *madrasa* in Fās (670/1271) mentions in its foundation inscription the need to resurrect the forgotten religious sciences, a clear attack on Almohad heterodoxy:

"Praise be to God, Master of the Two Worlds! Who exalts the status of men of learning, Who recompenses with a generous hand those who devote themselves to acts of piety; Who by means of *madrasas* revives the vanished traces of *fiḳh* and of religion, using as His instrument those of His good servants whom He has specially singled out for His guidance and ennobled by His solicitude and by His care . . ." Finally, the desire to make Fās an intellectual centre—the sultans Abu 'l-Ḥasan and Abū ʿInān both prided themselves on being men of learning—may help to explain not only the concentration of *madrasas* in that city during the Marīnid period but also the endowment of several *madrasas* with fine libraries in the 7th/13th and 8th/14th centuries (Ṣaffārīn, Fās; BūʿInāniyya, Fās).

These *madrasas* all obey a well-defined schema. Their dimensions are smaller than those of any other groups of *madrasas* elsewhere in the Islamic world, ranging from 35 × 36 m. (115 × 118 ft.) to 14 × 14.5 m. (46 × 47.5 ft.). Perhaps their exclusive use by a single *madhhab* made larger buildings unnecessary. Around a central courtyard are grouped on the ground floor a mosque, galleries facing each other along the lateral axis and an entrance vestibule which is frequently open onto the courtyard along its entire length. Unlike the universal practice elsewhere in the Islamic world, the courtyard façades of these various halls are not marked by colonnades or *īwāns* but are fenced off by an unbroken surface of wooden panels. On the first floor, a narrow gallery overlooking the courtyard gives on to the cells in which the students lived; sometimes in the earlier *madrasas* these cells are also ranged behind the galleries on the ground floor.

No *madrasas* with facilities for all four *madhhabs* incorporated into their ground plans are known in the Maghrib. One legal school—the Mālikī—maintained a virtually unchallenged dominion over the Maghrib throughout the mediaeval period. Perhaps this exclusiveness, which made it unnecessary for architects to provide separate teaching areas reserved for other *madhhabs*, was the factor which kept the *madrasas* of this area small.

This diminutive size gives such buildings an essentially human scale which well expresses the informality of teaching in the mediaeval Islamic world. They are made even more inward-looking and cloistered by the downward pitch of their roofs as seen from the courtyard. Yet the organisation of space within the building is by turns ingenious and dramatic. On the first floor the needs of circulation and accommodation are admirably dovetailed; the corridor which encircles the courtyard and gives access both to individual cells and to the corner staircases is kept so narrow that two people can barely squeeze past each other in it. This frees extra space for accommodation. At the same time, it is no mere walkway but has some aesthetic distinction. The openings at regular intervals along its shaded length allow the viewer to catch partial glimpes of a courtyard bathed in sunlight. Most Moroccan *madrasas* have a central pool with a

fountain. Given the somewhat cramped dimensions of these courtyards, the presence of rippling water sets space into motion to a degree that would not be possible in larger expanses. This introduction of nature into the ordered, man-made world of architecture is typically Islamic. These fountains serve a further, more directly scenic, function too. For anyone within the halls bordering on the courtyard, the view into that courtyard is firmly directed by the act that the only entrance to these halls is a single arch. On the major axes of the *madrasa* this arch frames the fountain, which thus becomes the centrepiece of a carefully calculated composition.

Most Moroccan *madrasa*s were produced either under the Marīnids in the 8th/14th century or under the Saʿdian or Filālī sultans in the 11th/17th century. Since these two periods also saw a much greater production of mosques and mausolea than other periods, it is unlikely that the building campaigns of the two periods in question themselves constitute evidence that a specific penchant for *madrasa*s can be attributed to the patrons of the time. But the political background outlined above provides the missing explanation. Given the role of the *madrasa* in training the politically influential Mālikī *ʿulamāʾ* it is not surprising that the patrons of these buildings—when their names are recorded—should include the sultans themselves (e.g. the Bū ʿInāniyya *madrasas* in Fās, Salé, Meknès and Algiers) and their high officials, and that they should have been lavishly endowed, as their luxurious decoration indicates.

More often, however, their names reflect their relative size (*al-Kubrā*, "the greater", or *al-Ṣughrā*, "the lesser); their location in a quarter dedicated to a certain trade (*al-ʿAṭṭārin*, "the perfumers, or as in Fās and Meknès, *al-Ṣaffārīn*, "the metalworkers"), and occasionally even those who taught there (al-Miṣbāḥiyya is named after its first professor, Miṣbāḥ b. ʿAbd Allāh al-Yalsūtī) or the subjects in which the *madrasa* specialised (thus the Sbāʿiyyīn *madrasa* derives its name from the study of the methods of reading the Ḳurʾān). Like so much religious architecture in Islam, these *madrasa*s are often sited in the midst of bazaars—though there seems to be no connection between the presence of a *madrasa* in a particular quarter of the bazaar area and its endowment. Thus, while certain trades or crafts might singly or in concert put up the money for a mosque, the foundation of *madrasa*s seems to have been the result of official patronage.

That the teaching function of these *madrasas* was paramount is suggested by the almost total absence of the patron's tomb in them. One may note as exceptions the case of the 18th century Sulaymāniyya *madrasa* in Tunis, founded by one ʿAlī Pasha and containing the tomb of his son Sulaymān and earlier the case of the vizier Ibn Tafragin who was buried in the *madrasa* he had founded in 765/1364. Buth this official had significantly enough spent some time in Egypt, where this practice was widespread.

Such oriental influences, though rare, are of crucial importance. A later Tunisian *madrasa*, the Muntaṣiriyya (837-40/1434-7) again demonstrates Egyptian influence in the unusual feature of a rectangular bastion or salient placed in the middle of each of the courtyard façades. These projections do duty as portals to significant parts of the building and are thus explicable as interpretations—though in a different idiom—of the *īwān*s in cruciform disposition found in *madrasa*s further east. The lateral lecture halls of the Bū ʿInāniyya *madrasa* in Fās also seem to be a local interpretation of the *īwān* scheme. Yet another derivation from eastern models may be the use of the *madrasa* as one element in a larger complex. A typical example of this fashion is the *madrasa* built in Tlemcen in *ca.* 754/1354 by Sultan Abū ʿInān in association with the mosque, tomb and *zāwiya* of Sīdī al-Ḥalwī, or the mosque, tomb and *madrasa* of Sīdī Ibrāhīm built in Tlemʿen by the Zayānid Abū Ḥammū II. The Ṣahrīdj *madrasa* in Fās (721-3/1321-3) is situated right next to the mosque of the Andalusians; but as if this juxtaposition were not enough, it was by 750/1350 given dependencies significantly larger than itself. These included a now-vanished guest-house, the Dār Abī Habasa with 21 rooms, a large ablutions hall and—most important of all—another *madrasa*, that of al-Sbāʿiyyīn, which still survives. This latter phenomenon of paired *madrasa*s linked by a passage cannot but recall the Ṣāliḥiyya complex in Cairo. Also relevant in this connection was the Ḳadīma *madrasa* built by Abū Ḥammū I in Tlemcen in *ca.* 710/1310 for two pious brothers, for it comprised two halls, each with a house attached. Thus it seems that the principle of separate premises for separate courses was accepted even when there was no question of different *madhhab*s being accommodated within a single building. For all their strong local character, then, these Maghribī *madrasa*s attest the strength of eastern Islamic influences in this genre of building.

In many cases, the connection between a mosque and a *madrasa* is so close that the obvious conclusion to draw is that the mosque served *inter alia* as the oratory for the *madrasa* (e.g. the Walad al-Imām mosque, Tlemcen, erected in *ca.* 710/1310 next to the Ḳadīma *madrasa*). Conversely, the oratory of many a Maghribī *madrasa* served as the mosque for the quarter where it was built. Accordingly, many of these *madrasa*s have minarets, and one even has a *minbar*, thereby qualifying it to be a *djāmiʿ*. It has even been suggested that the *madrasa*, by dint of becoming the most typical and widespread structure of the later mediaeval Maghrib, began in its turn to influence the layout of the mosque itself, specifically in its preference for square rather than rectangular courtyards, shallow rather than deep prayer halls and monumental portals on the major axis of the building. Something of the same process has been noted in Mamlūk Egypt, where the cruciform plan developed in the *madrasa* was subsequently adopted quite widely for mosques.

Although the casual visitor to these Moroccan *madrasas* is apt to believe, after walking around half a dozen of them, that they follow a standard pattern, such an impression is quickly modified on closer examination. Their layouts suggest that while the architects in question had a firm grasp of the essential constituent elements of a *madrasa*, they were unable to impose a preconceived solution on the sites allotted to them. These *madrasa*s are located within an extremely cluttered urban setting, and so they commonly betray the various shifts of their designers to make the most of a difficult site. In these circumstances, it would be idle to expect to find a model which was more or less faithfully copied, or even a consistent, rational development of plan in these *madrasa*s. Even so, all the Moroccan buildings of the genre share an emphasis on interior rather than exterior façades in that they focus on a central courtyard; and their decoration is extraordinarily consistent in medium and orna-

mental repertoire alike. In these respects, then, it is justifiable to point to their marked generic similarity, which easily asserts itself over such contingent factors as site and size. Moreover, most of the Moroccan *madrasas* were erected—as noted above—in less than a century, from 670/1271 to 757/1356, a period which also encompasses the surviving work in Algeria and Spain.

Externally, their most striking characteristic is a negative one: they lack a monumental façade. This is no novelty in Islamic architecture, but it is a feature which recurs so consistently in these buildings that it seems justified to regard it as a deliberate principle. The only exception is itself so consistent that it proves the rule: virtually every *madrasa* has an elaborate portal, usually a densely carved overhang or hood on brackets, a kind of awning executed in wood. By its marked projection—sometimes as much as two metres—and its commanding height above the bustle of the street, it signals the entrance of the *madrasa* from a distance. The tortuous alleyways of these Moroccan towns would discourage any more marked emphasis on the façade; there is simply no point of vantage from which a general view of the building could be enjoyed. In addition, one or two *madrasas* have a porch in front of the main entrance (e.g. the Bū ʿInāniyya, Fās, where the vault is crowned by a pyramidal roof). This is more in the nature of the *čahār-sū* of eastern Islamic bazars than a monumental enclosed construction like the porch of mediaeval parish church, for it is simply a vault or dome spanning the street and supported by the walls which define that street. Most of these *madrasas* abutted on to the principal streets of the town, streets that were nonetheless so narrow that even a slightly projecting porch would have created an obstacle to traffic.

In common with contemporary local domestic architecture, these *madrasas* nearly always contain a bent entrance, partly to ensure that the interior of the building is sundered from the outside world—a matter of noise as well as proximity. Corridors leading off the entrance passage from left to right respectively give access to the latrine area and a staircase leading to the upper storey (ʿAṭṭārīn and Miṣbāḥiyya *madrasas*, Fās), though other locations for the latrines do occur. The standard practice is to provide a series of cubicles around a subsidiary courtyard with a central fountain. This latter feature means that the area can serve for ablutions as well, and it is doubly proper therefore that it should be physically separated from the rest of the *madrasa*.

Several *madrasas* have minarets (Ṣaffārīn, Fās; *madrasa* of Fās al-Dj̲adīd; Bū ʿInāniyya, Fās) and this may serve as a reminder that the institution often served as an independent place of prayer. Often enough it was located very close to a mosque so that there was no need for a separate minaret. Indeed, the interplay between mosque and *madrasa* was close and continuous. Just as the *madrasa* functioned as an oratory, so too did the mosque function as a place of teaching. This is especially relevant when it is remembered that most Moroccan *madrasas* are in Fās, which boasted in the Ḳarawiyyīn mosque [*q.v.*] the foremost centre of learning in the western Mag̲h̲rib. Lectures in the Ḳarawiyyīn would therefore supplement the teaching of the *madrasas*. Indeed, in some sense the *madrasas* acted as an overflow facility for the earlier and more prestiguous institution. This was clearly part of the function of the Miṣbāḥiyya *madrasa*, which was situated very close to the Ḳarawiyyīn and whose students, mostly drawn from southern Morocco until recently, were enrolled in studies in the mosque. The Ṣahrīdj̲ and Sbāʿiyyīn *madrasas* illustrate the same phenomenon. Similarly, most Tunisian *madrasas* are found in Tunis itself, where the students could benefit from the teaching offered in the other great Mag̲h̲ribī university-mosque, the Zaytūna. To concentrate the teaching function in a single urban centre in this way obviously made good sense from the economic point of view, and it meant also —since in both cases the centre in question was also the capital city—that the educational activity of mosque and *madrasa* alike would be directly under the eye of the sovereign. Once again, then, the inherently political nature of the *madrasa* asserts itself.

In view of the diminutive size of these Mag̲h̲ribī *madrasas* vis-à-vis equivalent institutions further east in the Islamic world, the emphasis laid on the prayer hall—which functioned concurrently as a lecture hall, as indeed did many mosques outside the regular hours of prayer—is noticeable, and is especially relevant in the context of the preceding remarks. It seems, in short, that these *madrasas* functioned quite widely as neighbourhood mosques. The case of the Bū ʿInāniyya *madrasa* in Fās, though admittedly exceptional, offers supporting evidence for this theory. It is placed midway between the old city, clustered around the Ḳarawiyyin mosque, and the new foundation of Fās al-Dj̲adīd, which at that time (751/1350) had not yet been given a Friday mosque. Thus the minaret of the Bū ʿInāniyya could pass on the *ad̲h̲ān* given in the Ḳarawiyyīn mosque which was too far away to be audible in Fās al-Dj̲adīd, and the Friday prayer could accordingly begin there at the ordained hour. The foundation inscription of the Bū ʿInāniyya *madrasa* (originally named al-Mutawakkiliyya after one of the titles of its founder) specifically states that the building has the advantage of serving as a *dj̲āmiʿ*. This *madrasa* has many of the appurtenances normally reserved for Friday mosques—a *minbar*, a *maḳṣūra*, a mortuary and a Ḳurʾān school, plus a unique external clock with a set of songs presumably intended to mark the divisions of the daily prayers. It even has a subsidiary entrance to the rear of the building, as well as an unusual division of the main entrance into two sections, one of which is intended for those with bare feet and is accordingly provided with a treshold of running water. The same idea is applied within the building, for a water-channel runs laterally across the façade of the prayer hall and is crossed by a slab of marble at each side. The building is raised above the level of the bazaar and is reached by a staircase provided with benches; but its roots in everyday life are aptly emphasised by the shops which line its main façade. It is precisely in its flexibility and in its multiple functions that the Bū ʿInāniyya *madrasa* approximates most closely not to other *madrasas* but to the classical type of mediaeval Friday mosque, as much a community centre as a place of worship.

Although the Bū ʿInāniyya *madrasa* is unique in the Mag̲h̲rib in its comprehensive range of functions, it is typical in that it is a royal foundation. In this particular case the ruler bore not only the expense of building but also financed the provision of water and endowed the salaries of the staff, the board and other expenses of the students and the upkeep of the building by making over to the institution a formidable list of properties.

Various methods are employed to emphasise

the role of the prayer hall in the Maghribī *madrasas*. It was the constant concern of the architects to give this hall pride of place in the overall layout, and the majority of them achieved that aim by means of axiality. Sometimes, as in the Ṣahridj and Bū ʿInāniyya *madrasas*, Fās, the entrance, courtyard and mosque were all disposed on the major chord of the building, and in the former case even the elongated rectangular pool played a spatial role. More often, the exigencies of the site and the predilection for a bent entrance meant that this axial emphasis could assert itself only at the entrance to the courtyard (al-ʿUbbād *madrasa*, Tlemcen; Miṣbaḥiyya *madrasa*, Fās). So firmly did this axial arrangement establish itself that it was even maintained when it ran counter to the correct orientation of the prayer chamber, as in the ʿAṭṭārīn *madrasa*, Fās, where in order to mark the *ḳibla* accurately, the *miḥrab* has to be placed to the right of the entrance instead of opposite it as the internal logic of the layout demands.

The placing of the chambers for students varies quite markedly. In the earlier *madrasas*, all the living accommodation was confined to the ground floor (Ṣaffārīn *madrasa*; *madrasa* of Fās al-Djadīd). In the following decades, it continued to be standard practice for the more commodious *madrasas* to provide, in addition to the main accommodation at first-floor level, at least some student accommodation on the ground floor. It is here that the ornate wooden lattice-work screens known as *mashrabiyyas* come into their own. Placed between the arcades or other openings of the court, they close off from the public gaze the sections of the *madrasa* which serve for student accommodation. The bleakness of the latter area is therefore masked by a lavish exterior. Symbolically enough it is only the outer, namely courtyard, face of these *mashrabiyyas* that is richly carved; the inner face is plain as perhaps befits the sparse facilities offered to the students. Between these screens and the cells runs a corridor, for all the world like the cloister of some mediaeval western monastery. These screens continue on the upper storeys where their principal function is obviously to decorate the interior façade rather than to seal off the student cells. Sometimes the corridors or galleries are located only along the lateral walls of the courtyard (ʿAṭṭārīn *madrasa*, Fās; Taza *madrasa*), but they often extend to three sides, especially in the later examples of the genre, and there is even an isolated case of a *madrasa* with student cells arranged unevenly but on all four sides of the ground floor (Sabʿīn *madrasa*, Fās). The extra height required for a suitably imposing prayer hall meant that there was frequently no room for student cells above it, and there is even a case of a prayer and assembly hall located on the first floor (Miṣbaḥiyya, Fās).

Nothing testifies more forcibly to the inadequate publication of these buildings than the widely divergent figures given for the number of student cells which they contain. Often enough these statistics are confused with the number of students which the *madrasa* could accommodate. This figure is in itself wide open to discussion. According to some estimates, a typical cell can hold as many as seven or eight students. However, this is clearly an inaccurate guide for rooms at the smaller end of the scale; indeed, cells measuring no more than 1.50 × 2 m. are quite frequently encountered and it would clearly be difficult to accommodate more than one or at the most two persons in such a room. That many cells were intended to house only a single occupant is clearly indicated by the custom that the student "paid" for his room by buying the key for it from his predecessor. Besides, in many cells the floor space was reserved for living as distinct from sleeping accommodation—a feature which will be discussed in more detail shortly. Within a given *madrasa*, moreover the size and layout of individual cells will often fluctuate quite markedly. This is especially apt to occur when the *madrasa* has walls built at acute angles because of the spatial constraints of the site. While windowless cells are known, it was standard practice to provide tiny windows, often with metalwork grilles, opening on to the corridor, the main courtyard, a subsidiary courtyard (especially in post-Marīnid *madrasas*), or even—though rarely—on to the street.

The spartan fittings of these cells do suggest that the provision of maximum sleeping space was a priority of the designer. There was no bedding to clutter up valuable space. Students slept under a blanket on a mat. Often projecting shelves below the ceiling function as bunk beds; they are reached by wooden bars mortared diagonally across the corners of the rooms so as to form a simple ladder. Sometimes a small table is provided—the students were, after all, issued with paper, pen and ink. A narrow slot beside the door permitted the daily ration of flat bread to be distributed with maximum speed. Since that ration was fixed at one piece per student, the amount of bread set aside per day for the *madrasa* provides the necessary clue in calculating the maximum occupancy for which the building was designed. This quantity of bread was made available daily, according to the requirements of the *waḳf* which financed the institution, irrespective of whether the building was fully occupied or not; in practice, therefore, it often happened that at least some students would have extra rations.

The largest of the mediaeval *madrasas* in Morocco is the Miṣbaḥiyya, for which a tally of 117 rooms has been proposed, with 23 on the ground floor alone and the balance in the two upper storeys. A two-storey design is commoner, however, and therefore the ʿAṭṭārīn *madrasa*, in which Bel counted 34 cells, or the Bū ʿInāniyya *madrasa*, whose capacity has been estimated at 100 students, are more representative. These are large numbers for buildings designed on such an intimate scale, especially when it is remembered that the prayer hall of such a *madrasa* could serve as the *masdjid* not only for the students and staff but also for the people of the area. It is hard to avoid the conclusion that the students lived a hard life—frequently cold, cramped and underfed.

With the fall of the Marīnids, the golden age of the Maghribī *madrasa* was over. Not only are there comparatively few surviving *madrasas* of later date, but the majority of them are either attached to mosques or shrines, and dominated by them, or they are intrinsically of very little interest (Rabat, Ceuta, Tangiers and Ksar el Kebir/Alcazarquivir). Only two deserve closer inspection—the Ben Yūsuf or Yūsufiyya *madrasa* in Marrakesh, dating to 972/1564-5, and the Sharrāṭīn *madrasa* in Fās, dating to 1081/1670, both royal foundations. Their interest lies in their plans rather than in their decoration or structural techniques, for in these latter respects they are disappointingly derivative.

Although the Ben Yūsuf *madrasa* is traditionally believed to have a plan based on that of the Marīnid *madrasa* whose site it occupies, it has a degree of

integration and symmetry foreign to its predecessors. Externally, it forms an almost perfect square but for the projecting polygonal *miḥrāb*. The internal disposition is admirable in its clarity and economy. Broadly speaking, the arrangement is tripartite, with a large porticoed courtyard—containing a substantial pool instead of the usual fountain—acting as the focus of the design and the student cells relegated to the flanking tracts. The oratory, placed as usual along the main axis, is also divided into three parts, a device already encountered in Marīnid *madrasas*. The arrangement of the cells, however, is novel; for instead of lining a long corridor they are clustered symmetrically in sixes or sevens around a series of seven small courtyards or *duwayras*. These are accessible via a cloister-like corridor which encloses the courtyard on three sides and also leads into the patio for ablutions. A similar arrangement is followed on the first floor, so that the *madrasa* contains about a hundred rooms.

A comparable lucidity of planning informs the Sharrāṭīn *madrasa*. Here too the polygonal *miḥrāb* projects forcibly, breaking the even tenor of the perimeter wall. This wall is stepped in three places but is otherwise straight. Exceptionally, three separate entrances give access to the corridors which debouch into the courtyard. Each of the three lesser courtyard façades is broken by three bays, and the whole elevation rises to an unprecedented three stories. Student cells, mostly arranged around somewhat noisome *duwayras* more like pits than courtyards, occupy three of the four sides on the ground floor; traditionally, students from various parts of the country—the Tafilalt, the Rīf and eastern Morocco—congregate around the appropriate *duwayra* so that each courtyard becomes in some sense a local microcosm. The oratory on the fourth side is similar to that of the Ben Yūsuf *madrasa*. Despite the proximity of the building to the Ḳarawiyyīn, the *miḥrāb* is seriously out of true, facing as it does the north-east. The high walls, cramped courtyard and blank spaces of the building give it a somewhat oppressive atmosphere. Its history does not belie this impression, for the *madrasa* was erected on the site of a Marīnid foundation, the Madrasa al-Labbādīn, which Mawlāy al-Rashīd had ordered to be demolished because its students had brought women there and given themselves over to debauch. Despite the radial symmetry of its plan, the building falls far below Marīnid standards so far as its decoration is concerned. The large capacity of these two later *madrasas* and their eminently logical layout put them in a category of their own among Moroccan *madrasas* and make them a worthy coda to a distinguished tradition.

(R. HILLENBRAND)

MADRID. [See MADJRĪṬ].

MADURA, an island north of East Java, separated from Java by a narrow strait in the north of Surabaya; it is 2,113 sq. miles in area, and has 2,385,300 inhabitants, among them 2,378,047 Muslims (1971). It is divided into four *kabupatens* (regencies): Pamekasan, Sampang, Sumenep (Sungenep) and Bangkalan, all of them being districts in the Indonesian province of East Java.

In the course of history, many of the Madurese settled in adjacent areas of East Java, or participated in the government-sponsored transmigration programme to other islands. The Madurese language is spoken as "native" idiom by approximately 9 million people. It knows different styles according to the status of the speaking and the addressed person, but the differences are not so great as in Javanese, Balinese, or Sundanese. The traditional literature is written in a mixture of Madurese and Javanese, due to the strong influence Javanese culture and language have exercised on Madura. The customs of the Madurese, too, are similar to the Javanese, although they seem to be less refined.

Geologically, Madura is related to North Java, consisting of the same limestone rocks as the hill range around Surabaya and Rembang. Fauna and flora, too, are similar to East Java, but the soil is much less fertile. Of great economic importance is the breeding of domestic animals, especially cattle, which at the same time gives provision to the most popular sport, i.e. bull racing, which originally may have been connected with the annual division of the

sawahs, or rice-fields. Another source of income is fishing and trading. As skilled sailors and shipmakers, the Madurese have developed their own type of vessels (*perahu Madura*).

Islam is the religion to which the Madurese generally adhere, but as in other Indonesian societies, *adat* law still exercises its influence. In pre-Islamic times, Madura was divided into two main parts: Western Madura with traditionally close relations to Surabaya, and Eastern Madura with Sumenep as its most important centre. The ruler of Sumenep is said to have played an active role in the transition period between the kingdoms of Singasari and Majapahit which was characterised by the turbulences caused by Ḳubilay Khān's military plans. In both East and West Madura the ruling families are said to have had matrimonial relations with the court of Majapahit. Thus the first (legendary) ruler of Sampang, Lembu Peteng, is described as a son of the Majapahit king Bra Vijaya and the famous "princess of Čampa" who confessed Islam. One of his grandsons, according to tradition, was the later Sunan Giri, one of the "nine *wālīs*" (*wali songo*) who spread Islam in Java. In Sumenep, a certain *adipati* Kangduruhan, presumably a son of the first Muslim ruler of Demak, Raden Patah (d. 1518), played a role during the second and third quarters of the 16th century. These were probably the first Muslim rulers in Madura. After the final fall of Majapahit in 1527, Sumenep participated in fighting the still "heathen" kingdoms in the eastern corner of Java which were supported by the Balinese king of Gelgel (Klungkung). The court of Aros Baya (Bangkalan) embraced Islam in 1528, and the crown prince and later ruler, *panembahan* Lemah Duwur, tried to keep peaceful relations with Demak. Later he married a daughter of Adi Vijaya, the *sulṭān* of Pajang (1548-82), and matrimonial relations with the Javanese *sulṭāns* continued to exist after Pajang was succeeded by Mataram (1589). Descendants of (West-) Madurese nobility were influential in Mataram, especially in the 17th and 18th centuries. The relationship between Sumenep and Mataram, however, was less fortunate: after the whole of Madura was conquered by the army of Sulṭān Agung in 1624, the ruling family of Sumenep was extinguished. A Javanese prince, Angga Dipa (from Jepara?) became governor, residing in Sumenep.

After 1670, the situation in Madura became turbulent again. After the defeat of Makassar [*q.v.*] by the Dutch admiral C. Speelman in 1667 and 1669, part of the Makassarese nobility and their soldiers fled to Madura and other areas in North Java to earn their livelihood as pirates. In 1670, *raden* Truna Jaya, a descendant of the last ruler in West Madura, was allowed by the *susuhunan* of Mataram, Amengku Rat I (1646-77), to reside in Madura, which he soon got under his control. For different reasons, not all of them being quite clear, Truna Jaya, who was spiritually supported by the Sunan Giri, joined the Makassarese pirates against the Dutch East India Company (*Vereenigde Oost-indische Compagnie, V.O.C.*) and their ally, the *susuhunan*. After having destroyed most of the North Javanese ports (except Jepara) and appeased the Makassarese in 1676, Truna Jaya turned to the interior of Java with his forces, which included part of the Makassarese nobility. In 1677 he lost Surabaya after it was attacked by Speelman and Mataram troups, and he established new headquarters in the old royal town of Kediri in East Java. In the same year he sacked the *kraton* (palace) of the *susuhunan*. After the old *susuhunan*'s death, his son Amengku Rat II (1677-1703) took stern measures against his former protégé Truna Jaya and attacked Kediri. Truna Jaya escaped, but finally, at the end of 1679, he was taken prisoner and a few days later killed by the *susuhunan*.

After 1683, the V.O.C. virtually ruled over East Madura; this was legalised by Mataram in 1705, and in 1743 the V.O.C. extended its suzerainty over the whole island. Having old grudges against Sulṭān Agung and the house of Mataram, the Madurese were in favour of Mataram's being divided in 1755. In the "Javanese War" of 1825-30, they sided with *pangerang* Dipa Negara. This led to a limitation of the local rulers' power by the Dutch, until in 1885 the island was put under direct Dutch rule. During the revolutionary years after World War II, Madura was part of the republican territory as acknowledged by the Linggajati Agreement in 1947.

(W. H. RASSERS - [O. SCHUMANN])

MADYAN SHUʿAYB, a town of north-western Arabia, lying inland from the eastern shore of the Gulf of ʿAḳaba; it is mentioned in the mediaeval Islamic geographers as lying on the pilgrimage route between the Ḥidjāz and Syria, which there went inland to avoid the mountainous coast of the Gulf.

The name is connected with that of the tribe of Midianites known from the Old Testament (LXX Μαδιαμ, Μαδιαν; in Josephus Μαδιηνῖται, ἡ Μαδιηνὴ χῶρα) but it can hardly be used without further consideration to identify the original home of this tribe, as the town might be a later Midianite settlement, and besides, it is difficult to fix the real home of such wandering tribes. In the Old Testament, a town of Midian is not mentioned (not even in 1 Kings, xi, 18 where "Maʿon" may conceivably be read). On the other hand, Josephus (*Antiquities*, ii, 2, 1) knows Madiane as a town on the Erythraean

Sea, as does Eusebius (*Onomast.*, ed. Lagarde, 276); in Ptolemy (vi, 7, 2) it is mentioned as a town on the coast and called Modiana or Modouna while in another passage he gives it as an inland town under the name Madiama, a difference which is explained by the actual position of the town. In Muḥammad's time there is only one reference (in Ibn Isḥāḳ) to the town of Madyan, when the Prophet sent an expedition under Zayd b. Ḥāritha thither. There are occasional references in the poet Kuthayyir (in Yāḳūt), who speaks of the monks there and in the record of Muḥammad b. al-Ḥanafiyya's journey to Ayla. According to Yāḳūt also, Madyan was occasionally the residence of the Umayyad prince ʿAbd al-Wāḥid b. Sulaymān, and visits to him there by the poet Ibn Harma [*q.v.*] are mentioned. In the geographers we find Madyan only as a town near the coast, six days journey from Tabūk; it was the second station on the pilgrim's road from Ayla to Medina and was a dependency of Medina. In the 3rd/9th century al-Yaʿḳūbī speaks of its position in a district rich in springs and watercourses, gardens and date groves and of its mixed population. Al-Iṣṭakhrī says it is larger than Tabūk and describes from his own observations the spring there, from which Moses watered the flocks of Shuʿayb (see below); it was now covered by a house which had been built over it. The town then began to decline gradually. In the 6th/12th century al-Idrīsī says it is an unimportant little trading centre with scanty resources: al-Maḳrīzī in his *Khiṭaṭ* describes Madyan as affording its inhabitants only a modest livelihood, with declining trade, and as having various remarkable ancient buildings and ruins still standing there (ed. Būlāḳ 1270/1854, i, 186-8).

It was only in the 19th century that the district of Madyan began to be visited by western travellers like Rüppell and Burton, and was only described in detail in this present century by Musil and Philby, with a preliminary investigation of its antiquities being undertaken recently by a team led by P. J. Parr. The mediaeval town probably lay in the middle reaches of the Wādī 'l-Abyaḍ (or Wādī 'l-ʿAfāl, as its lower reaches are called), which carried the ancient pilgrimage route southwards. On the western side of the wādī, in lat. 28° 30′ 30″ and 16 miles/25 km. north-east of Maḳnā (Ptolemy's Makna) on the ʿAḳaba Gulf coast, is the archaeological site known locally as Maghāʾir Shuʿayb "the caves of Shuʿayb", referring to a large necropolis with tombs carved into a very soft and friable limestone, hence much worse-preserved than those at Petra. As Musil and Philby correctly surmised, the tombs are Nabataean; the surface pottery is largely Nabataean and Roman, and a fragment of a monumental inscription in Latin has been found. Parr's expedition also noted extensive areas of ruins nearby on the eastern side of the wādī, and the participants in the expedition prefer to locate the Islamic Madyan at these latter sites of al-Malḳaṭa and al-Māliḥa.

In the Ḳurʾān, following the Old Testament, there are repeated references to Madyan as a people: for example, in the stories of Moses' stay with them (XX, 42; XXVIII, 21 ff., 45), where his father-in-law (Jethro in the O.T.) is still anonymous, or in one of the stereotyped legends of prophets in which the Madyan are punished because they would not believe their prophet Shuʿayb (VII, 83-91; XI, 85-98; XXIX, 35-6). This Shuʿayb was later identified with the father-in-law of Moses, for which there is no authority in the Old Testament; but in the early sūras (XV, 78; XXVI, 176-91; XXXVIII, 12/13) it is not the people of Madyan but the *aṣḥāb al-ayka* "men of the thicket" who reject the divine message brought by Shuʿayb. A. F. L. Beeston has recently suggested that these last were the devotees of the Nabataean deity Dusares or Dhu 'l-Sharā [*q.v.*] (and Musil noted that the lower part of the Wādī 'l-Abyaḍ was full of dense undergrowth) and that they must nevertheless have been closely connected with Madyan, despite the Muslim exegetes' distinguishing of two separate missions for Shuʿayb; the version of Shuʿayb's mission in the Meccan sūras might be considered as that intended for an audience familiar through its trading links with the cult of Dhu 'l-Sharā in northwestern Arabia, and that of the Medinan sūras for one familiar only with the general existence of Madyan. See *The "Men of the Tanglewood" in the Qurʾān*, in *JSS*, xiii (1968), 253-5, and also C. E. Bosworth, *The Qurʾānic prophet Shuʿaib and Ibn Taimiyya's epistle concerning him*, in *Muséon*, lxxxvii (1974), 425 ff., and SHUʿAYB.

(F. BUHL - [C. E. BOSWORTH])

KITĀB **MAFĀKHIR AL-BARBAR**, the title of an anonymous work written to the greater glory of the Berbers of Morocco and al-Andalus, existing in a ms. of the Bibliothèque Générale of Rabat (cote 1020 D). E. Lévi-Provençal published from this, as *Fragments historiques sur les Berbères au moyen âge—Nubadh taʾrīkhiyya fī akhbār al-Barbar fi 'l-ḳurūn al-wusṭā* (Collection de textes arabes publiée par l'Institut des Hautes Études Marocaines, i, Rabat 1934), the following extracts: a chapter from Ibn Ḥayyān's *Muḳtabis* on the relations of al-Manṣūr Ibn Abī ʿĀmir [*q.v.*] with the Berbers of the Maghrib (pp. 3-37), a passage from Abū Marwān ʿAbd al-Malik al-Warrāḳ's *Miḳbās fī akhbār al-Maghrib wa 'l-Andalus wa-Fās* on Zīrī b. ʿAṭiyya and his son al-Muʿizz (37-42); an extended section on the revolts, the Berber chiefs and kings in Spain and the Maghrib, stemming in large part from Ibn Ḥammādūh al-Sabtī's *Muḳtabas* (43-60), with the intercalation of passages borrowed from Muḥammad b. Abi 'l-Madjd al-Maghīlī's *Kitāb Ansāb al-Barbar* (48-52, 57-8), from al-Warrāḳ on the Almoravids (53), from Ibn Bassām's *Dhakhīra* on the Barghawāṭa and the Almoravids (54-7) and from Abū ʿAlī Ibn Rashīḳ on the Almohads (59-60); concise biographies of scholars, writers, poets, saints and even false prophets of the Berbers (60-78);

a passage from Ibn Ḥazm's *Djamhara* on the Berber tribes established in Spain (78-80); and finally, a list of the Almoravid governors of al-Andalus according to al-Warrāḳ's chronicle (1-2).

The only indication about the anonymous author comes from the biography of the *shaykh* Abū ʿAlī Ṣāliḥ b. ʿAbd al-Ḥalīm, where it is said that the latter was alive in 712/1312, the very year in which the compilation was put together. But we have here quite clearly the case of a Berber who, although a good Muslim, is especially proud to belong to a people whose entitlement to glory he undertakes to proclaim, since many people consider this people as "the most erring people, the most ignorant, the most lacking in good qualities and the farthest from virtuous deeds". In order to achieve this aim, he eschews retailing all the history of the Berbers since the time, so he says, when they settled in the Maghrib after having fled from Syria in the wake of David's killing of Goliath, and limits himself to recalling their part in al-Manṣūr Ibn Abī ʿĀmir's expedition against Algeciras in 368/978-9, but he nevertheless intends to speak of "their kings during the Islamic period, their chiefs, their rebels, their genealogies and some of their famous men". This programme seems then to have been carried out.

Lévi-Provençal thinks that Ibn Khaldūn probably used this *Kitāb Mafākhir al-Barbar*, and his opinion is substantially shared by Maya Shatzmiller, who has recently drawn attention to the existence, in the Bibliothèque Générale of Rabat, of a ms. (cote K 1275), whose contents she has studied in a note *Une source méconnue de l'histoire des Berbères: le* Kitāb al-Ansāb li-Abī Ḥayyān, in *Arabica*, xxx/1 (1983), 73-9. It is quite certain that the fragments published by Lévi-Provençal belong to this ms., so that the problems posed by a compilation of this kind can now be examined with greater sureness. Moreover, Lévi-Provençal had published *Un nouveau récit de la conquetè de l'Afrique du Nord par les Arabes*, in *Arabica*, i/1 (1954), 17-43, based on a text which appears equally in the ms. in question, and he considered that the *Mafākhir al-Barbar* could well be attributed "with likelihood to Ibn ʿIdhārī", but Mme. Shatzmiller comes very near to attributing to Abū Ḥayyān (654-745/1286-1344) the authorship of the compilation which she describes.

(Ed.)

AL-**MĀFARRŪKHĪ**, MUFAḌḌAL B. SAʿD, author of the local history of Iṣfahān in Arabic entitled *Risālat Maḥāsin Iṣfahān*. The work appears to have been written during the reign of Malik Shāh (465-85/1072-92). Nothing is known about al-Māfarrūkhī's life, but it is apparent from the wealth of poetry contained in the work and from the frequent use of rhymed prose that he was an *adib*. He cites his father, Abu 'l-Faḍl Saʿd, as his *shaykh* and quotes several of his poems.

He claims descent (92) from one Māfarrūkh b. Bakhtiyār who in turn was descended from Adhurshāburān b. Ādhurmānān, whom he describes as completing the building of the walls of Djayy, the fortified nucleus of pre-Islamic Iṣfahān, one hundred and seventy years before Islam. Samʿānī claims (*al-Ansāb*, fol. 502b) that the *nisba* al-Māfarrūkhī relates only to *mawālī* of the original Māfarrūkh, but the genealogies of earlier bearers of the *nisba* seem in several instances to go back to Mārarrūkh himself (cf. Abu Nuʿaym, *Akhbār Iṣfahān*, i, 134-5; ii, 142, 272, 325). On his grandmother's side, al-Māfarrūkhī claims descent (25-6) from a poet in the retinue of ʿAḍud al-Dawla named Abū Muslim Ṭāhir b. Muḥammad, himself allegedly descended from Abū Muslim the ʿAbbāsid revolutionary. A final ancestor cited on his maternal grandmother's side was related to a one-time governor (99).

Al-Māfarrūkhī's book reflects his education in *adab* and familiarity with court culture. Unlike other local histories of the period, it pays little attention to religion and contains no biographies of *ʿulamāʾ*. Instead, it contains poetry in praise of Iṣfahān, descriptions of the area's points of interest, tales from the pre-Islamic period, and encomiums of Būyid and Saldjūḳid rulers.

An 8th/14th century Persian translation of the work contains many interpolations that postdate al-Māfarrūkhī's composition. These have been identified by Browne.

Bibliography: *Kitāb Maḥāsin Iṣfahān*, ed. Djalāl al-Dīn Ṭihrānī, Tehran 1312/1933. The Persian translation, *Tardjuma-yi Maḥāsin-i Iṣfahān*, ed. ʿAbbās Iḳbāl, Tehran 1328/1949, is studied at length by E. G. Browne, *Account of a rare manuscript history of Isfahan*, in *JRAS*, liii (1902), 411-46, 661-704. For reference to manuscripts, see C. A. Storey-Y. E. Bregel', *Persidskaya literatura* ii, 1011-2. (R. Bulliet)

MAFIA, the name of a group of islands off the Tanzanian coast in approximately 8°S and 40° E. They consist of a main island commonly known as Mafia Island, but by its inhabitants as Chole Shamba (Swa. "Plantation Chole"); a very small island known as Chole or Chole Mjini (Swa. "Town Chole"); Juani; Bwejuu; and Jibondo. The only references in Arabic literature are in Aḥmad b. Madjīd al-Nadjdī's log books, where it is called Manafiyya, and in the anonymous *History of Kilwa*, where it occurs once as Manfasiya, four times as Manfiyya, and three times as Manfasa. In Portuguese there are further references in a now lost *Chrónica dos Reyes de Quiloa* ("Chronicle of the Kings of Kilwa"), where it is generally spelt Monfia, and in other historians and archives. In Swahili, Freeman-Grenville has published a traditional history of the town of Kua, Juani Island, Mafia; a variant version of this by Amur Omar Saidi, a former *ḳāḍī*, has been published by D. W. I. Piggott, and another version by T. M. Revington. At Kisimani Mafia (Swa. "at the well of Mafia"), H. N. Chittick has excavated the remains of a mosque and other buildings; he has likewise cleared the palace and a number of mosques at Kua, Juani Island.

No consecutive history can be established for the main island. The founder of Kilwa, ʿAlī b. al-Ḥusayn b. ʿAlī, retired to Mafia in his old age, and set up his son Muḥammad as ruler in *ca.* 386/996. He was succeeded by his brother, Bashat, who ruled for four-and-a-half years. The third ruler of Kilwa, Dāwūd b. ʿAlī, also made Mafia his residence, after abdicating at Kilwa in favour of his son. In the reign of Dāwūd b. Sulaymān of Kilwa (? *ca.* 526-66/1131-70), Mafia is mentioned as a mere appanage of Kilwa. It is not mentioned again until the reign of Sulaymān b. al-Ḥasan II (*ca.* 1294-1308), when it revolted. It was recovered *post* 1310 by his son, al-Ḥasan b. Sulaymān II (*ca.* 1310-33). When the Portuguese took Kilwa in 1505, Mafia passed quietly into their hands. They bartered goods for local produce, cattle, ghee and gum copal. They had a small blockhouse, but its site has so far not been identified. In 1653 the islands were pillaged by the King of Pemba, who was forthwith punished by Francisco de Seixas Cabreira. When the Portuguese lost Mombasa to the ʿUmānī Arabs in 1698, Mafia again quietly changed hands;

and when, after a brief comeback (1728-9), the ʿUmānīs again expelled the Portuguese from Mombasa, several Portuguese residents in Mafia deemed it wiser to become Muslim. Under the ʿUmānīs, Arabs gradually acquired the southern part of the main island, turning it over to coconut plantations, for which its sandy soil is especially favourable.

The excavations carried out by Chittick show that Kisimani Mafia was important from the 6th/12th to 8th/14th centuries, but that it thereafter declined. According to the diary of Lt. (later Admiral) J. B. Eustace, the last inhabitants departed after the disastrous cyclone of 1872. In Kua it has been shown that most of the buildings belong to the 12th/18th century. The site covered some thirty to forty acres, including the palace, and there were at least seven mosques and two cemeteries. It is now totally deserted. There are also late mediaeval Islamic remains on Chole and Jibondo Islands.

In ʿUmānī times, the islands were ruled from Chole. When the Germans took the islands over when German East Africa was proclaimed in 1885, they built a headquarters there and a street of shops, which still survive. The administrative headquarters were in 1911 transferred, however, to Kilindoni, on the main island, and this is the present seat of government. The greatest number of the inhabitants, in all about 16,000, live in the northern part of the main island. They are almost all Muslims. Some aspects of their society have been described by A. P. Caplan. Regrettably, there is no description of the state of Islamic learning, albeit clearly there is a class of *literati*; at other levels witchcraft practices abound.

(G. S. P. Freeman-Grenville)

MAFRŪSHĀT (A.), that which is spread out (on the ground or on a bed), bedding.

In mediaeval times, there was no adequate, single term for designating furniture and furnishings; this idea was expressed rather by the term *farsh* (meaning not only "that which is spread out" but also, by extension, the more solid domestic objects which filled the role of "furniture" according to western concepts—whence the adjective *mafrūsh* "furnished, provided with furnishings" [see athāth in Suppl.]) or else by collocations of words such as *farsh* and *āla* (lit. carpets, mattresses and utensils), *farsh* and *athāth* (carpets, mattresses and domestic articles), etc. Carpets, mats and cushions played an important part in domestic interiors, at this time. Complete furnishing ensembles were often put together through the use of various cushions, set around low oriental tables which were quite unsuitable for the use of chairs and stools (seats of this kind existed, but had restricted functions; they were rarely used at meal times [see athāth]), and by use of cushions there were formed circles (*ḥalḳa*, with its *ṣadr* or place of honour, often a seat or a throne, *sarīr*, *takht*, in palaces) for gatherings of friends, family celebrations, literary discussions, etc. The use of rigid seats and of sofas and couches was more limited, and that of cushions, for sitting upon, more widespread (but this depended on the circumstances and the social setting). People leading a simpler life made do with sitting on very simple cushions or on a carpet or mat, but rarely on the actual earth. However, in the gatherings of high society, the persons farthest from the *ṣadr* received the lowest seats and had to make do with a single cushion (other persons each got two cushions, one on top of the other, or a cushion folded into two—quite a social hierarchy!) or a carpet. Actually to sit on the earth was considered, in such social groups, to be a sign of mourning.

In many households, the carpets and mats were protected by means of a lining, and it was difficult to distinguish the carpets from the mattresses, but better-off households had clearly-distinguishable mattresses which were placed on beds with frames (a rare and expensive piece of furniture). On the carpets [see bisāṭ in Suppl.] were placed other domestic articles which served as mattresses, seats and bedding at one and the same time, according to the so-called "oriental" way of life. Mattresses (*bardhaʿa*, *ḍidjāʿ*, *farsh*, *firāsh*, *ḥashiyya*, *iwazz*, *muḍarraba*, *marḳad*, *martaba*, *maṭraḥ*, *mifrāsh*, *ṭarrāḥa* and *ṭinfisa*) were usually placed on the ground. Cushions (*bardhaʿa*, *dāʾira*, *ḥashiyya*, *ḥusbāna*, *ḳiṭʿa*, *mikhadda*, *mirfaḳa*, *miṣdagha*, *misnad* or *misnada*, *mudawwara*, *numruḳ*, *ṭinfisa*, *tukʾa*, *tukiyya* or *wisāda*) varied greatly; they were distinguished by their functions (cushions for the back, for sitting on, for leaning on with the elbow and pillows) and by their shapes (big, small, elongated, round, rectangular, etc.). Often, however, their original function had become changed. Thus *mikhadda*, properly "pillow", might be used for sitting upon, and *wisāda*, properly a much larger cushion often used for supporting the back, might be used for "pillow"; in the spoken language of mediaeval Egypt, *mikhadda* was used for all kinds of cushions and the word *wisāda* had almost disappeared from usage so that, in order to designate a pillow, resort had to be made to a pleonasm, *mikhadda li 'l-khadd* "pillow for the head", lit. "for the cheek". "Offering" a cushion (to someone who had been invited) was literally "throwing down" (*ṭaraḥa*) a cushion, but this verb was also used, by extension, in the meaning of offering someone a chair, stool, etc., and thus symbolises the transition between a purely "oriental" mode of life and the use, in certain circles, of solid furniture.

Sedentary civilisation was always proud of its luxury cushions (see J. Karabacek, *Susandschird*, Leipzig 1881, e.g. 71, 81: cushions covered in embroidered tapestry), and sometimes it accused the ancient Arabs of never having had any of them (Ibn Khaldūn, *Muḳaddima*, tr. Rosenthal, i, 347-8 and n. 85). But this accusation was far from the truth; the Bedouins had their own kinds of cushion (see al-Thaʿālibī, *Fiḳh al-lugha*, Beirut 1881, 130-1, and

other sources). The arts of weaving, making tapestries and embroidering cushions were widespread amongst Bedouins, country-dwellers and city-dwellers all through the ages. Iconographic evidence of the richness of shapes and functions of mattresses and cushions, as well as the forms and colours of curtains, is given in well-known miniature paintings (e.g. in the series illustrating the works of Dioscorides and al-Ḥarīrī). Curtains and hangings had been known amongst the Arabs since pre-Islamic times; their role in Islam sedentary civilisation was even more important, as much for the daily life of the greater part of the various social classes as for the palaces and their modes of behaviour (see Ibn Sīda, *al-Mukhaṣṣaṣ*, Cairo 1316/1898-9, iv, 75; Ps.-Djāḥiẓ, *K. al-Tādj*, tr. Pellat, Paris 1954, 56 ff.; al-Washshā', *al-Muwashshā*, Cairo 1953, 230-1; al-Shābushtī, *K. al-Diyārāt*, Baghdād 1966, 42, 43, 45, 110, 170, 188, 424; al-Ḳāḍī Ibn al-Zubayr, *al-Dhakhā'ir wa 'l-tuḥaf*, Kuwait 1959, passim; W. H. Worrell, in *Ars Islamica*, i [1934], 219-22; M. Canard, in *Byzantion*, xxi [1951], 363; D. Sourdel, in *REI*, xxix [1960], 132; E. Ashtor, *Histoire des prix et des salaires dans l'Orient médiéval*, Paris 1969, 87, 178, 255). The term *mafrūshāt* (modern Tkish. *mefruşat*) still appears today in the labelling and signs of shops which sell curtaining, decorative fabrics, cushions, etc.

(J. Sadan)

MAFṢŪL (a.), a term used to denote certain juridical categories of landed estates in Syria in the time of the Mamlūks. The word has no connection with the Arabic root *f.-ṣ.-l.*, but is derived, according to al-Nuwayrī, *Nihāya*, viii, 256, "from the Frankish" *vassal*.

MAGHĀRIBA (a., pl. noun), denotes the Arabic-speakers of the Muslim West (Maghrib, pl. Maghārib), as opposed to those of the East (Mashriḳ, pl. Mashāriḳ), known as *Mashāriḳa*. This division of Arabic-speakers into *Mashāriḳa* and *Maghāriba*—which is a continuing process, discernible in the contemporary dialects, variously categorised as Oriental and Maghribī—may be traced from its origins. The frontier between the two major groupings—Muslim Spain included, in spite of its special circumstances and its separate destiny—is still located to the east of Tripoli, at Lebda, which accounts for the peculiar situation of Libya, constantly divided between its Maghribī and Oriental associations.

The Arabs who settled on a permanent basis in the West rapidly became sufficiently Maghribised or Hispanised to appear different from their racial compatriots who had remained in the East, as is indicated by a considerable quantity of concordant evidence. From the middle of the 2nd/8th century onward, the Arab colony which established itself in the province of al-Ḳayrawān (the *Ahl Ifrīḳiya*) became aware of its specific local identity (see M. Ṭālibī, *al-Maghrib min al-fatḥ ilā awākhir al-rubʿ al-awwal min al-ḳarn al-thānī wa-budhūr al-shuʿūr bi-kawmiyyāt maḥalliyya*, in no. 4 of *Silsilat al-dirāsāt al-idjtimāʿiyya*, CERES Tunis 1979, 207-30) in violently opposing, at the time of the great Khāridjī upsurge of 122/740, fellow-Muslims who had come from the East to support it, while regarding it, it is true, with all the contempt hitherto reserved for Berbers alone. A similar evolution, with opposition between indigeneous Arabs (*baladiyyūn*) and "foreigners" arriving at a later stage, is also to be observed in Muslim Spain, although the distinction became blurred in the course of time (see E. Lévi-Provençal, *Hist. Esp. mus.*, Paris 1950, i, 44-53, 83, 110, 345). In the East, the Maghribī (pl. Maghāriba) in turn created the impression of a poor relation, and this old mediaeval reflex is so tenacious that it continues to the present day, with varying nuances and in varying degrees, to colour Mashriḳ-Maghrib relations at all levels, including that of music. In spite of all the developments that have taken place, the Maghrib still admires the Mashriḳ and imports from it, much more than it exports to it, cultural consumer goods such as books, films and records.

We are concerned here with a very ancient phenomenon which deserves analysis and explanation, and to which no overall study has yet been devoted. The following are examples dating back to the first two centuries of Islam: Abū Muḥammad Ibn ʿImrān al-Tudjībī (d. 125/743 or 745), resident in Tunis, cherished a genuine feeling of exile in this "barren corner", that is the Maghrib (M. Talbi, *L'Emirat aghlabide*, Paris 1966, 43); the Tunisian Ibn Farrūkh, who studied in ʿIrāḳ under Abū Ḥanīfa (80-150/700-68 [*q.v.*]), was humiliated on account of his Maghribi demeanour (*li 'l-maghribiyya*, *ibid.*, 20); Asad b. al-Furāt (d. 212/827 [*q.v.*]), who became one of the most eminent teachers of al-Ḳayrawān, was allowed to attend lectures given by Mālik (d. 179/796 [*q.v.*]) to a group of Egyptians, because he was too intelligent to remain in the class of the Maghāriba (*ibid.*, 20); etc. The Maghrib was thus visibly subject to an inferiority complex *vis-à-vis* the Mashriḳ, a fact which led Ibn Bassām (d. 542/1147) to write indignantly: "The people of our lands are eager to ape the Orientals ... to such an extent that if a raven were to croak in those distant horizons, or a fly to buzz in the furthermost extremities of Syria or ʿIrāḳ, they would fall on their knees as if before an idol, and recite all this like words of Scripture" (*Dhakhīra*, ed. Cairo 1358/1931, i/1, 2).

This explains why the dominant direction for the movement of élites has above all been established as from the West to East. For purposes of demonstration, it may be noted that al-Maḳḳarī (d. 1041/1641 [*q.v.*]) compiled a list of 307 Andalusians who visited the Orient (*Nafḥ*, ed. Iḥsān ʿAbbās, Beirut 1968, ii, 5-704) as against 148 Orientals who made the reverse journey (*ibid.*, iii, 5-149). An even more significant fact is that no great poet of Damascus, of Baghdād or of Cairo, in fact, no poet at all, ever set out on the road to the Maghrib. The *riḥla*, a journey usually with the combined objectives of pilgrimage, of study and occasionally also of trade, took place, for evident religious cult and cultural reasons, in an eastward direction. The traveller usually returned to his own land endowed with knowledge and prestige.

But it very often happened that a traveller settled permanently in the Orient. Thus Maghribī colonies were formed in the major eastern metropolises which marked the pilgrimage routes, particularly at Alexandria, at Cairo, at Ḳūs, at Damascus, at Medina and at Mecca. In the absence of a systematic general study, their history is still fragmentarily and imper-

fectly understood. It may, however, be assumed that if the Maghribī presence was felt, and at times concentrated, in the East, it never played in history and in society a role equivalent to that of the Persians of the Turks. In particular, there was no Maghribī *shuʿūbiyya*, and no influence on institutions or on the style of life.

Berber women were highly regarded in the Umayyad and ʿAbbāsid courts. Hishām b. ʿAbd al-Malik (105-25/724-43) requested some of them from his governor of Ifrīḳiya (M. Talbi, *op. laud.*, 33); Abū Djaʿfar al-Manṣūr (136-58/754-75), himself the son of a Berber mother, Salāma, married a woman from al-Ḳayrawān, Umm Mūsā, mother of the future caliph Muḥammad al-Mahdī (158-69/775-85); Rāḥ, originating from the Nafza tribe, was the mother of ʿAbd al-Raḥmān al-Dākhil (138-72/756-88), the founder of the Umayyad dynasty of Spain; Ḳatūl was the mother of al-Muʿtaḍid (279-89/892-902); and Ḳarāṭīs was the mother of al-Ḳāhir (320-3/932-4; M. Talbi, *op. laud.*, 42-3).

In the armies of the Umayyad and ʿAbbāsid caliphs, the role of the Maghribīs, without ever having the importance of the Khurāsānīs or of the Turks, was far from being negligible. Under the leadership of Ṭāriḳ b. Ziyād, Berbers played a decisive part in the conquest of Spain. In 98/717 the army of Ifrīḳiya (*djaysh Ifrīḳiya*), led by al-Mughīra b. Abī Burda al-Ḳurashī, participated in a major assault, which ultimately met with failure, on Constantinople (Abu 'l-ʿArab, *Ṭabaḳāt*, ed. Ben Cheneb, Paris 1915, 22; Ibn ʿIdhārī, *Bayān*, ed. G. S. Colin and E. Lévi-Provençal, Leiden 1948, i, 49). In Baghdād, it was from the time of the reign of al-Mutawakkil (232-47/847-61) that the Maghāriba began to play, in the army and under officers drawn from their own ranks, a considerable role. They received pay equal to that of the Turks (al-Ṭabarī, *Taʾrīkh*, ed. Abu 'l-Faḍl Ibrāhīm, Cairo 1968, ix, 155), and, with the latter, they nominated al-Mustaʿīn (248-52/862-66) as successor to al-Muntaṣir (247-8/861-2; al-Ṭabarī, ix, 256). They abandoned him subsequently, taking an oath of loyalty, again in partnership with the Turks who played the role of a driving force, to al-Muʿtazz (al-Ṭabarī, ix, 287) and participated actively in the civil war which broke out between 251/865 and 252/866 (al-Ṭabarī, ix, 290, 295, 304-39). In 255/869 they took part in the dethronement and assassination of al-Muʿtazz, who was unable to pay their salaries and those of the Turks, and, from this moment onward, they ceased to occupy the forefront of the stage.

It is not until the time of the Fāṭimids that the Maghribīs are seen making a massive influx into the Orient. The Fāṭimids owed their victory to the Kutāma Berbers [*q.v.*], and the latter followed them to Cairo and to Damascus, forming the spearhead of their army and of their Ismāʿīlī propaganda. Djawhar al-Ṣiḳillī, the conqueror of Egypt, gave them positions of authority at all levels of powers. "In all functions, without exception, Djawhar appointed a Maghribī as partner to the official who already held the post", writes al-Maḳrīzī (*Ittiʿāẓ*, 78). Between 361/972 and 363/974, the Kutāma were the instigators of numerous riots in Cairo. In 386/996 they imposed their chieftain, Ibn ʿAmmār, on the caliph al-Ḥākim (386-411/996-1020). In Damascus, the presence of the Maghāriba also led to trouble. The most serious riot, in which they clashed with the indigenous population, broke out in 461/1069. The town and the Great Mosque suffered severe damage.

Numerous representatives of the Maghribī élite were not content with visiting the East; they settled there. Obviously, an exhaustive list cannot be presented here. For purposes of illustration, the following are among the most eminent: al-Ṭurṭūshī, born in Tortosa in 451/1059 and died *ca.* 525/1131 in Egypt, where he exercised wide influence as a *faḳīh* and ascetic; Ibn Djubayr, the celebrated author of a *riḥla*, born in Valencia in 540/1145 and died in 614/1217 in Alexandria, where he gathered around him a circle for the study of tradition and of Ṣūfism; Muḥyī 'l-Dīn Ibn al-ʿArabī (560-638/1165-1240 [*q.v.*]), the most famous and most controversial of the Ṣūfīs, born in Murcia and buried in Damascus in the *turba* of the distinguished family of the Ibn al-Zakī, who had welcomed him; the historian ʿAbd al-Wāḥid al-Marrākushī who, born in Marrakesh in 581/1185, took the road to the East in 613/1216 and died there some time after 621/1224, having lived successively in Egypt, Baghdād, the Ḥidjāz and Damascus; Ibn Marzūḳ (*ca.* 710-81/1310-79 [*q.v.*]), who, born in Tlemcen, left in 771/1370 for Cairo where he enjoyed high repute and became *ḳāḍī*, preacher and teacher; Ibn Khaldūn who, born in Tunis in 732/1332, settled permanently in Cairo (784-808/1382-1406), without ever relinquishing his Maghribī clothing; al-Maḳḳarī who, born in Tlemcen in 986/1578, left in 1027/1618 for the Orient, where he composed at the request of his students in Damascus his much-praised *Nafḥ al-ṭīb*, dying in Cairo in 1041/1641.

Among the contemporaries, the following may be noted: Bayram al-Tūnusī (1840-89), author of the *Ṣafwat al-iʿtibār*, who settled in Cairo; the *amīr* ʿAbd al-Ḳādir (1807-83) who, freed and given a pension by the French authorities, in 1855 chose to live in Damascus where he played an appreciable moderating role; ʿAbd al-Ḳādir al-Wardīghī al-Maghribī (d. 1895), who was one of the most eminent teachers of al-Azhar; and ʿAbd al-Ḳādir al-Djazāʾirī (1887-1945), a distinguished member of the Arab Academy of Damascus.

Finally, it may be recalled that the founder of a religion—that of the Barghawāṭa [*q.v.*]—Yūnus b. Ilyās b. Ṭarīf (227-71/842-84), sought his inspiration in the Orient (M. Talbi, *Hérésie, acculturation et nationalisme des Berbères Barghawāṭa*, in *Actes du premier congrès d'études des cultures méditerranéennes d'influence arabo-berbère*, Algiers 1973, 217-33), and that the founder of a school and of a state, Ibn Tūmart [*q.v.*] (*ca.* 471-524/1078-1130), there brought together the elements of the doctrine which gave birth to the Almohad movement.

The presence of Maghāriba in the East was not confined exclusively to distinguished individuals. It also comprised populous colonies of merchants, students and various types of émigrés. Information on these colonies is very scanty. Only that of the Ifrīḳiyan Jews who settled in Cairo between the 11th and 13th centuries is fairly well-known today, through the medium of the Geniza documents, edited by S. D. Goitein (*A Mediterranean society*, i, Berkeley-Los Angeles 1967, ii, Berkeley-Los Angeles -London 1971, iii, Berkeley-Los Angeles 1978; and *Letters of medieval Jewish traders*, Princeton 1974). These documents reveal a well-organised and perfectly-structured world, endowed with efficient means of communication and of currency transfer, all of this in the service of important commercial operations covering not only the whole of the Mediterranean basin but extending as far as the Indian Ocean. The recent study by J.-C. Garcin has in addition underlined the decisive role played by

the Maghāriba in the restoration and reinforcement of Sunnism in Egypt after the fall of the Fāṭimids. At Ḳunā [*q.v.*] on the pilgrimage route and a day's march to the north of Ḳūs [*q.v.*], they settled in large numbers. "The town to a large extent owed its new prosperity to the prestige which it acquired when saintly persons, most of them Maghribī, settled there, died there and were buried in its cemetery which became a place of pilgrimage in its own right. These ascetics and mystics were distinguished by their Sunnism, and it was through them rather than through the direct influence of circles in Alexandria or Cairo that the Sunnī 'counter-reformation' spread among the people" (*Un centre musulman ... Qūṣ*, Cairo 1976, 161). This example is not unique. Louis Pouzet, in a well-documented article (*Maghrébins à Damas au VIIe/XIIIe siècle*, in *BEO*, xxviii [1977], 167-99) stresses how the Maghāriba, installed in large numbers in Syria, "where able to profit from circumstances relatively unfavourable towards them (exile and partially enforced emigration, personal difficulties of a doctrinal kind and otherwise, political agitation and upheavals in the very land of their exile, etc.) to establish a presence of the very highest level for some of them, and quite prestigious for the 'Maghribī colony' of Damascus as a whole" (192). In the 18th century, the presence of Maghāriba in Cairo is seen to be more numerous and varied than ever: students at al-Azhar having at their disposal a *riwāḳ* of their own and constituting a pressure-group which could show itself formidable on certain occasions; traders exercising a monopoly over the marketing of certain products such as oil or *ṭarbūshs*; etc. (A. Raymond, *Artisans et commerçants au Caire au XVIIIe siècle*, Damascus 1974, i, 171, 191, 201, ii, 52, 419, 452, 470-6, 507, 518). Their number is estimated at 15,000 or 20,000 persons, firmly installed in certain quarters such as that of the Ibn Ṭūlūn Mosque. On his arrival in Egypt, Bonaparte clashed with them; unable to dislodge them from Cairo, he contemplated utilising them and decided to raise a "Maghribī battalion" constituted of "energetic scoundrels, as pitiless as their chief" (A. Raymond, *Tunisiens et Maghrébins au Caire au dix-huitième siècle*, in *CT* [1959], nos. 26-7, 364-5). This enterprise failed, since the Maghribīs were among those who responded most enthusiastically to the call for resistance. The establishment of the French in North Africa gave rise to a vast migratory movement, essentially in three phases: 1881-8, 1890-1908 and 1909-14. In general, Algerians settled in Syria, and Tunisians in Constantinople, in Egypt and in Tripolitania (P. Bardin, *Algériens et Tunisiens dans l'Empire Ottoman de 1848 à 1914*, Paris 1978).

Recent history provides further examples of the continuity of the Maghribī presence in the East. The Tunisian nationalist leader, al-Shaykh al-Thaʿālibī, visited Egypt in 1898, met the reformist scholar Muḥammad ʿAbduh, was influenced by him and introduced his ideas in Tunisia (N. A. Ziadeh, *Origins of nationalism in Tunisia*, Beirut 1962, 97 ff.). Later, when the Arab League was created, President Habib Bourguiba, then leader of the Néo-Destour Party, travelled secretly to Cairo in March 1945. With the Moroccan Istiḳlāl and the PPA (*Parti Populaire Algérien*) he established there, in 1947, the "Bureau du Maghreb" before returning to Tunis on 8 September 1949.

Bibliography: Besides the references cited in the body of the article, information may be gleaned from all sources of a historical or geographical nature, in particular from the *Riḥlas* and the *Ṭabaḳāt*. (M. Talbi)

AL-MAGHĀZĪ (also *maghāzī 'l-nabī*, *maghāzī rasūl allāh*), a term which, from the time of the work on the subject ascribed to al-Wāḳidī (d. 207/823), if not earlier, has signified in particular the expeditions and raids organised by the Prophet Muḥammad in the Medinan period.

The first such sortie is reported by al-Wāḳidī to have involved a party of thirty men led by Ḥamza b. ʿAbd al-Muṭṭalib, which in 1/623 briefly intercepted a Ḳurashī caravan heading for Mecca from Syria on the coastal route (other accounts differ). The last was an expedition in the direction of Syria by an army of 3,000 men under the command of Usāma b. Zayd in 11/632, immediately following the Prophet's death. For al-Wāḳidī (largely followed by Ibn Saʿd), the compass of the term *al-maghāzī* appears to have included important *ghazwas* (such as those of Uḥud, al-Khandaḳ, al-Ḥudaybiyya, Khaybar, Mecca, Ḥunayn and Tabūk; Badr is elsewhere styled a *ghazwa*, but not by al-Wāḳidī), small-scale *sariyyas* (such as that of Ḥamza), acts of assassination of individuals (notably Kaʿb b. al-Ashraf), and such other significant events of the period as the pilgrimage of 9/631, the *ḥidjdjat al-wadāʿ* of 10/632, and the death of the Prophet in 11/632. In this narrower sense of events in the Medinan period, principally expeditions, raids and assassinations numbering in excess of eighty, but also in a broader sense of the Prophet's biography and background, the term *al-maghāzī* came to be rooted in the Islamic reflective tradition at an early stage and was perpetuated in later works both for the more serious purposes of *ʿilm*, e.g. Ibn ʿAbd al-Barr (d. 463/1071), al-Kalāʿī (d. 634/1237) and Ibn Sayyid al-Nās (d. 734/1334), and on a popular level, particularly with poetic embellishments reminiscent of chansons de geste (see Paret).

It is this broader sense of the term *maghāzī* which appears to have been prevalent in respect of the earliest Muslim transmissions relating to the period of the Prophet (see, for example, the comments by Sezgin, 251, 275). Moreover, while Sachau's suggestion that the term *maghāzī* was a calque on the "struggles" of Christian spiritual athletes (*Das Berliner Fragment*, 448) may be unconvincing, it is nonetheless apparent that it was the term *maghāzī* that characterised the early transmissions and that the term *sīra* emerged only later as signifying a literary genre relating specifically to the Prophet. In 1899, Hartmann (*Die angebliche sīra*, 32) opined that Ibn Isḥāḳ "hat keine *sīra* geschrieben" and it has since been proposed (Hinds, *Maghāzī and Sīra*) (1) that not just Ibn Isḥāḳ but *all* transmitters and compilers before Ibn Hishām (d. 218/834 or 213) who dealt with material about the period of the Prophet in general regarded that material as being about *maghāzī*; (2) that Ibn Hishām, in using the term *sīra*, was simply introducing the bulk of the *Maghāzī* of Ibn Isḥāḳ with a term which was in the idiom of his own time; and (3) that it was probably al-Wāḳidī (d. 207/823) who was the first to view *maghāzī* and *sīra* as fields of study which were related but could somehow be differentiated—a view in which he was evidently followed by Ibn Saʿd (d. 230/845). Those scholars who concerned themselves with *maghāzī* and pre-deceased Ibn Isḥāḳ (whose probable date of death was 150/767) included notably ʿUrwa b. al-Zubayr (d. 94/714), al-Zuhrī (d. 124/742) and Mūsā b. ʿUḳba (d. 141/758) (for further names and details, see Horovitz; al-Dūrī, *Baḥth*, 20-7, 61-113; and

Sezgin, 276-87); in addition, a *Kitāb al-Maghāzī* is ascribed to each of seven compilers who died after Ibn Isḥāḳ, but before al-Wāḳidī (viz. Maʿmar b. Rāshid (d. 154/770), Abū Maʿshar Nadjīḥ b. ʿAbd al-Raḥmān (d. 170/786), ʿAbd al-Malik b. Muḥammad b. Abī Bakr (d. 176/792), ʿAlī b. Mudjāhid (d. 182/798), Yaḥyā b. Saʿīd al-Umawī (d. 194/809), al-Walīd b. Muslim al-Umawī (d. 195/810), and ʿAbd Allāh b. Wahb (d. 197/812)), while the few works dating from the same period which contain the term *sīra* in their titles bear no relation to the Prophet (see Hinds for references).

Just how broad the scope of these early *maghāzī* works was is difficult to determine, since (apart from a few papyri) they survive only in later recensions (in the case of the work of Ibn Isḥāḳ) or as fragmented citations in later compilations (in the case of the other works). While the existing recensions of Ibn Isḥāḳ's work are restricted in scope to the period and background of the Prophet, it has been proposed by Horovitz (*The earliest biographies*, 166-7) in respect of the *Kitāb al-Maghāzī* of Mūsā b. ʿUḳba that that work may have included material relating not only to the period of the first four caliphs but also to the Umayyad period. Although Schacht (*On Mūsā b. ʿUqba's kitāb al-maghāzī*, 296) did not accept this proposal, other evidence has since become available to support the view that, in early Islamic times, the subject matter of *maghāzī* was drawn at least from the period of the first four caliphs in addition to that of the Prophet. This evidence is to be found in the *Kitāb al-Maghāzī* contained within the *Muṣannaf* of the Yemeni *muḥaddith* ʿAbd al-Razzāḳ b. Hammām al-Ṣanʿānī (126-211/744-827), where the majority of the reports bear the *isnād* Maʿmar b. Rāshid from al-Zuhrī and presumably reflect the view of those two authorities about what constituted the proper subject matter of *maghāzī*. The account starts with the digging of the well of Zamzam (as does Yūnus b. Bukayr's recension of Ibn Isḥāḳ's *Maghāzī*), moves on to the background of the Prophet and the main events of his lifetime, and then touches on various events after the Prophet's death; these events include the *bayʿa* of Abū Bakr at the Saḳīfat Banī Sāʿida, Abū Bakr's appointment of ʿUmar as his successor, the conflict between ʿAlī and Muʿāwiya, the *shūrā*, the *ghazwa* (*sic*) of al-Ḳādisiyya, and the marriage of Fāṭima.

The published papyri shed little light on the general character of early *maghāzī* works. The earliest relevant document so far known is an eight-line papyrus text dated by Grohmann to the early 2nd/8th century, which contains some details about the battle of Badr (*Arabic papyri from Ḫirbet el-Mird*, Louvain 1963, 82-4, 105). Kister (*Notes on the papyrus text*) has pointed out that the last section of the Chicago papyrus (Or. Inst. 17635) dealing with Badr, Biʾr Maʿūna and the B. al-Naḍīr, which is dated by Abbott to the late 2nd/8th century and attributed by her to Maʿmar b. Rāshid (i, document 5), is textually almost identical with a passage in Abū Nuʿaym's *Dalāʾil al-nubuwwa* (Hyderabad 1320, 176), where the *isnād* ends with Ibn Lahīʿa—Abu 'l-Aswad (d. 131/748)—ʿUrwa b. al-Zubayr; Kister himself is inclined to ascribe authorship (*sic*) of the papyrus to Ibn Lahīʿa (d. 174/790). The early 3rd/9th century Heidelberg papyrus on the meeting at al-ʿAḳaba, the conference of Ḳuraysh in the *dār al-nadwa*, the *hidjra*, and the expedition against Khathʿam, which has an *isnād* going back to Wahb b. al-Munabbih, is accorded the Arabic title *maghāzī Rasūl Allāh* by Khoury, although this phrase nowhere appears in the text itself.

It is therefore clear that only the eight-line Khirbat al-Mird papyrus can conceivably be regarded as being from the earliest (i.e. pre-ʿAbbāsid) period, and this is obviously too truncated to provide any definitive picture of the shape of the *maghāzī* works which are reported to have existed at that time. Otherwise, we have only citations at one remove or more in later works, and later references to the existence of early *maghāzī* works. One such report, which has been noted in modern studies, is given by al-Balādhurī (d. 279/892), with an *isnād* going back to al-Zuhrī, according to which the caliph ʿAbd al-Malik, on seeing one of his sons with *ḥadīth al-maghāzī*, gave orders for it to be burned and enjoined him (instead) to recite the *Kitāb Allāh* and know and act according to the *sunna* (*Anonyme arabische Chronik, Band XI*, 172; Goldziher, *Muh. St.*, i, 206 (Eng. tr. 191-2); Abbott, i, 17). Goldziher, while remarking that there seems to be "nothing against admitting the existence of such literature in early times", also comments that "the text of this account unmistakeably bears the stamp of those circles who condemned unauthenticated *maghāzī* in favour of authentically recommended traditions", and in this connection he goes on to cite the saying attributed to Ibn Ḥanbal that "three things have no *aṣl*: *tafsīr*, the *malāḥim* and the *maghāzī*" (see also Goldziher, *Richtungen*, 57).

The purpose of, and the climate of opinion about, the study of *al-maghāzī* from the second half of the 2nd/8th century onwards are, however, matters requiring further research and only a few brief additional comments can be made here. Ibn Isḥāḳ is reported to have committed his material on *al-maghāzī* to writing for the ʿAbbāsid caliph al-Manṣūr, who instructed his son al-Mahdī to study the subject with that compiler (Abbott, i, 89; Watt, *The materials used by Ibn Isḥaq*, 31); and Hārūn al-Rashīd's chief *ḳāḍī*, Abū Yūsuf, who had been Ibn Isḥāḳ's pupil (Abbott, i, 92), is said to have been interested in *maghāzī*, *tafsīr* and *ayyām al-ʿarab* (Goldziher, *Muh. St.*, ii, 207). It is apparent that one practical application of the study of *maghāzī* was in that area of *fiḳh* called *siyar*, which was concerned with the rules of war and of dealings with non-Muslims, apostates and rebels. The term *siyar* appears in the *corpus iuris* ascribed to Zayd b. ʿAlī (*kitāb al-siyar*, *bāb al-ghazw wa 'l-siyar*), is supposed to have been used by Abū Ḥanīfa (d. 150/767), was the name by which the work of al-Awzāʿī (d. 157/774) was known to Abū Yūsuf and al-Shāfiʿī, and figures in the titles of two works by al-Shaybānī (d. 189/805); it was, moreover, a term which, as the 8th/14th-century lexicographer al-Fayyūmī explains, "took over from [the term] *al-maghāzī* on the tongues of the *fuḳahāʾ*". While this seems in general to be true, the same type of material also appeared elsewhere under other rubrics: the appropriate section in the *Muwaṭṭaʾ* of Mālik is entitled neither *maghāzī* nor *siyar* but *djihād*; in the *Muṣannaf* of ʿAbd al-Razzāḳ b. Hammām al-Ṣanʿānī the *kitāb al-djihād* includes the sort of material that the *fuḳahāʾ* were styling *siyar*, but the work also includes a *kitāb al-maghāzī* (as noted above); the later al-Bukhārī has separate books on *djihād* (*bāb* 1; *faḍl al-djihād wa 'l-siyar*) and on *maghāzī*, but he seems to be the exception in this respect among the 3rd/9th century compilers of *ḥadīth* material—the other compilations contain books on *djihād* (and, in some cases, *siyar*) but not

on *maghāzī* (for references, see Hinds, *Maghāzī and Sīra*). This declining interest in *maghāzī* as such was accompanied by the emergent view that Ibn Isḥāḳ had drawn material from Jews and Christians (Yāḳūt, *Udabā'*, vi, 401; Ibn Ḥadjar, *Tahdhīb*, ix, 45) and that he and [at least some] other *aṣḥāb al-maghāzī* had Shīʿī inclinations (*Udabā'*, vi, 400); in addition, Ibn Ḥanbal is reported as having said that Ibn Isḥāḳ's handling of *isnād*s rendered him unsuitable as an authority for *ḥadīth* (*Tahdhīb*, ix, 43), and the same consideration may have been behind his reported denunciation of al-Wāḳidī as *kadhdhāb* (*Tahdhīb*, ix, 364).

There remains the question of how useful the *maghāzī* material is for the purpose of historical reconstruction of the early Islamic period. Here it may be remarked first that there are considerable chronological and other discrepancies between the accounts available; these have been discussed most recently by Jones (*On the chronology* ...) and Kister (*The expedition of Bi'r Maʿūna*). In more general terms, however, Watt sees "little ground for doubting the truth of the main events of the *maghāzī*" and is of the opinion that "the *maghāzī*-material (in the special sense of the main outline of events, and omitting all anecdotes) ... is an essential foundation for the biography of Muḥammad and his times" (*The materials used by Ibn Isḥāq*, 28). On the other hand, Sellheim has attempted to discern the main tendencies of Ibn Isḥāḳ according to "layering" of sources (*Quellenschichtung*), involving an original layer which reflects historical reality, a further layer made up of legendary material about the Prophet, and a top layer reflecting political tendencies of Ibn Isḥāḳ's own time (*Prophet, Chalif und Geschichte*). Such an approach is not wholly incompatible with Schacht's conclusions that an *isnād* cannot alone guarantee the authenticity of a work ascribed to an author of the early 2nd/8th century and that in general "the more perfect the *isnād*, the later the tradition" (*JRAS* [1949], 147). From this standpoint, Schacht has examined the short Mūsā b. ʿUḳba text (an edition of the 4th/9th century) published by Sachau and has challenged Sachau's view that the text contains no elements from the ʿAbbāsid period. Schacht has seen the growth in the 2nd and 3rd centuries of traditions ascribed to Mūsā as typical of the way in which spurious information was put into circulation, and has concluded that "the whole of the standard biography of Mūsā in the later works is without documentary value, particularly the touching picture, taken seriously by Sachau and Horovitz, of his regular lectures to a circle of pupils in the mosque of Medina. This presupposes the concept of Medina as the home of Islamic learning, a concept which was as yet unknown to Shāfiʿī (d. 204)" (*On Mūsā b. ʿUqba's kitāb al-maghāzī*, 299).

More recently, Wansbrough, who also doubts the feasibility of historical reconstruction of the Islamic period up to *ca.* 200 A.H., has viewed the *sīra-maghāzī* literature (as he terms it) as an Islamic adaption of Biblical salvation history. In his opinion "the earliest expression of Islamic soteriology consisted in membership of the *umma*" and it is in the *sīra-maghāzī* literature "that the earliest formulation of Muslim identity is contained" (*The sectarian milieu*, 89), the conceptual motive in this (as in scripture and *sunna*) being polemic (103). Wansbrough sees a transition from the *sīra-maghāzī* literature, where *ecclesia* is the dominant cognitive category and precedent is historically articulated, to the *sunna-ḥadīth* literature, where *nomos* is the dominant cognitive category and precedent is "idealized and hence shorn of its historical dimension" (87); for him, the Ibn Isḥāḳ-Wāḳidī-Bukhārī development from *sīra* to *sunna* marked a passage from loosely structured *narratio* to concise *exemplum* (77-8). In modification of this view, however, it should be remarked that the signification of *sīra* was also close to that of *exemplum* and that the passage was rather from *maghāzī* to *sunna* via *sīra*, the *sīra* material being essentially *maghāzī* material viewed in a new light. It can also be noted that, while the narrowing-down of the scope of the *maghāzī* to the period and background of the Prophet seems to have been conventional from the 3rd/9th century onwards, it is nonetheless difficult to discern a point at which al-Wāḳidī's even narrower definition gained any exclusive currency. It seems rather that the two senses of *maghāzī* co-existed: in the broader of the senses, the term echoed an earlier scope which had been yet broader (note particularly the title of al-Kalāʿī's work) and seems to have been used more or less synonymously with the term *sīra* as a genre label; the narrower sense appears to have been a more technical one, i.e. the *maghāzī* "proper", as distinct from the *mabʿath*, for example. The term *sīra*, while occurring as a genre label more or less synonymous with *maghāzī*, also came to signify pre-eminently the account of the Prophet's life and background as transmitted by Ibn Hishām on the basis of the work of Ibn Isḥāḳ—the *maghāzī* which became *sīra* as *exemplum*, only to be largely superseded by the *sunna-ḥadīth* literature.

Bibliography: For a general survey, see F. Sezgin, *GAS*, i, Leiden 1967, 237-56, 275-302; Sezgin is incorrect when he suggests (306) that Ibn Ḥadjar, *Tahdīb*, i, 167 ascribes a work on *al-maghāzī* to Wahb b. Munabbih (the reference is to *maghāzī* material from [ʿAbd Allāh] b. Wahb)—for further critical comments on Sezgin's remarks about Wahb b. Munabbih and *al-maghāzī*, see R. G. Khoury, *Wahb b. Munabbih: der Heidelberger Papyrus PSR Heid Arab 23*, Wiesbaden 1972, Teil 1, 12; Sezgin is also incorrect in saying (38) that the *Fihrist* (see 228, 9) attributes a work on *al-maghāzī* to Hushaym b. Bashīr.

The main surviving texts (other than major chronicles) dealing with *al-maghāzī* are: Ibn Isḥāḳ, *Kitāb al-Maghāzī*: extant portions (mainly in the recension of Yūnus b. Bukayr) ed. by M. Ḥamīd Allāh under the title *Sīrat Ibn Isḥāḳ* (Rabat 1976) and by S. Zakkār under the title *Kitāb al-Siyar wa 'l-maghāzī* (Beirut 1978); al-Wāḳidī, *Kitāb al-Maghāzī*, ed. J. M. B. Jones, London 1966 (for a version in German, see J. Wellhausen, *Muhammed in Medina. Das ist Vakidi's Kitab al-Maghazi in verkürzter deutscher Wiedergabe*, Berlin 1882); ʿAbd al-Razzāḳ b. Hammām al-Ṣanʿānī, *Kitāb al-Maghāzī*, in vol. v of *al-Muṣannaf*, Beirut 1970-2; Ibn Hishām, *al-Sīra al-nabawiyya*, ed. Saḳḳā *et alii*, Cairo 1955 (for a version in English, see A. Guillaume, *The life of Muhammad: a translation of* [Ibn Hishām's recension of Ibn] *Isḥāq's Sīrat rasūl allāh* (*sic*), London 1955); Ibn Saʿd, ii/1: Ibn ʿAbd al-Barr, *al-Durar fi 'khtiṣār al-maghāzī wa 'l-siyar*, ed. Sh. Ḍayf, Cairo 1966; al-Kalāʿī, *al-Iktifā' fī maghāzī rasūl allāh wa 'l-thalātha al-khulafā'*, i, ed. ʿAbd al-Wāḥid, Beirut 1968; Ibn Sayyid al-Nās, *ʿUyūn al-athar fī funūn al-maghāzī wa-'l-shamā'il wa'l-siyar*, Cairo 1356; al-Ḥalabī, *Insān al-ʿuyūn fī sīrat al-amīn al-ma'mūn al-maʿrūfa bi'l-sīra 'l-ḥalabiyya*, Būlāḳ 1875 (with

al-Sīra al-nabawiyya wa'l-āthār al-muḥammadiyya by Aḥmad Zaynī Daḥlān in the margin).

MAGHĪLA, a Berber tribe belonging to the great branch of the Butr and related, if one is to believe the ancient Berber traditions cited by Ibn Khaldūn, to the tribes of Ḍarīsa, Saṭfūra, Lamāya, Maṭmāṭa, Ṣadīna, Malzūza and Madyūna who lived, in the early Middle Ages, in eastern Barbary.

It is also apparently in the same region that the ancient habitat of Maghīla is to be sought in the period in question. According to the Berber traditions cited by various early Arab historians, the Maghīla, after coming from Palestine into North Africa, reached Lūbiya (Lībya), from where they made their way to the Maghrib, establishing themselves, before the Arab conquest, in the mountainous regions of this land, probably in the Djabal Dahar and Djabal Tebaga in south-eastern Tunisia. Vivien de Saint-Martin has suggested seeing in the Maghīla the Libyan tribe of the Mecales or Imacles of Corippus (6th century A.D.). This hypothesis appears very probable, despite the opposition of Stephane Gsell. Similarly, another hypothesis of Vivien de Saint-Martin and J. Desanges appears highly likely, according to which the Mecales of Corippus and the Maghīla of the Arabic sources were none other than the Makhlues of Herodotus, a Libyan tribe who lived, in the 5th century B.C., in south-eastern Tunisia. It is there, to the south-east of the Shott el-Djerid, that J. Desanges places the Makhlues and the Mecales. As for the Maghīla, we lack proof of Arabic sources on their habitat in eastern Barbary in the 1st-3rd/7th-9th century; however, Ibn Khurradādhbih enumerates them, in his geographical work composed *ca.* 232/846-7, among the Berber tribes of the east, counting them alongside well-known eastern tribes such as the Hawwāra, Ḍarīsa, Warfadjdjūma, Mazāta and Nafūsa.

Algeria. The Arab historians and geographers note the existence of two groups of the Maghīla in this country. One of them occupied, in the 8th/14th century, according to Ibn Khaldūn, the countryside from the mouth of the Chélif on the west as far as the town of Mazouna on the east. It seems that formerly the possessions of this group of Maghīla were larger and that they extended towards the east as far as the environs of the town of Ashīr, where al-Bakrī locates, in the 5th/11th century, "at the entrance of the great desert", the town of Tāmaghilt, whose name seems to be strictly linked to that of Maghīla. Further to the west, al-Bakrī places, at two days' journey from Tāhert, a castle which also bore the name of Tāmaghilt. It is again in the environs of Tāhart that there is to be found, according to al-Bakrī, at a distance of five *farsakhs* from the sea, very near Oued el-Khamis, to the north of the town of Mazouna, a locality called Ḳalʿa Maghīla Dalūl, also doubtless named after a section of the Maghīla who lived there. On the west side also, the limits of the territory of the Maghīla exceeded, in the 5th/11th century, those of the 8th/14th century. Indeed, it is in the territory of the tribe of Maghīla that the town of Aslen was situated, which was to be found immediately to the east of the mouth of the Tafna, and to the east of the island of Arashḳūl, Rachgoun on our maps. It is from one of the ports of the Algerian Maghīla that there set sail, in 138/755, the founder of the Umayyad dynasty of Spain, ʿAbd al-Raḥmān I b. Muʿāwiya, in order to disembark at al-Munakkab (Almuñecar) in al-Andalus. In our opinion, this port is none other than Marsā Maghīla, an anchorage situated a little to the west of Ténès, which is noted in the geographical work of al-Bakrī.

Another Algerian section of the Maghīla lived, in the 2nd-4th/8th-10th centuries, in a region situated in the province of Tlemcen. Ibn Khaldūn says that the Zanāta tribe of Banū Īfran domiciled in this region, supported by Berbers of the tribe of Maghīla, revolted in 148/765 against the ʿAbbāsids, "having chosen as their chief Abū Ḳurra the Īfranid, or rather the Maghīlid". In another passage of his work, Ibn Khaldūn however puts in doubt Abū Ḳurra's belonging to the Maghīla. He says only that the Banū Īfran and the Maghīla lived alongside each other, the Banū Īfran being stronger and more numerous. According to another passage of Ibn Khaldūn's work, the Maghīla professed the Ṣufrī faith. They lived always in the lands which depended on the town of Tlemcen towards the middle of the 4th/10th century, and al-Bakrī cites an Arabic poem which speaks of the losses of this tribe in a war which took place in 338/949-50.

Morocco. In Morocco also, there were, according to al-Bakrī, al-Idrīsī, Ibn Khaldūn and other Arab mediaeval authors, two branches of the tribe of Maghīla, of which the remnants lived in the

8th/14th century dispersed in the triangle formed by the towns of Fās, Meknès and Sefrou. One of these branches occupied the region situated to the south-east of Fās, where the mediaeval Arab geographers place, halfway between Fās and Meknès, the fortress called Maghīla. Al-Bakrī also locates there a district called Maghīla, which, in his period, was under the command of a certain Mūsā b. Djalīd. Al-Bakrī places to the south of Fās, on the road leading from this capital to Sidjilmāsa, two localities doubtless inhabited by the Maghīla, of which one was called Maghīlat Ibn Tidjāmān (its population professed the Ṣufrī faith), while the other was Maghīlat al-Ḳāṭ. It seems that these two fortresses belonged to the same branch of the Maghīla as that which was governed Mūsā b. Djalīd. They were also perhaps the same Maghīla as those who, united with the Awraba and Ṣadīna, supported the cause of the Idrīsids from the arrival of Idrīs I b. ʿAbd Allāh in the north of present-day Morocco. Another branch of the Maghīla occupied, in the 5th/11th century, the district of Maghīla which al-Bakrī locates to the south of Oued Ouergha, to the north-west of Fās and which has to be distinguished from the district of Maghīla situated to the south-west of the same town.

It may further be added that it is to the tribe of Maghīla that Ibn Abi 'l-Madjd al-Maghīlī belonged, author of a genealogical work devoted to the Berbers and quite frequently cited in the Maghribī chronicles.

(T. Lewicki)

AL-**MAGHĪLĪ**, Maḥammad b. ʿAbd al-Karīm, reformist *faḳīh* of Tlemcen, chiefly famed for his persecution of the Jewish community of Tuwāt (Touat) in the Algerian Sahara and for the advice he gave to Sudanic rulers. The general outline of his career is fairly well established, but many details remain obscure. He was born in Tlemcen. *ca.* 1440 of Berber stock and studied under ʿAbd al-Raḥmān al-Thaʿālibī (d. 875/1470) and Yaḥyā b. Yadīr al-Tadallisī (d. 877/1472). At an uncertain date he took up residence in Tamanṭīṭ, then the principal fortified town (*ḳaṣr*) of the Tuwāt oasis, which was closely linked to Tlemcen and to the towns of the Sudanic belt by the ties of commerce.

The prosperity of the Jewish community there and in the neighbouring oasis of Gurāra, and the connivance of the Arab chiefs in ignoring the letter of the law in regard to these "protected persons", aroused his ire. He wrote a treatise (*R. fī aḥkām ahl al-dhimma*) asserting that the Jews of Tuwāt had broken their pact (*ʿahd*) with the Muslims, and thus forfeited their protection, by not paying *djizya* regularly in a state of "abasement and humiliation" (*al-dhill wa 'l-ṣaghār*) and by "rebelling against Islamic laws" (*al-tamarrud ʿalā 'l-aḥkām*) through too close an association with their Muslim overlords. He also claimed that the existence of the Tuwāt synagogue was contrary to Islamic law and demanded its destruction.

Both he and the *ḳāḍī* of Tamanṭīṭ, ʿAbd Allāh al-ʿAṣnūnī, who opposed his views, sought the support of North African scholars. The majority favoured al-ʿAṣnūnī's interpretation, but the support al-Maghīlī received from two Tlemcen scholars, the historian al-Tanasī and the theologian al-Sanūsī (al-Wansharīsī, *al-Miʿyār al-mughrib*, Fās 1315/1897-8, ii, 170-202; tr. in *Archives Marocaines*, xii [1908], 244-65, who adds his own view which supports theirs), was sufficient to encourage him to rouse a mob to destroy the synagogue. He also offered seven *mithḳāl*s of gold for every Jew killed.

Not long after these events, which probably took place shortly before 1490, al-Maghīlī left Tuwāt, possible expelled on account of his unwelcome zeal, but this is not clear. It may be at this period that he visited Fās, where he made an unsuccessful attempt to establish his influence with the Waṭṭāsid sultan Muḥammad al-Shaykh (Ibn ʿAskar, *Dawḥa*, 96, is the one source to report this bizarre episode). He then left North Africa for *Bilād al-Sūdān*, stopping first at the important commercial centre of Takidda (Tegidda, identified with Azelik to the west-south-west of the Aïr massif) to teach and preach, and passing on to Katsina and Kano, then burgeoning city-states. He had contact with the ruler of Kano, Seriki (*sulṭān*) Muḥammad Runfā, as early as 879/1491-2, when he addressed him a letter on "deterring people from forbidden acts" (text in Būnār's edn. of *Aḥkām ahl al-dhimma*, misleadingly titled *Miṣbaḥ al-arwāḥ* [a different work by al-Maghīlī], 73-7). He evidently resided several years in Kano, for a family there still claims descent from him (and "Sharifian" status), and it is no doubt while he was there that he wrote his longer treatise of advice for Muḥammad Runfā (published under the invented title (*Tādj al-dīn fī mā yadjib ʿalā 'l-mulūk*, Beirut 1932).

The date and duration of his visit to Katsina are not known, but before the close of the century he was in Gao advising the Songhay ruler Askia Muḥammad b. Abī Bakr after the latter's return from pilgrimage. His replies to that ruler's questions legitimised the Askia's seizure of the goods and chattels of his predecessor, Sunni ʿAlī, and strengthened his claims to sovereignty over a wide area of Muslim territory in the Sudanic belt. On hearing of his son's death in Tuwāt at the hand of a group of Jews, al-Maghīlī called on the Askia to arrest all Tuwātīs in his realm and only the opposition of the *ḳāḍī* of Timbuktu, Maḥmūd b. ʿUmar, prevented persecution. He subsequently returned to Tuwāt and died there under unknown circumstances in 909/1503-4 or 910/1505-6.

His known writings total twenty-six items, mainly on topics of *fiḳh* and *tawḥīd*. He also had an interest in formal logic (*manṭiḳ*). He exchanged verse polemics with al-Suyūṭī, who declared its study forbidden, and wrote a treatise called *Minaḥ al-Wahhāb fī radd al-fikr ʿalā 'l-ṣawāb*, which was widely studied in West Africa. The treatises he wrote during his Sudanic tour were known to the 19th century reformers of

Māsina and Sokoto. ʿUthmān b. Fūdī [q.v.] used his arguments concerning the anathematisation (*takfīr*) of Sunni ʿAlī to justify his attacks on the Hausa rulers and other passages of the "Replies" were quoted to show that Bornū was a "land of unbelief".

The Kunta [q.v.] revere him as one of the four "regenerators" (*mudjaddidūn*) of the 10th century of the Hidjra. They, and all other Ḳādirīs of West Africa whose affiliations go back through the Kunta *silsila*, consider him an important link in the clain, though this chain can be shown to be ahistorical, and it is doubtful if al-Maghīlī himself had received the *wird* of the order.

(J. O. Hunwick)

MAGHNĀṬĪS, Maghnatīs, Maghnīṭīs, Arabic rendering of ἡ μαγνῆτις (λίθος), indicating 1. the magnetite and 2. the compass.

1. The Magnetite and Magnetism

The magnetite (lodestone, magnetic iron ore, Fe_3O_4) is a very widely-spread mineral, well-known since antiquity, and found in huge quantities in individual deposits as well as a finely-allotted constituent of almost all kinds of volcanic rock. The Islamic natural scientists, geographers, cosmographers and encyclopaedists transmit much information about its properties. The magnetite is first of all "the stone which attracts iron" (see e.g. al-Khwārazmī, *Mafātīḥ*, ed. Van Vloten, 262 f.). Al-Bīrūnī, *Djamāhir*, Ḥaydarābād 1355, 212-15, has a circumstantial chapter on it. According to him, *maghnāṭīs* shares with amber (*kahrabāʾ*) the property of attraction, but is more satisfactory than the latter for extracting particles of iron from the human body. The name is correctly explained as being Greek, while *aramīṭīḳun* (ἀδάμας or ἀδαμάντινον) and *abraḳalīṭā* (λίθος ἡρακλεία are given as synonyms, although the first, as is well-known, indicates the diamond; for the confusion of the magnet and the diamond in antiquity and in the Middle Ages, see E. O. von Lippmann, *Beiträge zur Geschichte der Naturwissenschaften und der Technik*, i, Berlin 1923 (new impression Wiesbaden 1971), 182, 194, 213 ff. Referring to earlier authors, al-Bīrūnī records that the blue magnetite—which he did not know himself—was considered to be the best; it was burned by many people and sold as *shādhana* (haematite). According to the same author, the black-brown, and further the iron-coloured, were equally appreciated. The richest deposits known to him were those of Zibaṭra in south-east Anatolia. From the fact, however, that ships in the China Sea (*al-Baḥr al-Akhḍar*) were kept together by vegetable fibres, but those in the Mediterranean Sea carpentered with nails, he concludes that the richest deposits of magnetite occur in the submarine mountains of the China sea, since it is exactly there that the nails would be extracted by magnetism and ships would disintegrate. In the mountains of Zābulistān [*q.v.*, in eastern Afghānistān] magnetite is said to occur as solid rock; on their sun-lit outer surfaces the power of attraction would be weak, but in the inside strong, as al-Bīrūnī himself had ascertained by means of a collaborator.

Other denominations of the lodestone, based

on confusion, are: *bāhit* or *ḥadjar al-bahta* (i.e. the haematite, which results from converting magnetite or other minerals), *adāmas al-iḍṭirārī* (i.e. the diamond; ἀδάμας means "indomitable", from which *iḍṭirārī* can possibly be explained), *lāḳiṭ* (see below), *ḳaramiṭ* (possibly through Romance *calamita*, derived from κάλαμος, but cf. for this E. O. von Lippmann, *Geschichte der Magnetnadel bis zur Erfindung des Kompasses [gegen 1300]*, in *Quellen und Studien zur Geschichte der Naturwissenschaften und der Medizin*, iii/1 [Berlin 1932], esp. 15-20).

The notion that lodestone and iron are connected as the lover and the beloved, was spread very widely: iron is "obedient" to the stone because of a divine power inherent in the latter, and is attracted to it like the lover to the beloved (al-Ḳazwīnī, *ʿAdjāʾib al-makhlūḳāt. Kosmographie*, ed. Wüstenfeld, i, 239, below); between the two exists a profound inclination: when iron "smells" the magnet, it moves towards it until it clings to it and holds on tight to it, as the lover to the beloved (*op. cit.*, 210; cf. also *Rasāʾil Ikhwān al-Ṣafāʾ*, ii, Beirut 1376/1957, 110 f.). This image was expressed poetically by Ibn Ḥazm, *Ṭawk al-ḥamāma*, ed. Pétrof, 8, 20-9, 9, cf. E. Wiedemann, *Aufsätze zur arabischen Wissenschaftsgeschichte*, ii, 149-51. In other comparisons, the *tertium comparationis* is formed by the swiftness of reaction: the "phlegm" (*balgham*) combines with the soul quicker than iron with the magnet (M. Ullmann, *Katalog der arabischen alchemistischen Handschriften der Chester Beatty Library*, ii, Wiesbaden 1976, 99). This conception is connected with certain theories developed by Djābir b. Ḥayyān in his *Kitāb al-Raḥma*: "The strongest factors existing in this world are the delicate spiritual things which cannot be observed with the senses, but only with the intellect, like the stone which attracts iron through an immaterial power that can neither be felt nor seen. It permeates the solidness of brass (*ṣufr*) which finds itself between it (i.e. the magnetite) and the iron" (Ar. text in M. Berthelot, *La Chimie au Moyen Âge*, iii, Paris 1983 [reimpr. 1967], 144-5; French tr., *ibid.*, 175). Thus the Arabs were aware that the magnetite is efficacious through other bodies. A few sentences further on it is said: "We found (?) a magnetite which lifted a weight of 100 *dirhams* (= 312, 5 gr. according to W. Hinz, *Islamische Masse und Gewichte*, Leiden 1955, 3). We left it alone for a while and then tested it with another piece of iron, which however it did not lift. We thought this to be heavier than the 100 *dirhams* which it had lifted earlier. But when we weighed it, it had a weight of less than 80 *dirhams*, so its power had decreased, although its mass (*djirm*) had remained the same." From these observations it was rightly concluded that in course of time the lodestone loses part of its power of attraction. Thus the carrying capacity of the magnet used by "Geber" was quite considerable; for further quantitative indications by al-Ibshīhī and al-Tīfāshī, see Wiedemann, *Aufsätze*, i, 33.

Iron filings, put in a pan which one keeps in one hand while with the other a magnetite is moved backward and forward underneath the pan, follow these movements. Also, when the stone is brought near to a needle, it attaches the latter to itself, and likewise other needles which are strung to the first one, so that finally all of them are joined as it were to a string by an "immaterial power"; in the same way rings can be hung to one another (J. Ruska, *Das Steinbuch aes Aristoteles*, Heidelberg 1912, Ar. text 108, Ger. text, 154).

Next to its attractive power, the magnet has also a repelling power: when held over an ant-hill, it drives the ants away. When smeared with the saliva of a fasting man, it loses its attractive power. This power disappears also when the magnet is rubbed with garlic or onions, but when cleansed from garlic and put in the warm blood of a freshly-slaughtered billy-goat, the power returns (al-Ḳazwīnī, *ʿAdjāʾib*, 238; al-Dimashḳī, *Nukhbat al-dahr*, ed. Mehren, St. Petersburg 1866, Arabic text 73 f., French tr. 85; Ibn Ḳutayba, *ʿUyūn*, ii, Cairo 1346/1928, 108; (Pseudo-) Madjrīṭī, *Ghāyat al-ḥakīm*, ed. H. Ritter, Leipzig-Berlin 1933, 399, 15-6, tr. 406). The following observation of Ibn al-Faḳīh (*BGA*, v, 67, 134) is also worth noticing: When a knife or sword is rubbed against the rocks of a mountain near Āmid, they carry iron and attract needles more powerfully than lodestone. The latter itself does not possess attractive power, but when a knife or sword is rubbed against it, it attracts iron. This power is said to be preserved for a very long time, namely a hundred years. As Wiedemann (*op. cit.*, i, 36) remarks, magnetism is preserved in sword and knife because they are made of steel: they are a "permanent" magnet.

The question of the causes of interaction between magnet and iron has apparently also been studied in a more general way. No less a person than al-Rāzī wrote an essay entitled *Kitāb ʿIllati djadhbi ḥadjar al-maghnāṭīs li 'l-ḥadīd wa-fīhi kalām^un kathīr^un fi 'l-khalā*, "Book on the cause of the attraction of iron by the magnet, containing an extensive treatise on empty space". For this work, which unfortunately is lost, see Ibn Abī Uṣaybiʿa, *ʿUyūn al-anbāʾ*, i, 320, 11-2; and, for a shortened title, Ibn al-Nadīm, *Fihrist*, 301, 14-5. The essay probably examines whether and how the magnet is effective through empty space. Al-Tīfāshī recognised the chemical relation between iron and magnet from which the effectiveness is to be deduced. According to him, the attraction is based on reciprocity; deep inside, the lodestone has transformed itself into iron, for both minerals have the same nature which explains the inclination and love to each other "since the beginning of their existence" (Wiedemann, *op. cit.*, i, 34 f.). According to al-Ṭughrāʾī (*apud* Wiedemann, i, 699), the lodestone belongs to the stones which contain spirits.

It was believed that there existed a number of other stones with attractive power, apart from the iron magnet: the gold magnet which attracts gold, and when calcified, possesses the efficacy of the iron magnet; the silver magnet which is extraordinarily powerful (at a distance of five ells it attracts an ounce of silver); the brass and copper magnet, which, among other things, are used as a remedy against epilepsy; the lead magnet, ugly and evil-smelling; the flesh magnet, so-called because, if put on flesh, it sticks fast to it and, if pulled away, rips off pieces of it; the hair magnet which attracts hair and, if moved over the head, tears it off; finally, the nail magnet, which pulls out finger-nails (J. Ruska, *op. cit.*, Ar. text, 109-11, Ger. text 155-9). Other magnets are enumerated by al-Dimashḳī (*Nukhbat al-dahr*, Arabic text 74-7, French text 85-9), who remarks *inter alia* that gold is the magnet of mercury: when they come together, gold attracts the mercury and mixes with it; when filings of gold, lead, copper, iron and tin are mixed and mercury is then added, the latter goes in search of the gold filings and mixes with them, but not with the other filings because a "magnetic friendship" (*ṣadāḳa maghnāṭīsiyya*) exists only between mercury and gold. A number of similar magnets are catalogued by al-Ḳazwīnī (*op.

cit., 235 f.) under the term *lāḳiṭ* ("gleaning, collecting"), like *lāḳiṭ al-dhahab*, *l. al-raṣāṣ*, *l. al-shaʿar*, etc.

It is hardly to be wondered that, already in early times, all kinds of legends were coupled to the attractive power of the *maghnāṭīs*. Al-Djawbarī, for instance, relates that in the "monastery of the idol" (*dayr al-ṣanam*) an iron idol is floating free in space under a cupola. This statue is said to be the work of Yablūnus (Apollonius of Tyana), who had constructed a cupola from lodestone in such a way that the magnetic power was acting upon the statue so evenly from above and from the sides that it was floating exactly in the middle of the space (*apud* Wiedemann, i, 359). Al-Ḳazwīnī, *Āthār al-buldān. Kosmographie*, ed. Wüstenfeld, ii, 63, relates a similar story from the town of Sūmanāt (Somnath) in Gudjarāt. The secret was only disclosed when Sultan Maḥmūd b. Sebüktigin visited the temple and one of his companions took out one stone after the other from the cupola; the floating idol then sank to the floor. Christians in the West believed that Muḥammad's coffin was either made of some naturally magnetic substance and hovered in the air under a dome whose walls were covered with iron, or was made of iron and floated freely thanks to two magnets fixed in the roof and in the floor of the tomb (see Ch. Pellat, *Note sur la légende relative au cercueil de Mahomet*, dans *Bull. des Ét. arabes*, xxiii, Algiers 1945, 112-13; repr. in *Études sur l'histoire socio-culturelle de l'Islam*, London 1976, xii). For other examples—both classical and talmudic—of free-floating idols and other objects, see I. Löw, *Fauna und Mineralien der Juden*, ed. A. Schreiber, Hildesheim 1969, 131. Of ill fame were the magnetic mountains or islands which extracted the nails from the ships and sank them, for instance in the Red Sea (al-Ḳazwīnī, *ʿAdjāʾib*, 172) or in India (*ibid.*, 239; Ruska, *op. cit.*, Ar. text 108 f., Ger. text 155; Ibn al-Djazzār, *Kitāb al-Iʿtimād fi 'l-adwiya al-mufrada*, ms. Ayasofya 3564, fol. 85a, 7-10). Magnetic mountains became best known through the stories of Sindbad the Sailor.

The reciprocal relations between electric and magnetic phenomena were not known. However, the Arabs were aware of the parallel, already drawn by Galen, existing between the transmission of the efficacy of the electric fish (i.e. of the electric ray νάρκη, Ar. *raʿʿād*), and that of the magnet (Wiedemann, *op. cit.*, i, 32). The Arabs themselves perceived as highly unsatisfactory the fact that their efforts to explain magnetism in a physical way remained unsuccessful. A regretful observation of Ibn Buṭlān (*apud* Ibn al-Ḳifṭī, *Taʾrīkh al-Ḥukamāʾ*, ed. Lippert, Leipzig 1903, 313, 9-11) makes this clear: "Does iron strive for the stone out of longing, or does the stone attract iron by force? How painful (*ḳabīḥ*) is it for us not to understand this without any doubt, although we observe it with our senses."

In medicine, the lodestone does not seem to have been applied widely, although it is found in almost all pharmacopoeias (see D. Goltz, *Studien zur Geschichte der Mineralnamen in Pharmazie, Chemie und Medizin von den Anfängen bis Paracelsus*, Wiesbaden 1972, 174). It is potent for draining away thick mucus and, if held in the hand, for removing spasms and pains in hand and foot. It is administered to those who have swallowed iron filings or rust in order to attract and remove them. Strewn on gaping wounds in pulverised form, it contracts them. In cases of gout caused by heat, it allays the suffering if applied after being rubbed with vinegar. He who wears a lodestone round his neck will have a good memory and does not forget anything. Used in pulverised form as an eye make-up, it stimulates love relations. It helps a pregnant woman to have an easier confinement; worn in a seal-ring, it brings good luck; etc.

2. The compass

The Arabs of the East became acquainted with the compass through Chinese sailors, without however at first giving it a special name; there was considerable traffic between the Persian, etc. ports and Southern China. Thence it came to Syria and then to the Mediterranean ports of Europe. The compass had very probably, however, already reached the north of Europe by the trade-route of the Russian rivers as early as the 8th or 9th centuries A.D. This explains why the compass was known earlier in the north than in the south of Europe, and perhaps explains also why the Norsemen were able to undertake long

voyages by sea (cf. R. Henning, *Verhandl. der Gesellsch. deutscher Naturforscher etc.*, 84th Versammlung, 11/2 [1912], 95).

In deciding the direction by means of a magnetic needle, the Muslims used the end which pointed to the south; as Mecca lay to the south of most places, in Syria etc. the *ḳibla* [*q.v.*] corresponded almost exactly to the south.

The oldest passage in which the word *ḳaramiṭ* perhaps corresponding to "magnet" (*calamita*) occurs is given by Dozy for the year 239/854 in his *Supplément*, ii, 337, who found it in *al-Bayān al-mughrib* (*Histoire de l'Afrique et de l'Espagne*) edited by him. Serious objections have however been raised to interpreting the word as compass in this passage (*MSOS*, Berlin, x/1-2 [1900], 268). From the fact that in narratives of travels of the 9th century A.D. and that in al-Masʿūdī (923) the directions are given in the same way as on compasses, G. Ferrand concluded that the compass was already in use then. The next oldest absolutely certain reference is in the *Djāmiʿ al-ḥikāyāt* of ʿAwfī; it is in his *Lubāb al-albāb* (ed. Browne and Mīrzā Muḥammad Ḳazwīnī). A captain during a storm in the Red Sea or Persian Gulf finds his true course by means of a fish, of which we are expressly told that it had been rubbed with a *maghnāṭīs*. A similar statement regarding the use of a magnetic fish at sea is made by al-Maḳrīzī in his *Khiṭaṭ* (Būlāḳ 1270, i, 240; Cairo 1324, i, 357; *Z. f. Phys.*, xiv [1924], 166).

A very full description of the compass and its use in the Mediterranean was given in 640/1242 by a certain Baylak al-Ḳibdjāḳī in the *Kitāb Kanz al-tudjdjār fī maʿrifat al-aḥdjār*. A needle which has been rubbed with a "female" lodestone is placed diagonally through a rush or piece of straw, etc. Sometimes a cross made of two straws is used. The arrangement is floated on water set to rotate by a lodestone held in the hand and moved in a circular direction; the latter is then quickly withdrawn. The needle places itself pointing to the south, which is the same as the *ḳibla*. The turning is probably regarded as magical, but it has a physical significance. By the turning, the often very tenacious skin of the water is broken and the apparatus bearing the magnet is enabled to move freely. The turning is, however, not always done, but the needle with its support is simply placed on the water.

Al-Zarkhūrī describes several forms of compass in a work on mechanical toys, for example a small, beautifully-painted, wooden fish, in which a magnetic needle is placed. In place of the fish, which might hurt the feelings of pious worshippers, a wooden disk with a *miḥrāb* drawn upon it is also used. Finally, an apparatus just like our compass is described. Two magnetic needles are placed symmetrically in the centre under a circular piece of paper. Under the centre of the paper a funnel is placed which turns on a point; the whole is enclosed in a cylindrical receptacle with a glass top and is called *ḥuḳḳ al-ḳibla* "vessel, box for the *ḳibla*", or *bayt al-ibra*, "house of the needle"; according to Niebuhr, the same name is still given to the compass. At the present day, similar compasses are used along with a simple sundial. Another very full description is given by a certain Muḥammad b. Abi 'l-Khayr al-Ḥassānī in his *al-Nudjūm al-shāriḳāt* (cf. E. Wiedemann in the *Z. für Physik*, xiii [1923], 113: there is a manuscript in Beirut in addition to those mentioned here. Whether the Cambridge one was written in 1103 or 1588 cannot be ascertained with certainty). The needle is fastened to a copper plate hollowed out or raised in the centre and placed on a copper stand. One end of the needle, no doubt the south end, has something put on it to mark it.

An important passage in an anonymous work "Preparation of the bowl (*ṭāsa*) to ascertain the *ḳibla* and points of the compass" is in a Berlin manuscript (Ahlwardt, no. 5811). Here the point of the needle points south, the eye to the north (the rubbing [*ḥakk*] of the needle explains the peculiar modern name *ḥikk* for the compass).

It would take us too far to deal here with the box compass proper which is called in Turkish e.g. *pusula* from the Italian. We will only note that on the rhomb-card the south is called *al-ḳibla* and also *al-djanūb* (cf. thereon, for example, K. Foy, *Die Windrose bei den Osmanen und Griechen mit Benutzung der Baḥrīya des Admirals Pir-i Reis vom Jahr 1520*, in *MSOS*, Berlin xi/2 [1908], 234 ff.).

Wiedemann, *Über Geschichte des Kompasses bei den Arabern*, in *Verhandl. der physikalischen Gesellschaft*, ix (1908), 764-73; xi (1909), 262-6; xxi (1919), 665-7; *Z. für Physik*, xiii (1923), 13-16; xiv (1923), 240; xxiv (1924), 166-8; G. Ferrand, *Notes sur l'histoire orientale* (*Contribution à l'histoire de la boussole*), in *Publications de l'Institut des hautes études marocaines*, *Mélanges René Basset*, i, 1923, 1-16; W. C. Brice, *Compasses, compassi and Kanābiṣ*, in *JSS*, xxix (1984), 169-78.

In the *Beiträge*, ii, the earlier literature is collected. This is also done in other works e.g. by Clément Mullet on the compass. Of special importance are the works of A. Schück (*Der Kompass*, etc., Hamburg 1911, 1915 ff.), which also deal with the Bussole in China. (E. WIEDEMANN)

MAGHNISA, modern Turkish form Manisa, classical Magnesia, a town of western Anatolia, in the ancient province of Lydia, lying to the south of the Gediz river on the northeastern slopes of the Manisa Dağı, which separates it from Izmir or Smyrna (lat. 38° 36′ N., long 27° 27′ E.).

In Greek and then Roman times, Magnesia ad Sipylum was a flourishing town, noted amongst other things for the victory won in its vicinity by the two Scipios over Antiochus the Great of Syria in 190 B.C., and continued to flourish under the Byzantines (see Pauly-Wissowa, *Realencyclopädie*, xxvii, 472-3). After the capture of Constantinople by the Latins in 1204, the Byzantine emperor John Ducas retired to Magnesia and held out there till 1255; it was also the seat of a bishopric, which seems to have disappeared however by the 14th century.

Out of the ruins of the Saldjūḳ kingdom of Rum, a Turkmen chief Ṣārū-Khān (d. 1345) established himself in the town in 1313 and made Maghnisa the capital of his *beylik*, one which endured for over three-quarters of a century. Ibn Baṭṭūṭa, *Riḥla*, ii, 312-14, tr. Gibb, ii, 447-8, visited what he calls Maghnīsiyya during Ṣārū-Khān 's reign, and stayed in a *zāwiya* or hospice of one of the local *fityān* (i.e. of the Akhīs [*q.v.*]); he praises its size and its amenities. The Ulu Djāmiʿ of Maghnisa dates from this period also, and re-uses Byzantine materials. The Ṣārūkhān-oghullarī [*q.v.*] continued to hold the town till 792/1390 or the next year, when the Ottoman Bāyezīd I [*q.v.*] conquered it and gave it to one of his sons. After Tīmūr's victory at Ankara in 805/1402, Tīmūr gave Maghnisa to his grandson Muḥammad (see Sharaf al-Dīn ʿAlī Yazdī, *Ẓafar-nāma*, ed.

Calcutta, ii, 466-7), and the town was then briefly restored to the descendant of Ṣārū-Khān, Khiḍr Shāh Beg; but the latter was deposed and killed by the Ottoman Meḥemmed I in 813/1410.

Under the Ottomans, Maghnisa, from its nearness to the capital Istanbul, was often governed by the sultan's eldest son and regarded as a stepping-stone to further advancement. After his abdication in 848/1444, sultan Murād II retired to Maghnisa, leaving it to combat the Hungarian Crusaders but returning after his victory at Varna later that year (Von Hammer, *GOR*², i, 351, 357); the remains of his palace and garden are still visible.

Concerning the tax-paying population of the town, we possess figures for 937/1530-1 and again for 983/1575-6. Compared to other Anatolian cities, Maghnisa during the 10th/16th century experienced only moderate growth: from 1,356 taxpayers (about 6,000-7,000 inhabitants) at the first date to 1,995 taxpayers (about 7,000-8,000 inhabitants at the second one). This is all the more noteworthy as Maghnisa during this period continued frequently to house the courts of Ottoman princes, so that much public construction took place in the town. The Khātūniyya mosque was built in the name of Prince Shāhinshāh's mother Ḥüsnīshāh, while the Sulṭāniyye mosque, which possessed shops and taxation rights in Urla near Izmir, was founded by Ḳānūnī Süleymān's mother Ḥafṣa Sulṭān. As the last Ottoman prince residing in Maghnisa, sultan Murād III [*q.v.*] had the Murādiyye *külliyye* or complex constructed by his chief architect Ḳodja Sinān (994/1586).

In the second half of the 10th/16th century, the area between the Gediz Çayı and the Büyük Menderes rivers produced grapes and figs for consumption in Istanbul. To assure a regular supply for the Ottoman capital, a large number of official rescripts prohibited both wine-making and the exportation of raisins. Throughout the 10th/16th century, the exportation of cotton was equally forbidden. But for reasons not completely understood, this prohibition was reversed in the 1620s. Export trade in cotton particularly developped in the course of the 12th/18th century, when the area was controlled by a family of *aʿyān* or notables known as the Ḳara ʿOthmān Oghullarī (see below). The French traveller Pitton de Tournefort, who visited Manisa about 1700, stated that the cotton trade was the only major activity visible in the town [see on this trade, ḲUṬN. 2. In the Ottoman empire].

When Ewliyā Čelebi visited Maghnisa in 1082/1671-2, he was much impressed not only by the historical buildings, particularly by the Murādiyye mosque, but also by the opportunities for entertainment. Apparently the coffee houses of Maghnisa could rival with their more famous counterparts in Aleppo, Cairo and Damascus. Ewliyā also mentions the existence of more than 3,000 shops, aside from two covered markets. But he equally reports that one of the covered markets had been partially converted into a mosque. This observation, if correct, may indicate that business life in Maghnisa was in fact stagnating.

From the 11th/17th century onward, Manisa was increasingly eclipsed both politically and commercially by Izmir [*q.v.*]. The latter had been but a minor port in the 10th/16th century, containing less than 500 tax-paying inhabitants. But the transit trade in Persian silk lead to Izmir's rapid growth, and Maghnisa took on the characteristics of a minor regional centre, which specialised in the marketing of agricultural goods. However, a certain amount of textile manufacture survived into the 1890s, and so did the tanning industry, which had already been famous in the 11th/17th century.

In the 12th/18th century, Maghnisa became the capital of a powerful family of *derebey*s [*q.v.*], the Ḳara ʿOthmān-Oghlī family [*q.v.*], whose authority stretched from beyond Ṣārūkhān itself as far as the Sea of Marmara to the north. It was not until 1244/1829 that the central government was able to replace members of the family (whose administration is praised by the English traveller G. T. Keppel, *Narrative of a journey across the Balcan . . . in 1829-30*, London 1831, ii, 294-301) by its own nominees.

Late 19th century population figures reflect the relative decline of Maghnisa, now in the *wilāyet* of Aydïn, compared with Izmir; Cuinet assumed that the former contained 35,000, the latter 200,000 inhabitants, and Sāmī Bey, *Ḳāmūs al-aʿlām*, Istanbul 1898, estimated Maghnisa's population at 36,252, of whom 21,000 were Muslims, 10,400 Greeks, 2,000 Armenians, etc. During the Turkish War of Independence, the town suffered heavy destruction, and the first census of the Turkish Republic credits Manisa with only 28,664 inhabitants. By 1950, the late 19th century level of 35,000 had again been reached; by 1975 the town had increased to 78,114 inhabitants.

(V. Minorsky - [Suraiya Faroqhi])

MAGHŌSHA, the town of Famagusta in Cyprus [see ḳubrus].

The Mycenaen town of Alasya was located on or near the delta of the Pediyas, at Enkomi village. Its successor, the port of Salamis, only 1½ miles to the east, became a great metropolis during the Roman empire. Restored by Constantius II on a much smaller scale after the severe earthquakes of 332 and 342, with the new name Constantia, it survived until Arab Muslim raids of the 7th century led to its transferral to Ammochostos (Maghōsha) 6 miles to the south (for Alasya, see Hill, i, 36, 42-9, and P. Dikaios, *Enkomi: excavations 1948-1958*, Mainz 1969-71; for Salamis and Constantia, see Hill, i, *passim*, and V. Karageorges, *Salamis in Cyprus: Homeric, Hellenistic and Roman*, London 1969). The town passed to Guy de Lusignan in 1192. The Genoese occupied it between 1383 and 1464; the Venetians took the town from the Lusignans in 1489. The Ottomans conquered it after a prolonged and extremely costly siege of eleven months in 1572, with tens of thousands of lives lost. After the Turkish conquest much Latin property was turned over to the Orthodox; however, from 1573 the latter were forbidden to live in the walled town, as in Rhodes. In 1607 a Tuscan naval expedition of eight galleys and nine galleons failed in a surprise attack upon the town (Hill, iv, 48 ff.). The Knights of Malta, as well as English, Dutch, and Tuscan pirates, regularly harassed Levantine shipping for more than a century after 1572. A famine in 1640 and plague in 1641 are known, as well as severe earthquakes in 1557, 1569, and 1735 (Hill, iv, 67 f.). No area was more vulnerable to malaria, plague, and locusts.

The Ottomans failed to revitalise their great prize Maghōsha, but it is obvious that by the last quarter of the 15th century the town had already been reduced to a third-rate commercial centre. The harbour remained a prize worth fighting for, but the Ottomans were unable to transform it into a useful naval base. Its growth was further limited by official ambivalence; the Porte sometimes dreamed of using the naval and commercial potential of Maghōsha, but at other times appeared terrified that the prize would fall to enemies who might again use it against them. Although the Ottomans never had the energy to restore Maghōsha, they guarded the fortress too zealously to allow economic development, and the small garrison became the greatest part of the population.

After the fall of Acre or ʿAkkā [*q.v.*] (1291) to the Mamlūks, the ascent of Lusignan Maghōsha was meteoric. Little more than its good harbour was noted by W. von Oldenburg in 1211 (C. D. Cobham, *Excerpta Cypria*, 14). An anonymous Englishman (1344) called the town "a paradise of delight" with "plantations and gardens irrigated with water brought into them artificially ... It has a parish, Cathedral, and Metropolitan Church like unto Amiens. There reside in it merchants of Venice, Genoa, Catalonia and Saracens from the Soldan's dominions, dwelling in palaces, which are called 'Loggias', living in the style of counts and barons, they have abundance of gold and silver. All the precious things of the world may be found in their hands." (Th. Mogabgab, *Supplementary excerpts on Cyprus ...*, ii, 56 ff.; *Itinerarium ciuisdam Anglici Terram Sanctam*, in P. G. Golubovich (ed.), *Biblioteca bio-bibliografia della Terra Santa e dell' Oriente Francescano*, iv, Florence 1923, 446-7). Seized by Genoese trickery in 1373, and held by them for a century, the town lost much of its local trade. Then a series of disasters—disease, earthquakes, locusts, and shifting trade routes—left the town crippled. Nicolai de Martoni (1394) observed: "The city of Famagusta is large, as large, I reckon, as the city of Capua, and his fine squares, and houses very much like those of Capua, but a great part, almost a third, is uninhabited, and the houses are destroyed, and this has been done since the date of the Genoese lordship. The said city has finer walls than I have seen in any town ..." (Cobham, 22 ff.; *Revue de l'Orient Latin*, iii [1895], 627 ff., 637 f.). Long before 1435 when Pero Tafur visited it, the aristocracy had abandoned Maghōsha for Lefḳōsha or Nicosia, and most trade and economic activity had followed thereafter. "This place is depopulated on account of the bad air and bad water", particularly because of the nearby lake Constanza (Cobham, 31; *Andaças é viajes ...*, in *Coleccion de libros españoles raros o curiosos*, Madrid 1874, viii/1, 139). Venetian rule (1489-1571) did not bring any improvement; despite efforts to rebuild the town, its population probably never rose above 6,000 (Hill, iii, 507, 729 n, 878). As Martin von Baumgarten (1508) found, Maghōsha was "remarkable for its harbour and fortifications" but Lefḳōsha was "famous for its largeness". The silk merchant of Douai J. le Saige (1512) was astonished to see such a strong town with the walls "freshly repaired" and "a grand boulevard"; he found excellent produce along the coast, although only trade with Venica was permitted (Cokham, 55,57; *Peregrinatio*, Noribergae 1594, 139). Pīrī Reʾīs mentions a beautiful castle, and inner and outer harbours at the only large port on the island (*Kitabı Bahriye*, ed. Y. Senemoğlu, Istanbul, ii, 283). Maghōsha's economic distinction lay in its harbour: as various travellers noted, Cyprus had no other. Indeed, few harbours if any in the entire Levant could provide better protection from the elements or could give shelter to more vessels. Since the Mediterranean between the gulfs of Antalya and Iskenderun was reputedly extremely dangerous, vessels which otherwise might have followed the coastline closely all the way to Rhodes preferred rather to strike out from Iskenderun, Tripoli or Alexandria for the south coast of Cyprus, sail round it, and then sail on to Rhodes. According to Jacques de Villamont (1589), the capital of the province was Lefḳōsha, but "... on account of its fine harbour and incomparable fortress the Pasha generally lives at Famagusta for the safety of his person and galleys" (Cobham, 176; if the *pasha* did reside there, it was contrary to regulations). After visits in 1598 and 1599 Cotovicus wrote that it "has a remarkable and most safe harbour ... It is fairly spacious and

populous . . . the only defence which Cyprus has" (Cobham, 195; cf. Loredan (1476), who called it "the key and heart of Cyprus", despite its unhealthiness, in Hill, iii, 727 ff.). According to R. Pococke there was very little trade there, but an acqueduct brought very good water from three or four miles away, the surrounding villages had relatively fertile soil, and "all provisions are cheap" (Cobham, 255; in Pinkerton, ed., *A general collection of . . . voyages . . .*, London 1811, i, 576-7). Those villages produced silk and mulberries, and madder root was another product. By the 18th century silting had made the harbour too shallow for larger vessels, and according to J. M. Kinneir (1814): "This port could once admit vessels of a considerable draft of water; but since the conquest of the Turks, sand and rubbish have been suffered to accumulate in such a degree, that none but small vessels can now enter it with safety" (Cobham, 412; *Journey . . .*, London 1818, 176). W. Turner Kinneir: "The port was admirable, being about one quarter of a mile in length, and something less in breadth, sheltered by low rocks; even now that the port is 'mostly choked up', ships which winter in Cyprus always go there to anchor in safety" (Cobham, 435).

The Jew Elias of Pesaro (1563) found that ophthalmia was a common fever from late June to midwinter; but the townspeople were described as clean, and careful to protect themselves from contagion, especially from the plague, quarantine often lasting forty days. The houses were fine and well built, the roads well maintained, and there were fountains of running water at every street corner. The castle reminded him of that of Pesaro. The food was excellent, and the bread the best he had ever eaten. The twenty-five local Jewish families completely controlled all money lending in Cyprus, and anyone wanting to borrow money had to come there. Interest was 20% per annum when gold and silver were pledged, 25% if wool, thread, or silk was pledged, and profits were often higher (Cobham, 73 ff.; translation of Hebrew letter by M. Schwab, in *Revue de Géographie*, v [1879], 221 ff.).

When Jacques de Villamont reached Larnaka in 1589 he was told not to try to go to Maghōsha because plague had long been raging there and the inhabitants of both the town and its surroundings were nearly all dead (Cobham, 175). The Dutchman Jan Somer (1590) compared the town in size to Amsterdam, although not so populous; disease had reduced the place, despite a rich agricultural hinterland (*Beschrijvinge van een Zee ende Landt Reyse . . .*, Amsterdam 1649, 11). André Thevet (1590) chided those who wrote that ". . . the Turks made themselves masters of Famagosta, and slew all the Christians Latin and Greek, with the sword, so that old and young without exception felt the violence of these infidels. And still you see that the Greeks and others live in entire liberty" (Cobham, 178). Ottoman policy neurotically aimed to close off the fortress; foreigners were treated as spies. When de Stochove wanted to see the town in 1631 he was advised "that it was almost impossible to go in without meeting some unpleasantness", for the *pasha* was a malicious man and absolutely no one could enter without his consent, so he examined only the outer walls (Cobham, 217). In 1683 de Bruyn found that the Ottomans ". . . guard the city so jealously that no stranger is allowed to set foot in it . . ."; he was harassed when he simply tried to approach the walls (Cobham, 236, 241-2; *Reizen van Cornelis de Bruyn*, Delft 1698, 365 ff., 374 ff., with map). In the 18th century, most of the small population of the town must have been soldiers; some Christians settled in houses with gardens half a mile to the south in a village called Marash (Varosha). R. Pococke (1738) encountered a settlement of Christians who "are not permitted to dwell within the city". To the west was a large fertile plain inhabited mostly by Muslims because it was relatively "secure from the privateers", while Christians, who were not enslaved by them, lived near the sea. Most of the sparsely-inhabited town was destroyed by a severe earthquake in 1735, making both the mosques of S. Sofia and S. George unfit for use so that S. Catherine's church became the principal mosque. The town walls were severely damaged. The Swedish visitor Frederic Hasselquist (1751) estimated the population as 300 inhabitants, "chiefly Turks", who "occupy the miserable ruins . ." (Cobham, 254-5; in Pinkerton, ed., *op. cit.*, i, 577-8; Cobham, 307, *Iter Palaestinum*, Stockholm 1757, 178 ff.).

Archimandrite Cyprianos (published in 1788) described the Ottoman occupation of Maghōsha in some detail: the inhabitants ". . . remained in their houses, and appeared at the time to be the owners, yet afterwards the Turks dispossessed many of them, on the pretext that they were tenants only, not owners"; when the Greeks of Maghōsha petitioned the vizier Meḥmed Pasha they were permitted ". . . to live as Greek Christians, on condition that no Christian of the Latin Church should be found among them: for to the Latins he would grant neither church nor house, and those who remained in Cyprus were obliged to frequent the Greek churches, and forbidden to hold property in the island". Greeks were allowed to buy, sell, and inherit houses, fields, and property not already occupied by Turks. In 1815 W. Turner reported: ". . . of its numerous palaces and churches not one remains entire". It had only a hundred people, including three Greek families. They lived in ruins, in low houses, mostly of mud, and no-one cultivated the countryside. Nearby was a village of Christians living surrounded by gardens (Cobham, 347 ff., 434-5). The estimate of 3,000 Muslims, 5,000 Greeks, and 200 Armenians attributed to the governor Ṭalʿat Efendi seems too large (M. Louis Lacroix, *L'Univers. Histoire et description des tous les peuples. Iles de la Grèce*, Paris 1853, 88). The last Ottoman census reportedly showed 500 Muslims in the walled town and 2,200 Greek Orthodox in the suburbs. At this time, Maghōsha was used as a place of banishment for those under political or religious clouds; hence Nāmiḳ Kemāl [*q.v.*] and the Bahāʾī leader Ṣubḥ-i Ezel [see BAHĀʾ ALLĀH] spent time there in exile.

According to the census of 1881, Maghōsha with Marash (Varosha) was the fourth leading town of Cyprus with 2,609 inhabitants, of whom 1,845 were Greek Orthodox (71%), 727 were Muslim (28%), 6 were Roman Catholic, 22 Maronite, 1 Armenian Gregorian and 8 Church of England and Protestant; there were no Jews. There were 666 adult males over 20, one per 3.92 people; of those 184 were Muslim (one per 3.95) and 482 Christian (one per 3.90) (*Cyprus Gazette*, no. 82 [4 April 1881 census], 3 March 1882; 17 June 1882). By 1891 the population had grown 30% to 3,367, but the Muslims had increased only 15% to 835, falling to 25% of the town's population (*Cyprus Gazette*, no. 341, 15 May 1891). By 1900 the population had increased to 3,825, 47% larger than in 1881. The Muslims had grown only 18% to 856, while the Christians had increased 58% to 2,969. Of 1,094 adult males 811 (3.66 per

capita) were Greek Orthodox and 283 (3.02 per capita) were Muslims (*Cyprus Gaz tte*, no. 697, 26 April 1901; 30 August 1901).

In the second half of the 19th century, Maghōsha was filthy and malarial, "in utter absolute ruin", according to Samuel Brown, *Three months in Cyprus during the winter of 1878-9*, London 1879, 19. To Mrs. Scott-Stevenson "... it seemed the most desolate town I had ever been in"; even the dogs seemed "dull, and without energy to bark at us" (*Our home in Cyprus*[2], London 1880, 278). Although the third busiest harbour on the island, its entire trade came with coasting vessels, for large vessels called only at Larnaka and Limassol. The small suburb of Varosha to the south, equally pestilential, had extensive and luxuriant gardens and was the site of a pottery factory. The district was the leading one for fishing on the island (48 small boats caught 7,198 oke of thirty-four kinds of fish in 1889, the most important being sea bream (*sarpa*), *lifhrina*, *mavromati* and *skaros*; *Cyprus Blue Book*, 1889-90, 519). In that year the single Muslim school had 67 boy students and 13 girls. The municipal budget under the British was disproportionately smaller than the other towns. Initial British interest in making a new harbour flagged until 1895, when the proposal was raised again; and in 1899 a loan of £ 254,000 to dredge and improve the harbour and to construct a narrow gauge railway to Lefkosha was authorised by the British government. After its completion in 1906, interest in the port increased very slowly until after World War I. In 1931 with 8,979 inhabitants it was the fourth largest town of the island, and by 1946 it was the third largest, with 16,194, of whom 13,106 were Greek Orthodox, 2,699 Muslim, and 115 Armenian Gregorian. In the latter year, 2,273 of the 3,048 inhabitants of the walled town were Muslim.

(R. C. Jennings)

MAGHRĀWA, a major confederation of Berber tribes belonging to the Butr group and forming the most powerful branch of the family of the Zanāta.

The ascendancy, real or imaginary, of this confederation is traced back to Maghrāw, who is said to have been, according to the mediaeval Berber genealogists, the ancestor of the Maghrāwa as such. Following the Arab and Berber sources utilised in the 8th/14th century by Ibn Khaldūn in his *History of the Berbers*, the "cradle" of the Maghrāwa and "the ancient seat of their power" was the territory located on the Chélif in the north-western part of what is now Algeria, probably bounded by the Mediterranean to the north, the mountain of Wansharīs (Wānsharīsh, currently Ouarsenis) to the south and Tlemcen to the west. Leo Africanus [*q.v.*] says in his *Description of Africa* written in about 1525-6 that the "Magraua (Maghrāwa) mountain" stretched over a distance of some 40 miles (approx. 64 km), "close to the town of Mustuganin" (Mostaganem). The Maghrāwa have left a relic of their presence here in the name of Cap Maghraoua situated 104 km to the east of Mostaganem and 56 km. to the west of Ténès. It should be added at this point that, according to Abu 'l-Fidā' (1273-1331), Mostaganem served the Maghrāwa as a port. Leo Africanus extols the dignity and the courage of the inhabitants of the Magraua mountain, who were probably descendants of the Maghrāwa of mediaeval Arab sources. The Maghrāwa lived in this land in a nomadic state, but they also possessed (at least in the 7th-8th/13th-14th centuries) fixed dwellings and fortresses. In the 4th and 5th/10th-11th centuries, the individual segments of this confederation were spread throughout North Africa, from Morocco in the west to Tripolitania in the east.

Little is known of the origins and earliest history of the Maghrāwa. According to Ibn ʿAbd al-Barr (d. 463/1070), they arrived in North Africa in ancient times and established themselves "on the frontier of Ifrīḳiya, alongside the Maghrib" (i.e. in eastern Algeria), while the region which later, in the Middle Ages, became their homeland, in other words the territory located on the Chélif, constituted in ancient times the domain of "Adidjāna, father of Zanāta". If Ibn Khaldūn and his sources are to be believed, there is no doubt that the confederation of the

Maghrāwa already existed immediately before the Arab conquest of North Africa, probably in the first half of the 1st/7th century, if not much earlier, alongside two other major Zanāta branches (or possibly confederations), these being the Djarāwa, the people of the famous Kāhina, and the Banū Ifran. In all probability, the origins of the Maghrāwa could be traced back still further towards the beginning of the Christian era, through linking their name, in accordance with a hypothesis propounded by J. Desanges, with that of the Moorish peoples known to Pliny as the Macurebi and to Ptolemy as the Makkhourēbi. The latter seems to attribute to the main mass of the Makkhourēbi a very large coastal zone situated between the Zaccar and the Grande Kabylie, in the Roman province of Mauritania. In spite of the quite different localisation of the Maghrāwa and the Makkhourēbi (the latter tribe mostly occupied territory a little to the east of the cradle of the Maghrāwian confederation on the Chélif), the hypothesis of J. Desanges appears wholly acceptable and it seems that the Maghrāwa belong among those exceptional Berber tribes of the Middle Ages whose names are attested in the ancient Greek and Latin texts. It may further be added that another segment of the Makkhourēbi is mentioned by Ptolemy among the peoples of inner Libya (i.e. of southern Barbary). Ptolemy locates it, in fact, on the central reaches of the Draa. It is probably this group of the Maghrāwa which is encountered, in the 4th-5th/10th-11th century, in the neighbourhood of Sidjilmāsa and which succeeded in founding a kingdom with this city as its capital. There will be further mention of this kingdom below.

The Maghrāwa were related, if Ibn Khaldūn is to be believed, not only to the Banū Ifran and the Djarāwa, but also to the large Zanāta tribe of the Banū Irniyān. It seems furthermore that the genealogy of this tribe is linked to that of the Lawāta Berber group, in particular the Lawātian tribe of the Sadrāta. Among the numerous branches and subdivisions of the Maghrāwa confederation mentioned by Ibn Khaldūn and other mediaeval Arab authors, the first that should be mentioned is their royal clan which was called Wanzāmar or Warzamār (variants: Wazmār, Wartazmār, Warzāzmar or Wartazmīr). Also belonging to the Maghrāwa, according to Ibn Khaldūn and the Berber genealogists quoted by this author, were the Banū Sindjas, the Banū Rīgha, the Banū Laghwāṭ and the Banū Warrā (var. Warrāk), although according to Ibrāhīm b. ʿAbd Allāh, the best Zanāta genealogist of the 8th/14th century (a native of the Maghrāwa town of Timzūghat, situated in the region of the Chélif), these four tribes formed part of another branch of the Zanāta family. According to other Berber genealogists quoted by Ibn Khaldūn, there were yet more tribes belonging to the confederation of the Maghrāwa. These were the Banū Zandādj (Zandāk), the Banū Warsifān (or Warsīfān), the Banū Zadjdjāk, the Banū Izamratan (also Izmartan or Izmartī), the Banū Saʿīd and the Banū Ilīt (var. Ilant). It is interesting however, to note that Ibn Ḥawḳal includes, in his list of Berber tribes compiled after 976-7 A.D., the Banū Sindjāsan (Sindjas), the Banū Zandādj and the Banū Warsifān among the Zanātan tribes unrelated to the Maghrāwa. There are also certain Berber genealogists quoted by Ibn Khaldūn who mention the Banū Sindjāsan (Sindjas) and the Banū Warsifān without indicating their membership of the Maghrāwa confederation.

According to Ibn Khaldūn, the Franks (in this case, Romans) had imposed the Christian religion on the Maghrāwa, likewise on the Djarāwa and the Banū Ifran. Later, probably towards the end of the 7th or at the beginning of the 8th century A.D., the Maghrāwa tribes became converted without difficulty to Islam. They were governed in this period by an ancient and powerful dynasty, later known as Banū Khazar and owing its name to Khazar b. Ḥafṣ b. Ṣūlāt b. Wanzamār (Wazmār) b. Maghrāw. Ibn Khaldūn gives us a list, in his *History of the Berbers*, otherwise very incomplete, of the princes of this family which ruled the Maghrāwa in the central Maghrib, at Fās, at Sidjilmāsa and in Tripolitania. Another even less complete list of the *amīr*s whose origin dates back to Khazar b. Ḥafṣ is provided by Abū Zakariyyā Yaḥyā Ibn Khaldūn in his history of the Banū ʿAbd al-Wād. According to these lists, Ṣūlāt b. Wanzamār was the contemporary and client of the caliph ʿUthmān (644-56). In fact, he was apparently taken prisoner in one of the battles that took place between the Arabs and the Berbers at the time of the first Arab invasion of North Africa (26/647-8). Sent to ʿUthmān and pardoned by the caliph, he became a Muslim, and on returning to his country he was proclaimed chief of his tribe (according to a passage in Ibn Khaldūn's *History of the Berbers*, he had previously been chief of the Maghrāwa and of other Zanātian peoples). If this tradition is correct, the Banū Wanzamār must have been a Maghrāwian family which lived, around the middle of the 7th century A.D., in eastern Barbary, bordering on Ifrīḳiya, thus in the land which would have been, as stated by Ibn ʿAbd al-Barr, the original cradle of the Maghrāwa in ancient times.

After the death of Ṣūlāt who survived, in all probability, into the second half of the 7th century, the government of the Maghrāwa passed to his son Ḥafṣ, who is considered by Berber tradition as one of the greatest princes to rule over the Maghrāwa. He also became, following this tradition, the chief of other Zanāta tribes. The tribes in question were probably the remnants of the great Zanāta confederation of the Djarāwa of Aurès, formerly ruled by Kāhina [*q.v.*], remnants who went to join their Maghrāwa relatives of the central Maghrib. The power of the Maghrāwa also increased during the reign of Khazar, son of Ḥafṣ. He lived in the first half of the 2nd/8th century and gave his name to the historical dynasty of the Banū Khazar. A tradition quoted by Ibn Khaldūn states that this powerful prince took advantage of the Khāridjite revolt of Maysara [*q.v.*] in the Farthest Maghrib (in 122/739-40) and of the weakening of the Umayyad Arab governors of Ḳayrawān which resulted from it, to extend his authority over all the Zanāta nomads of the central Maghrib, with the exception of the powerful tribe of the Banū Ifran, masters of Tlemcen. The Arab sources tell us nothing of Maghrāwa involvement in the Khāridjite movement. However, this would not seem impossible, in view of the fact that a little later a member of the Maghrāwa, Nahdī b. ʿĀṣim al-Zanātī (or Nahd b. ʿĀṣim al-Maghrāwī) was appointed governor (probably of a segment of the Maghrāwa) by ʿAbd al-Wahhāb b. ʿAbd al-Raḥmān b. Rustum, Ibāḍī *imām* of Tāhart (168-208/784-823), and that in the *Kitāb al-Siyar* of al-Shammākhī (10th/16th century) and in a list of Zanātan Ibāḍī *shaykh*s, compiled in eastern Barbary in the 7th/13th centuries, there are found numerous Maghrāwa individuals belonging to the Ibāḍī sect. Khazar b. Ḥafṣ died after the fall of the Umayyads of the East (132/750), leaving control of the confederation

of the Maghrāwa to his son Muḥammad b. Khazar. The last-named made war against the Banū Īfran, from whom he captured, in about 172/788-9, the town of Tlemcen. It was during the reign of this prince that there took place the foundation of the kingdom of the Idrīsids in the Maghrib al-Aḳṣā by Idrīs b. ʿAbd Allāh [*q.v.*] with the support of the powerful Berber tribes of Awraba, Ṣadīha and Maghīla (172/788-9). In 173 or 174/789-91, Idrīs invaded the central Maghrib and accepted the submission of the Maghrāwa, whose *amīr* surrendered to him the territory of the Chélif and the town of Tlemcen; the latter later became the capital of another Idrīsid principality. Muḥammad b. Khazar also assisted Idrīs b. ʿAbd Allāh to snatch from the ʿAbbāsids all the provinces of the central Maghrib. Later, in 197/812-13, we find him pledging loyalty to Idrīs II. As for the Maghrāwa, in this period they continued in possession of the plains of the central Maghrib, as well as the open country round Tlemcen, which they shared with the Banū Īfran. Throughout the 3rd/9th century they remained vassals of the Idrīsid state. It was probably also in this period that the dynasty of the Banū Khazar founded Madīnat Banī Khazar, "the city of the Banū Khazar" in an arid plain of the central Maghrib. We do not know the exact position of this city, which is mentioned by Ibn Ḥammad in his biography of Abū Yazīd Makhlad b. Kaydād, "the man on the donkey". This Khāridjite chief sought refuge there after his defeat in the year 335/946-7.

This situation continued unchanged until the formation of the Fāṭimid empire. When the Mahdī ʿUbayd Allāh sent to the Maghrib, in 298/910-11, an army which took possession of the Idrīsid dominions and compelled the Idrīsid princes to recognise his authority, the Berber tribes of the central Maghrib, led by the Maghrāwa and other Zanāta tribes, rose in revolt against this sovereign. The rebels were commanded by the Maghrāwa prince Muḥammad b. Khazar, one of the grandsons of that Muḥammad b. Khazar b. Ḥafṣ who was *amīr* of the Maghrāwa towards the end of the 2nd/8th century. Ten years later, in 309/921-2, the Mahdī ʿUbayd Allāh sent an army against him which was however routed by the Maghrāwa. The following year, ʿUbayd Allāh dispatched against Muḥammad b. Khazar a fresh army commanded by his son Abu 'l-Ḳāsim. At the approach of this army, the Maghrāwa of the central Maghrib (or the majority of the tribes of this confederation) led by Muḥammad b. Khazar fled into the desert, having traversed the Moulouya. They took refuge in the territory of Sidjilmāsa, thus in the region where Ptolemy had located, in the 2nd century A.D., the homeland of a group of the Makkhourēbi, ancestors, as stated above, of the mediaeval Maghrāwa. Some time later, Muḥammad b. Khazar returned at the head of the Maghrāwa tribes to the central Maghrib, towards the former homeland of these tribes in the region of the Chélif. On this occasion, Muḥammad b. Khazar took possession of the territory of Chélif and of Ténès, expelled the supporters of the Fāṭimids from the Zāb and captured the town of Oran, where he installed, as governor, his son al-Khayr. He also conquered other sites in the central Maghrib, and subjected the whole of this land to the authority of the Umayyads of Spain. However, this success did not last long. In 315 or 316/927-9, the Fāṭimid army commanded by Abu 'l-Ḳāsim, son of ʿUbayd Allāh, set out to pacify the central Maghrib. This army routed the Maghrāwa and forced them again to flee into the desert. But in 333/944-5, Muḥammad b. Khazar, who had regained his position as the most powerful chieftain of the central Maghrib, attacked the western provinces of the Fāṭimid empire for the second time. He benefited in fact from the revolt of the Zanāta tribes of the central Maghrib and of Ifrīḳiya, who professed the doctrines of the Khāridjite sect of the Nukkār (Nakkāra) and rebelled against the Fāṭimids. The insurgents were commanded by the famous Zanātian chief, the Nukkārite *imām* Abū Yazīd [*q.v.*]. It seems that at least some of the Maghrāwa, who were predominantly Sunnī, acted in collusion with Abū Yazīd, and that Maʿbad b. Khazar, brother of the *amīr* Muḥammad b. Khazar, was a loyal supporter of the Nukkārī chief. Maʿbad b. Khazar was taken prisoner, in 340/951-2, by the Fāṭimid sovereign Ismāʿīl al-Manṣūr and suffered the death penalty. Another of the brothers of *amīr* Muḥammad b. Khazar, Fulful, embraced the cause of the Fāṭimids. However, the Maghrāwa who occupied the territory of Chélif collaborated at this time with the army sent to the central Maghrib by the Umayyad caliph of Spain ʿAbd al-Raḥmān III al-Nāṣir. In 333/944-5 two Maghrāwa expeditions took place against the Fāṭimid provinces of the central Maghrib. These expeditions were commanded by the *amīr* Muḥammad b. Khazar, by his third brother ʿAbd Allāh b. Khazar and by his two sons al-Khayr and Ḥamza. They were directed primarily against the Fāṭimid garrisons of Biskra and of Tāhart (Tiaret). Also participating in the second expedition was the Umayyad army commanded by the Berber general Ḥāmid b. Yasal. These two expeditions had a successful outcome for the Maghrāwa and their allies, the Umayyads of Spain. In fact, Biskra and Tāhart were captured by Muḥammad b. Khazar, by his son al-Khayr and by their allies (*ca.* 333/944-5). However, soon after these victories and the success of Abū Yazīd (whose army even succeeded in conquering Ifrīḳiya, the nucleus of the Fāṭimid empire), the military forces of this empire regrouped under the command of Ismāʿīl al-Manṣūr and routed the Berber warriors of Abū Yazīd in a battle near Maḳḳara (Bordj Magra), then turned against the Maghrāwa. Muḥammad b. Khazar surrendered to al-Manṣūr in 335/946-7. According to one source, he subsequently broke faith with the Fāṭimids, and it was only in 342/953-4 that he returned to the Fāṭimid camp and abandoned for ever the cause of the Umayyads. His position towards the latter dynasty was again equivocal in 347/958, at the time of the expedition of the Fāṭimid general Djawhar who set out for the central Maghrib with the object of pacifying this land, but ultimately, intimidated, he took part in this expedition. After this he paid a visit to the caliph al-Muʿizz at Ḳayrawān, where he died in 350/961-2, aged more than a hundred years. According to another source, Muḥammad b. Khazar embraced the cause of the Fāṭimids soon after 340/951-2 and remained loyal to this dynasty until his death. As for al-Khayr, son of Muḥammad b. Khazar and chief of the land of Laghouat, he did not share the pro-Fāṭimid policy of his father and remained a loyal supporter of the Umayyad caliph ʿAbd al-Raḥmān III of Cordova, except for a certain period *ca.* 334/945-6, during which he recognised the authority of the Fāṭimid caliph. In fact, in 340/951-2, he sent his son Futūḥ to Spain, to the court of the Umayyad caliph. Futūḥ was accompanied on this journey by the *shaykhs* of Tāhart and of Oran, supporters of the Umayyads. Subsequently, this delegation returned to Africa.

After the death of the *amīr* Muḥammad b. Khazar,

the supreme command of the Maghrāwa passed to Muḥammad b. al-Khayr, grandson of this *amīr* and son of al-Khayr. Even during the lifetime of his grandfather, Muḥammad b. al-Khayr had forged links with the court of Cordova, obtaining from the caliph ʿAbd al-Raḥmān III, in the year 344/955-6, the governorship of Fās. However, he requested from this caliph, in the same year as his appointment, permission to embark on a holy war in Spain. Having received this permission, he set out for Spain, leaving his cousin Aḥmad b. Bakr at Fās to act as his lieutenant. Later, after his proclamation as chief of the confederation of the Maghrāwa, Muḥammad b. al-Khayr harassed the Fāṭimid possessions in the central Maghrib at the instigation of the caliph al-Ḥakam II (350-66/961-76), successor to ʿAbd al-Raḥmān III. It should not be forgotten that the Fāṭimid empire had extended its boundaries westward largely by virtue of the victorious expedition of the general Djawhar in 347/958. In fact, at the beginning of the reign of Muḥammad b. al-Khayr over the Maghrāwa, that is *ca.* 351/962, the Fāṭimid influence had already advanced to the Maghrib al-Akṣā, while that of the Umayyads of Spain was confined to the districts of Ceuta and of Tangier. Now Muḥammad b. al-Khayr succeeded in pushing back a considerable distance towards the east the zone of Fāṭimid influence established by Djawhar. In fact, he conquered a large part of the central Maghrib, creating in this land a sizable, albeit ephemeral, dominion of the Maghrāwa under the control of the Umayyads. This dominion lasted some ten years, until the Fāṭimid governor of Ifrīḳiya, Zīrī b. Manād (who belonged to the major Berber family of Ṣanhādja, hostile to the Zanāta in general and to the Maghrāwa in particular) was entrusted by al-Muʿizz with the mission of blocking Maghrāwa expansion in the central Maghrib. Zīrī b. Manād also received from al-Muʿizz authorisation to appropriate all the territories in the Maghrib that he could seize from the Maghrāwa and the Zanāta. In 360/971 Zīrī b. Manād gathered a powerful army (composed mainly of Ṣanhādja warriors) which he put under the command of his son Bulukkīn (Buludjdjīn/Buluggin); this army was ordered to attack the Maghrāwa and the Zanāta. The first clash took place on 15 Rabīʿ II 360/15 February 971, probably near Tlemcen. The battle was keenly contested, and ultimately a terrible defeat was inflicted on the Maghrāwa and the Zanāta. Muḥammad b. al-Khayr, who was commander-in-chief of the Maghrāwa army, took his own life rather than face capture, and seventeen of the *amīrs* of the Maghrāwa and Zanāta were lost. In spite of this defeat, which contributed considerably to the consolidation of Fāṭimid authority in the Maghrib, the Maghrāwa soon rallied behind al-Khayr b. Muḥammad b. al-Khayr, son of their prince killed in the battle of Tlemcen. Their forces were rapidly joined by the army of Djaʿfar b. ʿAlī b. Ḥamdūn, former Fāṭimid governor of the Zāb, who allied himself with al-Khayr b. Muḥammad b. al-Khayr and thereby recognised the authority of the Umayyads of Spain. Three months later, the two allies inflicted a crushing defeat on the Fāṭimid army which attacked them near Tāhart. Despite this success, the Maghrāwa and the army of Djaʿfar b. ʿAlī b. Ḥamdūn (who had meanwhile become commander-in-chief of the coalition) were soon forced by another Fāṭimid army to evacuate the central Maghrib, crossing the Moulouya and taking refuge in the Maghrib al-Akṣā. First of all, they reached the littoral of Ceuta and Tangier which remained, as stated above, under the domination of the Umayyads. From there they made contact with the caliph al-Ḥakam II. It was thus that a section of the tribes which had formed the ancient confederation of the Maghrāwa left their homeland in the central Maghrib, not to return until about a century later, after their expulsion from Morocco by the Almoravids. Among the Maghrāwa *amīrs* tracing their origin from the princely family of the Banū Khazar who set out to seek new territories in the Maghrib al-Akṣā after their war with Bulukkīn b. Zīrī, Ibn Khaldūn mentions, besides Muḥammad b. al-Khayr, the close kinsmen of the latter, these being Zīrī b. Khazar, Zīrī b. ʿAṭiyya, Muḳātil b. ʿAṭiyya (brother of the last-named), Khazrūn b. Muḥammad and Fulful b. Saʿīd. They are all encountered, in 365/975-6, in the entourage of the general Djaʿfar b. ʿAlī b. Ḥamdūn, who was appointed by al-Ḥakam II governor of the Maghrib on behalf of Cordova. As for Bulukkīn b. Zīrī, he received from al-Muʿizz in 361/972, the mandate to govern Ifrīḳiya and the Maghrib as dependencies of the Fāṭimid caliphs of Egypt.

Thus, after the year 971, the history of the majority of the tribes that had previously constituted the confederation of the Maghrāwa was closely linked with the country that is now Morocco, where the various princes of the Banū Khazar family established three states, those of Fās, of Sidjilmāsa and of Aghmāt. We shall begin with the history of these dominions, subsequently considering other segments of the Maghrāwa who remained, after 361/971, in the central Maghrib and in Ifrīḳiya, or those who returned, after the conquest of Morocco by the Almoravids, to central and eastern Barbary.

A. Morocco. 1. *Fās.* Bulukkīn b. Zīrī was not content with the expulsion of the Maghrāwa and their Zanātian allies from the central Maghrib, from Ṭubna, from Bāghāya, from al-Masīla, from Biskra, from Tāhart, etc., but pursued them, with great success, towards the interior of present-day Morocco. He finally caught up with them near Sidjilmāsa and defeated them in battle. The *amīr* al-Khayr b. Muḥammad fell into the hands of the Fāṭimids and was put to death. After this battle, Bulukkīn b. Zīrī retraced his steps and returned to central Morocco where he carried out a massacre among the Zanātian tribes. Al-Khayr b. Muḥammad left a son named Muḥammad b. al-Khayr, whom a group of Moroccan Maghrāwa entrusted with the command. Besides him, the sources mention two other powerful and influential *amīrs* who enjoyed, in this period, considerable authority among the Maghrāwa. These were two kinsmen of Muḥammad b. al-Khayr b. Muḥammad, namely Zīrī and Muḳātil, sons of ʿAṭiyya b. ʿAbd Allāh b. Khazar. These three *amīrs* led the Maghrāwa after 971. It seems that some years later, the Maghrāwa of the Maghrib al-Akṣā divided into two groups, a northern and a southern, both obedient to the Umayyads of Cordova. The sources provide a list of the Maghrāwa princes belonging to the first of these groups who were to be found, in 365/975-6, in the entourage of Djaʿfar b. ʿAlī b. Ḥamdūn, Umayyad governor of the Maghrib al-Akṣā. This list includes Muḥammad b. al-Khayr b. Muḥammad, whose name is followed by those of Bakṣaṣ b. Sayyid al-Nās, Muḳātil b. ʿAṭiyya, Khazrūn b. Muḥammad and Fulful b. Saʿīd. The southern group of the Moroccan Maghrāwa were commanded by another prince of the Banū Khazar family, Khazrūn b. Fulful b. Khazar. This prince set out in 366/976-7 to conquer Sidjilmāsa, a town gov-

erned by the *amirs* of the Miknāsa family of the Banū Midrār. After the seizure of Sidjilmāsa, Khazrūn received from the *ḥādjib* of Cordova, al-Manṣūr Ibn Abī ʿĀmir, the mandate to govern this town which remained in his family, as will be noted below, until the arrival of the Almoravids.

Muḥammad b. al-Khayr b. Muḥammad seems to have still been the head of the Banū Khazar family in 369/979-80, when Bulukkīn b. Zīrī b. Manād undertook a new expedition to the borders of the Maghrib al-Akṣā. This prince fled to Spain, where he requested the support of the *ḥādjib* al-Manṣūr who governed Spain on behalf of the Umayyad caliph Hishām (366-99/976-1009). The latter responded to his appeals and sent an expedition to the Maghrib under the command of Djaʿfar b. ʿAlī b. Ḥamdūn. The Andalusian army, which included Maghrāwa and Īfran contingents, advanced to a position near Ceuta; Bulukkīn b. Zīrī declined to give battle and withdrew to take possession of the remainder of Morocco. Later, in 375/985-9, Muḥammad b. al-Khayr is mentioned at the head of a list of Maghrāwa *amirs* who rallied, according to Ibn Khaldūn, around the flag of Abu 'l-Ḥakam ʿAmr b. ʿAbd Allāh b. Abī ʿĀmir, Umayyad governor of the Maghrib al-Akṣā. However, it is not he, but his cousin Mukātil b. ʿAṭiyya and the latter's brother Zīrī b. ʿAṭiyya who are noted on this occasion as being among the Berber princes most loyal to the Umayyad cause. It seems that Muḥammad b. al-Khayr b. Muḥammad lost the leadership of the northern group of the Maghrāwa in 375/985-6 or shortly after this date, to Mukātil b. ʿAṭiyya. After the death of the last-named in 378/988-9, it was his brother Zīrī b. ʿAṭiyya who was proclaimed leader of the northern group of the Moroccan Maghrāwa. This *amir* had in addition been appointed (by the Umayyad *ḥādjib* Ibn Abī ʿĀmir) king of the Maghrib al-Akṣā before this date, in 377/987-8. Zīrī b. ʿAṭiyya founded a kingdom in the north of this country and made the town of Fās the capital of this dominion, which remained in the possession of his successors until the arrival of the Almoravids. He settled the Maghrāwa (of the northern group) in the outskirts of the town. It should also be remembered that the family of Zīrī b. ʿAṭiyya was descended from ʿAbd Allāh who was the brother of the powerful Maghrāwa *amir* Muḥammad b. Khazar, king of the central Maghrib who, as stated above, was a supporter of the Fāṭimids and died at Ḳayrawān in 350/961-2.

Some years after his appointment as sovereign of the Maghrib, Zīrī b. ʿAṭiyya went to war against the Ṣanhādja (acting on the orders of the *ḥādjib* al-Manṣūr) and substantially increased the size of his eastern provinces. In 382/993 he travelled to Cordova at the invitation of al-Manṣūr. It seems that the reign of Zīrī b. ʿAṭiyya was a period of some instability, with this prince and his Īfranid rival Yaddū b. Yaʿlā changing places on the throne of Fās according to the vicissitudes of war. In fact, on his return to Fās from Cordova, Zīrī saw his place taken by Yaʿlā and it was only at the cost of a murderous struggle that he recovered his throne. Because Zīrī constantly had in mind the reconquest of the territory of Chélif, and perhaps also the restoration of the ancient Zanāta and Maghrāwa kingdom of the Banū Khazar in the central Maghrib, he found the location of Fās too remote for the capital of the future state. Therefore he decided to construct a new capital for himself and for the principal chieftains of the confederation of the Maghrāwa. In 384/994 he founded the city of Wadjda (Oujda) on the borders of Morocco and present-day Algeria and installed himself there, accompanied by his court and his household troops. In the same period, he decided to reject the authority of Cordova, and ultimately the relations between him and al-Manṣūr Ibn Abī ʿĀmir were broken. Al-Manṣūr sent an expedition against him commanded by the freedman Wāḍiḥ; an encounter took place on the banks of Wādī Radāt and the Andalusian army was defeated. Al-Manṣūr then organised another expedition and appointed as commander his own son ʿAbd al-Malik al-Muẓaffar. This time, Zīrī was defeated on two occasions in 387/997. He tried to take refuge in Fās, but the residents denied him access to his capital, which ʿAbd al-Malik entered shortly after. Zīrī was compelled to withdraw by way of the Sahara, after which he attempted to found a state in the central Maghrib, in the territory belonging to the kingdom of the Zīrid Bādīs b. al-Manṣūr b. Bulukkīn. Thus in 388/998 he mounted an invasion of this part of the Maghrib. After the victory of the Ṣanhādjian army commanded by Ḥammād b. Bulukkīn, Zīrī b. ʿAṭiyya took possession of Tāhart, Chélif, Ténès and al-Masīla. It is interesting to note that in these towns he ordered that prayers be offered for the Umayyad caliph Hishām and his *ḥādjib* al-Manṣūr. He also laid siege to the town of Ashīr, capital of the Ṣanhādja, but he died in 391/1000-1, before taking this town.

On the death of Zīrī b. ʿAṭiyya, the Maghrāwa of northern Morocco proclaimed his son al-Muʿizz chief of this branch of the confederation. This prince, who did not share his father's hostile attitude in regard to the *ḥādjib* Ibn Abī ʿĀmir, had already, in 390/999-1000, been established by the latter at Fās in the role of Umayyad governor. Subsequently, the son of the *ḥādjib* ʿAbd al-Malik al-Muẓaffar, who became after the death of al-Manṣūr his successor at the court of Cordova, appointed al-Muʿizz, in 393/1002-3, to govern Fās and the Maghrib al-Akṣā. In 396/1006, al-Muʿizz received from Cordova letters of investiture for Fās and for the whole of the Maghrib al-Akṣā with the exception of the land of Sidjilmāsa, the preserve of the Maghrāwa dynasty of the Banū Khazrūn who were, like the *amirs* of Fās, subject to the Umayyads of Spain. Al-Muʿizz died in 417/1026 or, according to another source, in 422/1030; during his reign, the kingdom of Fās enjoyed a period of peace.

His successor was his paternal cousin Ḥamāma b. al-Muʿizz b. ʿAṭiyya who had been appointed governor of Fās by al-Muʿizz in 416/1025, before the death of this *amir*. Ḥamāma was able to consolidate his power in regard to Spain. However, in 424/1032-3, war broke out between this *amir* and the rival dynasty of the Banū Īfran, who possessed a kingdom with its capital at Shalla (Salé) on the Atlantic coast of Morocco. The Īfranid prince Abu 'l-Kamāl Tamīm b. Zīrī marched against Fās and captured this town. Ḥamāma retreated towards the east and reached the towns of Wadjda and Ténès in the eastern part of the kingdom of Fās, where he stayed for five years. Having mustered powerful contingents, he advanced on Fās in 429/1037-8. Abu 'l-Kamāl was forced to withdraw from Fās and return to Shalla. Later, in 430/1038-9, Ḥamāma continued the anti-Ṣanhādja policy of his predecessors by attacking the Ḥammādid prince al-Ḳāʾid (419-46/1028-54) who came to meet him and secretly paid large sums of money to the Zanāta troops of Ḥamāma. The latter, becoming aware of this and fearing the defection of his troops, returned to Fās, having declared his submission to the Ḥammādids. He died in 431/1039-40 or 433/1041-2.

After his death, power passed to his son Dūnās. Having suppressed a revolt by one of his cousins, this prince subsequently devoted all his efforts to the embellishment of Fās, which was now becoming a large commercial city. He died in 452/1062, leaving the throne to his son al-Futūḥ. But the rights of al-Futūḥ were contested by his brother ʿAdjīsa. The latter took control of part of the capital, while al-Futūḥ established himself in the other part. The two brothers engaged in a war which lasted three years, at the end of which ʿAdjīsa was killed and al-Futūḥ was able to reign effectively in Fās. However, his was not a long reign. In fact, he was driven from Fās in 454/1062 by the Ḥammādid sovereign Bulukkīn b. Muḥammad (447-54/1055-62). After his departure, the Maghrāwa chose one of his kinsmen to succeed him, Muʿannaṣar (or Muʿanṣar) b. Ḥammād b. Muʿanṣar b. al-Muʿizz b. ʿAṭiyya. He was proclaimed chief in 455/1063 and was soon obliged to wage war against the Almoravids, who were beginning to invade Morocco. Defeated by them in a major battle the same year, he took refuge with the Berber tribe of Sadīna, leaving Fās to fall into the hands of the warriors of Yūsuf b. Tāshfīn. But some time later he returned, deposing the lieutenant installed by Yūsuf b. Tāshfīn and regaining control of his capital. When the Almoravids laid siege to Fās, in 460/1067-8, Muʿanṣar attempted a sortie, but he did not return from the battlefield. The people of Fās then proclaimed as prince his son Tamīm. But the capital was taken by Yūsuf b. Tāshfīn two years later (462/1069-70), and the new sovereign was put to death by the Almoravid king, who also ordered the slaughter of more than three thousand Maghrāwa, Banū Ifran, Zanāta and Miknāsa living in Fās. Those who escaped the massacre took refuge in Tlemcen. Another group in Maghrāwa from Fās fled to al-Damna, a town situated in northern Morocco, on the frontiers of the land of Ghomāra. But the Almoravid king laid siege to the place in 465/1072-3 (or according to another source, in 471/1078-9); he captured the town and crushed the Maghrāwa. Al-Bakrī mentions, in 1068, yet another group of northern Maghrāwa living near the highway leading from Ceuta to Tetouan, on the fringe of territory belonging to the Berber tribe of the Madjaksa. There they possessed a market which they called Sūḳ Banī Maghrāwat ("Market of the Banū Maghrāwat"). It is not known whether this group survived the conquest of Fās and al-Damna by the Almoravids. However, it is by no means impossible that this small tribe should have succeeded in crossing the Moulouya and returning to the Chélif, the ancient cradle of the Maghrāwa.

2. *Sidjilmāsa*. At the instigation of the *ḥādjib* of Cordova Ibn Abī ʿĀmir, a Maghrāwa chief named Khazrūn b. Fulful b. Khazar embarked in 366/976-7 on the conquest of Sidjilmāsa, which for two centuries had been governed by *amīrs* of the Miknāsa family of the Banū Midrār [*q.v.*]. This chief, who was one of the most influential members of the princely family of the Banū Khazar, proclaimed in Sidjilmāsa the sovereignty of the Umayyads of Spain and sent to Cordova the head of the last prince of the Midrārid dynasty. After this, Khazrūn received from al-Manṣūr the governship of Sidjilmāsa which he retained until his death. He was then replaced by his son Wānūdīn. The latter was obliged to defend himself against the invasion by the Algerian Ṣanhādja of the Maghrib al-Akṣā. For a certain period of time he was thrown into disgrace by al-Manṣūr, whose son and minister al-Muẓaffar gave the government of Sidjilmāsa to Ḥāmid b. Yaṣal, but later, in 390/999, his authority was confirmed by the Umayyads. At the time of the fall of the Umayyad caliphate in Spain, he declared himself independent, conquered the region of Darʿa (Dra in our maps) and in 407/1016-17, took possession of Ṣufrūy (Sefrou), which was one of the dependencies of Fās, and of the valley of the Wādī Malwiya (Moulouya). Al-Muʿizz b. Zīrī, sovereign of Fās and master of Ṣufrūy (and perhaps also of the region of the Moulouya), under attack from Wānūdīn who conquered a large portion of his dominion, attempted not only to recapture these provinces but also to deprive Wānūdīn of his capital. The same year (407/1016-17), he mounted an expedition with a powerful army, but was beaten by the troops of Sidjilmāsa and led back to Fās only the remnants of his force. His son and successor Masʿūd was defeated, stripped of his dominions and killed by the Almoravids, who put to the sword all the Maghrāwa who had taken refuge in the region (445/1053-4). Ten years later (in 455/1063), the sons of Wānūdīn and the remnants of the Maghrāwa residing at Ṣufrūy were dispersed in their turn. Finally, in 463/1070-1, the Almoravids seized by force the settlements of the region of the Moulouya. In this way, the domain of the Banū Khazrūn family was utterly destroyed.

3. *Aghmāt*. Another segment of the ancient confederation of the Maghrāwa which entered Morocco *ca.* 971 founded a small kingdom at Aghmāt on the plain of Marrākush near the foothills of the High Atlas, in the period when the last princes of the family of Zīrī b. ʿAṭiyya were the rulers of Fās. Nothing is known of the history of the Maghrāwian dynasty which reigned at Aghmāt, but it seems to have been just another branch of the great Maghrāwa princely family of the Banū Khazar. The last of the Maghrāwa *amīrs* of Aghmāt, named Laḳūṭ, (Laḳḳūṭ, Laghūṭ) b. Yūsuf b. ʿAlī, was killed by the Almoravids in 451/1059. He was apparently been married to the wise and beautiful Zaynab bint Isḥāḳ of the Berber tribe of Nafza who became, after the death of Lāḳūṭ, the wife of the Almoravid *amīr* Abū Bakr b. ʿUmar. The latter subsequently, in 453/1061, handed over Zaynab to his kinsman Yūsuf b. Tāshfīn.

4. *al-Sūs*. After the arrival of the Maghrāwa in the Maghrib al-Akṣā in *ca.* 971, an *amīr* of the family of the Banū Khazar, named Muḳātil and, according to Ibn Ḥawḳal, the brother of the *amīr* Abū ʿAbd Allāh Muḥammad b. Khazar, set out, probably at the head of a group of Maghrāwa, towards the south where he occupied territories in the province of al-Sūs, According to the list of Berber tribes compiled by the geographer Ibn Ḥawḳal, he was present in this area in the period following 366/976-7. This prince is completely unknown to us. He may in fact be none other than Muḳātil b. ʿAṭiyya, brother of Zīrī (sovereign of Fās), mentioned *ca.* 365/975-6 and residing, in this period, in the north of Morocco, as stated above.

Despite the crushing defeat inflicted on the kingdoms of Fās, of Sidjilmāsa, of Aghmāt and of al-Damna, the Almoravids did not succeed in exterminating all the branches of the Maghrāwa in Morocco. In fact, the remnants of this confederation stayed in this country where they are mentioned again, in the 8th/14th century, by Ibn Khaldūn. Among these remnants attention should be drawn to the Banū Warrā, a substantial branch of the Maghrāwa. In this period, families belonging to this tribe were widely dispersed in Morocco, particularly in the environs of Fās and in the Sūs. According to Ibn

Khaldūn, at the beginning of the 8th/14th century, the Marīnid sultan Yūsuf b. Yaʿḳūb deported to the territory of the Chélif the chiefs and almost all the families of the Banū Warrā who resided in the region of Fās. Another Maghrāwian branch, the Banū Sindjas, also occupied in the 8th/14th century numerous places in Morocco.

B. Algeria 1. *Tlemcen*. According to Ibn Khaldūn, the Maghrāwian sovereign of Fās, al-Muʿizz b. Zīrī, seized from the Ṣanhādja, i.e. from the Zīrid king Bādīs b. al-Manṣūr (386-409/996-1016), the town and province of Tlemcen, where he established as governor his kinsman Yaʿlā, son of the *amīr* Muḥammad b. al-Khayr, who had previously (until *ca.* 375/985-6) headed the confederation of the Maghrāwa in the Maghrib al-Aḳṣā. Yaʿlā served Muʿizz b. Zīrī faithfully and passed on to his descendants the government of Tlemcen and of all the surrounding country.

His successors lived in peace with the Ṣanhādja dynasty, masters of the central Maghrib, which enabled them to consolidate their authority at Tlemcen, which became an independent state. This situation continued until the arrival in the central Maghrib of the Hilālian tribes of Zughba and Athbadj. In *ca.* 446/1054-5 the invaders turned their weapons against the Zanāta tribes of the area and captured from them all the open country. The Ḥammādids, who found themselves in this period, after many truces, in a state of war with the *amīr* Bakhtī, a descendant of Yaʿlā b. Muḥammad b. al-Khayr, obtained the support of the Zughba. The war between Bakhtī and the Zanāta on the one hand and the Ḥammādids and the Zughba on the other, lasted a long time. Bakhtī put at the head of his army a vizier named Abū Suʿda who belonged to the Zanāta tribe of the Banū Īfran. This general rallied beneath his flag all the Zanāta tribes of the central Maghrib, headed by the Maghrāwa and the Banū Īfran. The sources mention numerous battles which took place between the Ḥammādids (and their allies, the Zughba and the Athbadj) and the army of Bakhtī. In one of these conflicts, Abū Suʿda lost his life (450/1058). After the death of Bakhtī, at a date unknown, the throne passed to his son al-ʿAbbās. It was during this period that the Almoravids, having completed the conquest of the Maghrib al-Aḳṣā, appeared in the central Maghrib. Their chief, Yūsuf b. Tāshfīn, dispatched an army composed of the Lamtūna against Tlemcen and, in 473/1080-1, he seized this town from al-ʿAbbās. Subsequently, he put this *amīr* to death, along with all the other descendants of the family of Yaʿlā b. Muḥammad b. al-Khayr and exterminated the Maghrāwa who were trapped in the town.

2. *Chélif*. The emigration of the Maghrāwa of the central Maghrib to the Maghrib al-Aḳṣā which took place in 1971 involved only a part of the tribes of the Maghrāwa confederation, who left this country led by al-Khayr b. Muḥammad b. al-Khayr and other *amīrs* descended from the ancient princely family of the Banū Khazar. The other Maghrāwa tribes residing in the central Maghrib remained in the territory of Chélif and neighbouring sites, the region which had been, as stated by Ibn Khaldūn, the centre of their settlements. These tribes were obliged, after the collapse of their power in 971, to pay tribute to the major dominions of the central Maghrib as a guarantee against their attacks. Among these Maghrāwa were the powerful tribe of the Banū Warsifān and the tribes of the Banū Wartazmār (Wanzamār), the Banū Īlīt, the Banū Zadjdjdāk and the Banū Sindjas. Later, the Arab sources add to these the Banū Bū Saʿīd and the Banū Warrā. In the 5th/11th century the Banū Warsifān resided in the neighbourhood of Milyāna, where they lived under the control of their own *shaykhs*, subject in this period to the authority of the Ḥammādids, and the Banū Sindjas, who had their own *amīr*, possessed the region of Medea, known as Lamdiya in the Arabic sources.

After the collapse of the dominions of Fās, of Sidjilmāsa and of Aghmāt brought about by the Almoravids, a Maghrāwa prince named Muʿanṣar b. Ḥammād, who claimed descent from Zīrī b. ʿAṭiyya, fled from Yūsuf b. Tāshfīn at the head of a group of Maghrāwa and entered the territory of Chélif, subject at this time to the Ḥammādid king al-Nāṣir (454-81/1062-89). It seems that the Maghrāwa tribes of this region recognised his authority, with the exception of the Banū Warsifān who were unwilling to accept him and who remained loyal to the Ḥammādid governor based at Milyāna. Muʿanṣar b. Ḥammād attacked them and killed a number of their *shaykhs*: he also slew the Ḥamādid governor of Milyāna. Al-Nāṣir was unable to come to the aid of the Banū Warsifān on account of his struggles with the Hilālian Arabs. So the Banū Warsifān marched alone against Muʿanṣar, killed him in battle and sent his head to al-Nāṣir. This battle seems to have been only one episode in a long war between the Maghrāwa invaders of Morocco, who were joined by numerous Maghrāwa and Zanāta tribes, and the Ḥammādids which took place *ca.* 460-70/1067-78. In this war, which ended with the decisive defeat of the Maghrāwa and the Zanāta, the Maghrāwa and Zanāta chiefs were decimated. Among these chiefs, mention should be made of Abu 'l-Futūḥ b. Ḥabbūs (or Ḥannūsh), *amīr* of the Banū Sindjas and ruler of Lamdiya (Medea).

The history of the Maghrāwa of the region of Chélif under the domination of the Almoravids is entirely unknown. They seem however to have suffered greatly at the hands of the Lamtūna. In fact, when ʿAbd al-Ṣamad, a Maghrāwa *amīr* who belonged to the Banū Khazar family and traced his origin from the royal family of the Banū Khazrūn of Tripoli, arrived in the territory of Chélif at around the middle of the 6th/12th century, he found there only remnants of the Maghrāwa. He established himself among this people and was greeted with honour by the Banū Warsifān, the Banū Wartazmār (Wanzamār), the Banū Bū Saʿīd and other Maghrāwa tribes. These tribes, ever loyal to the family of the Banū Khazar, the ancient kings of the territory of Chélif and of the entire central Maghrib, were all eager to recognise in his person the rights of this dynasty. ʿAbd al-Ṣamad allied himself through marriages to their leading families and left numerous children, who were known in the territory of Chélif by the name of Banū Khazar or Banū Muḥammad, no doubt in memory of Muḥammad b. Khazar, the Maghrāwa king of the central Maghrib in the 4th/10th century. The arrival of ʿAbd al-Ṣamad in the region of Chélif took place shortly before the establishment of the empire of the Almohads, who became masters of the central Maghrib in 547/1152 after a war against a coalition of Zanāta tribes. Also members of this coalition were the Maghrāwa, in particular the tribe of the Banū Warsifān (in *ca.* 539/1145). One of the descendants of ʿAbd al-Ṣamad, a certain Abū Nās who was renowned for his piety, received from the Almohads, who treated him with great respect, the government of part of the territory of Chélif and the command of the Maghrāwa in this region.

Such were the origins of a new Maghrāwa state in the central Maghrib. The real founder of this state was Mandīl b. ʿAbd al-Raḥmān, grandson of Abū Nās who lived at around the end of the 6th/12th and beginning of the 7th/13th centuries. This prince conquered the neighbouring territories, including the region of Wānsharīs and the town of Lamdiya (Medea) along with the places dependent on them. The dynasty which he founded is known in the mediaeval Arabic sources as Awlād Mandīl [*q.v.*]. As for Mandīl b. ʿAbd al-Raḥmān himself, he took the field against Ibn Ghāniya, but lost the battle and died in 622/1225, prisoner of this chief.

The successors of Mandīl took possession of Miliana, of Ténès, of Cherchel, of Mitīdja and a large part of the region of Wānsharīs, founding a quite substantial kingdom, much of which was subsequently taken from them by their neighbours, in particular by the Banū ʿAṭiyya, chiefs of the Zanāta tribe of Tūdjīn which inhabited the region of the high Chélif. In *ca.* 670/1271-2, the Maghrāwa of Chélif recognised the sovereignty of the dynasty of the Banū ʿAbd al-Wād of Tlemcen. However, two years later the ʿAbd al-Wādid sultan Yaghmurasān b. Zayyān ravaged the land of the Maghrāwa and compelled them to cede to him the town of Ténès. Thus began the wars between the ʿAbd al-Wādids and the Maghrāwa *amīr*s which lasted a hundred years. One of the most important episodes of these wars was the expedition of the sultan of Tlemcen Abū Zayyān (703-7/1304-7) and his brother Abū Ḥammū against the tribes of Chélif in 706/1307, in the course of which the ʿAbd al-Wādids subjugated the valley of the lower Chélif and conquered the towns of this region. Nevertheless, the Maghrāwa continued to be the formidable enemies of the Banū ʿAbd al-Wād. In fact, in 714/1314-5, the *shaykh* of the Maghrāwa tribe of the Banū Bū Saʿīd raised, in the valley of Chélif, the standard of revolt against Abū Ḥammū who had become sultan of Tlemcen after the death of Abū Zayyān. However, he was forced to take flight. Living at about the same time was the *amīr* Rāshid b. Muḥammad, a renowned Maghrāwa warrior who, after the conquest of his land by the Banū ʿAbd al-Wād, offered his services to the princes of Bougie. In 703/1303-4 he reached the territory of Mitīdja (Mitidja), where another celebrated Maghrāwa warrior named Munīf b. Thābit came to join him with his partisans. But the latter, decisively defeated, took refuge with his entire family in Spain, where he remained until the end of his life.

Later, at around the middle of the 8th/14th century, the Maghrāwa of Chélif became once more a tribe of some importance. They were at this time subjects or allies of the sultans of Tlemcen, but they sought at every opportunity to rid themselves of this dependence. In this period, their principal centre was the town of Tīmzūghat or Tīmzūrat. In *ca.* 749/1348-9, a prince of the Awlād Mandīl dynasty named ʿAlī b. Rāshid (possibly the son of the renowned Maghrāwa *amīr* Rāshid b. Muḥammad mentioned above), took possession of the territory of Chélif and subjugated Miliana, Ténès, Brechk and Cherchel. He also possessed the village of Māzūna. But the revival of the state of the Maghrāwa did not last long. In fact they were attacked, in 751 or 752/1350-2, by the sultan Abū Thābit of Tlemcen, who subjugated the Maghrāwa of Chélif and captured Māzūna, Brechk, Cherchel, Miliana and Medea. The Maghrāwa warriors took refuge in the fortress of Adjrū which dominated the towns of Ténès. In *ca.* 772/1370, after the death of ʿAlī b. Rāshid, the Maghrāwa of Chélif proclaimed as chief his son Ḥamza, who was the last prince of the Maghrāwa state of Chélif. His reign was of short duration. In 774/1372, the sultan of Tlemcen sent powerful forces to subdue the Maghrāwa. The latter were defeated, and the ʿAbd al-Wādids took control of the town of Tīmzūghat (Tīmzūrat) situated in the centre of their territory. Ténès and Miliana also surrendered to the sultan of Tlemcen. In the wake of this defeat, the Maghrāwa of Chélif lost all their power and, to avoid the prospect of slavery, they emigrated from the region in large numbers. In 775/1373, the majority of this people took refuge in the district of Mitīdja. However, it is quite possible that some of the Maghrāwa of Chélif remained in their ancient homeland and that the noble and valiant inhabitants of the "Magraua Mountain" located near the village or Mostaganem who are spoken of in 1525 by Leo Africanus belonged to the various segments of the Maghrāwa.

3. *Zāb and its environs.* It has been observed above how the Maghrāwa princes of the Banū Khazar dynasty took advantage of the Khāridjite revolt of Maysara in 122/739-40 and of the enfeeblement of the Umayyad governors of Ḳayrawān to extend their authority over all the nomadic Zanāta of the central Maghrib, of which Zāb formed a part. So it was that from this period onwards, different Berber tribes and clans belonging to the confederation of the Maghrāwa began moving into this region. In 316/928-9 the powerful Maghrāwa prince Muḥammad b. Khazar appeared in Zāb, from which he energetically expelled the supporters of the Fāṭimids. Later, in 379/989-90, a Maghrāwa *amīr* claiming descent from the family of the Banū Khazar and named Saʿīd b. Khazrūn b. Fulful, discontented with the personal policies of the Umayyads of Spain who were lavishing extraordinary honours upon the *amīrs* Muḳātil and Zīrī, sons of ʿAṭiyya b. ʿAbd Allāh b. Khazar, deserted the Umayyad party and presented himself at Ashīr at the court of the Zīrid prince al-Manṣūr b. Bulukkīn (373-86/984-96) who gave to the turncoat the government of the town of Ṭubna in the region of Zāb. After the death of this *amīr* in 381 or 382 (991-2), it was his son Fulful b. Saʿīd b. Khazrūn who succeeded him in this role. In 389/999 this *amīr* rebelled against the Zīrid prince Bādīs b. al-Manṣūr (386-406/996-1016), but after defeat at the hands of the Ṣanhādja army he took refuge in the mountains and subsequently, in 391/1000-1, made his way through the desert to Tripoli.

Among other Maghrāwa individuals who were active in Zāb and the surrounding region mention should be made of three chiefs of the Banū Warzamār (Wanzamār), a leading family of the Maghrāwa, these being al-Manṣūr al-Warzamārī and his two sons ʿAbd Allāh and Masʿūd, who made war on Ḥammād b. Bulukkīn (405-19/1015-29), probably in the vicinity of the town of Bāghāya. It is also in this period that the Arabic sources mention the place known as Kudyat Maghrāwa, itself situated in the region of Zāb. According to al-Bakrī (1068), two tribes belonging to the ancient confederation of the Maghrāwa, these being the Banū Īzmartī (Īzamratan, Īzmartan) and the Banū Maghrāwa proper, resided in the vicinity of Biskra. The latter tribe was governed by *amīrs* descended from the Banū Khazar family. To the west of the town of Bantiyūs, which lies to the south-west of Biskra, there existed a place known as Sāḳiyat Ibn Khazar "the irrigation canal of Ibn Khazar", which owed

its name to a prince belonging to the family of the Banū Khazar, possibly the ancient Maghrāwa king Muḥammad b. Khazar who reigned in the central Maghrib in the first half and around the middle of the 10th century. To the west of Banṭiyūs, al-Bakrī notes the presence of the Maghrāwa in an expanse of desert three or four stages long, on the road leading from Oran to the land of Ḳasṭīliya (Bilād al-Djarīd). Maghrāwa are also to be found in this period to the south of Biskra. In fact, it is known that the town of Waghlanat or Wughallān (Ourlel or Ourellal on our maps), situated to the south of Biskra and probably inhabited by Berber Ibāḍī elements, was besieged in 450/1058-9 by the Maghrāwa chief named Abū Zaghīl al-Khazarī, clearly a member of the princely family of the Banū Khazar. Later, in *ca.* 468/1075-6, the Maghrāwa, the Ghumart and other nomadic Zanāta tribes of the Zāb region allied themselves with the Hilālian Arabs and sacked the towns of the Zāb. The leader of these brigands was the Maghrāwa chief al-Muntaṣir b. Khazrūn, master of the Zanāta of Tripoli (of whom further mention will be made below), who made his base at Waghlānat. The inhabitants of Zāb complained to the Ḥammādid prince al-Nāṣir (454-81/1061-89), who dispatched against al-Muntaṣir his son al-Manṣūr at the head of an army. Al-Manṣūr entered Waghlānat and destroyed the town. Some time later, al-Muntaṣir, for whom ʿArūs b. Sindī, chief of Biskra, had laid a trap, was killed by the latter and his head sent to al-Nāṣir.

It may be added that among the Maghrāwa tribes which inhabited Zāb and the neighbouring regions there were also the Banū Zandādj (Zandādja, Zandāk). This was an important tribal group which, according to al-Yaʿḳūbī, Ibn Ḥawḳal and al-Bakrī, lived in the 3rd-5th/9th-11th centuries in the environs of Ṭubna, of al-Masīla (Msila) and of Maḳḳara or Maḳra (the ancient Macri, the contemporary Bordj Magra), a town situated midway between Ṭubna and al-Masīla. According to the Ibāḍī historian al-Shammākhī (10th/16th century), the majority of the Zandādja professed the doctrines of the Ibāḍī sect.

Ibn Khaldūn (8th/14th century) mentions three other tribes belonging to the Maghrāwa residing in the region and vicinity of Zāb, these being the Sindjas, the Rīgha and the Laghwāṭ. The first of these tribes occupied the territory currently known as the Ouled Nail and the land extending as far as Djebel Amour and the mountain of Rāshid. According to Ibn Khaldūn, the Sindjas resided, before the arrival of the Hilālian Arabs, in the plains of Ifrīḳiya, and the latter forced this people, not without difficulty, to take refuge in the mountains and fortresses of the Ouled Nail and the surrounding regions. In the 8th/14th century, they paid tribute to the Hilālian Arabs who had subjugated them. According to Ibn Khaldūn, in this period they still professed the doctrines of the Khāridjite sect (in this case, Ibāḍī).

The Rīgha, a nomadic branch of the Maghrāwa which comprised a large number of families, was established in Djebel Aiad and in the plain extending from this mountain to the town of Niḳāwus (Ngaous on our maps). In the time of Ibn Khaldūn, the Rīgha of the mountains paid tribute to the *amīrs* of the tribe of ʿAyāḍ, and the families of the Rīgha residing in the plain of Niḳāwus were subject to the local Arabs.

The Laghwāṭ, a branch of the Maghrāwa tribe renowned for its valour and its resistance to Arab domination, inhabited in the 8th/14th century, the desert region separating the district of Zāb from the mountain of Rāshid. There they occupied a large settlement which bore their name, Laghouat on modern maps.

4. *Wādī Rīgh.* A large number of Maghrāwa families settled, probably at about the middle of the 4th/10th century, in the land stretching between Zāb and the territory of Wārdjilān (Ouargla on our maps) where the new arrivals built on the banks of a stream flowing from south to north, numerous towns and villages surrounded by date-palms. In the ancient Arab sources, this territory was called Wādī Arīgha or Wādī Rīgh, from the name of the Maghrāwa tribe of the Rīgha; on modern maps this land bears the name of Oued Righ or Oued Rirh. The majority of the Maghrāwa families who inhabited Wādī Arīgh were Ibāḍī Khāridjites; they principally professed the doctrines of the Wahbīs and the Nukkārīs. Alongside the Rīgha, there were also present in the 8th/14th century some members of the Sindjas clan, who arrived in this territory after leaving their former settlements in Zāb or in Ifrīḳiya. The Ibāḍī historian al-Shammākhī mentions on several occasions the Maghrāwa of Rīgh. The most ancient reference to the Maghrāwa of Oued Righ dates from *ca.* 362/972-3. Other mentions of the Maghrāwa of Rīgh occur in the 5th/11th and 6th/12th centuries.

5. *Eastern Algeria.* A segment of the tribe of the Sindjas resided, in the 8th/14th century, in the region of Constantine. In the same part of Algeria, Arabic sources of this period also mention an offshoot from the Maghrāwa tribe of the Banū Warrā which gave its name to a mountain and a village situated in the vicinity of Bougie. Finally, a Maghrāwa tribe known as the Banū Īkshan which professed the doctrines of the Ibāḍī sect resided, in the 4th/10th and 5th/11th centuries and possibly also in subsequent centuries, in the plain of Bône, Fahṣ Būna in Arabic sources. Ibāḍī sources from the 7th-10th/13th-16th centuries mention eight or so important Ibāḍī *shaykhs* belonging to this tribe.

C. Tunisia. A segment of the Maghrāwa tribe of the Banū Īzamratan inhabited the canton of Nafzāwa situated in the south of Tunisia. According to the Ḥafṣid historian Ibn Nakhīl, quoted by Ibn Khaldūn, this was the tribe of origin of the Berber chief ʿAbd Allāh b. Muḥammad al-Rand who governed, on behalf of the Zīrids, the town of Ḳafṣa (Gafsa), at the time of the invasion of the Banū Hilāl. In 445/1053-4 he declared himself independent and accepted the submission of Tūzar, Nafṭa, Taḳyūs, al-Ḥāmma and other localities in the province of Ḳasṭīliya; he founded the dynasty of the Banu 'l-Rand. On his death, in 465/1072-3, his son and successor Abū ʿUmar (Abū ʿAmr) al-Muʿtazz succeeded in constituting to the west of southern Ifrīḳiya an important principality comprising Ḳamūda (Gamouda), Ḳafṣa and Ḳasṭīliya, bounded to the north by the regions of Sebiba, Ḳayrawān and Sfax. The capital of this principality was the town of Ḳafṣa, situated in the centre of the territory which it dominated. The domain of the Banu 'l-Rand existed until 554/1159, at which date the Almohads captured Ḳafṣa and deposed the ruling family.

It seems that the Maghrāwa established themselves in the Nafzāwa in a quite ancient period. In any case, Muḥammad b. Isḥāḳ al-Khazarī, who was probably descended from the princely Maghrāwa family of the Banū Khazar, was appointed governor of the Nafzāwa by the Ibāḍī *imām* of Tāhart, ʿAbd al-Wahhāb b. ʿAbd al-Raḥmān b. Rustum (168-208/

784-823). Muḥammad b. Isḥāḳ was an Ibāḍī, as were the majority of the inhabitants of the district of Nafzāwa. Princes descended from the Banū Khazar family were still ruling the Nafzāwa at the time of the Zīrid al-Muʿizz b. Bādīs (406-54/1016/62).

It may be added that the Maghrāwa chief Warrū b. Saʿīd, descended from the Banū Khazrūn family an offshoot of the Banū Khazar, was appointed governor of Nafzāwa by the Zīrid prince Bādīs b. al-Manṣūr (400/1009-10). After him, his brother Khazrūn obtained from Bādīs the government of Nafzāwa (401-4/1010-14).

The Maghrāwa and the Zanāta also resided, in the second half of the 5th/11th century, throughout the region of Ḳasṭīliya. Ibn Khaldūn refers, in fact, to a raid of Hilālian Arabs against these Berber groups. Probably those involved were the same Maghrāwa who took part in a coalition of the Hilālian Arab tribes of Riyāḥ, of Zughba and of Sulayman which campaigned, in 457/1064-5, against the Ḥammādid sovereign al-Nāṣir.

Among the Maghrāwa tribes inhabiting Ifrīḳiya, mention should also be made of the Banū Sindjas, who distinguished themselves by the part that they played in the war of the Zanāta against the Zīrid and Ḥammādid Ṣanhādja. In 514/1120-1 they blockaded Gafsa and ravaged the surrounding area. They also appeared in the Bilād al-Djarīd, where they were attacked by Muḥammad b. Abi 'l-ʿArab, general of the Zīrid sovereign ʿAlī b. Yaḥyā (509-15/1116-21). The Zīrid army expelled them from the Djarīd and destroyed their power.

D. Tripolitania. An offshoot of the Maghrāwa led by *amīrs* descended from the family of the Banū Khazrūn, a branch of the Banū Khazar, established an independent government at Tripoli. The history of this state, which existed for almost a century and a half (391-541/1000-1145), is little known in spite of the information provided by Ibn Khaldūn, Ibn ʿIdhārī, al-Tidjānī and other Arab authors. Nevertheless, some facts are available, in particular concerning the first century of the dominance of the Banū Khazrūn.

It has been observed above that Fulful b. Saʿīd b. Khazrūn, a Maghrāwa *amīr* descended from the family of the Banū Khazar, was, like his father Saʿīd b. Khazrūn, a supporter of the Zīrids, lieutenants of the Fāṭimids in Ifrīḳiya and, like his father govern of the town of Ṭubna in the Zāb on behalf, of this Ṣanhādja dynasty. In 390/1000-1 Fulful b. Saʿīd rebelled against the Zīrid prince Bādīs b. al-Maṣūr. Defeated by Bādīs, he took refuge in the Sahara and subsequently marched on Tripoli, a province dependent on the Zīrids. He took control of this land in 391/1000-1. Becoming master of the town and province of Tripoli, Fulful b. Saʿīd was constrained to fight a prolonged war against Bādīs b. al-Manṣūr, and requiring military support he first of all recognised the authority of the Fāṭimid caliph al-Ḥākim whose aid was, however, ineffectual. Therefore, he decided to approach the Umayyads of Spain, and in 399/1008-9 he sent a mission to the court of Cordova, whose sovereigns had always been, since the time of ʿAbd al-Raḥmān III (300-50/912-61), allies and protectors of the Maghrāwa and their kings, the Banū Khazar. However, this approach led to no result, as Fulful b. Saʿīd died in 400/1009-10, before the return of his ambassadors from Cordova.

After the death of Fulful, the Maghrāwa and the other Zanāta tribes proclaimed as *amīr* his brother Warrū b. Saʿīd. This chief was obliged, first of all, to recognise the authority of the Zīrid Bādīs b. al-Manṣūr, who marched on Tripoli and occupied the town, forcing the Zanāta and Maghrāwa warriors to flee. Warrū b. Saʿīd was granted a general amnesty and appointment as governor of Nafzāwa (400/1009-10). But in 401/1010-11 he once more repudiated the authority of Bādīs and inaugurated a lengthy war, during which the Maghrāwa and Zanāta ravaged extensive areas of southern Ifrīḳiya and Tripolitania. However, they were unable to take control of the town of Tripoli which remained in the hands of Muḥammad b. al-Ḥasan, the governor appointed by Bādīs b. al-Manṣūr. Ultimately, in 404 or 405/1013-15, Warrū b. Saʿīd again offered his submission to the Zīrids.

After the death of Warrū b. Saʿīd in 405/1014-5, the Maghrāwa and Zanāta of Tripolitania were divided into two parties, one supporting the succession of Khalīfa, son of Warrū, and the other rallying round Khazrūn b. Saʿīd, the latter's brother. It was Khalīfa who emerged victorious over his rival, having taken possession of his camp. Khazrūn b. Saʿīd made his way to Egypt, to the court of the Fāṭimid caliph,where the two sons Saʿīd and al-Muntaṣir spent their youth. In this manner, Khalīfa b. Warrū established his authority over all the Maghrāwa and Zanāta of Tripolitania. This chief pledged loyalty to Bādīs b. al-Manṣūr, but after the death of this sovereign and the accession of his son al-Muʿizz (406-454/1016-1062), he rebelled against the new Zīrid king. Groups of Maghrāwa and Zanāta led by Ḥammād, brother of Khalīfa, made incursions into the territories of Gabès and of Tripoli. These raids lasted until 413/1022-3. Soon after this, the new Zīrid governor of Tripoli, ʿAbd Allāh b. al-Ḥasan, ceded the town to Khalīfa, who thus restored the domination of the Banū Khazrūn. Subsequently, in 417/1026, Khalīfa b. Warrū made overtures to the Fāṭimid caliph al-Ẓāhir b. al-Ḥākim (411-27/1021-36) and obtained from him confirmation as governor of Tripoli. The same year, Khalīfa also sent a lavish gift to al-Muʿizz b. Bādīs. It is probable that Khalīfa died during the reign of al-Ẓāhir.

It was apparently in the lifetime of Khalīfa b. Warrū that Saʿīd b. Khazrūn and his brother al-Muntaṣir, sons of Khazrūn b. Saʿīd, returned from Cairo and established themselves in the neighbourhood of Tripoli. At one point, it is not known when or how, Saʿīd b. Khazrūn succeeded in taking control of the town of Tripoli, but he was killed in 429/1037-8. After him, his kinsman Khazrūn b. Khalīfa seized Tripoli. But his residence in the town lasted only a year, until December 1038, when he was forced to leave Tripoli in secret to escape from al-Muntaṣir b. Khazrūn, who arrived at the head of a Zanāta army to secure the accession of his brother Saʿīd b. Khazrūn. This chief, proclaimed *amīr* of the Maghrāwa and Zanāta of Tripolitania, governed the town and province of Tripoli for a very long period. It was during his reign, between the years 430 and 440/1038-49, that a lengthy war took place between the Zanāta and Maghrāwa of Tripoli on the one side and the Zīrid king al-Muʿizz b. Bādīs on the other; the latter attacked them at the head of a Ṣanhādja army. The Maghrāwa and Zanāta routed the first Ṣanhādja expedition, and repulsed the second, but were defeated by the third and were compelled to conclude a peace treaty with al-Muʿizz. According to Ibn Khaldūn, al-Muntaṣir again recognised the authority of al-Muʿizz b. Bādīs in 443/1051-2, during the invasion of the Banū Hilāl. In fact, he came to the aid of Bādīs at the head of a thousand Zanāta horsemen,

but was beaten by the Hilālians and fled along with the entire Zīrid army. Despite the occupation of the plains of Tripoli by the Hilālian Arab tribes, the capital of the province remained in the hands of al-Muntaṣir, who was still in residence there in *ca.* 468/1075-6. It was at about this date that he decided to lead the Arabs of the tribe of the Banū ʿAdī in an assault on the central Maghrib, which was at this time in the possession of the Ṣanhādja dynasty of the Banū Ḥammād. The forces of al-Muntaṣir occupied the towns of al-Masīla and Ashīr, and also the regions of Zāb and Rīgh. Al-Muntaṣir established his headquarters in the small town of Waghlāna, to which reference has been made above; in addition, he remained master of Tripoli. It has also been mentioned above that he was treacherously killed by the chief of Biskra, who recognised the authority of the Banū Ḥammād.

After his death, another member of the Banū Khazrūn family, whose name is not mentioned in the sources, took control of Tripoli. The subsequent history of Tripoli under this dynasty is not known. It is known, however, that the last *amīr* claiming descent from the Banū Khazrūn was expelled from the town of Tripoli by King Roger II of Sicily, who replaced him with Abū Yaḥyā Ibn Maṭrūḥ al-Tamīmī (540/1146). However, according to Ibn Khaldūn, a section of the Banū Khazrūn family was still residing in the plains of Tripoli at the time of the conquest of this land by the Almohads (*ca.* 555/1160).

As for the Maghrāwa of Tripolitania, they subsequently took refuge in the Djabal Nafūsa. They were still present in this area in the 8th/14th century, at the time of Ibn Khaldūn, according to whom the dense population of the district was composed of Nafūsa, of Maghrāwa and of some Sadrāta families. These Maghrāwa seem to have converted to Ibāḍism, the religion of the Berber population of the Djabal Nafūsa.

It has been observed above that the Maghrāwa remained, after their conversion to Islam, supporters of Sunnism, with the exception of some branches of the confederation which embraced Ibāḍism. However, it seems that the conversion of this tribe to Islam was for a long time superficial and that certain Maghrāwa tribes were still, in the 5th/11th century, semi-pagan. In fact, according to al-Bakrī (1068), there existed among the Banū Warsifān the cult of demons known as *al-shamārīkh* (sing. *shumrūkh*), to whom offerings were made.

AL-**MAGHRIB**, the name given by Arab writers to that part of Africa which Europeans have called Barbary or Africa Minor and then North Africa, and which includes Tripolitania, Tunisia, Algeria and Morocco.

The word *maghrib* means the west, the setting sun, in opposition to *mashriḳ*, the east, the rising sun (Levant), but as Ibn Khaldūn remarks, the general denomination was applied to a particular region. The extent of this area, moreover, varies according to different authors. Some oriental writers (e.g. al-Muḳaddasī) include in the Maghrib not only Northern Africa but also Sicily and Spain; the majority, however, reserve the name Maghrib for the first of these countries. But they are not in agreement upon the boundaries to be assigned to it on the east. On the other hand, they are in agreement about the northern, western and southern boundaries. To the north, the Maghrib is bordered by the Mediterranean. To the west, it extends as far as the Atlantic Ocean, which it hugs from Tangier to the desert of the Lamtūna (Abu 'l-Fidāʾ) or only, according to Ibn Khaldūn, as far as Safi and the Deren (Great Atlas). To the south it stretches (Ibn Khaldūn) as far as the barrier of moving sands separating the country of the Berbers from the land of the Negroes, that is to say the Erg [see ṢAḤRĀʾ] and as far as the rocky regions called *ḥammāda* [*q.v.*]. Some districts situated outside this limit, such as Būda, Tamentīt, Gurāra, Ghadamès, Fezzān and Waddān, are sometimes considered as belonging to the Maghrib. As regards the eastern boundary, certain authors made it extend as far as the sea of Ḳulzum (the Red Sea) and thus include in the Maghrib, Egypt and the country of Barḳa [*q.v.*]. Others, whose opinion is adopted by Abu 'l-Fidāʾ, make it coincide with the actual frontier of Egypt, from the oases (al-Wāḥāt [*q.v.*]) as far as *al-ʿAḳaba al-kabīra* between Barḳa and Alexandria. Ibn Khaldūn does not accept this delimitation, because, he says, the inhabitants of the Maghrib do not consider Egypt and Barḳa as forming part of their country. The latter commences only at the province of Tripoli and encloses the districts of which the country of the Berbers was composed in former times. Ibn Saʿīd and later Maghribī writers limit themselves to reproducing with a few variations in detail, the information of Ibn Khaldūn. As for Yāḳūt, he confines the Maghrib to the country stretching from Miliana [*q.v.*] to Sūs (ed. Wüstenfeld, iv, 583).

Placed, according to al-Idrīsī, in the third clime, but according to al-Zuhrī (§§ 11, 21) in the 6th *iḳlīm* or *djuzʾ*, the Maghrib is divided into several regions more or less clearly defined. Ibn Hawkal (tr. Kramers-

Wiet, 57 ff.) distinguishes two regions: the Eastern Maghrib from the frontier of Egypt as far as Zawīla in Tripolitania, and the Western Maghrib from this point to Sūs al-Akṣā; but the division commonly accepted is that into three regions, Ifrīkiya, Central (*awsaṭ*) Maghrib and Farther Maghrib (Abu 'l-Fidā', Ibn Khaldūn, etc.). Ibn Saʿīd adopts a slightly different division: Ifrīkiya, outer Maghrib, and further Sūs. Ifrīkiya [*q.v.*] had varying limits; central Maghrib was from Bougie to the Moulouya river (Ibn Khaldūn); and the farther Maghrib from the Moulouya to Safi and to the Deren, to which must be added al-Sūs, which forms, as might be said, according to Ibn Khaldūn, an island or country detached from all others and surrounded by seas, deserts and mountains.

At the present time, the term Maghrib is still used in opposition to Mashrik in a sense near to that which it had in mediaeval times, but it also denotes simply Morocco when the full expression al-Maghrib al-Akṣā is abbreviated. Furthermore, the political union of the North African countries which certain politicians seek is called al-Maghrib al-Kabīr.

Bibliography: Apart from Ibn Khaldūn, *Hist. des Berbères*, tr. de Slane, i, 186 ff., most of the geographers describe the Maghrib: see M. Hadj-Sadok, *Description du Maghrib et de l'Europe au IIIe-IXe siècle* (= texts and trs. from Ibn Khurrādadhbih, Ibn al-Faḳīh and Ibn Rusta), Algiers 1949; Ch. Pellat, *Description de l'Occident musulman au IVe-Xe siècle* (= text and tr. of al-Muḳaddasī's ch.), Algiers 1950; Bakrī, *Description de l'Afrique septentrionale*[3], ed. and tr. de Slane, Paris 1965; Zuhrī, *Kitāb al-Djaʿrāfiyya*, ed. and comm. M. Hadj-Sadok, in *BEO* (1968), §§ 274-317 and see 89-90; *al-Istibṣār*, ed. S. Z. Abdelhamid, Alexandria 1958, 109 ff.; Ibn Saʿīd, Abū Ḥamīd al-Andalusī and Aḥmad b. ʿAlī Maḥallī, in E. Fagnan, *Extraits inédits relatifs au Maghreb*, Algiers 1924, 6-40, 153-90; Abu 'l-Fidā', *Taḳwīm al-buldān*, ed. Reinaud and de Slane, 122, tr. Reinaud, ii, 168 ff.; Muḥammad Abū Ra'a, *Voyages extraordinaires et nouvelles agréables*, tr. Arnaud, Algiers 1889, 11, 156 ff.

(G. YVER*)

AL-**MAGHRIB**, AL-MAMLAKA AL-MAGHRIBIYYA, a kingdom of North Africa whose name in European languages (Fr. Maroc; Eng. Morocco; Span. Marruecos) is a deformation of the name of the southern metropolis of the kingdom, Marrākush [*q.v.*].

1. GEOGRAPHY.

Morocco occupies the western part of Barbary; it corresponds to the Maghrib al-Akṣā of the Arab geographers [see AL-MAGHRIB]. Lying between 5° and 15° W. longitude (Greenwich) on the one hand and between 36° and 28° N. latitude on the other, it covers approximately an area of between 500,000 and 550,000 km². On the north it is bounded by the Mediterranean, on the west by the Atlantic and on the south by the Sahara. On the eastern side it stretches to the Tell and to the plateau of Oran. The boundary which separates it from Algeria is quite conventional and fixed definitely only on the northern side.

Although Morocco forms one with the northern part of Africa, it is chiefly oriented to the west. It is, one might say, the Atlantic slope of Barbary; it is nevertheless a continental country. The coast does not lend itself to a maritime population; the Mediterranean coast is steep and inhospitable, the Atlantic coastline straight and lacking in natural shelters. The estuaries of the rivers are of very little value because of the sandbars which obstruct their entrances. The geological structure is somewhat complicated. Below the folds of the primary age, of which there still exists much eroded evidence covered by secondary deposits, have risen strata contemporary with the Alps. The actual relief which has resulted from these movements of the earth's surface and from these successive modifications consists of folded mountain chains, plateaux and plains. The chains are two in number, the Rīf and the Atlas. The Rīf is the continuation from the other side of the Straits of Gibraltar of the Baetican Cordillera [see RĪF]. The Atlas [*q.v.*] chain forms the backbone of Morocco. It breaks into the High Atlas oriented west-north-east, linked by the volcanic massif of Sīrwā (3,300 m.) to the Anti-Atlas which lies more to the South, and also to the Middle Atlas running in a diagonal line from the south-west to the north-east, as far as the country of the outer foothills of the Rīf, from which it is separated by the corridor of Taza. From these different chains stretch plateaux. Those of the east connect the High Atlas to the Saharan Atlas of Algeria; those of the West gradually descend towards the Atlantic. Amongst the latter some are only the vestiges of the primary layer raised and eroded; others are composed of sedimentary deposits of varying origins.

In consequence of the oblique orientation of the Middle Atlas, which gradually draws away from the coast, the plains, which occupy in Morocco a more important place than in the rest of Barbary, lie mainly on the Atlantic side. They are composed of two series, the one stretching diagonally from the mouth of the Tensīft to that of the Muluya (the sub-Atlantic plains, the plain of Sebou, the corridor of Taza, the plain of the lower Moulouya). The other stretches to the foot of the High Atlas (Ḥawz of Marrākush) and disappears in the heart of the Middle Atlas.

Climate. The climate of Morocco has been defined as "an Atlantic variety of the Mediterranean climate" (Gentil). This however must not be taken to apply to the whole of the country; the different regions differ as much in regard to temperature as in the distribution of rain. On the Atlantic coast the climate is relatively mild in winter and cool in summer (Tangier: 12°-24°; Agadir: 14°-22°); only small differences are recorded between the coldest month and the warmest. In the interior on the other hand, the seasonal variations and even the daily ones increase the farther one goes inland. They become excessive in character in eastern Morocco where the climate is distinctly continental. The rainfall is equally lacking in uniformity. Brought by the west and south-west winds, the rains are abundant in the autumn, the winter and the beginning of spring but they are very rare during the summer. The Atlantic coast has everywhere a copious rainfall although the quantity which falls decreases as one goes from north to south (Tangier: 32 inches, Casablanca: 16 inches). It also enjoys the benefit of an atmosphere which is saturated with moisture even in summer. The interior is not so well served. The rains diminish in quantity from west to east. The mountain massifs always form an exception. They condense the moisure in the form of rain and even snow which, although it is by no means perpetual, nevertheless covers the high summits of the Atlas mountains until the beginning of the

summer. Eastern Morocco on the other hand, isolated by the barrier of the Middle Atlas, is not subject to oceanic influences and only receives, except in the immediate neighbourhood of the Mediterranean, rare and irregular downfalls of rain.

The flora reveals in striking fashion these variations of climate. Forests of evergreen oak, of oak and of cedar clothe the peaks of the High and the Middle Atlas and of the Rīf. The cork tree is found in extensive forests in the massifs of the Zaʿāʾir and Zayān and as far as the region of the Atlantic (forest of the Maʿmūra). The thuya and the arganier [see ARGĀN] are already more disseminated. Poplars, willows, elms and tamarisks form a fringe of verdure along the wādīs. The olive tree is met almost everywhere in its wild state. But, as the rainfall decreases, the forest gives place to scrub where the jujube tree and the mastic abound, then to prairie and steppes. The prairie, which hardly goes beyond the limits of the maritime plain, is the home of plants which are used for fodder and of bulbous plants. The steppe is the home of shrubs and bushes (artemisia, drin, alfa) which are adapted to a dry soil and to extreme variations in temperature. The steppes cover a part of the interior plains of western Morocco and practically the whole of eastern Morocco, where they extend to the neighbourhood of the Mediterranean. As regards the desert, it is devoid of vegetation in the *ḥammādas* [*q.v.*], although the oases form spots of verdure in the midst of the general desolation.

Hydrography. The structure of the country and the relative abundance of rainfall affect the hydrography. Morocco is much richer in running streams and in subterranean waters than any other country in Northern Africa. Wādīs (weds) are here more numerous; their courses are longer and their volume larger. A number of them even deserve the name of rivers. The waters flow in three different directions: towards the Atlantic, towards the Mediterranean and towards the basin of the Sahara. The Atlantic rivers are in all respects the most important. They can be divided into three groups: those of the north (Loukkos and Sebou), those of the centre (Bū Ragrag and Umm al-Rabīʿ), and those of the south (Tensift and Sous). The Loukkos drains the districts of the Gharb; the Sebou, those of the Middle Atlas, of the Zarhūn, and the southern slope of the Rīf. On emerging from the mountains it takes numerous turns and windings across the alluvial plain and reaches the ocean after a course of 300 miles. Although subject to considerable variation in volume, according to the season, it never dries up completely. It is even navigable in its lower course [see AL-MAHDIYYA]. The Bū Ragrag and the Umm al-Rabīʿ run for a part of their course through the central plateau, the Moroccan "Meseta". The irregularity of their courses makes them useless for navigation. The Tensīft, to the north of the High Atlas, the Wādī Sūs to the south, which are much less in volume approach more nearly to the classic type of wādī of northern Africa. The watercourses of the Sahara (Wād Gīr, Wād Zīz, Wād Darʿa) diminish in volume as they go farther away from the mountains and end by disappearing in the sand. The Darʿa [*q.v.*] alone reaches the Atlantic, but it only flows intermittently in its lower course. As for the Mediterranean rivers, they are only torrents with violent and rapid floods. The Moulouya (Malwiyya) alone forms an exception. It collects water from the slopes of the Middle Atlas but only reaches the sea in much diminished volume on account of the loss it suffers in crossing the steppes.

Although the common characteristics of all the countries of Barbary are found in Morocco, the greater or less differences in relief, the differences in climate, the peculiarities of vegetation bring in their train a diversity more marked than in Algeria or Tunisia. The combination of these different elements determines the existence of regions which differ the one from the other in their configuration, their resources, the density and manner of existence of their population. We may distinguish six such regions: Northern Morocco, the basin of the Sebou, Central Morocco, the country of the Atlas, Eastern Morocco, and Moroccan Sahara.

Northern Morocco. Northern Morocco comprises a mountainous zone (the mountains of the Rīf properly so-called which are to the north-west continued in the "domes" of the Djebāla (Jbāla) as far as the Strait of Gibraltar) and regions less rugged in character which to the south-east and the west form the transition into the adjoining countries. The mountains, split into deep ravines by the courses of the wādīs, for the most part only leave between their last escarpment and the sea-shore a narrow strip, or a few bays enclosed between the rocky promontories. A few cuttings which run across the ranges afford communication between the two watersheds. The Rīf, therefore, must seem to be a world very little accessible to influences from without. Arab influence has scarcely grazed it. The population has always vigorously opposed the political measures of the sultans as well as the attempts of Europeans to settle themselves there. Crowded into a limited territory, since the highest parts of the mountains are useless, the people of the Rīf find their chief means of subsistence in the cultivation of vegetables and fruits. A number of them gain from temporary emigration an addition to their resources. They are not nomadic but inhabit villages perched on the slopes. Towns are represented only by Shafsāwān (Chechaouen) and Wazzān (Ouezzan), religious and commercial centres, situated the one on the northern side and the other on the southern side of the Djebāla. Towards the south-east, plains interspersed with mountain masses extend as far as the Moulouya. The lack of rain gives to these plains (Salwān, Gāret) the aspect of steppes more fitted to a pastoral life than to agriculture and a settled life. Towards the west the lowlying coastland, still a very narrow border at the strait of Gibraltar, increases gradually from the north to the south between the Atlantic coast and the last slopes of the Djebāla. This district commonly called the Gharb is a corridor. It still keeps in this respect its historical significance, but its economic value is diminished by the stagnation of its waters in the hollows in the flat bottoms of the valleys, and by the insecurity resulting from the proximity of the warlike tribes of the high mountains. A few townships have however succeeded in establishing themselves, either at the crossing of roads such as al-Ḳaṣr al-Kabīr [*q.v.*] or in proximity to the coast like Ceuta, Tangier and Larache [see the articles SABTA, ṬANDJA and AL-ʿARĀʾISH].

The valley of the Sebou. The valley of the Sebou lies between the Rīf, the Middle Atlas, the Moroccan Meseta and the Atlantic. The situation of the region, the abundance and variety of its natural resources makes it of exceptional value. The Sebou links up the whole of it. Through its tributary the Innawen, the valley of which leads

to the pass of Taza, it makes communication with the rest of Barbary easy. The mountain massifs there (Zarhûn, Zālagh, mountains of Gerwān) offer no inseparable obstacles to communication. The high plains of Sā'is and Meknès are contrasted with the lower plains of the Shrārda and the alluvial plains of the lower course of the Sebou. The influence of the Atlantic is felt far into the interior and combines with the numerous streams that flow into the Sebou and its tributaries and the subterranean waters to promote the development of all forms of vegetation. Forests cover the higher slopes of the mountains; fruit-trees flourish on the sunny slopes and cereals on the high plains; the *merdjas*, temporary marshes produced by the Sebou in its lower course, are used for grazing until they are sufficiently dry to be of use to agriculture. This combination of circumstances, so auspicious for human habitation, has made the valley of the Sebou a centre of intensive settlement. The most diverse ethnic elements have settled together and mixed there. All types of habitation are found as well as all degrees of attachment to the soil from a nomadic to settled town life. Human activities are displayed in the most varied forms (grazing, agriculture, arboriculture, commerce, industry). The country villages, douars of huts in the plains, villages of houses of clay in the mountains, are numerous, the towns are flourishing. Mawlāy Idrīs [*q.v.*] is the sacred city of Morocco, Sefrou on the borders of the plain of Sā'is and the high limestone plateau lives by trading with the people of the mountains and the industry of its weavers and makers of slippers. Fās and Meknès are among the great cities of Morocco.

The first of these towns has remained to this day the political, religious, intellectual and economic centre of Morocco. It has resisted all the usual causes of decline. From all time the ownership of the high plains of the Sebou has been bitterly contested. Their possession has been the condition for the establishment and survival of the dynasties which have succeeded one another in Morocco. Their political significance and role in history corresponds very exactly to their geographical position and economic value.

Central Morocco. Between the valley of the Sebou, the ranges of the Atlas and the Atlantic, covering about a quarter of habitable Morocco, lies the region called by the geologists the Moroccan Meseta. It concludes districts of very different character, the only feature uniting them being the possession of a common substratum, the Hercynian paenoplain covered almost everywhere by sedimentary horizontal formations. Differences of structure and of climate distinguish clearly the various parts: the Atlantic plain, the plateaux of the centre, and the interior plain of the Ḥawz. The maritime plain lies along the Ocean from Rabat to Mogador [see AL-SUWAYRA]. Very narrow at its northern and southern ends, it broadens near the centre (Dukkāla, Shāwiyya) to a width of 50 miles. To the rains and the constant moisture from the vicinity of the Atlantic, the abundance of running streams and subterranean waters, the natural fertility of the soil further adds to the conditions for prosperity. The *tirs* or black lands which run in an unbroken line behind the coast from the Bū Ragrag to Tensift are admirably suited for the growth of cereals. The rural population, almost everywhere settled, is therefore considerable. The land of the Dukkāla has 40 people to the square kilometre, a density very much greater than that of the other districts of Morocco. The towns of the coast, Salé, Rabat, Casablanca, al-Djadīda, Azemmour, Safi, Mogador [*q.vv.*], benefit by the richness of the hinterland. The exportation of agricultural produce has at all times been a branch of commerce, and has been much developed since the settlement of Europeans there. While facility for communications and the continental relations with the valley of the Sebou opened the plain to Arab influences, the ports of the coast maintained contact with abroad and permitted the infiltration of European influences.

The interior is much more broken. The ground rises gradually up to a height of 2,000-2,500 feet. The predominant formation is plateaux terminating on the north in the very old massifs of the Zaʿā'ir and Zayān, which are really mountains in character, in the south in the equally old but less elevated massif of the Raḥāmna. These plateaux deeply cut into by the course of the Umm Rabīʿ overlook on the west side the low-lying coastlands from the top of cliffs, and slope gently on the south-east to the plain of Tadla. This is a depression, over 120 miles in length, running to the north into the heart of the Middle Atlas where it terminates in a cul de sac, while it broadens greatly in its southern part. A low pass enables communication to be made between the Tadla and the Ḥawz of Marrākush, a basin shut in by the High Atlas in the south, the Middle Atlas in the east, the Djbīlāt in the north and the hills of the Shiyāḍma in the west. The economic value of this inner region is very unequal. On the mountains of the north, the rains and streams support forests and the local inhabitants devote themselves to cattle-rearing. The plateaux of the centre covered with a surface of limestone have great stretches of bare rock and cultivation is difficult. The Tadla is no better favoured except in the zone adjoining the Atlas, watered by torrents descending from the mountains. The plain of the Ḥawz would also suffer disastrously from drought, if human industry had not averted this danger. An ingenious system of irrigation [see ḲANĀT] has transformed the country round Marrākush into a vast palmgrove and resulted in a particularly dense population. Comparatively large towns (Amīzmīz, Damnāt [*q.v.*] and Tameṣluḥt) and especially Marrākush have been enabled to rise and prosper. Between this region, already half Saharan, and the high lying plains of the Sebou, the plateaux of the centre and the mountains of the north which come down to within a short distance of the shore, interpose a barrier which the attitude of its inhabitants makes still more difficult to cross. The Zayān, the Zaʿā'ir, the Zemmūr, over whom the authority of the *makhzen* has never been very securely exercised, have more than once cut direct communication between Fās and Marrākush. These two cities have been at different periods the capitals of distinct and even hostile kingdoms.

The region of the Atlas. In spite of the marked differences between the different elements of the Atlas, the whole region nevertheless has general characteristics of its own. Between Atlantic Morocco on the one hand and Saharan Morocco on the other, the Atlas lies as an almost continuous barrier. Only the few transverse fractures in the Middle Atlas permit passage between the basin of the Sebou and the Saharan oases, while in the High Atlas valleys running right into the heart of the massif give access to passes opening on the valleys of Sous and the Darʿa. Moister and colder, the

Middle Atlas is covered with forests which are denser and more extensive than those of the High Atlas. Both however are great watersheds. From the Middle Atlas come the great rivers of the Atlantic slope (Sebou, Gīgû, Umm Rabīʿ, Wādī 'l-ʿAbīd), from the High Atlas the Tasawt and the Tensift. The lands of the Atlas are nevertheless poor. The high mountains offer little to support mankind. Human activities are found mainly in the zones of contact between the mountains and the plains (*dīr*) of the Middle Atlas and in some specially favoured valleys of the High Atlas. Except in the Middle Atlas, where the nomadic mode of life results in the exodus in the bad season of the inhabitants who lead a pastoral life, and on the plateaux of the High Atlas on the Atlantic side (Ḥāḥa, S̲h̲iyāḏma) the inhabitants of which are mainly engaged in cattle-rearing, the natives are settled. They live in villages perched on the slopes and terraces between wādīs or scattered along the valleys. There is nothing approaching a town in size. These regions, defended by the nature of the country, have almost completely escaped outside influence: they are still almost exclusively the domain of Berber tribes (Berāber in the Middle Atlas and S̲h̲lūḥ in the High Atlas). The customs and institutions peculiar to this people [see BERBERS] have survived to a greater extent here than in any other region of North Africa. In particular, their political organisation was most rudimentary: municipal republics administered by a *d̲j̲amāʿa* in the Middle Atlas, feudal lordships ruled in patriarchal and despotic fashion by a few powerful families in the High Atlas. The people of these regions have also always opposed vigorously the central power; the authority of the *mak̲h̲zen* [*q.v.*] over the Berbers of the High Atlas has never been exerted except through the local chiefs. As to the tribes of the Middle Atlas, they have for long retained an almost complete independence.

Eastern Morocco. Eastern Morocco may be described as the continuation of the central Mag̲h̲rib, of which it has the distinctive characteristics. In it, as in Orania, we have a *tell* zone and a zone rising by successive stages up to 6,000 feet. The upper valley of the Moulouya separates them from the Middle Atlas. The monotony of these vast spaces is only broken by the outcrops of *gūrs*, flat beds of rocks cut up by erosion and by the depressions of the chotts [see S̲H̲AṬṬ]. Beaten by the winds, exposed to the rigours of an extreme climate, these lands are only fit for the pastoral life led by the nomads who raise sheep. The valley of the Moulouya is no better favoured, except in the vicinity of the Atlas, where villages surrounded by vineyards with a settled population are found along the tributaries of the river. As to the Tell, hills of no very great height (the most important being that of the Benī Snāsen which does not exceed 5,000 feet) divide it up into compartments occupied by plains (plains of the Awlād Manṣūr, on the coast, of the Trīfa, of the Angād which in the south reaches the cliffs in which the high plateaux end). The dryness of the climate frequently gives these plains a steppe-like character; only the western part of the plain of the Angād with a fertile and well-watered soil lends itself to cultivation. The nomads come here to procure grain. But this region owes its importance less to its natural resources than to its situation on the natural route between Atlantic Morocco and the rest of Barbary. Oujda [see WAD̲J̲DA], which commands the passage, has thus been enabled to escape various causes of decay that have threatened it. A border district, eastern Morocco has always been a disputed region, a "march" for which the lords of Tlemcen and Fās have contended. The authority of the latter was never solidly enough established here to impose itself on the settled inhabitants of the mountains and on the nomads of the plateaux and plains.

The Moroccan Sahara. The Moroccan Sahara is the northwestern corner of the Sahara. There we find the general characteristics of this desert region [see ṢAḤRĀʾ]. Only the parts adjoining the Atlantic and the threshold of the mountains offer favourable conditions for man. In the plain of Sūs [*q.v.*], shut in between the Atlas and the Anti-Atlas, the rivers and the irrigation canals enable shrubs to grow. The Darʿa, Zīz and Gīr are in their upper courses fringed by a thin border of cultivated land, pasturage, vineyards, and in their middle course assure the growth of palmgroves of which the best known, if not the most prosperous, is that of the Tafilalt [*q.v.*]. The richness—only relative it is true—of these oases is in contrast with the desolation of the rocky plateaux (*ḥammādas*) which form the greater part of the Moroccan Sahara. These natural conditions determine the mode of life of the inhabitants. Some lead a nomadic life and drive their flocks up and down the plateaux; others are permanently settled on the Sous, in the high valleys and in the oases. Sūs contains numerous villages and even towns (Agadir, Tiznit, Tarudant); the oases have a settled population in the *ḳṣūr*. Those of Tafilalt, Tamgrut, Bū Dnīb and Figīg carry on a certain amount of commerce between Atlantic Morocco and the Sahara. But this very circumstance has prevented them escaping as completely as the lands of the Atlas from the political and intellectual influence of Western Morocco, especially Tafilalt where considerable groups of Arab *s̲h̲orfā* [see S̲H̲URAFĀʾ] have been long established in the midst of Berber populations. But, although the present dynasty actually came from Tafilalt, the people of this region have frequently escaped S̲h̲arīfian authority.

II. History.

Morocco before Islam. Morocco, like the other parts of North Africa, has probably been inhabited from a very remote period. We know, however, nothing definite about its earliest inhabitants. The traces which they have left, weapons and tools of chipped flint, pottery, rock-paintings, some of which represent animals of the quaternary period, now extinct, megalithic monuments identical with those found all round the Mediterranean basin, give us no information in this respect. At most, we may suppose that the primitive population consisted of emigrants from southern Europe, the Sahara and perhaps from Egypt. The fusion of these diverse elements gave birth to a race, the members of which, frequently different in type and physical features, were united by a community of language. The ancient writers called them Libyans and Moors. They were the ancestors of the present Berbers [*q.v.*].

The first historical fact known, and that only imperfectly, is the appearance in the 12th century B.C. of the Phoenicians on the Moroccan coast. The sailors of Tyre and Sidon built factories there, where they exchanged goods of eastern origin for local products (cattle, wool, hides) and slaves. But Phoenician influence was exercised mainly through the intermediary of Carthage when it in turn had become the metropolis of a great maritime empire. The Carthaginians rebuilt the ruined factories and added new ones. In the middle of the 5th century, Hanno in the course of his celebrated "Periplus" established on the Atlantic coast seven colonies of which one was at the mouth of the Sebou. Rusaddir (Melilla), Septem (Ceuta), Tingis (Tangier), Lixus (Larache), Sala (Salé) were the principal Carthaginian establishments. It does not seem, however, that Carthage sought to extend her power into the interior. She was content no doubt to conclude treaties with the native chiefs and to recruit mercenaries from the country. Morocco remained independent, but the tribes who inhabited it were not organised into states, except perhaps in the east, where ancient writers mention in the period of the Punic Wars the existence of a kingdom of Mauretania of Marusia extending along both banks of the Moulouya.

The destruction of the Carthaginian empire hardly altered this state of affairs. For two centuries Rome administered only the "Province of Africa" directly and left the other regions of Barbary in the hands of native chiefs under a more or less severe protectorate. Northern Morocco shared the fate of Mauretania down to the annexation of this kingdom in 42 A.D. The region to the east of the Moulouya formed part of Caesarean Mauretania. The lands stretching from the Moulouya to the ocean formed Mauretania Tingitana, an imperial province governed by a procurator. When the empire was reorganised by Diocletian, it was attached to Spain.

Roman Morocco never covered more than a small portion of the modern Morocco. On the Atlantic coast, it barely extended beyond the mouth of the Bū Ragrag, and in the interior to the massif of the Zarhūn. The plateaux and sub-Atlantic plains and the mountains of the Rīf, Middle and High Atlas escaped the authority of Rome. It was the same with the Sahara. The expedition of Suetonius Paulinus, who in 41 A.D. advanced as far as the Wādī Gīr, remained an isolated incident.

To defend herself against the rebellions of her own subjects and to protect the country from Berber inroads, Rome had to keep in Tingitana an army of 10,000 men, to build strategic roads and to establish fortified posts on the sides of the triangle: Sala, Zarhūn, Tingis. With the exception of Volubilis [see MAWLĀY IDRĪS], the importance of which has been revealed by its ruins, and which was undoubtedly a centre of influence of Roman culture on the people of the interior as well as a military base, the towns were all on the coast. They were Lixus and Tingis, raised to the rank of *coloniae*, and Ceuta. They owed their prosperity mainly to trade with Spain, to which were exported oil and wheat, the two main products of the country. On the whole, however, Rome's influence on Morocco was superficial and has left little trace.

Without any really firm hold on the country, weakened by native risings and by the quarrels between the Donatists and the orthodox, Roman rule was to collapse suddenly at the beginning of the 5th century. Germanic invaders, the Vandals, came from Spain and in 429 A.D. conquered without opposition Tingitana which they gave back a few years later to the Romans. Soon afterwards the western empire disappeared and the natives seized the opportunity to become independent. The Byzantines, who in the 6th century destroyed the Vandal kingdom, were content to re-occupy the two strongholds of Ceuta and Tangier. The rest of Morocco was in the hands of the Berbers. The latter were divided into a large number of tribes, of whom the principal were the Ghumāra [*q.v.*] on the Mediterranean coast, the Barghawāṭa [*q.v.*] on the Atlantic coast between the strait of Gibraltar and the mouth of the Sebou, the Miknāsa, in the central district, the Maṣmūda [*q.v.*], on the western slope of the High Atlas and on the coast from the Sebou to the Sūs; the Haskūra between the Sūs and the Darʿa; the Lamṭa and Lamtūna [*q.vv.*] on the left bank of the Darʿa. These Berbers were all of Ṣanhādja stock; some professed Christianity or Judaism, but the majority still followed the old nature worship. The Arab conquest brought them a new religion: Islam.

The Introduction of Islam. The Arabs appeared in the extreme Maghrib at the end of

the 1st/7th century. Tradition relates that Sīdī ʿUḳba, the founder of al-Ḳayrawān, in *ca.* 65/684-5 undertook an expedition which carried him as far as the shores of the Atlantic Ocean. This raid, however, if it ever took place, was too transitory to have any permanent results. But at the beginning of the following century, Mūsā b. Nuṣayr [*q.v.*] who had just completed the conquest of Ifrīḳiya, took Tangier, installed a governor there and set himself to conquer and convert the local people. He succeeded without much trouble. Attracted by the hopes of gain, the Berbers adopted Islam and enrolled themselves in the armies which were invading Spain. They were not long, however, in rising against the Arabs. Dissatisfied with the share allotted them of lands taken from the Christians in the Peninsula, and exasperated by the exactions of the governors of Tangier, they took up arms in 122/740 on the call of the porter Maysāra [*q.v.*]. The rebellion was both religious and political in character. With the same readiness with which they had adopted Islam, the Berbers adopted Khāridjī doctrines from the east, teachings which also appealed to their equalitarian tendencies and to their spirit of independence. The army sent from Syria to establish order was destroyed on the banks of the Sebou in 124/742 and the extreme Maghrib was lost at one stroke to the caliph and to orthodoxy. Berber principalities were organised in the Rīf; in the west, the Barghawāṭa recognised the authority of a certain Ṣāliḥ, founder of a rival religion to Islam, who had composed a Ḳurʾān, that is a sacred book, in Berber. None of these little states was strong enough to impose its authority on the others and to collect all the Berber tribes under one rule.

It looked for a time as if the Idrīsid dynasty [*q.v.*] were to play this part. Idrīs I and his successor Idrīs II, actually enforced their authority over the greater part of the tribes of northern Morocco and successful expeditions extended their kingdom from the shores of the Mediterranean to the High Atlas and from the Atlantic to beyond Tlemcen. Ardent champions of Islam, they imposed their religion on those peoples who did not yet practise it or who had abandoned it after once adopting it. The conversion of the extreme Maghrib to Islam is their work much more than that of the Arab conquerors. Zealous defenders of orthodoxy, in spite of their ʿAlid origin, they fought the Khāridjīs with the same vigour but did not, however, succeed in completely extirpating the heresy. It is not without good reason that legend has transformed these rude warriors into saints, the one Idrīs I, patron saint of Morocco, the other Idrīs II, the patron saint of the city of Fās [*q.v.*]. The building of this city had enduring results. It gave northern Morocco a religious, political and economic centre which it had lacked since the disappearance of Roman rule. Favoured by its position, Fās prospered rapidly. It survived all causes of decline, even the collapse of the Idrīsid power.

The Idrīsids indeed rapidly declined. The various groups which had recognised the authority of the founders of the dynasty were not long in casting it off and fighting with one another. These rivalries were taken advantage of by the Fāṭimids of Ifrīḳiya and the Umayyads of Spain, who during the 4th/10th century disputed the possession of the extreme Maghrib. With the assistance of the Miknāsa, the Umayyads in the end remained masters of the country. They were in their turn ousted by the Maghrāwa [*q.v.*], whose chief Zīrī b. ʿAṭiyya, abandoning the cause of the Umayyads, seized Fās, where his descendants ruled for three-quarters of a century.

The Almoravids and the Almohads. The extreme Maghrib seemed to be condemned to anarchy and to be broken up among small factions when the Almoravid invasion came [see AL-MURĀBIṬŪN]. After having first of all subjected all the lands south of the High Atlas, then established themselves solidly on the northern slopes, at the foot of which Yūsuf b. Tashfīn founded Marrākush in 454/1062, these Saharan hordes turned to the centre, east and north of Morocco, sweeping everything before them: Fās, Tangier, the Rīf, Oran and Ténès fell before them. The Berber principalities of the Maghrāwa, the Barghawāṭa and Banū Īfran disappeared. In less than twenty years, Yūsuf b. Tashfīn became sole master of the extreme Maghrib as far as Algiers. To these territories, already vast, was soon to be added half of Spain. Summoned by the Muslim *amīrs* who were threatened by the king of Castile, Yūsuf b. Tashfīn checked the Christian advance at Zallāḳa (479/1086 [*q.v.*]), then dispossessed the petty Muslim rulers to his own advantage. Morocco was thus extended across the Straits of Gibraltar as far as the Ebro and to the Balearic Islands. The fortunes of the Almoravids were, it is true, as ephemeral as they were brilliant. In contact with Andalusian civilization, the Saharans rapidly became decadent. The rigid orthodoxy, which had been their strength, relaxed; they in their turn were regarded as infidels, "anthropomorphists" (*mudjassimūn*), whom it was lawful and even meritorious to fight. It was in the name of orthodoxy that the Maṣmūda and the Hintāta of the High Atlas under the lead.rship of Ibn Tūmart and ʿAbd al-Muʾmin [*q.vv.*] entered into the struggle against the Almoravids.

This struggle ended in the displacement of the Almoravids by the Almohads [see AL-MUWAḤḤIDŪN]. In seven years (533-40/1139-46), ʿAbd al-Muʾmin conquered all Morocco; Sidjilmāsa, Oran, Tlemcen, and Ceuta fell one after the other into his hands. Next came the turn of Salé, Fās, and finally of Marrākush, the gates of which were opened to him by the treachery of the Christian mercenaries. Muslim Spain was also conquered with the exception of the Balearic Islands. Even in Africa, the Ḥammādid kingdom of Bougie was conquered in 545-6/1151-2. A few years later (554-5/1159-60), a new expedition led ʿAbd al-Muʾmin into Ifrīḳiya and secured him possession of the interior and of the coast, which he took from the Normans of Sicily, who had occupied it some time before. Morocco in the strict sense of the word was now merely a province in the vast Berber empire. The unification of these territories under one ruler had important consequences for the Maghrib. It facilitated the diffusion in North Africa of the Hispano-Moorish civilisation, which was to be perpetuated in Morocco after it had disappeared from the Peninsula itself. Further, it brought into the extreme Maghrib a new ethnic element: the Arab one. ʿAbd al-Muʾmin, as well as his successors, on several occasions deported Hilālī tribes from the central Maghrib and Ifrīḳiya, where they continually created unrest, to the sub-Atlantic plains where other groups of Arabs joined them of their own free will.

The Almohad empire was too vast, it comprised regions of too different a nature, peoples too foreign

to one another to last long united. The Almohad caliphs were powerless to restrain the separatist tendencies which revealed themselves on all sides. In the first half of the 7th/13th century the Almohad empire broke up. Ifrīḳiya and the central Maghrib recovered their independence; local dynasties set up in Tunis (Ḥafṣids) and Tlemcen (ʿAbd al-Wādids). The extreme Maghrib ended by slipping away from the descendants of ʿAbd al-Muʾmin, who were replaced by the Marīnids [*q.v.*].

The Marīnids. Berbers of Zanāta stock, driven by the Hilālī Arabs on to the plateaux of Oran and into the central valley of the Moulouya, the Banū Marīn had at first entered the service of the Almohads, then turned against them, when the power of the dynasty began to decline. By repeated razzias they made themselves masters of almost all northern Morocco. After the death of the caliph al-Saʿīd, who had been able to arrest their progress for a time, their leader Abū Yaḥyā (641-56/1243-58) seized Fās, Meknès, Rabat and Sidjilmāsa. The capture of Marrākush (668/1269) by Abū Yūsuf, successor of Yaḥyā, marked the final triumph of the Marīnids. Heirs of the Almohads, the first Marīnids endeavoured to reconstitute the empire of their predecessors. In Spain, they enforced their authority on the Muslims of Andalusia. In Africa, they endeavoured to take the central Maghrib from the ʿAbd al-Wādids. They were successful when Tlemcen, besieged seven times in sixty years, finally fell into the hands of Sultan Abu 'l-Ḥasan (748/1347). Ten years later, the same ruler took Bougie, Constantine and Tunis, but his hold on these was very insecure. At the end of barely a year, Abu 'l-Ḥasan, defeated by the Arabs, found himself forced to abandon Ifrīḳiya, the Ḥafṣids returned to Tunis and the ʿAbd al-Wādids to Tlemcen, while the sultan's own son Abū ʿInān rose against him in Morocco. Attaining to power, Abū ʿInān renewed his father's efforts. He re-occupied Tlemcen and Tunis, it is true, but could not retain them (761/1360). The Ḥafṣids and ʿAbd al-Wādids recovered their kingdoms almost at once.

Separatist tendencies thus triumphed and on this occasion in a most definite fashion. The extreme Maghrib, the history of which had hitherto been so often that of Barbary, began to live its own life. The Marīnid kingdom, while its boundaries in the east were still vague and changing, already corresponded roughly to modern Morocco and the Marīnids may be regarded as the first strictly Moroccan rulers. Lacking the religious prestige of their predecessors, they endeavoured to secure the moral authority which they lacked by taking as their patron saints the apostles of Islam in the Maghrib. The cult of Mawlāy Idrīs in the 8th/14th and particularly the 9th/15th century assumed an importance which it has retained to the present day. No less characteristic is the development of intellectual life and the arts. The Hispano-Moorish civilisation never flourished more brilliantly in Morocco than in the Marīnid period. The rulers attracted to their court the poets, men of letters and lawyers of the Iberian Peninsula and of the Maghrib. The university of al-Ḳarawiyyīn at Fās attracted students from all the lands of the western Muslim world. Fās, which the Marīnids, abandoning Marrākush and Rabat, the capitals of their predecessors, chose as their royal residence, was given splendid buildings by them, palaces, mosques and *madrasas*. It was at the same time a commercial city in which African and Spanish merchants mixed with Christian traders.

This brilliant exterior, however, was quite deceptive. Marīnid Morocco was never able to organise itself on a solid basis. The central power was very weak and did not succeed in imposing its authority everywhere. The accession of each sultan was an occasion for outbreaks. The pretenders who arose always found supporters readily, either among the Arabs or the Berbers. Powerless in the interior, the sultans were no more fortunate in their enterprises against their neighbours of the central Maghrib or against the kings of Granada. Their prestige and their authority could not survive these checks. The Marīnids in the strict sense disappeared from the scene in 869/1465, after the assassination of the sultan by an Idrīsid *sharīf*. The Banū Waṭṭās, descended from a collateral branch, the chief of whom seized the power in 873/1470, had themselves a wretched existence. Their kingdom broke up into a large number of independent little groups, principalities at Fās and Marrākush, Berber republics in the Atlas, Marabout fiefs in the Rīf, the Gharb and in the Darʿa and Sūs. The sultans were quite powerless to prevent this decomposition.

The Christian offensive and the revival of Islam. Of all the causes which combined to enfeeble and discredit these rulers, the principal was undoubtedly their impotence against the offensive of the Christians against the Maghrib. In 818/1415 the Portuguese took Ceuta, in 869/1465 al-Ḳaṣr al-Ṣaghīr, in 875/1471 Tangier. They thus secured themselves a base of operations in the north while by the occupation of Aṣīla and Anfā (Casablanca) they secured a footing on the Atlantic coast. In the early years of the 10th/16th century, they built fortified posts at Santa Cruz (Agadir) and Mazagan and took by force of arms Safi [see SAFĪ] and Azammūr [*q.v.*]. Holding all places of importance except Larache [see AL-ʿARĀʾISH] they brought under their protectorate all the lands near the coast (Shawiya, Ḥāḥa, Dukkāla), forced the local people to pay them tribute and to hand over to them strategic points up to the environs of Marrākush. Their expeditions had no other aim than plunder, no other result than to exasperate the inhabitants who saw their towns destroyed, their douars burned, their women and children massacred or sold as slaves.

Menaced in the west by the Portuguese, Morocco was threatened in the east by the Spaniards also. The latter completed the *reconquista* by the taking of Granada (1492). Thus free to go further afield, and still fired with the religious enthusiasm of Ximenes, they too went over to fight the Muslims on African soil. The occupation of al-Marsā al-Kabīr (1507) and of Oran (1509) and the establishment of a Spanish protectorate over the kingdom of Tlemcen constituted a serious danger to the Muslims of Morocco.

The threat from the Christians produced an awakening of religious sentiment. This renaissance of Islam in the 9th/15th and 10th/16th centuries, the results of which are still to be felt at the present day, is beyond question the great event in the history of Morocco since the Idrīsid period. The way for it had, moreover, been prepared by the Ṣūfī teachings imported from the east and by the development of the brotherhoods [see ṬARĪḲA] in which the adepts of these doctrines were organised. It also found a favourable soil owing to the persistence of maraboutism among the Berbers. The ascendancy

which the religious leaders exercised, the wealth they accumulated in their *zāwiyas*, made them independent of the sultan. They thus became temporal leaders also, all the more readily as the sovereigns could not fulfil their office of defenders of Islam owing to lack of energy and also of means. The activity of these religious leaders was always of a local nature; it was only effectively exercised within a limited area and did not extend over the country generally. The religious solidarity thus established, the kind of common conscience thus created, did not put a check to the political decline until the time when the Saʿdian *shorfā* took direction of the movement and exploited it for their own benefit.

The Sharīfian dynasties. A. The Saʿdians [*q.v.*]. The Saʿdian *shorfā* benefited by the prestige which the religious awakening had restored to the descendants of Fāṭima, the daughter of the Prophet. Coming from Arabia at the end of the 8th/14th century and settling in the valley of the Wādī Darʿa, while another branch of the family settled at Tafilalt (Ḥasanī or ʿAlid *shorfā*), they were not long in acquiring a considerable influence over the tribes of the south. Thus they were naturally led to support the people of the south, who were exposed to the attacks of the Portuguese of Santa Cruz. In 917/1511, the *sharīf* of Tagmaddart, requested by the Muslims to put himself at their head against the Christians, agreed to do so. Supported by the marabouts who gave him valuable assistance, he began hostilities against the Portuguese. The holy war regularly waged secured to his sons, Aḥmad al-Aʿradj and Muḥammad al-Mahdī, the possession of the whole of southern Morocco up to the Umm al-Rabīʿ. The intervention of the Marīnid sultan in the quarrels which broke out between the two brothers only resulted in his own downfall being hastened. Muḥammad al-Mahdī took Fās in 957/1550; the foiling of an attempt to restore the Marīnids in 961/1554, with the help of the Turks of Algiers, secured the definite triumph of the Saʿdians.

The coming of the Saʿdians meant a regular reconstitution of Morocco. Muḥammad al-Mahdī and his successors imposed their authority on the whole country, protected it against foreign foes and increased the extent of their territory by distant conquests. They finally triumphed over the difficulties created by the Turks of Algiers, and at the battle of al-Ḳaṣr al-Kabīr in 986/1578 arrested a counter-offensive of the Portuguese. Aḥmad al-Manṣūr (986-1019/1578-1610) occupied Timbuktu and destroyed the Askia empire of Gao. For half a century, the Moroccans were masters of the Western Sūdān, from the banks of the Senegal as for as Bornū. The plunder taken on this campaign of conquest enabled the sultan to keep a splendid court, the hierarchy of which was modelled on the Ottoman court, and to adorn his capital Marrākush with magnificent monuments.

To the same period also belongs the organisation of the *makhzan* [*q.v.*]. The early Saʿdians had relied for support on the Arab tribes of the south. To these al-Manṣūr added the Arab tribes of the region of Tlemcen and Oujda driven into Morocco by the Turkish conquest. These *shrāga* or "orientals," as they were called, received lands around Fās in return for the military service they were forced to give. Reinforced by a regular army formed of renegades, Spanish Moors and negroes, trained by Turkish deserters, the *makhzan* provided the sultan with the means of preserving order and levying taxes; it was thus the essential instrument of Sharīfian government and tended to become the government itself.

This instrument proved sufficient in the hands of an energetic ruler, but was inefficacious in weaker hands and in moments of crisis. The Saʿdians very soon found this out. The tendencies to disruption which had been held in check by the energy of al-Manṣūr broke out again on his death. The dispute for the throne set his sons against one another. One of them, Zaydān, ended by triumphing over his rivals but could not prevent the break-up of the empire. Larache was occupied by the Spaniards; Fās cast off Sharīfian authority. The Andalus of Rabat and Salé, enriched by their piracy [see ḲURṢĀN], formed an independent republic. Finally, the Saʿdians, although they had owed their elevation to the religious movement, now found the marabouts rising against them. Delivered from the restraints which the distrust of al-Mahdī and his successors had placed upon them, the latter began to gain more and more hold over the people and contributed to the ruin of the authority of the *shorfā*. Sūs was in the control of one of them, Sīdī ʿAlī; Tafilalt was under the Ḥasanī *shorfā*, the Gharb under al-ʿAyyāshī, leader of the "volunteers of the faith". In the centre, the power of the *zāwiya* of Dilāʾ [*q.v.* in Suppl.] increased. Maḥammad al-Ḥadjdj, their leader, victorious over the Saʿdians and over al-ʿAyyāshi, lord of Salé and Fās, seemed on the point of founding a new Berber empire from the Atlantic to the Moulouya. Incapable, in spite of the support given them by the English and Dutch, of disposing of their adversaries, the Saʿdians now held only Marrākush and its immediate environs. The last representative of the dynasty died in 1070/1660, assassinated by the *shaykh* of the tribe of Shabbānāt.

B. The Ḥasanī *Shorfā*. The disintegration of Morocco was arrested by the coming of the Ḥasanī *shorfā*. The latter had taken advantage of the disorder to assert their authority in the Tafilalt, then by expeditions, which partook of the nature of brigandage as much as of warfare, they had conquered eastern Morocco. One of them, Mawlāy Muḥammad, had even tried, without success, it is true, to take Fās from the Dilāʾīs. His successor Mawlāy al-Rashīd (1076-82/1664-72) was more successful. He took Fās, disposed of Ghaylān, an adventurer who had established himself securely in the Gharb, destroyed the *zāwiya* of Dilāʾ, reconquered Marrākush, thus rebuilding as it were piece by piece the Sharīfian empire. Installed by force of arms, the new dynasty recognised the necessity of securing the moral prestige which their origin could not give them. They therefore sought to attract to their side the Sharīfian families. They heaped favours on the *shorfā* of Wazzān, whose patronage was a guarantee even for the rulers.

The work begun by Mawlāy al-Rashīd was continued and brought to a successful conclusion by his successor Ismāʿīl (1082-1139/1672-1727). During the first fifteen years of his reign, he did not cease to wage war on the rivals who disputed the districts of Marrākush and the Sūs with him. While fighting his enemies, he was engaged in building up an army which would work his will. To the *makhzan* formed by the Shrāga and Udāya, he added a body of black slaves, the ʿAbīd al-Būkhārī (Bwākher), the property of the sultan; their children were specially trained for military service. The number of effectives in this corps by the end of the reign numbered 150,000

men. The sultan was thus able to reduce to obedience the Berbers of the Atlas and the upper Moulouya. Defeated and disarmed, the latter were kept in control by garrisons placed in *ḳaṣbas* built at the exits to the valleys or commanding the lines of communication. The notables whom the sultan had taken into his service or united to himself by matrimonial alliances forced their tribesmen to live in peace. The *bilād al-makhzan*, i.e. the country where tribute was regularly paid, extended over almost the whole of the extreme Maghrib. The pacification of the interior did not cause Mawlāy Ismāʿīl to forget the obligations imposed on every Muslim ruler to fight the infidels. He therefore continued the holy war against the Christians of the coast. He recaptured al-Mahdiyya, Larache, Aṣīla, and Tangier, evacuated by the English in 1684, but could not take Ceuta from the Spaniards in spite of a siege or rather uninterrupted blockade for seventeen years. He was no more successful in his enterprise against the Turks of Algiers, who disputed with the Moroccans the possession of the plains of eastern Morocco and the *ḳṣūr* of southern Oran. The expeditions which he directed against the Algerians ended in failure, and the lower course of the Moulouya continued to be the boundary of the Sharīfian empire. In spite of his lack of success here, Mawlāy Ismāʿīl is nevertheless the great figure of the Ḥasanī dynasty, the model the Moroccan sultans have set themselves to the present day. Morocco, however, remained what it was before, i.e. an aggregation of different groups, the cohesion of which depended on the personal energy of the sovereign, who squeezed his subjects to the utmost to get the money necessary for the building of his capital Meknès, the palaces of which were built by the forced labour of the local people and of Christian slaves.

On the death of Mawlāy Ismāʿīl, a reaction set in. For thirty years his sons fought with one another. The real masters of the situation were the ʿAbīd al-Bukhārī, who made and unmade sultans as they pleased. One of them, Mawlāy ʿAbd Allāh, was proclaimed and deposed six times. He succeeded, however, in triumphing over his competitors by playing the Berbers off against the ʿAbīd, the importance of whom gradually diminished with the wars. The remedy, however, was not much better than the disease. This period was for Morocco one of misery and ruin. The authority of the Sharīfs emerged much weakened from it.

Mawlāy Muḥammad (1170-1206/1757-92) succeeded, however, in restoring it. Inheriting the energy and vigour of his grandfather Ismāʿīl, he brought the rebel Berbers back to their allegiance, and by the taking of Mazagan in 1183/1769 destroyed the last trace of Portuguese power on the Atlantic coast. Convinced, on the other hand, that the weakness of the central power was mainly due to a lack of financial resources, he endeavoured to procure money by encouraging the development of foreign trade. He inaugurated a mercantile policy, concluded treaties of commerce with Denmark, Sweden, England, and France and endeavoured to attract foreign merchants to his kingdom by founding for them the town of Mogador [see AL-SUWAYRA] in 1764. Heavy taxes, however, severely impeded the progress of this policy. Morocco remained a poor country and did not open itself, as had been hoped, to European penetration. It also remained in a perpetual turmoil. Under Mawlāy Yazīd (1206-8/1792-4) the country was once more handed over to anarchy. Mawlāy Sulaymān (1208-39/1794-1822), after at first being able to restore order, had to spend the last ten years of his reign in putting down the continual risings of the Berbers of the Middle Atlas; in the course of one of these expeditions he actually fell into the hands of the rebels. This rebelliousness caused the sultan much misgiving; he also wanted to prevent the infiltration of foreign and anti-Muslim influences which he believed would aggravate it. He forbade his subjects to leave the country and restricted to a minimum their intercourse with Christians. The diplomatic and consular agents were relegated to Tangier, and access to the interior was made almost impossible for Europeans. His successors followed his example. Down to the end of the 19th century, Morocco was more rigorously closed than it had been in the time of the Marīnids and Saʿdians and even in the early days of the Ḥasanī Sharīfs. In spite of this systematic isolation, the sultans had nevertheless to face the same difficulties as Mawlāy Sulaymān and had no more success than he in overcoming them.

For half-a-century the domestic history of Morocco was a series of rebellions which the sovereigns had great difficulty in suppressing. The regions remote from the centre, Rīf, Tafilalt, Figīg, eastern Morocco, escaped the authority of the *makhzan*. In the very heart of the country, the Berbers cut communications between Fās and Marrākush, forcing the sultans when they wanted to move from one capital to the other to make a great detour by Rabat. The empire broke up more and more. Mawlāy al-Ḥasan (1290-1311/1873-94) postponed for a few years the inevitable collapse. His reign resembled that of Mawlāy Ismāʿīl. At the head of his army, the artillery of which had been reorganised by a French military mission, he was continually in the field raiding the rebels and tearing down *ḳaṣbas*. He re-established order in the region of Oujda, forced the people of the Sūs to recognise his *ḳāʾids*, reduced to obedience the Zaʿāʾir and Zayān, endeavoured to extend the *makhzan* country by expeditions against the independent Berbers, endeavoured to develop his influence in the Saharan regions and to restore his authority in Tuwāt. But he died before completing his task and all had to be begun again.

Morocco and the Christian powers. The situation was the more critical, in that the fate of Morocco could no longer be a matter of indifference to the European powers. It increased the cupidity of some and aroused the cupidity of others. In spite of their desire for isolation, the sultans had not been able to break every link with Europe. They had also to take account of the proximity of Spain, established for three centuries in the "presidios" of the Mediterranean coast, and of the French who had replaced the Turks in Algeria. The conquest of the old Regency, destroying all the Sharīfs' hopes of extension eastwards, had caused great irritation in Morocco. ʿAbd al-Ḳādir [*q.v.*] found followers among the peoples of this country and support hardly disguised on the part of the *makhzan*. This hostile attitude resulted in the Franco-Moroccan war of 1844. The Sharīfian army was crushed at the battle of Isly, the ports of Tangier and Mogador bombarded. The moderation of France alone enabled the *makhzan* to come fairly well out of of this unfortunate escapade. Henceforth, the relations between France and Morocco remained peace ful, although the impotence of the Moroccan government to guarantee security on its borders forced France to military demonstrations like the Benī Znāsen

campaign (1859) and the Wādī Gīr expedition (1870). Spain in turn being unable to obtain satisfaction from the attacks directed against her garrisons, decided also to resort to arms. The campaign of 1859-60, ended by the victory of O'Donnell, revealed the military weakness of Morocco. The treaty of Tetouan (1860) granted to Spain, along with some trifling territorial aggrandisement, an indemnity of 100,000,000 reals. To pay this debt, the Sharīfian government had to raise a loan in London on the security of the Moroccan customs and to accept the control of European commissioners. For the first time, foreigners intervened in the domestic administration of the empire. The breach thus made was continually enlarged. The exercise of the right of protection, the erection of a lighthouse on Cape Spartel, served as a pretext for diplomatic negotiations and for the extension of international control. European ambitions were not dissimulated. In order to protect itself against them, the *makhzan* tried to play one off against the other and confined itself to granting, as it did at the conference of Madrid (1880), concessions devoid of all practical significance. Mawlāy al-Ḥasan excelled in this difficult game and the vizier Bā Ḥmād [*q.v.* in Suppl.], who directed affairs during the early years of the reign of ʿAbd al-ʿAzīz, Mawlāy al-Ḥasan's successor, displayed no less skill. Morocco was thus the object of a very keen struggle for influence. England wanted to maintain her economic preponderance along with the control of the Strait; France wanted to ensure the security of her Algerian possessions and of the roads leading to the Saharan oases occupied in 1901-2; Spain appealed to her "historic rights"; Germany lastly was preparing to seize the opportunity to acquire openings for her commerce and emigrants.

The Moroccan crisis and the establishment of the French protectorate. Such a position could not last. The imprudences of Sultan ʿAbd al-ʿAzīz precipitated the crisis. The whims of the sovereign and his immoderate desire for European innovations displeased the stricter Muslims. The modifications in the fiscal policy made by the *tartīb* [*q.v.*] disturbed the people already taxed to the utmost. Rebellion broke out everywhere. A pretender, the *rūgī* Bū Ḥmāra [*q.v.*], rose in the region of Taza and routed an army sent against him. It was in vain that France by the agreements of 1901 and 1902 endeavoured to organise the activities of the *makhzan* against the rebels and to postpone the inevitable catastrophe. On the failure of this effort, France decided to arrange with England and Spain to settle the Moroccan question and prevent the dismemberment of the empire. In return for recognition of the protectorate *de facto* exercised by England in Egypt and the granting to Spain of a sphere of influence in northern Morocco, these two powers recognised the right of France to act as her interests best demanded. France hastened to propose to the sultan a plan for reforming the Moroccan administration. The intervention of Germany prevented its realisation. On 31 March, 1905, the Emperor William II landed at Tangier and in a sensational speech posed as the defender of the independence of the sultan. On the advice of the German representative, ʿAbd al-ʿAzīz appealed for the constitution of an international conference to study the reforms to be introduced into the Maghrib. The conference met at Algeciras (15 January-7 April, 1906) and affirmed the three principles of the sovereignty of the sultan, the territorial integrity and the economic freedom of Morocco. It did not, however, settle the Morocco question. The two international bodies which it decided to set up, the police for the ports and the state bank, both capable of being of great service, could not take the place of the general reforms necessary for the salvation of the empire. Disorders continued, acts of hostility against Europeans in Morocco itself and acts of brigandage on the frontiers increased in number. Not being able to obtain satisfaction for outrages on its subjects, the French government ordered the occupation of Oujda and Casablanca in 1907. The country was then pacified around these two centres and order restored in eastern Morocco and in the Shāwiya to the great benefit of the natives themselves. The Spaniards in their turn for similar reasons intervened in 1908 in the adjoining region of Melilla and after a severe campaign in 1909 occupied Salwān and a number of strategic points.

During this period, war broke out between ʿAbd al-ʿAzīz and his brother Mawlāy ʿAbd al-Ḥafīẓ, proclaimed sultan at Marrākush and then at Fās. Supported by the anti-foreign party, the pretender was victorious. All the powers, including France and Spain, recognised him, after he had promised to respect the agreement of Algeciras, the international treaties and all the engagements entered into by his predecessors. France and Spain announced their intention of not prolonging their occupation of Sharīfian territory. The Franco-Moroccan agreements of 4 March, 1910 and the Hispano-Moroccan one of 19 November of the same year, stipulated that the occupation should cease as soon as the *makhzan* should have a force sufficient to guarantee the security of life and property and peace with its frontiers. This settlement seemed all the more desirable as there had been occasional friction between France and Germany which had only been smoothed over with great difficulty, the most serious being the affair of the deserters from Casablanca in September 1908. A disquieting state of tension remained between these two powers, although France had endeavoured to give satisfaction to Germany in signifying, by the agreement of 8 February, 1909, her willingness not to impede the economic freedom nor hinder the development of German interests.

The aggravation of the situation in the interior hastened the dénouement. The sultan's rule was no more effective than that of his predecessors; the exactions of the Moroccan agents in the spring of 1911 provoked a rising of the Arab and Berber tribes in the region of Fās. Besieged in his capital and on the point of succumbing, the sultan appealed to the French. They decided to send an expeditionary force to the help of the sultan, but ordered its commander to avoid any injury to the independence of the sultan and any occupation of new territory. Vigorously commanded by General Moinier, the military operations had the desired effect. Fās was relieved on 21 May, and after certain police operations necessary to secure the peace of the district, the expeditionary force returned to the coast. But, while the danger was thus banished from the interior, unexpected complications resulted. Spain, taking advantage of the occasion to take possession of the sphere of influence reserved for her by the agreement of 1904, established herself in Larache and al-Ḳaṣr. Germany feeling the moment was decisive, claimed compensation in her turn and in July 1911 sent a warship to

Agadir. This demonstration provoked the greatest alarm in France and in Europe generally. In the end, however, a peaceful settlement was reached. After four months of difficult negotiations, the agreement of 4 November 1911 put an end to the dispute, Germany abandoned all political claims to Morocco and admitted with certain reservations, chiefly of an economic nature, the principle of the French protectorate. There was no longer any obstacle to the establishment of this régime, which the sultan accepted by the treaty of 30 March 1912. This diplomatic document stipulated the maintenance of the sovereignty of the sultan, the representation of and protection by French diplomatic and consular agents of Moroccan subjects and interests abroad, the carrying out, with the collaboration of and under the direction of France, of a number of administrative reforms, judicial, financial and military, intended to "give the Sharīfian empire a new régime, while safeguarding the traditional prestige and honour of the sultan, the practice of the Muslim faith and the institutions of religion".

The French protectorate extended over the whole of Morocco, but the Spanish sphere of influence enjoyed by the agreement of 27 November 1912 complete autonomy from the administrative and military points of view, whilst Tangier and its environs were included in an international zone whose status was not, however, definitely regulated till 1923.

The establishment of the protectorate was to have had as its first result the restoration of the authority of the Sharīf, whose support was essential for the carrying out of the reforms. This could only be attained by a considerable effort. The central power was weaker than it had ever been at the time when the conclusion of the protectorate treaty put an end to the crisis. The *bilād al-makhzan* was almost non-existent. France had to conquer Morocco for the sultan. The name of Maréchal Lyautey, appointed High Commissioner and Resident General, will remain inseparable from the history of the pacification of Morocco. Very difficult in itself, for it brought the French into contact with warlike tribes, some of whom had never recognised the authority of the *makhzan*, the task was further complicated by events abroad. Order had hardly been restored around the chief towns, Fās, Meknès, Marrākush and communication restored between eastern and western Morocco, when the War of 1914 broke out. For a moment it was feared that the French were going to abandon the interior and fall back on the coast, but the progress of the pacification of the country was only slowed down, not interrupted. All the conquered positions were retained and the rebels held on all fronts. The counter-offensives of the rebels in the Taza corridor, along the Middle Atlas and in Sūs were crushed. The War finished, the offensive was resumed to reduce the districts still unsubdued (Middle Atlas, south of the High Atlas, upper valley of the Moulouya). Three years of difficult fighting (1921-4) ended in the occupation of "all Morocco of value", i.e. those regions of economic, political or military importance. The Rīfan offensive in 1925, however, threatened to compromise all the success achieved. A Rīfan chief, ʿAbd al-Karīm, had gathered around him the greater part of the tribes of northern Morocco and inflicted serious reverses on the Spaniards which forced them to abandon a portion of the territory which they had occupied. Crossing the Spanish zone, he invaded the valley of the Wargha and threatened Fās. The resistance of the posts echelonned along the frontier gave reinforcements time to reach the scene of hostilities. Checked in the autumn, the Rīfan advance was definitely crushed in the spring of 1926 thanks to the combined action of France and Spain. The reduction of the last pockets of resistance in the mountains and the southern regions was completed in 1930.

The administrative reorganisation kept pace with the pacification. The old machinery was retained but submitted to a control which guaranteed the local population against abuse of their power and excesses by the agents of the *makhzan*. Technical services were created to give the country the works necessary for its economic life.

Thus, within the space of some 40 years, Morocco, which was still a mediaeval country, became a modern kingdom equipped with a quite extensive highway network, electrified railways and deep water ports. The remarkable results achieved in all sectors were facilitated by the influx of European immigrants and capital. Approximately 350,000 Europeans in the French zone and about 100,000 in the Spanish zone participated actively in the economic life of the country and contributed in particular to the prosperity of agriculture, while the towns enjoyed rapid development.

At the same time that the pacification of the country was completed, young people educated in metropolitan universities as well as in the modern establishments founded in Morocco itself, began to agitate; the Berber *dahir* [see MAḤKAMA, 5. i] of 16 May 1930 gave the signal for opposition to French policy and for the struggle for independence. During the Spanish Civil War, Moroccan troops served under the victorious General Franco; as a result, the inhabitants of the northern zone were able to benefit from a more liberal régime. Subsequent events during the Second World War, and in particular the defeat and occupation of France in 1940, had no very serious immediate effect, although they induced the nationalists to pursue their activities with greater vigour, not without encouragement from the Allies; in other respects, the increasingly overt manifestation of national sentiment in the Arabic-speaking countries brought latent aspirations for independence out into the open. 1944 saw the establishment of the *Istiḳlāl* party, to which the sultan Muḥammad V, who had occupied the throne since 1927, showed himself far from hostile; on 10 April 1947, he made a speech at Tangier which disturbed the French authorities. The nomination of General Juin as Resident-General and the reforms immediately effected failed to restore stability; in 1953 France decided to depose the sultan, sending him to exile in Madagascar and replacing him with a less assertive prince, Mawlāy ʿArafa; this decision further exacerbated popular discontent, and acts of terrorism and violent demonstrations followed. As a result, the French government had no option but to recall the sultan and to accept, through the declaration of La Celle Saint Cloud of November 1955, the principle of Moroccan independence, which was officially recognised in the agreement of March 1956. The Spanish government followed the example of France in 1956, but retained the ports of Ceuta and Melilla.

The achievement of independence posed numerous problems to the Moroccan authorities, who were at first obliged, owing to the lack of trained native personnel, to retain the services of thousands of

French and Spanish officials, before appealing to new allies for support. The "Army of liberation" was absorbed into the *Forces Armées Royales* (FAR), and the French and Spanish troops withdrew in 1961, while the American airbases were evacuated.

One of the first concerns of the sultan (who took the title of king in 1957) was to appoint a consultative Assembly, superseded in 1960 by a constitutional Council charged with preparing a Constitution; the latter, which instituted a parliamentary monarchy, was approved by referendum on 7 December 1962 [see DUSTŪR. xvii]. During the same period, the *Parti Démocratique de l'Indépendance* (PDI), recently founded, became quite active, but in 1959 a number of its members, together with some independents, joined the *Union Nationale des Forces Populaires* (UNFP), closely linked to the *Union Marocaine du Travail* (UMT) and the product of a schism within the *Istiḳlāl* provoked by the syndicalist Mehdi Ben Barka.

The first Moroccan government, led by a non-political colonel, was composed of members of the *Istiḳlāl* and the PDI, but after November 1956 the latter were eliminated, and an entirely *Istiḳlāl* cabinet appointed. In 1960, the king took upon himself the functions of prime minister, with the assistance of his son, prince Mawlāy Ḥasan, who was to succeed him after his death in the following year. In the legislative elections held in 1963 after the promulgation of the Constitution, the *Istiḳlāl* and the PDI, now in opposition, obtained respectively 41 and 28 seats, as many between them as the number gained by the *Front pour la Défense des Institutions Constitutionelles* (FDIC) which had recently been established. On 16 July of the same year, several leaders of the UNFP were arrested for "serious infringement of the law" and for being the founders of a "subversive movement". The charges of conspiracy laid against some hundred individuals were not pressed, but since the two parties boycotted the next elections, the Government won a decisive majority in the regional councils and Chamber of Deputies.

Also in 1963, an armed conflict broke out between Morocco and Algeria on account of a frontier post which the latter had seized. Between 1965 and 1967, relations with France were compromised by the abduction and disappearance in Paris of the leader of the UNFP, Mehdi Ben Barka. These events led the French authorities to institute proceedings against Moroccan secret service agents and specifically against the Minister of the Interior, General Oufkir, who was sentenced in his absence. The name of this officer was mentioned again in connection with two unsuccessful attempts on the King's life. The first took place on 10 July 1971, at the palace of Ṣkhīrāt (to the south of Rabat), where guests who had gathered to celebrate the anniversary of the sovereign were attacked by cadets of the Military Academy of Aḥermummu; about a hundred were killed and 132 wounded, but miraculously the King escaped assassination, in spite of the fact that the conspirators announced his death and proclaimed a Republic, having seized a number of public buildings including the radio station. Forces loyal to the King succeeded, however, in restoring order, and a commission of enquiry, in which General Oufkir participated, attributed responsibility to a number of senior army officers who were disgraced and shot.

The following year, on 16 August 1972, the King's private plane was attacked over Tetouan by one of the four F.5 fighter aircraft from the base at Kenitra which had been detailed to escort it; one person was killed and two wounded, but the pilot of the Boeing succeeded in landing his plane at the airport of Rabat-Salé, where renewed strafing caused a further 8 deaths and injured 50. The officer responsible for the attack ejected from his fighter, but was arrested and implicated General Oufkir, who met his death the following night.

The failure of these successive attempts on his life only enhanced the prestige of the Sovereign, who was nevertheless confronted by a new danger. In fact, after the independence granted by Spain to Rio de Oro, a section of the population of the Western Sahara refused to withdraw from territory claimed by Morocco and formed the Polisario Front. Since then, from its bases in Algeria, this organisation has continually harassed Moroccan troops immobilised in the south, behind a "wall" which they have been obliged to construct to defend themselves from attacks by an enemy equipped by various nations with the most modern arms and equipment. The expenses incurred as a result of this interminable and violent war have been a considerable burden on the finances of Morocco, whose economy is also suffering as a result of the world-wide economic crisis.

III. POPULATION.

a. Total population and density. Before independence, it was difficult to fix with any precision the total population of Morocco. The attempts made at a census during the protectorate enable, it is true, comparatively accurate estimates to be made for the greater part of the country.

The total which was usually given was 5 millions, of whom one-tenth (500,000 inhabitants) was in the zone of the Spanish protectorate, but the censuses of 1950 (Spanish zone) and 1952 (French zone) furnished the following figures: Spanish zone, 1,010,117 plus Ifni, 38,295 plus Ceuta and Melilla, 141,305; Tangier (1956), 175,000; French zone, 8,003,985, of whom 362,814 were Europeans and 199,156 Jews; a total, accordingly, of 9,368,702 souls. Some years later, according to the census of 1960, there was a total population of 11,626,470 (30% of these being town-dwellers); the Jews were still 159,000, the French 195,000 and the Spanish 125,000. In September 1982, the population had passed the 20 millions mark (20,419,555), of whom 57.3% were rural dwellers. This population is very unequally distributed and its density varies with geographical conditions. The most thickly populated part is that of the plains of western Morocco between the massif of the Jbāla in the north and the Great Atlas in the south: Gharb, Shāwiya, Tadla, Dukkāla and ʿAbda. The density of the population also varies with the fertility of the soil. The population of this region is estimated at two-fifths of the total. The mountainous regions, Jbāla, Rīf, Middle Atlas are not thickly populated, as we might have expected from the comparatively dense population of Kabylia. As to the Sahara zone, outside the belts of oases in the Wādī Gīr, the Wādī Zīz and the Wādī Darʿa (Dra), it is very sparsely inhabited.

b. Elements of the population. The population of Morocco consists for the most part of Berbers and Arabs, the former being the older element and the latter invaders. As to the Berbers, who do not seem to be a homogeneous race and whose origin is obscure, see BERBERS. As to the Arabs, they are in a minority, but it is often difficult to attribute an exact ethnic origin to certain tribes or confederations, so much have the Arabs and Berbers become mixed since the Muslim conquest, and intermingled either by peaceful or warlike methods. It will be more prudent and will give a more accurate result if we distinguish in Morocco between those who speak Arabic and those who speak Berber (see below VII. LANGUAGES). The former live entirely in the plains, while with the exception of the massif of the Jbāla, the inhabitants of the mountains speak Berber.

1. Berbers. Three main groups may be distinguished among the Berbers of Morocco: in the north the Rīfans and the Benī Znāsen; in the centre the Znāga (Ṣanhādja and the Brāber (*Barābir*), who form the population of the Middle Atlas; the third group is that of the Shlūḥ [see SHILLUḤ] who occupy the western part of the High Atlas and of the Anti-Atlas, as well the plain of Sūs. In addition to these main groups, we may mention the Jbāla, arabicised Berbers, to the north-west of Fās, and the Ḥarāṭīn (plur. of the Arabic *ḥarṭānī* [*q.v.*]), who form the basis of the settled population of the zone of the Saharan oases.

2. Arabs. The early invasions at the time of the Muslim conquest do not seem to have appreciably modified the ethnology of the country. Up to the 7th/13th century, the country districts of Morocco were almost completely Berber; it was the great Almohad ruler ʿAbd al-Muʾmin [*q.v.*] who was the first to introduce into Morocco Hilālī Arab tribes hitherto settled in the Central Maghrib or in Ifrīḳiya; these importations, continued by the successors of this prince and by the Marīnid dynasty, soon drove the Berber element into the mountains or absorbed and arabicised it. Evidence of such assimilation is still found in the fact that tribes with clearly Arab names contain sections whose names show their Berber origin.

These Arab tribes, who are all settled in the plain, may be divided into two main ethnic groups: the Banū Hilāl and the Maʿḳil [*q.vv.*]. The latter occupies almost exclusively the valley of the Upper Moulouya as well as the lands south of the Atlas. The Banū Hilāl occupy the sub-Atlantic plains and the steppes of Eastern Morocco.

3. Jews. There were formerly about 200,000 Jews in Morocco, mainly living in the towns. There were

also a considerable number among the tribes of the Great Atlas. They also formed the principal element in the population of the two little towns of Dubdū and Damnāt. The origin of the earliest elements in this Jewish population is obscure: it is difficult to ascertain whether they were Jews who had migrated from Palestine or were judaicised Berbers. The modern element is made up of Jews who fled from Spain to Morocco in the 16th century. The former call themselves *pᵉlishtīm* (Palestinians) and are called *forasteros* (foreigners) by the Spanish immigrant Jews, who were practically all settled in the towns of the coast and rapidly became europeanised. Since independence, large numbers of them have emigrated, mainly to Israel.

4. Miscellaneous elements. The blacks, of whom there are considerable numbers in Morocco, do not however form a distinct group there. In the north we find many, who are almost all of slave origin. The predilection of the townsmen of Morocco for black concubines, noted for their domestic virtues, has brought into the population, especially in bourgeois circles, a very considerable amount of negro blood. To the south of the Atlas in the oases, the intermarriage of blacks and Berbers has produced the Ḥarāṭīn. Finally the blacks of the Bilād al-Sūdān, since the Middle Ages, have always been esteemed as mercenaries to form the imperial guards, especially since the taking of Timbuktu by the armies of the Saʿdian sultan Aḥmad al-Manṣūr [*q.v.*].

Large numbers of Muslims from Spain, whether of Arab origin or descendants of Christian inhabitants of the Peninsula, have contributed to form the population of the towns at various times: Cordovans banished by al-Ḥakam I at the beginning of the 3rd/9th century after the "revolt of the suburb" and Muslims expelled from Spain at the Reconquista [see AL-ANDALUS, vi. Appendix].

We must not omit the influence that may have been exercised on the population of Morocco by Europeans (renegades, who had adopted Islam, mercenaries recruited outside Morocco and settled in the country), and finally we may note that frequently the sultans have purchased women for their harems in Constantinople.

IV. Social and Economic Life

a. Country. The population of Morocco, although for the most part rural, nevertheless has a larger proportion of town-dwellers than Central Barbary and, like the rest of North Africa, might be divided into nomadic and settled; this division does not at all coincide with that into Arabs and Berbers; there are still nomadic Berbers, while certain Arab tribes are becoming settled on the lands which they cultivate.

It has been shown that the nomadic or settled life of the country-people in North Africa does not depend, as was long thought, on ethnic factors, but is entirely conditioned by geographical considerations. It is the rule for dwellers in the mountains to be settled while the people of the desert steppes, forced to move about in search of pasture for their flocks, are nomads. There are however means between these two extremes and especially in Morocco, where we find many semi-nomads, who move only short distances, principally on the borders of the various mountains of the centre and south. But generally nomadism is the outcome of pastoral migration and its geographical area is in direct relation to the rainfall and therefore to the nature of the vegetation.

It is in eastern Morocco, in the steppes which lie to the east of the Moulouya, and to the south of the Great Atlas, towards the Sahara, that we find the principal groups of nomads in Morocco. In eastern Morocco, we may mention among the large tribes which lead a nomadic life the confederation of the Benī Gīl, between Berguent and Fīgīg; on the other side of the Atlas, the Ayt Seddrāt, the Ayt Djallāl, the Id-an-Blāl, the Ayt-u-Mrībeṭ; lastly to the south of the Darʿa (Dra) country, the Rgība, the Shkārna and the Awlād Dlīm. As to the semi-nomads, we find them, outside the Middle Atlas, in the great plains of the Gharb, in the north, the Rḥāmna and the Shyāḍma, and in the south, where a pastoral life has not yet completely disappeared before a more settled state of society.

Nevertheless, Morocco is, of the three countries of Barbary, that which has in its rural population the largest proportion of settled people, of fixed habitat and living not only in tents but also in houses. The latter are rarely found isolated in the country, but on the contrary are grouped into villages of more or less importance and more or less near one another, according to the density of the population.

The type of dwelling varies with the district. In the mountains we find houses built of unbaked bricks or stone with a gabled, thatched, pitched or a flat roof. In the plains, the tent predominates, more or less fixed to the spot, and with it we find more and more the hut of branches with a conical roof called *nuwwāla*. In the Saharan oases, the population collects within a walled area of *ḳṣūr* (sg. *ḳṣar*, from the class. *ḳaṣr*); these conglomerations sometimes possess the elements of town-life. The villages are called douar (*duwwār*) in the plains, and *dshar* in the mountains. In some hill regions we find survivals of cave-dwelling.

b. Town. Among the towns of his country, the Moroccan distinguishes a certain number that he definitely regards as cities (*ḥaḍariyya*). These are Fās, Rabat-Salé and Tetouan, which have been more than others subjected to the influence of Spanish culture. It must however be noted that in the majority of the other towns we can still find traces of the existence of colonies formed by Muslims from Spain, especially from the 9th/15th century onwards. The population of the non-*ḥaḍariyya* towns is found to be composed of rustic elements but little urbanised. This is the case with Oujd and al-Djadīda (country Bedouins) and also with Tangier (countrymen from the hills). Marrākush and Meknès owe their special urban character to the fact that as capitals they have contained the courts of two Sharīfian dynasties, both of Bedouin origin; they are *makhzaniyya* towns in which the standard of civilisation does not reach the refinement of the *ḥaḍariyya* Spanish towns. The ports Tangier, Larache, Mazagan, Safi and Mogador were for long the only points of contact between Morocco and European influences, politically as well as commercially. Lastly in the mountains, little towns like Shefshāwen, Wazzān, Sefrou, Dubdū, Damnāt, owe their existence to political reasons. The two first were founded as bulwarks against the Portuguese advance in northern Morocco in the 10th/16th century. Damnāt and Dubdū are mainly Jewish towns. As to Sefrou, it seems probable that it is a survival of an old Berber town. We may also mention as towns of secondary importance, on

the Mediterranean coast, Ceuta, completely europeanised for several centuries, on the Atlantic coast Arzila (Aṣīlā), Casablanca, which owes its origin to the little port of Anfa, Azemmir, Agadīr. In the interior, al-Ḳaṣr al-Kabīr, Taza, Tarudant. Several ancient towns have now disappeared, e.g. Nakūr and Bādis on the Mediterranean, Ṭīt to the south of Mazagan, the two Aghmāt and Tīnmallal to the south of Marrākush, and several others, descriptions of which have been given by the geographers like al-Bakrī, al-Idrīsī and Leo Africanus.

As a rule, the Moroccan town is grouped round a citadel or *ḳaṣaba* (pop. *ḳaṣba*) which is the seat of authority. Under the protection of the citadel lies the *mellāḥ* or Jewish quarter [see MALLĀḤ]. All around spreads the town proper or *mdīna* with its great mosque, markets and *ḳayṣariyya* [*q.v.*]. It is surrounded by a rampart (*sūr*) beyond which there are usually the suburbs more or less rural in character. The town itself is divided into quarters (*ḥawma*) with streets (*zanḳa*), alleys (*darb*) and squares (*raḥba*).

c. Economic Life. The country people, whether settled or nomadic, who no longer form more than 70% of the population of Morocco, live on the land, either by agriculture or stock-raising, most often combining the two. Those in the highlands grow cereals (wheat, barley), certain leguminosae (broad beans, chick-peas, vetches) and fruit-trees. They also exploit their forests in a very primitive fashion (thuyas, cedars). The people of the plains devote themselves mainly to cereals and the rearing of cattle, sheep, camels, horses and asses. In the oases of the south, the population cultivates the date-palm and understands the art of irrigating the land.

The rural industries are very primitive. They are limited to supplying the necessary implements of agriculture, and weaving wool into the material for garments, tents and carpets. The Berbers of Sūs show a certain aptitude at metal-working (arms and jewels). The Sūs no longer exports the cane-sugar and copper, which formed considerable articles of trade under the Saʿdians.

Each tribe has a certain number of markets (*ṣūḳ*) which are held in the open country and bear the name of the day on which they are held. It is in the *sūḳ* that the peasant sells his produce and buys the manufactured articles that are brought by the merchants from the towns. Cereals are preserved in siloes (*maṭmūra* [*q.v.*]); in the Great Atlas and to the south of it we find fortified store-houses, which belong to the community and are called *agadir* [*q.v.*].

It is in the towns that we find industrial activity concentrated. Each trade, which originally formed a gild (*ḥanṭa*), is grouped in one street which bears its name. In it the articles are made and sold. The stocks are kept in the fonduks (Ar. *fondaḳ*) which correspond to the *khān* and *wakāla* of the east. Some products, like grain, oil, coal, wool, are sold in special places called *raḥba*. The monopolies of exporting (*sāḳa*) corn and hides established by the sultans at the end of the 19th century have been abolished. Several European products have become of the first necessity in Morocco and form the subjects of an important traffic: cotton goods, tea and sugar and candles. For the history of the weights, measures and coins in use in Morocco before the establishment of the protectorate, see the works by Massignon and Michaux-Bellaire quoted in the *Bibliography*. The very vivid picture drawn by Leo Africanus of the commercial and industrial activity of Fās in the Middle Ages is still very valuable.

The Jews, who devoted themselves specially to certain trades that flourish in larger centres (goldsmiths, embroiderers), played an important part as brokers. The citizens of Fās, who had a large number of converted Jews among their number, had almost a monopoly of the import trade of Morocco, especially from England, and for this reason had little colonies in the sea-ports.

The Berbers of the Sūs like to settle in the towns as grocers (*baḳḳāl*) and having made their fortunes return to the country. Since the war, a large number of them have migrated to France as artisans and labourers and they settle in groups, according to their original tribes, in the suburbs of certain large industrial towns.

V. Political Organisation

It is only at rare intervals and for short periods that Morocco has been entirely under the authority of the sultan: whence the distinction between the territory subjected to the government (*bilād al-makhzen*) and the territory unsubjected (*bilād al-siba*). As a rule, the *makhzen* territory included the towns, valleys and plains. The mountains, on the other hand, remained more or less independent, according to the degree of power possessed by the sovereign [see MAKHZAN].

Outside the towns the population is grouped into tribes (*ḳabīla*). Several are sometimes grouped together under a common name, without however being a confederation in the strict sense of the word; this is the case with the Ghumāra in the north, the Ḥāḥa, the Dukkāla, the Shāwiyya in the south. The tribe is subdivided into sections (*rubʿ*, *khums*, *fakhdha*), which are subdivided into sub-sections comprising a certain number of villages of tents or houses.

The tribes who own the sultan's sway are governed by a *ḳāʾid* appointed by the *makhzen*. His duty is to allot and levy the taxes, to raise contingents of soldiers and keep good order. He has under his command a *shaykh* for each section under whom are the *muḳaddams* of the sub-sections.

For the distinction between *makhzen*, *djaysh* (vulg. *gīsh*) and *nāʾiba* tribes, see MAKHZAN.

In the tribes not subject to the *makhzen*, political activity was confined to the *djamāʿa* [*q.v.*], i.e. an assembly of men able to bear arms. The *djamāʿa* (*jmāʿa*) dealt with all the business of the tribe, civil, criminal, financial and political. It administered justice following local custom (Arabic *ʿurf*, Berber *izref*). It elected a *shaykh* (Berber *amghār*) who was only an agent to carry out its decisions. Alongside of the *djamāʿa* of the tribe, there were *djamāʿas* of the sections and sub-sections but their powers were limited.

In the towns, the *makhzen* was represented by a governor whose official title was *ḳāʾid*, but in certain large towns he was often called *bāshā*. The title of *ʿāmil* was sometimes given to the governor of Oujda. The *ḳāʾid* of the town, generally speaking, had the same powers as the *ḳāʾid* of the tribe and acted as judge in case of any violation of the law. He had an assistant or *khalīfa*. Alongside of him, the *muḥtasib* supervised the corporations, fixed their average prices and lookd after public morals.

The *ḳāʾid* had under his orders the *muḳaddams* of the quarter and his police (*mkhāzniyya*) carrying out his instructions. Among the officials sent by the

makhzen to each town may also be mentioned the *nāḍir* or inspector of endowments (*ḥubūs*), the trustee of vacant inheritances (*wakīl al-ghurabā'*, popularly *bū-mwārət* = *abu 'l-mawārith*), the collector of local taxes and market-dues (*amīn al-mustafād*). Lastly in the harbour and frontier towns, the customs were collected by officials called *umanā'* (sg. *amīn*).

Justice [see MAḤKAMA. 5. i] is administered by the *ḳā'id* or by the *ḳāḍī*, as the case may be. The latter deals with questions of personal law; official reports on the cases are drawn up by the *ʿudūl*. In technical cases he appeals to experts: master-masons, agriculturalists, veterinary surgeons (*mwālīn ən-naḍar*: *arbāb əṭ-ṭurḳa, fəllāḥ, bayṭār*).

Landed property takes a number of different forms. In the first place, there are the state-domains; they were either managed directly by the *makhzen* (crown-lands) or they could be allotted to *gīsh*-tribes in return for the military service for which they could be liable; others of these lands might be granted in temporary or definite ownership to private individuals by imperial edict (*ẓahīr* or *tanfīdha*).

The *ḥubūs* lands are urban or rural. In the towns, they not infrequently cover half the area. They are let out under special conditions which give the tenants special privileges, *məftāḥ* and *gzā* (class. Ar. *djazā'*). In the country, the *ḥubūs* lands consist mainly of fields and orchards. In all cases, the revenue from these lands is set aside for the maintenance of buildings of a religious character or of public utility (mosques, colleges, schools, fountains) and for the payment of the officials attached to these establishments.

In Morocco, there are vast tracts of land which are not the property of any one individual, either as a result of the insecurity prevailing or of the sparsity of the population. These lands belong undivided to the whole tribe; they are called common lands (*blād əl-jmāʿa*).

Lastly, lands which have come to belong to private individuals (*mulk*) by inheritance or purchase have their character confirmed by a certificate of ownership (*mulkiyya*).

The old Muslim imposts (*zakāt* and *ʿushr*) have been merged into a single tax, the *tartīb* [*q.v.*]. In addition to this tax, from which the state draws the essential part of its revenues, we may mention the duties levied at the gates of towns and in the markets (*maks*), unpopular with the people and not countenanced by religion, and the urban tax on buildings (*ḍarība*). In addition to these, the main taxes, there was the *hadiyya* or present offered to the sultan on the occasion of the three great Muslim festivals. The *djizya* or poll-tax paid by non-Muslims and the *nā'iba* or payment for exemption from military service by certain Arab tribes have been abolished.

VI. Religious Life

a. The Berbers before Islam. For lack of documents, it is difficult to get any accurate idea of the religious beliefs and practices of the Berbers of Morocco before their conversion to Islam, and it is only from the survival of animistic cults which can still be observed in the country that we can guess what the primitive religion was. The figures on two carved stones found in Morocco seem to be evidence of the existence of a solar worship. On animistic practices surviving in modern Islam in Morocco, see below.

b. Conversion to Islam. At the time of their invasion, the Arabs found that in the districts around the towns the people were more or less under the influence of Jewish and Christian teachings; but there is little doubt that they did not practise these religions in their true form. It will be more correct to think of them as professing Judaism or Christianity rather than as real Jews or Christians. It seems evident that these influences had prepared the Berber population around the mountains to adopt the new monotheistic religion, which the invaders imposed upon them. The two earliest invasions, that of ʿUḳba b. Nāfiʿ *ca*. 50/670 and that of Mūsā b. Nuṣayr in 92/711, could result only in a very partial and superficial islamisation, for very few Arab elements remained in the country. Islam, a town religion, was for long confined to larger centres. The Berbers generally became converted in the hope of escaping the exactions of the conquerors; but when the latter wanted to treat them simply as tributaries, they did not hesitate to apostatise, on seven different occasions, if we may believe the Arab historians. One thing is certain, that while remaining Muslims, they were not long in trying to cast off the authority of the caliphs of Baghdād by adopting the heterodox doctrines of the Khāridjīs [*q.v.*; see also ṢUFRIYYA]. The Berbers of Morocco went even further when new local religions arose among them more or less based on Islam, with their own prophets and Ḳur'āns. After the attempt at rebellion by the Berber of Tangier, Maysara [*q.v.*], which was quickly suppressed, the Barghawāṭa [*q.v.*] recognised as their prophet one of their number, Ṣāliḥ b. Ṭarīf, who gave them a religion and a Ḳur'ān in the Berber language. This religion, the progress of which was opposed by the early Moroccan dynasties, seems only to have been finally exterminated by the Almohad rulers of the 7th/13th century. This Barghawāṭa movement was the most lasting; we also note that which was created by Ḥā-Mīm (d. 313/927-8 [*q.v.*]) among the Ghumāra, near Tetouan.

In spite of these reactions, Islam, having become the official religion of increasingly powerful dynasties, gradually gained ground and penetrated slowly into the Berber mountains, but it is only from the death of ʿAbd al-Mu'min, who destroyed the religion of the Barghawāṭa and put an end to the rule of the "anthropomorphist" (*mudjassimūn*) Almoravids, that we can date the complete unification of Islam in Morocco. Till then, Islam had had in Morocco champions who were soldiers rather than theologians, and who after forcing the people to adopt Islam at the point of the sword, were little fitted to instruct them in it. It required a Berber of the Great Atlas, Ibn Tūmart [*q.v.*], a theologian who had been educated in the east, to come back to his country and to secure the devoted support of a mass of followers in order to found the movement, which was political as well as religious, of the Almohads or "preachers of *tawḥīd*" [*q.v.*].

If the Almohad reformation was only temporary in Morocco, it was nevertheless strong enough while it lasted to obliterate in the country all trace of schism or heresy and to establish thoroughly in it the school of Mālik b. Anas [*q.v.*] which it still follows.

c. Evolution of Moroccan Islam. From the time of the fall of the Almohad dynasty, Moroccan Islam rapidly acquired features of its own. Islam, defeated in Spain, was gradually driven out of it, then attacked in Morocco itself by the

Christians of the Peninsula. The western frontier of the *Dār al-Islām* was brought back to its own territory and then thrust farther back. Islam in Morocco, attacked by Christianity and forced to *djihād*, became an active principle. It required all the moral forces of the country, even those of which the orthodoxy seemed doubtful; in order to utilise them, it did not hesitate to absorb them by covering them with a more or less superficial veneer of orthodoxy. It was at this period that the cult of dead and living saints, and to a certain point Sharīfism, which had hitherto only existed alongside of Islam in Morocco, were adopted into it and received a kind of official recognition from the *makhzen*.

Before the Marīnids, Islam had required the constant assistance of the temporal power to maintain itself and advance. From the time of this dynasty, sprung from a Berber nomad tribe, the roles are inverted; it is now the sovereigns who utilise Islam to increase their own power, and try to monopolise it by creating official colleges for religious instruction (*madrasas*); the first of these (*Madrasat al-Ṣaffārīn*) was founded in 679/1280 by the sultan Abū Yūsuf at Fās, the capital of the dynasty, which made it the great centre of Muslim culture in Western Barbary. The immediate successors of the Marīnids, the Banū Waṭṭās, established in the same town the cult of their founder Idrīs II. The mausoleum in which he is said to be buried was henceforth an object of great veneration. He is the earliest in date and the most important of the innumerable canonised Muslims who are the objects of a regular cult in Morocco, even on the part of the religious leaders and the aristocracy. When the cult of Idrīs was established, his descendants—more or less authentic—claimed the title of *sharīf* and soon played a preponderating part in Moroccan society, as a political and moral influence. The power of the Idrīsid *shorfā* was soon reinforced by that of other *shorfā* descended from ʿAlī through al-Ḥasan and this is the origin of the two great groups of *sharīf*s in Morocco, the Idrīsid and the ʿAlid. To the latter belong the two Sharīfan dynasties, the Saʿdian and Filālī, the latter still in power. From the moment of their accession to the throne, the influence of the *shorfā* on the destinies of the country became more and more preponderant.

The phenomenon of Sharīfism is closely connected on the other hand with the development of religious brotherhoods [see ṬARĪḲA]. Although we find evidence of their existence at the end of the Almohad dynasty (Ḥudjdjādj, Māghiriyyūn, Amghāriyyūn), it is only as a result of al-Djazūlī's (d. 869/1645 [*q.v.*]) campaign in favour of a *djihād* against the Portuguese that we find the principles of the brotherhoods, as we know them to-day, first coming into existence.

d. Islam in modern Morocco. Here we will only give a survey of the principal points of detail in which the people of Morocco differ from the rest of the Muslim community as regards the practice of their religion. With the exception of a few isolated groups, still little studied, who are credited with heterodox or heretical practices (Zkāra, in the neighbourhood of the Bnī Znāsen, in eastern Morocco, Bdādwa, in the Gharb, not far from al-Ḳṣār al-Kabīr), all the Muslims of Morocco are Sunnīs and since the Almoravid period have followed the Mālikī rite, which prevailed in the west over that of al-Awzāʿī. It is in the towns that the population observes most strictly the duties of religion. The Bedouins of the plains and the Berbers of the mountains are rather lukewarm Muslims. The Jbāla, however, between Fās and Tangier, are very devoted to Islam, show great piety, and Ḳurʾānic studies are very much in favour with them; it is from them that are recruited a great number of schoolmasters who practise their calling in the plains [see SHARṬ]. It is also practically only among the hillmen of the north and south that we find a mosque in every village.

In spite of the great distance which they have to traverse, the Moroccans like to accomplish the canonical pilgrimage. A considerable number settle in the east (there are Moroccan colonies in Alexandria and Cairo); the importance of these colonies had even induced the sultan ʿAbd al-ʿAzīz to appoint a Moroccan consul, *amīn al-Maghāriba*, for Egypt.

In addition to the two canonical festivals of Islam (*ʿīd kabīr* and *ʿīd ṣaghīr*), the Moroccans celebrate the festival of the birth of the Prophet (*mūlūd*, class. *mawlid* [*q.v.*]) and that of ʿĀshūrāʾ (10th Muḥarram). The *mūlūd*, established in Morocco by the Marīnids, has become a kind of national festival, since the accession to power of sovereigns claiming descent from the Prophet; this festival in Morocco almost surpasses in importance the two canonical feasts.

The peculiarities just mentioned would not be sufficient to give Moroccan Islam a special character, nor would its religious brotherhoods, if the latter were confined to the practices of religion or exaltation of the faith and to satisfying the need for an elevated mysticism among their adepts. These religious brotherhoods are fairly numerous: Tidjāniyya, Darḳāwa, Ṭayyibiyya-Tuhāma, Kattāniyya [*q.vv.*] etc. But alongside of these brotherhoods, whose members are almost exclusively recruited from the literate or well-to-do classes of the towns and country, there are popular brotherhoods in considerable numbers, in which preoccupation with religion gives place to charlatanish practices and sanguinary displays. Such are the Jīlāla, the ʿIsāwa, the Ḥmādsha, the Dghūghiyya. Some of these brotherhoods recruit their members exclusively from a particular class of society; thus the Rmā (class. *rumāt*) is a brotherhood of marksmen, and the Gnāwa a negro brotherhood. All these brotherhoods have this feature in common that their founder has become a famous saint (*walī*).

The cult of saints is highly developed in Morocco and undoubtedly was so before the introduction of Islam, which found itself obliged to tolerate it. There are however very different categories of saints, from the venerated patron saint of a capital or of a district to the local holy man whose name is forgotten, between whom comes the *sayyid* whose tomb is marked by a *ḳubba* [*q.v.*] (chapel surmounted by a dome), more or less elaborate. The more humble saints are recognised by the circular wall (*ḥawsh*) which surrounds their tombs.

These venerated individuals, male and female, have attained sanctity by very different ways, some in their lifetime, by their learning, devotion, asceticism, miraculous powers (*baraka*), sometimes even by more or less mystic mania (*madjdhūb* [*q.v.*]); the others, after their deaths, have been distinguished by miracles, apparitions etc. The warrior in the holy war (*djihād*, *ribāṭ*), slain fighting against the infidel is frequently beatified—hence his name of *murābiṭ* (pop. *mrābəṭ*—French and English

"marabout"). But the early significance of this term was frequently lost sight of and the term *murābiṭ* came to be generally applied to saints, who never took part in a *djihād* in their lifetime. *Murābiṭ* thus came into general use as a synonym of the other words used for saint in Morocco: *walī*, *sayyid*, *ṣāliḥ*. But it is the only one applied to the descendants of a saint, who possess the *baraka* of their ancestor. Among the Berbers, the saint is called *agurram*. The names of great saints have *mawlāy* prefixed, the others the title *sīdī*, while women saints of Berber origin are called *lālla*.

The saint to whom sanctuaries are most frequently dedicated—modest though they are (*maḳām*, *khalwa*)—was not a native of the country but the famous patron saint of Baghdād, ʿAbd al-Ḳādir al-Djīlānī [*q.v.*], popularly called al-Jīlālī, who undoubtedly never visited Morocco. But the saint whose cult is surrounded with the greatest splendour is the famous Mawlāy Idrīs, founder and patron saint of Fās. Among the other great Moroccan saints may be mentioned: Mawlāy ʿAbd al-Salām Ibn Mashīsh, patron of the Jbāla; Mawlāy Abū Salhām, in the Gharb; Mawlāy Abu 'l-Shitāʾ al-Khammār (Mawlāy Būshshtā), in the north of Fās; Sīdī Muḥammad b. ʿĪsā, patron of Meknès and founder of the brotherhood of the ʿĪsāwa; Mawlāy Abū Shuʿayb (Būshʿīb), at Azemmour; Mawlāy Abū Yaʿazzā (Būʿazzā), in the Tadla; Sīdī Abu 'l-ʿAbbās al-Sabtī (Sīdī Bel-ʿAbbès), born at Ceuta and patron of Marrākush. All these saints who, for the most have been or will be the subjects of articles, and others less famous, are the subjects of a hagiographical literature which will be dealt with in the article MANĀḲIB.

Devotion to individuals canonised in their lifetime or after their death is in Morocco not confined to Muslims. The Jews have also their saints, relatively as numerous as the Muslim saints. Some of the Jewish saints have acquired a reputation so great that even Muslims revere their tombs: e.g. those of the Rabbī ʿAmrān in Azjen, near Wazzān and of Rabbī Ben Zmīro at Safi. On the other hand, the Jews of Morocco show a special reverence for certain of the great Muslim saints of the country.

The area, surrounding the tomb of each of the principal saints is sacred (*ḥurm*) and hence regarded as an inviolable asylum; among the best known are the *ḥurm* of Mawlāy Idrīs in Fās and that of Mawlāy ʿAbd al-Salām b. Mashīsh in the mountains of the north-west. These pieces of ground are the exclusive property of the families who are descended or claim to be descended from the saint. They are exempt from state taxes; more than that, the descendants of the saints have the right to levy for their own benefit certain special dues, by a privilege officially recognised by the sultan. The levying of these dues is not the only way by which the saint's chapel benefits his descendants. The principal source of revenue is the offerings of pilgrims when visiting the tomb; this is the *ziyāra*. In general once a year, there is a kind of patronal festival at the tomb of the saint which is called *mūsəm* (class. Ar. *mawsim*); a vast crowd, some of them from a considerable distance, gather there to pay their devotions to the *sayyid* and to see the display of fireworks given in his honour. On this occasion the offerings flow in and are shared among themselves by the saint's descendants.

In these circumstances, it is usual for every sanctuary of any importance to be regularly organised. The chapel which contains the tomb and the buildings attached to it, an oratory and guest-house, is called the *zāwiya* [*q.v.*]. It is superintended by a *muḳaddam* who collects and distributes the revenues. These do not come entirely from the *ziyāra*. The *zāwiya* often owns lands, sometimes extensive, which are let out and the profits shared with the tenants. They are called *ʿazīb* and the tenants are called *ʿazzāb*. These farms, sometimes acquired by purchase, often come from bequests or donations (*ḥubūs*) from pious private individuals.

We can thus see how certain famous and wealthy *zāwiya*s may exert a moral and political influence in the country round them, independent of their religious influence. The latter is however also very important. The great Moroccan *zāwiya*s are centres of orthodoxy and give life and vigour to Islam in the country. Some are centres of mysticism and they are always centres of religious instruction. This explains the enviable position occupied in Moroccan society by any group of descendants of a famous saint, or of marabouts. If their ancestor had, in addition to the virtues for which he was canonised, the honour to be a descendant of the Prophet, they are at the same time *shorfā*, which further increases their material privileges. The descendants of a saint who was not a *sharīf* try to claim this origin for him by inventing more or less fictitious genealogies. The marabouts who have in this way "infiltrated" into the social category of the *shorfā* are very numerous in Morocco. A Moroccan *zāwiya* is not only a centre of hagiolatry; it is also in the majority of cases a body of *shorfā* and the centre of a religious brotherhood or of a branch of one, or of a secondary order affiliated to a brotherhood. The *zāwiya* itself may have offshoots. Many of the establishments of this name are daughters of a mother *zāwiya* and are sometimes at a considerable distance from it.

Hagiolatry, religious brotherhoods and sharīfism thus form three special aspects of Islam in Morocco, which are profoundly intermingled, and it is difficult to study them separately. For a detailed account of the principal families of *shorfā* in Morocco of genuine sharīf origin or simply marabouts, see SHURAFĀʾ.

e. Survivals of Berber cults. The cult of saints, accepted and even recognised, as we have seen above, by Islam, is in Morocco much earlier than the introduction of this religion. Indeed, alongside of saints of note, there are others who are essentially popular, in the country as well as in the towns. In the large cities like Fās, the great *sayyid*s venerated by all classes of society rub shoulders with humble marabouts whose names show clearly their popular origin; these are Sīdī 'l-Makhfī (My lord the Hidden One), Sīdī Amsa 'l-Khayr (My lord Good Evening) or Sīdī Ḳāḍī Ḥādja (the reverend gentleman who procures what is wanted) and notices are given of them by hagiographers like the author of the *Salwat al-anfās* (cf. E. Lévi-Provençal, *Les historiens des Chorfa*, 383 below). The humble, often anonymous *khalwa*s, which abound in Morocco, undoubtedly are to be connected with earlier mythical individuals, already worshipped in the same place before the coming of Islam. Besides this devotion to popular saints, there are the animistic cults, which we see everywhere in Morocco observed by the lower classes of the population: worship of high places, of caves, springs, trees and rocks.

It is hardly possible to separate from these animistic cults that of Mawlāy Yaʿḳūb in Morocco, who always has a *ḳubba* beside thermal springs, whose curative virtues are recognised.

Survivals of paganism in every case completely foreign to orthodox Islam may be found everywhere in Morocco; they are hardly distinguishable from what one finds in other parts of Barbary. The rites which accompany birth and the ceremonies connected with it (giving of the name and circumcision), marriage and death are now well known. They constitute practices quite foreign to the prescriptions of the Sunna, but they are not regarded by those who follow them as in any way heterodox.

It is especially in the life of the country people that we see most clearly traces of pre-Islamic practices. Many of them are strangely like agricultural customs of the Romans. The Moroccan peasant has retained the use of the Julian calendar, no doubt introduced into the country by the Romans; it is of course much more suitable for the needs of agriculture than the Muslim lunar calendar. The names of the months are retained in their Latin form with little change: January is *yənnāyr* from the Latin *ianuar(ius)*. The beginning of the solar year in Morocco is the occasion of a festival celebrated, especially in the country, under the name of *ḥāgūza*; the festival of the summer solstice (*ʿanṣra*) is also celebrated and on that day it is usual to have fireworks. Similarly the agrarian rites, which are still scrupulously observed by the peasants of Morocco, are completely foreign to the canonical prescriptions of Islam. They are mainly ceremonies of inauguration (of death and rebirth of the land, first day of labour, first day of harvest); rites to protect the crops from the evil eye, or to preserve the *baraka* which they contain while standing, finally special rites to secure rain and good weather. These various ceremonies, to which ethnographers have already devoted detailed studies to which the reader may be referred, are sometimes closely linked up with ceremonies prescribed by Islam; thus the different pagan rites for producing rain (carnival processions, a large spoon dressed in women's clothes and solemnly carried round) do not exclude the worship of saints specially noted as rain-makers like Mawlāy Būshshtā, nor the celebration of the orthodox ceremony of *istisḳāʾ* [*q.v.*].

It is also in the worship of spirits (*djinn*) that we find ceremonies of a strongly Islamic stamp associated with quite profane rites. This cult is especially practised by the lower classes of society, and in the towns particularly by women. The djinns are regarded as supernatural powers, who have to be conciliated to avert their evil influence or fought when one is attacked by them. The rites which deal with them are either propitiatory or intended to overcome harm done. In spite of the many sacred formulae of Islam, which are found in the celebration of these two kinds of rites, one gets a strong impression of paganism from them; they undoubtedly remain practically what they were before the introduction of Islam into Morocco.

(E. LÉVI-PROVENÇAL and G. S. COLIN)

VII. LINGUISTIC SURVEY.

Two languages are spoken in Morocco: Berber and dialects of Arabic. Berber is the oldest attested in Morocco and we have no evidence of an earlier language being used; as to Arabic, it was introduced by the Muslim conquest of the 1st-2nd/7th-8th centuries. But until the arrival in Morocco of the Banū Hilāl and of the Sulaym (6th/12th century), it seems that Arabic, the language of an essentially urban culture, was spoken mainly in the towns while the country people continued to talk Berber; it was only after the occupation of the plains by the Arab tribes that their language spread there. With the exception of the region of the Jbāla to be mentioned later, the highlands of Morocco alone have remained faithful to the Berber language, while the towns and lowlands are more and more Arabic speaking.

In his *Annuaire du Monde Musulman*[3] (162), L. Massignon gives a proportion of 60% of Berber speakers; he retains this figure in the 1954 edn. (250), but A. Bernard had thought this exaggerated and had reduced it to 40% (cf. *Arabophones et Berbérophones au Maroc*, 1924, 278).

A. Berber.

On the language and literature, see BERBERS. V-VI, and also LĪBIYĀ. 2. Lybico-Berber inscriptions.

B. Arabic.

The Arabic dialects. The Arabic language was introduced into Morocco in at least two stages: first in the 2nd/8th century at the time of the first Muslim conquest, then in the 6th/12th at the coming of the Banū Hilāl and the Sulaym. Down to the coming of the latter, who were brought to Morocco by the Almohad ruler Yaʿḳūb al-Manṣūr, Arabic seems to have been spoken almost exclusively in the large towns of the north, where it was used by a considerable Arab population who enjoyed a double prestige, religious and political. It was the language of religion and law. From the towns, Arabic spread among the people of the surrounding country, and al-Idrīsī (*Description de l'Afrique et de l'Espagne*, text 79, tr. 90) already notes that in the 6th/12th century the Berber tribes of the southern hinterland of Fās (Banū Yūsuf, Fandalāwa, Bahlūl, Zawāwa, Maggāṣa, Ghaiyāt and Salālgūn) spoke Arabic.

It is this linguistic influence exerted by the towns on the country around them that explains the arabicisation of the mountainous country of the Jbāla (plur. of *jəbli*, "highlander") while the rest of the Moroccan highlands remained Berber speaking. The land of the Jbāla, in the wide sense, stretches in the form of a crescent from Tangier to Taza. It was surrounded by a cordon of towns: Nakūr, Bādis, Tīgīsās, Tetouan, Ceuta, al-Ḳaṣr al-Ṣaghīr, Tangier, Arzila, al-Ḳaṣr al-Kabīr, Baṣra, Azdjen, Banū Tāwudā, Walīlī, Fās, and Taza, which were the only ports or markets available for the tribes of the region; besides, the massif itself was traversed by the most important commercial routes of Northern Morocco: the roads from Fās to Tangier, to Ceuta, to Bādis, to Nakūr and to Ghassāsa; it was therefore natural that being subject to the direct and indirect influences of the towns, the highlands of Jbāla should be the first region of Morocco to be arabicised. The process was further favoured by several other factors: 1. the existence in the mountains of numerous large villages, almost towns, which became secondary centres of Ḳurʾānic culture; 2. the settlement almost everywhere in the 4th/9th century among the Jbāla of Idrīsid *sharīfs* who, driven from Fās by Mūsā b. Abi 'l-ʿĀfiya al-Miknāsī, founded independent principalities in the mountains, which became centres of Muslim urban culture; 3. the tribes of the Jbāla furnished a considerable part of the contingents which went to wage the holy war in Spain and returned home after being more or less arabicised by contact with the great Muslim towns of Andalusia; 4. lastly, the rebellions and civil wars which so frequently disturbed Muslim Spain, the emigrations or expulsions caused by the progress of the Christian reconquest, brought to Africa, from the "rising of the suburb" at Cordova (in 202/818) down to the 10th/16th century, an important element which settled in the region of the Jbāla either in the towns around the mountains or in the villages of the highlands (resettlement of Tetouan, foundation of Shafshāwan) bringing there, along with the Arabic language, the prestige of their cultural, intellectual and material superiority.

This rapid sketch of the spread of the Arabic language in Morocco explains why, after studying the question, three categories of Arabic dialects have been distinguished:

a. Urban dialects: *b.* highland dialects; *c.* Bedouin dialects; and we may add: *d.* the Jewish dialects.

a. Urban dialects. In Morocco not all the town dialects are "urban dialects". There are towns like Casablanca, al-Djadīda, Safi and al-Suwayra (and to a certain degree Meknès and Marrākush) the

population of which is entirely or for the most part of rural origin and where the absence of an old nucleus of town-dwellers has not enabled them to become urbanised. The Moroccans however distinguish quite clearly such places from towns with a really urban culture, more or less influenced by Andalusian culture. The principal towns with urban dialects are Fās, Rabat-Salé, Tetouan, Taza, al-Ḳaṣr al-Kabīr; Tangier, Wazzān and Shafshāwan also have urban dialects but these are much contaminated by the surrounding highland dialects. Meknès and Marrākush have been influenced by the Bedouin elements introduced by the *makhzen* groups into the dialects of these two old capitals. It is interesting to note the case of Azammour where the old town (Azemmūr al-Ḥaḍar) has an urban dialect, while the new town, which has in more recent years grown up beside it around the sanctuary of Mawlāy Abū Shuʿayb (*vulgo* Bū Shʿayb), uses a Berber dialect. The urban dialects of Morocco form one group with those of the western part of the Central Maghrib, notably with those of Tlemcen, Nedroma and Algiers. Their phonetic characteristics are the loss of the interdentals of the classical language, the affricative pronunciation (*tˢ*) of *tāʾ*, the frequent attenuation of *ḳāf* to *hamza*. In Fās, *b*, *m*, *k*, *g* and *djīm* assimilate the *lām* of the article and are treated as "sun letters"; the simple *djīm* is pronounced like the French *j* (= Persian ژ), but when it is geminated, it gives *jj* in Fās and *dj* in Tangier. The *rāʾ* is often pronounced very close to the French uvular *r*.

As peculiarities of the dialect of Fās, we may note the construction *kətbətto* "she has written it" for *kətbət* + *o*, and the use of an invariable relative *di* representing the old dialectal *dhū*. Tangier and Tetouan have a preposition *n*-, "to" which is used before nouns (*n-əd-dār* "to the house") but not before suffixed pronouns. To translate "of", Marrākush uses *t*-; the dialect of this town uses certain Berber adverbs: *ashku* "because", *həlli* "only".

All the urban dialects use the characteristic prefix of the present indicative: *ka*- in the north, *ta*- in the south. Fās uses one almost as much as the other.

b. Highland dialects. These are at least as well known as those of the towns. In 1920 G. S. Colin published notes on that of the Tsūl and the Brānes in the north of Taza; in 1922, E. Lévi-Provençal published texts, prefaced by a grammatical sketch, of the dialects of the middle valley of the Wargha; since then Colin had an opportunity of studying those of the Bni Ḥōẓmar (near Tetouan), of the Mesṭāsa (near Bādis) and of the Ghzāwa (near Shafshāwan).

The highland dialects are of course more differentiated than the urban dialects. The tribes which use them belong to two political clans probably originally of different racial origin: the Ghumāra, the old inhabitants, and the Ṣanhādja, the invaders. In the present state of our knowledge it does not seem possible to make the dialects coincide with political or racial boundaries; but we can nevertheless recognise two main groups of highland dialects:

1. The northern dialects, extending from the Straits of Gibraltar to the south of Shafshāwan and embracing in the east the confederation of the Ghumāra; 2. the southern dialects, from Wazzān to Taza, used by two great classes of tribes: first, the Ṣanhādja tribes of the valley of the Wargha: Ṣanhādja of the Central Wargha, Ṣanhādja of the Sun and of the Shade, of Moṣbāḥ and of Gheddo; secondly, the Butr tribes, more or less closely related to the Zanāta and occupying the lands north of the region of Taza: Mernīsa, Brānes, Tsūl, Maghrāwa and Meknāsa. It seems to be a historical fact that these Zanāta and Ṣanhādja peoples only settled in their present habitats long after the first Arab conquest; the Ṣanhādja of the Central Wargha certainly now occupy lands which before the Almoravid period were peopled by the Ghumāra. We should therefore regard these southern highland dialects as younger than those of the northern group. The slight differences noted between the two groups may then be due to two main causes: 1. an evolution of the neighbouring urban dialects which would have taken place during the period between the arabicisation of the Ghumāra and that of the Ṣanhādja-Zanāta; 2. the non-identity of the Berber substrata.

To the two main groups: Ghumāra and Ṣanhādja-Zanāta, we may perhaps add two little islands in the south: the highlanders of the region of Ṣefrū to the south of Fās (Bhālīl, Bni Yāzgha etc.), and the Ghiyyāta to the south of Taza; they probably constitute the last vestiges of a continuous Arabic-speaking bloc which stretched to the south of the Fās-Taza corridor, the existence of which in the 6th/12th century we know from al-Idrīsī.

Phonetically, the Moroccan highland dialects are characterised by the profound changes undergone by the Arabic consonantal system as a result of the spirantisation of the dental and post-palatal occlusives. We find the interdentals *th* and *dh*, which do not represent the classical interdentals; *tāʾ-thāʾ* and *dāl-dhāl* have given in these dialects *t* and *d* respectively, which remain occlusive only at the beginning of the word or after a consonant or geminated; but after a vowel we have *th* and *dh*: *bənt* "daughter", plur. *bnāth*; after a vowel also *kāf* is pronounced as a spirant like the χ of modern Greek. The representative of the group ظـض of the classical language is usually *ḍ*, sometimes hardened to *ṭ*; but among the Ghumāra we have *dh* (= emphatic *dhāl*). The sound *č* is fairly common. The short vowels are commoner than in the towns; many of the short vowels *i* and *u* of the classical language are preserved; this is how we find a considerable number of imperfects $iR^1\ R^2\ uR^3$ and a few $iR^1\ R^2\ iR^3$.

As to morphology, the fem. personal suffixes *-a* (< *-hā*) and pl. *-em* (< *-hum*) are characteristic: they are the complement of the series begun by the masc. *-u*, *-o* (< *-hu*). Among the northern Jbāla we find the use of a suffix *-əsh* marking the plural: it seems really to be a borrowing from Latin. The dual, reserved for names of parts of the body which occur in pairs and for names of various measurements (of weight, length, volume and time) is in *-āyən*: *shahrāyən* "two months", *yiddāh* "his hands". The relative, pronoun and adjective, is *d*. The classical construct state (*iḍāfa*) is very rare and is only found in a few stereotyped phrases: it is in general replaced by analytical constructions in which the preposition *d* "of" is used, expressing possession as well as the material of a thing.

Almost everywhere the prefixes of the 2nd pers. com. and of the 3rd pers. fem. of the imperfect are *də*- (and not *tə*-): *dəktəb* "thou writest, she writes". The passive participle of hollow verbs is often of the type *məfʿāl*: *məbyāʿ* "sold", *meḥwāz* "filled up". Finally, we may note a few

traces of a passive of the form *fʿāl-yəfʿāl*: *ḳbāṭ* "to be taken". As evidence of conservatism, we may mention that in these dialects we have the word *fā* "mouth" which seems to have disappeared since old Arabic.

In spite of their divergencies, which are due mainly to pronunciation and to the local use of words and phrases corresponding to two very distinct forms of culture, the urban dialects and the highland dialects cannot be either historically or linguistically separated. The fundamental disparity is that which exists between the urban and highland group and the Bedouin group. It is the townsmen who have taught the highlanders to speak Arabic, but the urban dialects, used by individuals whose intellectual activity is greater, have evolved more rapidly. They are also more sensitive to external influence, literary and political. These facts, added to the predominance of Berber blood in the highlands, suffice to explain why the dialects of the Jbāla still seem coarse and quaint to the townsmen. On the other hand, the towns have been frequently repopulated, wholly or in part by people from the neighbouring hills. All this explains the family resemblance which the linguist finds between the dialects of the towns and those of the hills; perhaps the latter, being more conservative, are also the more interesting for the history of the language. W. Marçais regards them as valuable representatives of the Arabic spoken in the country district of the Maghrib before the coming of the Banū Hilāl and the Sulaym (cf. W. Marçais, *Textes arabes de Takrouna*, i, preface, p. XXVIII).

The principal features which are common to the urban-highland group and which distinguish it from the Beduin group are the following:
— loss of the classical interdentals;
— pronunciation of *ḳāf* as *ḳ* or *hamza* (and not *g* as among the Bedouins);
— tendency to the syllabic grouping R^1 R^2 *ə* R^3, when R^2 is not a laryngal nor a sonant;
— rarity of the construct state;
— suffix of the 3rd pers. masc. sing. in *-u*, *-o* (and not *-ah*, as among the Bedouins);
— relative rarity of the addition of personal suffixes, but regular use of the analytical phrase with *dyāl*: *əd-dār dyāl-ī*, "my house";
— diminutive of R^1 R^2 *ə* R^3 or R^1 *ə* R^2 R^3 becomes R^1 R^2 *iyyə* R^3: *kliyyeb*, "little dog";
— diminutive of adjectives of the types R^1 R^2 *ə* R^3 (< class.: *afʿal*) and R^1 R^2 *ī* R^3 becomes R^1 R^2 *ī* R^2 *e* R^3: *ḥmīmər*, "a little red"; *kbibər*, "a little large";
— plural of the adjectives R^1 R^2 *e* R^3 (< class. *afʿal*) becomes R^1 *ū* R^2 *e* R^3: *kōḥəl*, "black" (plur.);
— reductions of the plurals C^1 C^2 *ā* C^3 *ī* C^4 to C^1 C^3 *ā* C^3 *e* C^4: *mfātəḥ*, "keys";
— use of a verbal prefix to mark the indicative present: *ka-* or *tᵃa-* in the towns and *la-*, *ḳa-*, *a-* in the hills;
— in the singular of the perfect, the feminine person is in general used for the masculine: e.g. *ktəbti*, "thou hast written" (m.), whence we find in Rabat for the plural, an analogous form *ktəbtiw*, "you have written".
— in the vocabulary, *s̲h̲ḥāl*, "how much?"; *dāba*, "now"; *lḳā* (*rḳa*, *ḳḳa*), "to do", are characteristic;
— in the imperfect of the defective verbs, the plural is formed on analogy of the singular: *yəbḳāw*, "they remain"; *yəbḳiw*, "they weep".

c. Bedouin dialects. These are in Morocco the dialects of the plains: the Atlantic plain from Arzila to Mogador with its continuations into the interior, the valley of the Moulouya, the plateaux of eastern Morocco and the region of the Moroccan Sahara (Wād G̲h̲īr, Wād Zīz etc.); they are still little known. That of the Dukkāla of the north (Ūlād Bū ʿAzīz, Ūlād Fred̲j̲), corresponds in almost all its details to the dialect of the Ūlād Brāhīm of Saïda (Orania) on which W. Marçais has written a monograph. There is no doubt that on examination one can divide the Bedouin dialects into groups characterised by more or less conservatism. Those which have most chance of having preserved their original character are those of the tribes of the Saharan steppes who have remained relatively stable and intact: Bni Gīl, Mhāya, D̲h̲wī Mnīʿ, Ūlād Jrīr, etc. In any case, the following are the main characteristics of these dialects: firstly, the *ḳāf* is pronounced as *g* (= *ḳāf maʿḳūda*), and it is already this pronunciation which for Ibn K̲h̲aldūn characterises the Bedouin dialects of his time. The *t̲h̲āʾ*, *d̲h̲āl* and *ḍād-ẓāʾ* are retained with their interdental value. The short vowels are indistinct: the sound *i* is almost completely absent and many short unaccented vowels sound practically like a labial *ə*. Characteristic are the appearance of an extremely short transitional vowel of *u* character, which is developed after *k*, *g*, *k̲h̲* and *g̲h̲* placed before a consonant or an *ā*; e.g. *kūbār*, "great" (plur.), *igūʿed*, "he sits down", *k̲h̲ūrāfa*, "tale", *g̲h̲ūzāl*, "gazelle", *s̲h̲kʷāra*, "saddle-bag", *rūgʷāg*, "thin" (plur.); a similar sound is found after *bb*, *ff*, *mm* and *kk*, *gg*, *ḳḳ*, *k̲h̲-k̲h̲*; e.g. *lug̲h̲rubbʷa*, "the crows", *nuffʷāk̲h̲a*, "a blow", *rummʷān*, "pomegranate", *sukkʷār*, "sugar", *s̲h̲uḳḳʷa*, "piece (of cloth)", *nuk̲h̲k̲h̲ʷāl*, "sound"; by analogy the combinations *mw* and *fw* when the *w* corresponds to a classical *wāw*, are reduced to *mm* and *ff*; e.g. *lemmʷiḍaʿ*, "the (little) place", *leffʷād*, "the entrails".

The retention of the accent on the first syllable causes "projected" syllabic forms: *yə́ktəb*, "he writes", plur *yə́kkətbu*; *mə́g̲h̲g̲h̲ərbi*, "Moroccan", *mŭkkaḥla*, "musket", *bə́ggərti*, "my cow".

The personal suffix of the 3rd pers. masc. is *-ah*. The dialectal preposition translating "of" is *ntāʿ* or *tāʿ*, from the classical *matāʿ*; according as the word before it is feminine or plural, this preposition becomes *ntāʿt* (*tāʿt*) or *ntāʷʿ* (*tāʷʿ*).

It does not seem that the Bedouin dialects know the use of the verbal prefix indicating the indicative present. In the plural personal forms of the defective verb, there is a reduction of the diphthong: *glū-yə́glū*, from the verb *glā* "to fry"; *nsū-yénsū*, from the verb *nsā* "to forget".

We may also note the use of a preposition *li-*, "to": *gāl-lina*, "he told us".

From the point of view of vocabulary, some words are characteristic of Bedouin dialects: *ba-ibi*, "to wish", *yāməs*, "yesterday", *d̲h̲arwək*, *d̲h̲urk*, "now", from the classical *d̲h̲a'l-waḳt*.

d. Jewish dialects. The Jews who emigrated from Spain have as a rule retained the use of an archaic Spanish; many have also learned Arabic for business reasons. Alongside of the Spanish Jews, we have in the Berber highlands and in the towns of the interior Moroccan Jews of unknown origin whom the former call *forasteros* (Span. "foreigners"); according to the district, they speak Berber or Arabic [see JUDAEO-ARABIC and JUDAEO-BERBER].

e. **Relations of the linguistic groups of Morocco to one another.** Morocco appears to the philologist a wonderful field for the study of the influence of the substratum on an imported language, since the language of the substratum, i.e. Berber, is still alive alongside of the Arabic and quite well known. The results of the examination are very meagre: the phenomena actually ascribable to the action of the substratum alone are infinitesmal; this may, however, be due to the fact that Arabic, a Semitic language, and Berber, a proto-Semitic language, are not sufficiently differentiated.

From the phonetic point of view, there is hardly any sound change found in the highland dialects of the arabicised Berbers, for which a corresponding change cannot be found in the dialectal phenomena of old Arabic; only, perhaps their tendency to spirantisation should be connected with the identical tendency observed in the northern Berber dialects found in the confines of the Jbāla country.

If we consider the morphology, we see that in the highland dialects the verb has lost feminine forms of the plural of the old Arabic, which still survive in some Bedouin dialects and are still found in Berber. A Berber origin has been sought for the use of the verbal prefix indicating the present of the indicative; but similar prefixes are found in Egypt and in Syria where there are very different substrata.

Certainly, Berber has the scheme *ta- — -t* which forms nouns indicating trades (*ta-bennay-t*, "trade of a mason") and names of abstract qualities (*ta-ḥrāmi-t*, "roguery"); it is however curious to note that in modern Berber, this scheme has not this significance and is only used to form the feminine and secondarily the diminutive.

In the syntax of the highland dialects, we find indisputable traces of Berber influence; plural treatment of singulars applied to liquids (water, urine), phrases translated or stereotyped, e.g. *hā-in Ḳaddūr* "Ḳaddūr's brother", with retention of the Berber particle indicating belonging to, *-in*.

But it is in the vocabulary that the Berber substratum makes its influence most felt. Whether surviving in the highland dialects or borrowed in the Bedouin dialects, many of the terms relating to country life are Berber (names of plants, animals, rocks, agricultural implements and tools); they have often retained in Arabic the Berber prefix *a-*, which, still felt to have its original value, makes them unfit to take the Arabic article also; alongside of the singular in *a-*, we usually have a Berber plural in *a—ān* also retained. It is curious, by the way, but intelligible to find in the highland dialects words of Arabic origin with this Berber prefix. These must be Arabic words borrowed and berberised at a time when the Jbāla still spoke Berber and which have been retained just as they were in their Arabic dialect after being arabicised, e.g. *a-ḥfir*, "ditch", plur. *a-ḥəfrān*; in Tangier the nave of the mosque is called *a-blāṭ*; at Rabat two words imported from Europe have a Berber form: *a-šḳif*, "the sulṭān's boat" and *a-tāy*, "tea".

Some Berber words have survived in the administrative language of the *makhzen*: *afrāg*, "a wall of cloth surrounding the sultan's camp"; *agdāl*, "a pasture reserved for the sultan's animals"; *azfel*, "lash to punish the guilty"; *məzwār*, "syndic (*naḳīb*) of the Sharīfs".

The Bedouin dialects naturally contain much fewer Berber elements than the urban dialects and still less than the highland dialects; their rustic vocabulary nevertheless made numerous borrowings from the technical vocabulary of the previous Berber tillers of the plains. Within the Arabic area, the highland and urban dialects have borrowed from them a certain number of terms relating to the rural activities of the Bedouins; they are as a rule revealed by the pronunciation of *ḳāf* as *g*. The Bedouin dialects in their turn borrow from the towns their words relating to a more advanced culture; but, for economic, political and, to a certain extent, aesthetic reasons, they give more than they borrow.

In addition to the Berber and Arabic elements, the Moroccan vocabulary contains a fairly important number of "European" loanwords. They come from the vocabulary of a higher culture and relate to the flora (in cultivation or its products), to agriculture, to food and dress, to furniture and housing, sometimes even to parts of the body. There are Greek or Latin borrowings of the oldest period, Romance or Spanish for later periods; but neither their meaning nor their phonetic treatment enables us always to be able to date accurately the time of their introduction and their origin.

These "European" loanwords are naturally found in larger numbers in Northern Morocco, which has been more subject to Mediterranean influences which, through refugees from Spain, have been felt as far as the northern part of the Middle Atlas. The Bedouin dialects have escaped these influences (cf. Simonet, *Glosario de voces ibéricas y latinas usadas entre los Mozarabes*, Madrid 1888; Schuchardt, *Die romanischen Lehnwörter im Berberischen*, Vienna 1918; G. S. Colin, *Etymologies maġribines*, in *Hespéris* (1926-7); A. Fischer, *Zur Lautlehre des Marokkanisch-arabischen* (chs. ii, iii, and *Excurs*), Leipzig 1917).

In spite of the profound differences which separate them, the highland and Bedouin dialects of Morocco (and of the Maghrib) agree in one essential and characteristic morphological feature: the forms sing. *n*—, plur. *n—u* in the first persons of the imperfect. Now this fact is attested in the 6th/12th century for Almoravid Spain and Norman Sicily, i.e. in languages from which Hilālī influence is clearly excluded; it is also found in Maltese; it must then be admitted that the two groups of dialects have independently brought about this innovation, which seems to have remained exceptional in the dialects of the east. The two groups agree also in the loss of short vowels in open syllables; this phonetic peculiarity is also found in many eastern dialects; but it is curious that it has become general in the Maghrib while the dialects of Spain and Egypt do not have it.

It is in the *Documents inédits d'histoire almohade* that we find the first information about Moroccan Arabic (use of *bāsh*, "in order that", *mtāʿ*, "of", first persons of the aorist in *n*— (sing.), *n—u* (plur.)); but we have to wait till D. de Torres to find a few phrases transcribed (cf. French tr. Paris 1636, 241, 323, 339). Mouëtte, who was captured at sea by the Moors in 1670 and was for a long time a prisoner, has left us a *Dictionnaire arabesque* in French and Moroccan, in transcription (cf. *Relation de la Captivité* Paris 1683, 330-62). The first grammatical notes were collected by Höst (cf. *Efterretninger* . . ., 1779, ch. 8, p. 202-210), who has also given us a Berber-Danish-Moroccan Arabic vocabulary (*op. cit.*, 128-33). It is to Fr. de Dombay that we owe the first monograph on Moroccan dialects, which is also the first serious contribution to the study of Arabic dialects; the dialect which he deals with is that of

Tangier (*Grammatica linguae mauro-arabicae*, Vienna 1800). Since then, there have been a number of studies: for works before 1911 see the bibliography given by W. Marçais in his *Textes arabes de Tanger*, 207-13; for later works, see the bibliography in *Textes arabes de Rabat* by L. Brunot and the *Bibliographies marocaines* given periodically in *Hespéris*.

2. Literature of the Arabic dialects. Like all popular literatures, the literature of the Arabic dialects of Morocco is essentially poetical. The only texts in prose are those which have been collected recently by European students of dialects.

In the Arabic poetry of Morocco two periods must be distinguished: the first extending down to the beginning of the Saʿdian dynasty; the first known texts are those which Ibn Khaldūn gives at the end of his *Muḳaddima* among the specimens of the poetry of the towns. To these we may add a mass of poems composed in honour of the Prophet (*Mawlidiyyāt*) and collected in numerous collections existing in manuscript. From this group cannot be separated the poems which accompany classical Moroccan music, "Andalusian" music, many of which must have been composed in Morocco; these were collected and classified by al-Ḥāʾik, a musician of Spanish origin who had settled in Tetouan. All these poems belonging to this first period are written in the Spanish Arabic dialect, which after the great success of the Cordovan Ibn Ḳuzmān (6th/12th century [*q.v.*]) became the classical language of the new poetic genre called *zadjal* [*q.v.*], which had this in common with the *muwashshaḥ* [*q.v.*], that, while employing like it new metres, its prosody was based on the quantity of the syllables, but it differed from the *muwashshaḥ* in that it was written in the Spanish dialect and not in the classical language.

The main characteristics of the poetry of the Moroccan dialects of the first period are attention to the quantity of each syllable and the use of the Spanish dialect.

The second period, on the other hand, is distinguished by a system of prosody founded exclusively on the number of syllables in each verse and by the use of a special language called *məlḥūn* [see MALḤŪN].

Alongside of this men's poetry, there are the songs of the women (songs of women working at the mill, songs of gleaners, songs of family fêtes, lullabies), the children's songs which are often strangely conservative, epigrams and proverbs; see S. Biarnay, *Notes d'ethnographie et de linguistique nord-africaines*, Paris 1924 (songs of women and children); L. Brunot, *Proverbes et dictons arabes de Rabat*, in *Hespéris* (1928) (with Moroccan bibliography of the subject).

III. Other Languages. A sketch of the languages of Morocco which only took account of Berber and Arabic dialects would be incomplete, for three other elements of secondary importance have to be considered:

a. Classical Arabic, the official language, is used only in writing, for sermons, lectures and conferences; it is never the language of conversation except on the radio and television. But, thanks to these two methods of communication and to the fact that religious studies which are considerably developed in the towns (especially Fās) and also among the Jbāla (Ḳurʾānic studies and especially *ḳirāʾāt*), many words of classical Arabic have been introduced into the popular dialect. The phonetic peculiarity to notice in borrowed classical words is the retention of the short vowels as a result of the process of elongation; e.g. classical *ḍahīr*, plur. *ḍahāʾir*, "decree of the sulṭān", borrowed by the popular dialect in the form *ḍāhēr*, whence a dialect plural *ḍwāhər*. Several Ḳurʾānic expressions or phrases of exegesis hence passed into everyday language as adverbs: *bəllāti* "guilty" (taken from Ḳurʾān vi. 153), *b-ət-tāwīl* "slowly", lit. "in commenting on", *wa-ḳīla* "perhaps".

b. Spanish was the only language spoken by many of the Muslims of Spain, who in the 9th/15th century and especially in the 10th/16th took refuge in Morocco, mainly at Tetouan and Rabat-Salé. Mouëtte, who was taken a prisoner to Morocco in 1670, says that Spanish was as common there as Arabic; his remarks is probably true only of the towns already mentioned. The descendants of these emigrants from Spain later learned Arabic and forgot Spanish, under the influence of Islamic culture. Not having been subject to the latter influence, the Jews of Spanish origin still speak an archaic Spanish, sprinkled with Arabic terms moulded to the flexions of Latin morphology.

c. In the palace of the sultan, many black servants of both sexes still spoke Sudanese dialects, but these seem to have had no influence on the Arabic dialects of Morocco.

No trace has so far been found of the existence in Morocco of secret languages; one could hardly put in this category the argots of certain guilds (butchers) nor those of the students, the originality of which consist simply in transposing certain letters of each word of the ordinary language and in the addition of certain prearranged syllables. One should not, finally, omit to mention that the use of Spanish and, above all, French, which spread during the protectorate, remains as widely spread—if not more so—since independence, and is not without an appreciable effect of dialect vocabulary.

(G. S. COLIN)

VIII. INTELLECTUAL LIFE.

More especially since the end of the Middle Ages, Morocco has occupied a place by itself, often important, in the history of civilisation. From the point of view of intellectual life, it was for long under the tutelage, more or less marked, of neighbouring countries, and it was only from the time it became an independent state that it began to show independence in this respect also. The great activity at the centres of learning in Arab Spain down to the end of the 7th/13th century had undoubtedly an influence in Morocco, but it was after the return of the Iberian Peninsula to Christianity, that, owing to the migration of refugees from Spain to Morocco, where there happened to be ruling princes anxious to further Islamic studies, it was able to preserve the last and only centres of study in the Muslim west. In any case, in spite of the relatively large number of scholars which it has produced in various branches of *ʿilm*, this country is far from having inherited in the eyes of the rest of Islam the reputation and intellectual prestige, which Spain enjoyed when it was a Muslim country. However, it may be said that the towns of Morocco have always held in recent centuries a large proportion of men of letters, much attached to their traditional culture. Lastly, it may be noted that this culture, to the end of the 19th century at least, never allowed the slightest place for modern sciences, the study of which, if it has gradually become more or less established in the Muslim East, has hardly interested the West.

The characteristic feature of this culture, which is essentially founded on religion, is that it has remained unchanging. In this country, where tradition strictly regulated all acts of public and private life, it is not surprising that the intellectual ideal has always remained the same. It has already been remarked that, until recent times, the Moroccan *faḳīh*, whether he were magistrate, teacher, or official of the Sharīfian government, possessed the same stock of knowledge as a *faḳīh* of the periods of the Marīnids or Saʿdians. The same instruction had been given him and by the same methods. He received first of all an elementary education in the Ḳurʾānic school [see KUTTĀB], he learned the Ḳurʾān by heart, often completely, and some of the elements of grammar. Next he became a student (*ṭālib*), and the *ṭalab al-ʿilm*, which he studied, was governed by no rules or programmes other than the traditional ones. He first of all studied the "mother-words" (*ummahāt*), compendia made to be memorised readily, on theology and grammar (usually the *Murshid al-muʿīn* of Ibn ʿĀshir and the *Ādjurrumiyya*). It was only then that he entered upon a more thorough study of more advanced texts, usually commentaries (*sharḥ*) or glosses (*ḥāshiya*) on works (*matn*) of established reputation and exclusively Islamic in character. The whole trend of his studies was toward a better knowledge of theology and law.

The result was that in most cases in Morocco men of learning were almost entirely jurists and that they differentiated between purely Islamic sciences (*ʿulūm*) and profane learning (*funūn*), with some contempt for the latter. One understands also why the part played by Morocco in Arabic literature is primarily in the domain of subjects directly connected with the Ḳurʾān and the Sunna, theology, law and *uṣūl*.

The centres of learning have varied with periods and historical circumstances. The early ones seem to have been the points nearest to Spain, Ceuta and Tangier. The foundation of Fās and the building in this city of the great Mosque of the Ḳayrawānīs (Djāmiʿ al-Ḳarawiyyīn [*q.v.*]) facilitated the establishment of a centre of culture in the interior. A little later, Marrākush, the capital of the Almoravids and of the Almohads, became by desire of its rulers the centre of attraction for Maghribī scholars and even for a certain number from Spain. But it is from the Marīnid dynasty, who saw in the development of educational centres in Morocco a means to make themselves popular in the country and to acquire prestige in the eyes of the Muslim world, that the rise of Fās as an intellectual centre dates: it was the metropolis of learning in the country from the 8th/14th century. Not only did the Marīnid princes make it the political capital but by the foundation of a series of colleges or *madrasas* around the Djāmiʿ al-Ḳarawiyyīn and mosque of New Fās, they were able to attract to this city a host of students from all parts of the country and to give it the renown for learning, which it still jealously claims to-day. In the Marīnid period, *madrasas* were also multiplied outside Fās: Meknès, Salé and Marrākush had their own, which shows that regular education was given in these towns.

In addition to the part played by the *madrasas*, there was the activity of the *zāwiyas*, directly connected with the development of maraboutism and Sharīfism in the country in the period when the Spaniards and Portuguese were trying to establish themselves in Morocco in the 10th/16th century. The *zāwiyas*, religious centres, headquarters of the *djihād*, naturally became centres of teaching. At the time when Fās could only with difficulty keep its character as the principal centre of learning in the country, the *zāwiyas*, in which teaching was carried on, became more and more numerous; e.g. the *zāwiya* of al-Dilāʾ [*q.v.* in Suppl.] in the Middle Atlas, the *zāwiya* of Tamgrut in the land of Daʿra and the *zāwiya* of Wazzān [*q.vv.*] in the north. The most famous scholars were frequently either heads of brotherhoods or *shorfā*, who taught in the motherhouse of their order.

We do not intend here to give a detailed sketch of the Arabic literature of Morocco, but will be content with a few general indications and names distinguishing where possible, between Islamic and profane sciences.

It was not till the Muslim West adopted the Mālikī rite that Morocco began to produce work in the domain of *ʿilm* in close accord, as already mentioned, with the school of Spain. In this period of intellectual dependence, the relations between the two countries were continued and the Maghribī students down to the 7th/13th century considered a sojourn in Cordova, Murcia or Valencia necessary to finish their course. The East did not yet seem to exert the attraction that it did later. At this period, besides, the islamisation and arabicisation of the Berber masses was still too recent. Only a few names may be mentioned for this early period, Darrās b. Ismāʿīl, of whom much that is recorded is legendary; the famous reformer Ibn Tūmart [*q.v.*], creator of the Almohad movement and author of several *risālas* or *ʿaḳīdas* on his teaching; the *ḳāḍī* ʿIyāḍ (476-544/1083-1149 [*q.v.*]), author of numerous works on Muslim learning, of which the most famous are the *Kitāb al-Shifāʾ* and the *Mashāriḳ al-anwār* with a collection of biographies of learned Mālikīs, entitled *al-Madārik*.

During the modern period, on the other hand, the number of learned Moroccans becomes more and more considerable. The best known are for *ḳirāʾāt*: Ibn Barrī (8th/14th century); Ibn Fakhkhār 9th/15th century); the scholar of Meknès Ibn Ghāzī (d. 919/1513); ʿAbd al-Raḥmān Ibn al-Ḳāḍī (d. 1082/1671); ʿAbd al-Raḥmān b. Idrīs Mandjra (d. 1179/1765-6); Muḥammad b. ʿAbd al-Salām al-Fāsī (d. 1214/1809 [*q.v.*]): for *ḥadīth*; Yaḥyā al-Sarrādj (d. 808/1405-6); Sukkayn al-ʿAṣimī (d. 956/1549); Riḍwān al-Djinwī (d. 991/1591); Muḥammad b. Ḳasim al-Ḳaṣṣār (d. 1012/1603-4); Idrīs al-ʿIrāḳī (d. 1228/1813); for *fiḳh*: Abu 'l-Ḥasan al-Ṣughayyir, commentator of the *Mudawwana*; al-Djazūlī [*q.v.*] and Aḥmad Zarrūḳ (9th/15th century) commentators of the *Risāla* of Ibn Abī Zayd al-Ḳayrawānī; al-Wansharīsī (d. 955/1548); al-Mandjūr (d. 995/1587 [*q.v.*]); Ibn ʿĀshir (d. 1040/1630-1); Mayyāra (d. 1072/1661-2); for philology: al-Makkūdī (d. 807/1404-5); Ibn Zakrī (d. 899/1494 [*q.v.* in Suppl.]). Their works have for the most part been recorded and will be found detailed either in Brockelmann or in Bencheneb's work on the individuals mentioned in the *Idjāza* of ʿAbd al-Ḳādir al-Fāsī. Only a small number have found a place in eastern libraries; but on the other hand, they all form the foundations of the collections of manuscripts formed and preserved in the imperial palaces and mosques of Morocco.

Some Moroccan scholars have written works on *adab* or collections of poems, in addition to books of a strictly Muslim character. None of them can

claim any great originality and purely literary *dīwāns* are rare. Poetry, as a rule—when it is not didactic (*urdjūza*)— is religious or mystic. At the courts, there were always a few literary men maintained by the princes, who were the panegyrists, often very extravagantly, of their patrons.

It is at the courts also, especially from the 8th/14th century, that we find the few historians who have given us original chronicles or compilations. Their works, planned on a singularly curious conception of history, have nevertheless the merit of giving us the only detailed information about the political history of the country in the period of the author or immediately preceding it. Those which date from the Middle Ages are, however, much the best. The kind of work not only did not improve later, but became simply dry chronicles in which events are related in a brief and colourless fashion.

The early historians of Morocco—if we except the Berber genealogists about whom we do not know very much—are contemporaries of the Almoravid dynasty. A little later, the Almohads find a historian in the person of a companion of the Mahdī Ibn Tūmart, al-Baydhaḳ [*q.v.*] al-Ṣanhādjī, the interest of whose memoirs contrasts strikingly with many later chroniclers. Alongside of the work of al-Baydhaḳ may be placed the chronicles of Ibn al-Ḳaṭṭān and of ʿAbd al-Wāḥid al-Marrākushī [*q.vv.*] as of high value. But it was in the Marīnid period that the historian found most favour in Morocco. Leaving out Ibn Khaldūn, whom Morocco is not the only one to claim, we may mention Ibn ʿIdhārī [*q.v.*], a scholar of Marrākush, to whom we owe a history of North Africa and Spain, the *Bayān al-mughrib*; that of Ibn Abī Zarʿ [*q.v.*], author of a history of Fās and the Moroccan dynasties, *Rawḍ al-ḳirṭās*; Ibn Marzūḳ [*q.v.*], author of the *Musnad*, a monograph on the sultan Abu ʾl-Ḥasan ʿAlī; Ibn al-Aḥmar [*q.v.*] of the family of the kings of Granada, author of the *Rawḍat al-nisrīn*. Under the Saʿdians, the principal historians were al-Fishtālī and al-Ifrānī [*q.vv.*], author of the *Nuzhat al-ḥādī*; finally, under the ʿAlawids, al-Zayyānī and Akansūs [*q.vv.*].

Geography is represented in modern Moroccan literature only in the form of *riḥlas* [*q.v.*] or accounts of the travels of pilgrims, in which the description of the country passed through only occupies an insignificant place. Nevertheless, the geographer al-Idrīsī [*q.v.*] and the great traveller Ibn Baṭṭūṭa [*q.v.*] were of Moroccan origin.

The biographical literature of Morocco is considerable. The collections of *manāḳib* [*q.v.*] of saints, monographs dealing with families of *shorfā* or religious brotherhoods are abundant, especially in the modern period. There are also collections by town or century, some of which are of a certain interest, even from the point of view of history. All these biographies have been surveyed in E. Lévi-Provençal, *Les historiens des Chorfa*. The most notable biographers down to the middle of the 19th century are Ibn ʿAskar, author of the *Dawḥat al-nāshir*; Ibn al-Ḳāḍī, author of the *Durrat al-ḥidjāl* and the *Djadhwat al-iḳtibās*; the historian al-Ifrānī, author of the *Ṣafwāt man intashar*; and al-Ḳādirī, author of the *Nashr al-mathānī* and the *Iltiḳāṭ al-durar*.

As to medicine and natural science, Morocco down to the 8th/14th century was closely dependent on Spain. The physicians of the Almoravid and Almohad princes were from Spain, like Ibn Bādja (Avenpace), Ibn Ṭufayl and the celebrated Ibn Rushd (Averroes) and Ibn Zuhr (Avenzoar). In the modern period, we find at the courts of the sultans several physicians of Moroccan origin who have left works. The chief were, in the Saʿdian period: Abū Muḥammad al-Ḳāsim al-Wazīr al-Ghassānī, in the ʿAlawid period: Ibn Shuḳrūn, ʿAbd al-Wahhāb Adarrāḳ, Aḥmad al-Daraʿī, ʿAbd Allāh b. ʿAzzūz al-Marrākushī, Aḥmad Ibn al-Ḥādjdj and ʿAbd al-Salām al-ʿAlamī. Finally, two famous Moroccans studied the exact sciences in the 7th/13th century: Abū ʿAlī al-Ḥasan b. ʿUmar al-Marrākushī, author of a treatise on astronomical instruments, part of which has been translated by Sédillot, and Aḥmad Ibn al-Bannāʾ [*q.v.*], to whom we owe several works on arithmetic, geometry, algebra, astronomy, astrology and alchemy.

At the end of the 19th century, the reign of Mawlāy al-Ḥasan was marked by a kind of renaissance in Muslim studies in Morocco, particularly characterised by the need which writers felt of getting their works printed to make them more widely known. The lithographic presses of Fās acquired a certain importance at this time and began to publish texts which had hitherto circulated only in manuscript. A little later, there appeared at Fās the three volumes of the *Salwat al-anfās* of Aḥmad b. Djaʿfar al-Kattānī [*q.v.*], an excellent biographical dictionary of the celebrities of the northern capital. At the same time, there was published in Cairo the great Moroccan history of Aḥmad b. Khālid al-Nāṣirī al-Salawī [*q.v.*] entitled *Kitāb al-Istiḳṣā li-akhbār duwal al-Maghrib al-aḳṣā*.

MAGHRIBĪ, Aḥmad Khattū, famous mediaeval Gudjarātī saint. Born *ca.* 737/1336 in Dihlī

and educated there, he migrated to Khattū, near Nāgawr, in Rādjasthān at the instance of his spiritual director, the Maghribī master, Bābā Isḥāḳ. In 776/1375, Bābā Isḥāḳ died, and Aḥmad set out on an extended pilgrimage, visiting Arabia, Iran and ʿIrāḳ before returning to Dihlī, where he survived the wrath of Tīmūr in 800/1398 (ʿAbd al-Ḳādir Badāʾūnī, *Muntakhab al-tawārīkh*, Calcutta 1864-9, i, 270-1; Eng. tr. G. Ranking, i, 357-8). He subsequently proceeded to Sarkhēdj, near Aḥmadābād, and there attained enduring fame. According to Mughal historians (Niẓām ad-Dīn Aḥmad, *Ṭabaḳāt-i Akbarī*, Bibl. Ind., ii, 97; ʿAlī Muḥammad Khān, *Mirʾāt-i Aḥmadī*, suppl., Baroda 1930, 78-9), Sultan Aḥmad Shāh I founded the city of Aḥmadābād in 813/1411 on the advice, and with the blessing, of Aḥmad Khattū.

In addition to being well versed in traditional Islamic sciences and theoretical Ṣūfism, Aḥmad was a poet whose Persian verses are cited in the same extant *malfūẓāt* which provide the primary source material for his biography, viz., the *Tuḥfat al-madjālis* by Maḥmūd Irdjī and another *malfūẓ* by Muḥammad b. Abī 'l-Ḳāsim. At his death on 10 Shawwāl 849/9 January 1446, the saint was buried in a towering marble mausoleum which, with adjacent structures built by later Gudjarāt sultans, elicited praise from the Mughal emperor Djahāngīr on a visit to Sarkhēdj in 1027/1618 (*Tūzuk-i Djahāngīrī*, Aligarh 1864, 212).

Bibliography: ʿAbd al-Ḥaḳḳ Muḥaddith Dihlawī, *Akhbār al-akhyār*, Dihlī 1309/1891, 153-8; Ḥādjdjī al-Dabīr, *Ẓafar al-wālih bi Muẓaffar wa-ālihi*, ed. E. Denison Ross, London 1901, Eng. tr. M. H. Nizami, *Shaikh Ahmad Maghribi as a great historical personality of medieval Gujarat*, in *Medieval India—a miscellany*, iii, Aligarh 1975, 234-59. (B. LAWRENCE)

AL-MAGHRIBĪ, BANŪ, a family of Persian origin who performed in the course of two succeeding centuries (the 4th/10th and 5th/11th centuries) the influential functions of *wazīr*, *kātib* or intendant (*mudabbir*) at several princely courts throughout the Middle East, in Baghdād, Aleppo, Cairo, Mawṣil, and Mayyāfāriḳīn.

In the collections of *akhbār* concerning the vicissitudes of this family, the respective representatives of four succeeding generations are mentioned in particular. The first three of these are described in the *akhbār* concerning the family and also in this article, as seen from the point of view of the representative of the youngest generation, the *wazīr* Abu 'l-Ḳāsim. The life of the latter is otherwise better known owing to the historical sources available. Sāmī al-Dahhān, the editor of the *Kitāb fi 'l-siyāsa* (Damascus 1948) written by the *wazīr* Abu 'l-Ḳāsim, has given in his Preface an account of events which affected the family's rather adventurous history, which may be supplemented by the information given by Kamāl al-Dīn Ibn al-ʿAdīm, the historian of Aleppo (see IBN AL-ʿADĪM, and *Bibl.*). The four members of the Banu 'l-Maghribī family mentioned above will here be discussed from the point of view of the youngest, Abu 'l-Ḳāsim:

(1) His great-grandfather, Abu 'l-Ḥasan ʿAlī b. Muḥammad.
(2) His grandfather, Abu 'l-Ḳāsim al-Ḥusayn b. ʿAlī.
(3) His father, Abu 'l-Ḥasan ʿAlī b. al-Ḥusayn.
(4) Finally, he himself, Abu 'l-Ḳāsim al-Ḥusayn b. ʿAlī.

1. The great-grandfather, Abu 'l-Ḥasan filled a post in the so-called *Dīwān al-Maghrib*, an administrative division specially established for the collecting of the *kharādj* or landtax of provinces in the regions west of Baghdād. See for this aspect of the ʿAbbāsid administration, D. Sourdel, *Le vizirat ʿabbāside*, ii, 591. In spite of its Persian descent, the family acquired the name Banu 'l-Maghribī from its responsibility for the proper functioning of the *Dīwān al-Maghrib*.

2. The grandfather, al-Ḥusayn b. ʿAlī, discharged *inter alia* the function of *mudabbir* at Baghdād in the service of Muḥammad b. Yāḳūt, a high dignitary at the ʿAbbāsid court (cf. Sourdel, *op. cit.*, 484-5). At Baghdād, al-Ḥusayn b. ʿAlī became related to a certain Abu ʿAlī Hārūn b. ʿAbd al-ʿAzīz al-Awāridjī by having married his sister. Abū ʿAlī Hārūn is known to us as the subject of two eulogies composed by al-Mutanabbī [*q.v.*], see R. Blachère, *Abou 't-Ṭayyib al-Motanabbî, un poète arabe*, Paris 1935, 90-2, and as the author of a pamphlet against the famous Baghdādī mystic al-Ḥallādj [*q.v.*], see L. Massignon, *La passion de Ḥusayn ibn Manṣūr Ḥallâj*, Paris 1975, i, 533-4. As a *kātib*, Abū ʿAlī Hārūn was employed in an administrative department under supervision of the *amīr al-umarāʾ* Ibn Rāʾiḳ [*q.v.*].

In consequence of the overthrow of the latter in 330/942, Abū ʿAlī and also his brother-in-law al-Ḥusayn b. ʿAlī had to flee from ʿIrāḳ in order to find employment elsewhere. After some time, the grandfather, al-Ḥusayn b. ʿAlī, was able to find a new job in the service of the Ikhshīdids [*q.v.*] of Egypt and Syria. The family was to stay in Egypt for some years till there was a change in the Egyptian government; in the words of Ibn al-ʿAdīm (*Bughya*, ms. fol. 16b), "Until the power of the one who made himself master of Egypt was renewed"—probably thereby referring to the decease of the Ikhshīdid prince Muḥammad b. Ṭughdj [*q.v.*] in 334/946, and his being succeeded by his two sons, while real power of government was entrusted to his Nubian slave Kāfūr [*q.v.*]. Thus it was probably under the influence of this governmental change that the Banu 'l-Maghribī departed from Egypt in order to settle in Syria. There, they are found holding office at the Ḥamdānid [*q.v.*] court in Aleppo. For most of the rest of his life, the grandfather al-Ḥusayn b. ʿAlī was to remain there as a *kātib*, except that his stay at Aleppo was, at the end of his life, to be interrupted by a sojourn in Byzantine territory as a guarantee or hostage for the Byzantines, who had been requested to release a number of Muslim prisoners of war. Also comprised in this act of redemption (*fidāʾ*) was the deliverance of a second security, a very valuable piece of armour studded with jewels, a *badana* of Sayf al-Dawla himself. This affair of the *fidāʾ* occurred in 354/965 and is an indication of the importance attached to al-Ḥusayn b. ʿAlī as a political personality.

When the last remnants of the ransom had been handed over, the Byzantine authorities gave permission for him to return to his home country. However, soon after his arrival in Aleppo—or, according to some other sources, even before his return—al-Ḥusayn died. In his palmy days, he had been a subject of praise, in the poetry of Abū Naṣr b. Nubāta al-Saʿdī (327-405/939-1015, see Sezgin, *GAS*, ii, 504-5).

3. The father Abu 'l-Ḥasan ʿAlī b. al-Ḥusayn succeeded al-Ḥusayn b. ʿAlī in his function as a *kātib* in the service of Sayf al-Dawla and his son

Saʿd al-Dawla Abu 'l-Maʿālī Sharīf (reigned 356-81/967-91). Like his father, Abu 'l-Ḥasan also found someone who was prepared to eulogise him, Abu 'l-ʿAbbās al-Nāmī, who was al-Mutanabbī's successor at the Ḥamdānid court in Aleppo as soon as the latter had departed to try his luck in Egypt. Abu 'l-ʿAbbās al-Nāmī is mentioned in this connection by Ibn al-ʿAdīm, *Bughya* fols. 16b, 126b (see on this poet, Sezgin, *GAS*, ii, 506-4)

It was only after a period of many years in the Ḥamdānids' employment that the position of Abu 'l-Ḥasan at Aleppo was to change rather abruptly; when in 380/989-90, a rebellious general, the *amīr* Abu 'l-Fawāris Bakdjūr al-Ḥādjibī, tried to overthrow the reigning dynasty, Abu 'l-Ḥasan defected to the camp of the rebels. Hence on the failure of this rebellion, the *kātib* had to flee to Egypt, where he soon acquired new important functions in the Fāṭimid state under the caliph al-ʿAzīz bi'llāh [*q.v.*]. For information about these developments in the careers of the Banu 'l-Maghribī, see Ibn al-ʿAdīm, *Zubdat al-ḥalab*, i, 170, 178, and al-Maḳrīzī, *Khiṭaṭ*, Būlāḳ 1270, ii, 157.

After a short while, Abu 'l-Ḥasan re-appeared in northern Syria, this time as intendant of the Fāṭimid army (*mudabbir al-djaysh*), and with much more power than at the preceding time of the unsuccessful rebellion of Bakdjūr. It was his avowed intention to conquer Aleppo on behalf of his Fāṭimid overlord from the Ḥamdānid Saʿīd al-Dawla Abu 'l-Faḍā'il (381-92/991-1002). However, although Aleppo was to suffer a prolonged Fāṭimid siege, the Ḥamdānid capital stood its ground successfully, with support from the north by the Byzantines and helped by corruption amongst the attackers; even the *mudabbir al-djaysh* himself is reported to have accepted bribes in exchange for his secretly given advice to the Fāṭimid general about a final retreat.

It is perhaps in this period of Abu 'l-Ḥasan's life that the Syrian poet Abu 'l-ʿAlā' al-Maʿarrī [*q.v.*] addressed to him a *ḳaṣīda*, part of which has survived till our time. In this fragment (*Shurūḥ Saḳt al-zand*, Cairo 1947, iii, 1087-96, rhyme *ḥimyaru*) the poet explicitly mentions the Persian descent of his *mamdūḥ*, together with other praiseworthy qualities, e.g. his description of Abu 'l-Ḥasan as one who, instead of silver, only wishes to grant gold to his favourites—at the same time scattering pearls of material origin, accompanying his much more excellent pearls of spiritual wisdom. Notwithstanding the wisdom ascribed to him, Abu 'l-Ḥasan failed to realise his political aims in Syria, and was recalled to Egypt. There he appears to have escaped the immediate effect of the Fāṭimid caliph's wrath, possibly as a consequence of the sudden death of al-ʿAzīz and the accession to the throne of his successor al-Ḥākim [*q.v.*], in 386/996.

Once more in Egypt, Abu 'l-Ḥasan again succeeded in securing for himself a position of some importance, while his son Abu 'l-Ḳāsim al-Maghribī (see 4. below) came to be entrusted with a position of influence in the *Dīwān al-Sawād*. Soon, however, the fortunes of the Banu 'l-Maghribī were to change again, this time because of their increasing involvement in a number of intrigues and political struggles with an important personality at al-Ḥākim's court, who held the high position of *wazīr al-sayf wa 'l-ḳalam* (Minister of the Sword and Pen), the Christian Manṣūr b. ʿAbdūn. Although initially the Banu 'l-Maghribī could boast of some successes in their intrigues, aimed in particular at the Fāṭimid Christian functionaries, Manṣūr b. ʿAbdūn finally got the upper hand. He persuaded the capricious caliph to order the execution en bloc of the members of the Banu 'l-Maghribī, and accordingly, almost all of them died in 400/1009-10, with the sole exception of Abu 'l-Ḳāsim, the representative of the fourth generation of this family (for details about the intrigues, see Ibn al-Ḳalānisī, *Dhayl Ta'rīkh Dimashḳ*, 61-2).

4. Abu 'l-Ḳāsim al-Ḥusayn b. ʿAlī, "*al-wazīr* al-Maghribī", also called by another surname "al-Kāmil Dhu 'l-Wizāratayn", was born in Dhu 'l-Ḥidjdja 370/ May 981 at Aleppo, according to Ibn al-ʿAdīm, *Bughya*, fol. 14a-b, whose information should be preferred to al-Maḳrīzī, *Khiṭaṭ*, ii, 158, where instead of Aleppo, Egypt is mentioned as his original home. Having escaped from the massacre in Egypt, Abu 'l-Ḳāsim at first sought refuge with the Banu 'l-Djarrāḥ [see DJARRĀḤIDS], leaders of a clan of Bedouins who exercised some political influence in Palestine more or less independent of al-Ḥākim's authority. At his request, the chief of the clan, Ḥassān b. al-Mufarridj b. Daghfal, granted him protection or *idjāra* [*q.v.*], upon which the grateful fugitive composed and recited a fairly long *ḳaṣīda*, which can be found in Ibn al-Ḳalānisī, *Dhayl*, 62-3.

Once in Palestine, Abu 'l-Ḳāsim began inflaming the Bedouins against the Fāṭimid caliph, against whom he evidently felt an unquenchable thirst for revenge. At first, his policy proved successful, for even a quite important town like Ramla, which was under Egyptian jurisdiction, had to undergo a siege and subsequent invasion, looting and massacre—all this, as it appears, at the instigation and advice of Abu 'l-Ḳāsim. Not yet satisfied, he also planned and executed the erection of a counter-imamate to that of the Fāṭimids. A Meccan *sharīf*, al-Ḥasan b. Djaʿfar, who could from his ʿAlid pedigree claim a descent at least as authentic as that of the Fāṭimid *imām*, claimed for himself, as *amīr al-mu'minīn*, the honorific title al-Rāshid bi'llāh, all this accompanied by the approval and acclamations of Abu 'l-Ḳāsim and his Djarrāḥid protectors. This rebellion was financed by gold and silver taken from the Kaʿba, melted down, and coined into *dīnārs* and *dirhams*, known as "Kaʿbiyya" ones. However well-planned, the action of Abu 'l-Ḳāsim failed to achieve any result; the counter-caliphate proved unstable on account of the readiness of its Bedouin supporters to accept extensive bribes from al-Ḥākim. Just in time, Abu 'l-Ḳāsim was able to leave his former allies and to escape to ʿIrāḳ and ʿAbbāsid jurisdiction.

In connection with Abu 'l-Ḳāsim's stay in ʿIrāḳ, we find in Ibn al-ʿAdīm, *Bughya*, fol. 15b, a rather curious report about the suspicion fastened on him by reason of his name "al-Maghribī". The ʿAbbāsid caliph al-Ḳādir bi'llāh wrongly assumed from this a pro-Fāṭimid inclination, the Egyptians being indicated in the east by the term *Maghāriba*. From Wāsiṭ, where Abu 'l-Ḳāsim had to remain as long as this suspicion circulated, he sent to al-Ḳādir a *risāla*, in which the original meaning of the name "al-Maghribī" was duly explained, as derived from the *Dīwān al-Maghrib*, a Baghdād governmental department. Thus having purged his name and political intentions, he was allowed to reside at Baghdād, and was able to begin a completely new career of *wazīr* or *kātib* at different princely courts in the Muslim East.

After his stay in Baghdād, he is reported to have held several offices, at first in Mawṣil under the ʿUḳaylid prince Ḳirwāsh b. al-Muḳallad, then at Mayyāfāriḳīn under the Marwānid prince Naṣr al-Dawla b. Aḥmad. Thereafter, having returned via

Mawṣil, he held for a short while the office of *wazīr* in Baghdād in the caliph's service. But because of his involvement in pro-ʿAlid riots in Kūfa, he incurred al-Ḳādir's displeasure, and had to retrace his steps, again seeking refuge at the court of his former protector the Marwānid Naṣr al-Dawla.

Finally, at Mayyāfāriḳīn, he died in 418/1027, but before his death his ever-scheming mind had already planned that his mortal remains should be carried to Mashhad ʿAlī near Kūfa, without unduly attracting the attention of his opponents, for burial near the holy shrine. To this end, he is reported to have sent letters containing the request that the body of a beloved female slave of his might pass in her coffin through the intervening territories; only after the funeral were the real nature of the coffin's contents known.

From among the *wazīr*'s works, the following may be mentioned here:
(1) A compilation (known only in manuscript) of Ibn al-Sikkīt's work, *Iṣlāḥ al-manṭiḳ*.
(2) *al-Īnās bi-ʿilm al-ansāb* (also in ms.), containing many names for Arab tribes, which by their mutual resemblance or their unusual construction might easily cause misunderstanding or confusion.
(3) *Adab al-khawāṣṣ fi 'l-mukhtār min balāghat ḳabāʾil al-ʿArab wa-akhbārihā wa-ansābihā wa-ayyāmihā* (also in ms.), partial ed. by Ḥamad al-Djāsir, Riyadh 1980, with 1 vol. so far published. For further information concerning manuscripts and contents, see Brockelmann, G, I, 117, 353, S I, 600 and Sāmī al-Dahhān's Preface in *Kitāb fi 'l-siyāsa*, 25-7.
(4) *Kitāb fi 'l-siyāsa*, ed. Sāmī al-Dahhān, Damascus 1948, is a short manual for an unnamed ruler, giving him advice how to attain the ideal form of government. In doing this he should at first understand how to organise his own way of living; and secondly how to behave towards the higher classes of society in his empire, and which qualifications are to be required in order for his subjects to perform certain functions in the ruler's service, for example the ones of chancellor (*kātib*), chamberlain (*ḥādjib* [*q.v.*]), tax-collector, commander-in-chief, police-chief, etc. Thirdly, the ruler should know how to restrain the masses, in view of their inclination to revolt. In conclusion, the author quotes an injunction given by Abū Bakr to Yazīd b. Abī Sufyān, when the latter was sent with an army to Syria (cf. Ibn al-Athīr, *sub anno* 13 H., where a variant text is given). Although the author of the *Kitāb fi 'l-siyāsa* never discloses the identity of the prince to whom the work was dedicated, it may be surmised that the Marwānid ruler of Mayyāfāriḳīn, Naṣr al-Dawla Aḥmad, who on several occasions had shown himself such a loyal protector of Abu 'l-Ḳāsim, is meant.

Contemporary judgements upon the *wāzir* are known to us from two sources. A negative appreciation is found in the work of ʿAlī b. Manṣūr b. Ṭālib Dawkhala "Ibn al-Ḳāriḥ" who, for a long time, until shortly before 400/1010, had been a tutor employed for the education of the sons of the Banu 'l-Maghribī. Abu 'l-Ḳāsim had been one of his pupils, but after the massacre of the family, ʿAlī b. Manṣūr detached himself from it and composed a *hidjāʾ* [*q.v.*] full of abuse and strong criticism against Abu 'l-Ḳāsim. In this poem, he accuses the *wāzir* of *inter alia* having been the indirect instigator of his family's ruination through his own intrigues (see for details, Yāḳūt, *Udabāʾ*, v, 424-7).

Later on, Abu 'l-ʿAlāʾ al-Maʿarrī appears to have criticised this *hidjāʾ* poem. At any rate, ʿAlī b. Manṣūr felt himself obliged to remove the unfavourable impression made, and this among other things [see ABU 'L-ʿALĀʾ AL-MAʿARRĪ] was the aim of a letter which he addressed to al-Maʿarrī. This letter and al-Maʿarrī's reaction to it are now available in the annotated edition of ʿĀʾisha ʿAbd al-Raḥmān, *Risālat al-Ghufrān wa-maʿahā Risālat Ibn al-Ḳāriḥ miftāḥ fahmihā* (Cairo 1963 and later editions). Al-Maʿarrī's answer to Ibn al-Ḳāriḥ's criticism of the *wazīr* is found in the *Risālat al-Ghufrān*, and is characterised by an inclination to gloss over any possible false steps made by the *wazīr*. In particular, Abu 'l-Ḳāsim's intrigues in Egypt are ascribed to his youthful ambition and lack of experience, and their terrible result as being the ultimate effect of crushing Fate (*R. al-Ghufrān*, 534).

Finally, a dirge (*marthiya*) composed by the poet on the occasion of the *wazīr*'s death has survived, having been included in the poet's second collection the *Luzūm mā lā yalzam* (ed. ʿAzīz Zand, Cairo 1891-5, ii, 434; ed. Bombay 1303/1885-6, 346). In one verse of this poem, the poet seems to acknowledge that a certain measure of criticism against the *wazīr*'s way of life could be justified, cf. l. 7: "If the two angels who accompanied you did write down some small sin, how many an excellent characteristic contrasting this can be found, always wiping it out!" Elsewhere in the same poem, al-Maʿarrī makes mention of the *wazīr*'s precious library which survived its owner. Two centuries later, we find Ibn Shaddād (d. 684/1285 [*q.v.*]) reports its continued existence in his topographical work *al-Aʿlāḳ al-khaṭīra fī dhikr umarāʾ al-Shaʾm wa 'l-Djazīra* (apud *Kitāb fi 'l-siyāsa*, 109), with the following words: "In Mayyāfāriḳīn there was extant the library which up till the present time is known as "al-Maghribī's Library".

Bibliography: Kamāl al-Dīn Ibn al-ʿAdīm, *Bughyat al-ṭalab fī taʾrīkh Ḥalab*, ms. Topkapu Saray cilt 4, fols. 14a-26b and 124a-126b, where short biographies are given of, in this order, *al-wazīr* al-Maghribī Abu 'l-Ḳāsim al-Ḥusayn b. ʿAlī and his grandfather of the same name, Ābu 'l-Ḳāsim al-Ḥusayn b. ʿAlī. Further information in Ibn al-ʿAdīm, *Zubdat al-ḥalab min taʾrīkh Ḥalab*, Damascus 1951, i, index; Ibn al-Ḳalānisī, *Dhayl taʾrīkh Dimashk*, ed. MAGIC. [See SIḤR].

MAGNESIA. [See MAGHNISA].

MĀH AL-BAṢRA, "the Media of Basra", the district of Nihāwand [*q.v.*], the taxes of which contributed to the support of the military population at al-Baṣra after the Muslim conquest of al-Djabal. Although Sayf ascribes this arrangement to the time of ʿUmar I (13-23/634-44), according to al-Balādhurī, al-Dīnawar and Nihāwand were occupied by Baṣran and Kūfan forces respectively after the battle of Nihāwand in 21/642. By the caliphate of Muʿāwiya (41-60/661-80), the Muslim population at al-Kūfa had increased and required an increase

in revenues for their support, so al-Dīnawar was reassigned to al-Kūfa and Nihāwand to al-Baṣra. The people of al-Kūfa received the difference between the revenues of these places as an increase in income. Thereafter, Nihāwand was called Māh al-Baṣra and al-Dīnawar Māh al-Kūfa. Nihāwand was also called Māh Dīnār because a local Persian called Dīnār arranged the terms of peace for it with Ḥudhayfa b. al-Yamān after the battle of Nihāwand.

Māh al-Baṣra was one of the districts (*kuwar*) of al-Djabal in Muslim administration, and is attested as a mint designation on post-reform *dirhams* from 79/698 to 83/702. Arabs had settled in this district by the 2nd/8th century and ʿĪsā and Maʿḳil, the sons of Idrīs b. ʿĪsā al-ʿIdjlī, who owned the father of Abū Muslim, lived in Māh al-Baṣra. In the 3rd/9th century the taxes of Māh al-Baṣra were reckoned at a maximum of 4,800,000 *dirhams*. In 235/849-50 Māh al-Baṣra was assigned as *ḳaṭāʾiʿ* by al-Mutawakkil to his son al-Muntaṣir along with many other places. In 314/926, al-Muḳtadir assigned the taxes of Māh al-Baṣra and several other places to Yūsuf b. Abi 'l-Sādj for his provisions and to finance his campaign against the Ḳarāmita. In 324/936 Ṭāhir al-Djīlī tried to establish himself in Māh al-Baṣra, but was defeated and killed there by the Būyid *amīr* ʿImād al-Dawla. Māh al-Baṣra is attested as a mint designation for both *dirhams* and *dīnārs* from 262/876 until 372/982-3. In the 3rd/9th and 4th/10th centuries Māh al-Baṣra is described as a fertile, lush, well-watered district producing dhurra, saffron, and fruit, with the best black clay for seal impressions, buildings of clay and two mosques.

MĀH AL-KŪFA [see DĪNAWAR].

MAHĀBĀD, a town and district (*shahrastān*) in the modern Iranian province (*ustān*) of West Ādharbaydjān, situated in lat. 36° 45′ N. and long. 45° 43′ E. and lying to the south of Lake Urmia or Riḍāʾiyya. The town comes within the Mukrī region of Iranian Kurdistān, and acquired its present name in the time of Riḍā Shāh Pahlavī (1925-41). Previously, it was known as Sāwadj or Sāwdj-Bulāḳ; accordingly, for the earlier history of the town, see SĀWDJ-BULĀḲ. The present article deals with the post-1945 history of the town.

With a population of 16,000 in 1945, 20,332 in 1956 and 44,000 in 1976, increasing to over 50,000 by 1980, the town of Mahābād has attained importance from its geographical position on a fast-moving stream, but above all from its role in recent Kurdish history as an administrative, military and cultural centre. It boasts a purer Kurdish culture and an intenser Kurdish nationalist feeling than the larger centres of Riḍāʾiyya to the north and Sanandadj or Sinna [*q.vv.*] to the south, both of which have significant non-Kurdish minorities. Nearly all Mahābādis are Sunnī Muslim Kurds. Many speak Fārsī and Ādharī Turkish as well as the dominant Kurdish dialect which, along with that of Sulāymanī Kurdish in ʿIrāḳī Kurdistan, sets a literary standard for the language [see KURDS, Language].

In 1946 Mahābād became the capital of a short-lived autonomous Kurdish Republic under the leadership of Ḳāḍī Muḥammad and the armed protection of an ʿIrāḳī Kurd, Mullā Muṣṭafā Barzānī. This was made possible by Mahābād's position between the wartime British and Soviet occupation zones and beyond the reach of the Iranian army. In 1942 a small group of Mahābādīs formed a secret nationalist party, the *Kōmala* (Kurdish, "party" or "group", which maintained contact with Kurds in ʿIrāḳ and Turkey. Two years later, Mahābād's leading citizen and Islamic judge, Ḳāḍī Muḥammad, joined and thereafter dominated the *Kōmala*, which in 1945 became the Democratic Party of Kurdistān (*Ḥizb-i Dimoḳrāṭ-i Kurdistān*).

Initially, the Soviet Union supported the creation of a Kurdish entity within the Soviet-occupied Ādharbāydjān Republic headed by Djaʿfar Pīshavārī in Tabrīz. Kurdish leaders, however, objected, and finally obtained Soviet acquiescence in the proclamation of a separate Kurdish Republic at Mahābād on 22 January 1946. The Kurdish administration under Ḳāḍī Muḥammad was composed of urban and relatively modernised Kurds of Mahābād town. A small army of about 1,200 was recruited in the immediate area, but the main force of the Republic was provided by some 12,000 tribesmen under their traditional leaders, the most formidable of whom was Mullā Muṣṭafā at the head of 1,200 armed Barzānīs from Iraq.

Although the new Republic included all the Kurdish areas bordering the Turkish and ʿIrāḳī frontiers south of the USSR to the fringes of Saḳiz and Baneh, the Iranian province of "Kurdistān" further south, with Sanandadj as its capital, was still occupied by Iranian forces. An offensive was planned to take Sanandadj in June, but was abandoned on Soviet advice. By that time, the Kurdish experiment had become enmeshed in competing regional and national interests typified by Soviet vacillation between support for Ādharbaydjān and Kurdish autonomies on the one hand and a desire to play a role in the central government in Tehran on the other.

Under international pressures, Soviet troops withdrew from Iranian Ādharbaydjān in May. Thereafter, negotiations between Tehran and Tabrīz failed to produce an acceptable formula for regional autonomy. Iranian forces advanced and entered Tabrīz on 11 December. A few days after, Ḳāḍī Muḥammad and his associates surrendered Mahābād. After trial by a military court, the *Ḳāḍī*, his brother and his cousin were hanged in the main square of Mahābād on 31 March 1947. Mullā Muṣṭafā Barzānī and more than 500 of his followers remained in the Kurdish mountains until June, and then fought their way north to sanctuary in the USSR. There they remained for 11 years until the coup of 1958 in ʿIrāḳ led by ʿAbd al-Karīm Ḳāsim [*q.v.*] led to an amnesty and their return to ʿIrāḳ.

After 1947, the central government regarded the area as potentially subversive and maintained a large military contingent in Mahābād until the early 1970s. Peace in the Kurdish areas was maintained through a mixture of military force and subsidies to selected tribal leaders. The policy of protecting the position of tribal leaders delayed the introduction of land reform, which began in other parts of Iran in 1963, until 1970. When land reform did arrive, it reduced the economic power of the tribal leadership, and consequently their political influence. No active agricultural extension programme existed in the Kurdish areas until the middle 1970s, and economic conditions in Mahābād seem to have declined.

Beginning in 1970, Tehran began to put more emphasis on economic development in the Kurdish

areas. Mahābād's streets were paved, city water and lighting improved, an irrigation project began near the city and a modern road connecting Mahābād with Riḍāʾiyya and Sanandadj was completed.

In 1974 a truce between Mullā Muṣṭafā Barzānī and the ʿIrāḳī government ended in renewed fighting. This time the Kurds received strong backing from Iran, and Mahābād became the unofficial rest area behind the front. Its streets were filled with Barzānī's Pēsh Merga fighters driving captured ʿIrāḳī vehicles, and the bazaar resounded to stories of free-spending Kurdish fighters. As the fighting intensified, Kurdish non-combatants from ʿIrāḳ increasingly sought refuge in camps in the Mahābād area.

The 1975 Algiers Agreement put a sudden end to the Kurdish war, and over 100,000 new refugees fled to join the 30-40,000 already in Iran (about 28,000 of these were in the area around Mahābād). Mullā Muṣṭafā, his family and many of his tribesmen settled near Mahābād. By the end of 1975, most of the refugees had returned to ʿIrāḳ and the remainder (about 30,000) had been forced to leave the Kurdish areas of Iran and settle elsewhere in the country. Barzānī was moved to Tehran, and eventually went to the United States where he died in 1979.

Calm returned to Mahābād until the beginning of the Iranian revolution in 1978. Initially, the city united to seek the ousting of the Shah. This unity, however, was quickly followed by strife between Kurds demanding greater autonomy and revolutionary guards supporting Khomeini (Khumaynī). The most bitter fighting occurred in Sanandadj, but Mahābād again became the seat of the nationalist Kurdish movement. The city was captured by government forces in 1979, but was returned to Kurdish control as part of a negotiated truce. The area remained chaotic with various groups manoeuvring for power, including the sons of Mullā Muṣṭafā, Idrīs and Masʿūd, and the 1980 Iran-ʿIrāḳ war added to the complexities as some Iranian troops were moved out to join the fighting in the south.

(W. Eagleton and R. Neumann)

MAHĀBAT KHĀN, military leader in Mughal India. Zamāna Beg (later known as Mahābat Khān) was the son of Ghayyūr Beg Kābulī, a Riḍawī Sayyid, who migrated from Shīrāz to Kābul during the reign of Akbar and settled there. Zamāna Beg entered the service of Akbar's son Salīm as an *aḥadī* (cavalry trooper) and rose to the rank of 500. After Djahāngīr's accession (October 1605) he was promoted to the rank of 2,000 and given the title of Mahābat Khān, becoming a trusted noble of that Emperor. He led a rather unsuccessful campaign against Mewār (1608), but rose nevertheless to the rank of 4,000/3,000 by 1610. In 1615 he was awarded *dū aspa sih aspa* rank and was posted to the Deccan. Apparently unable to get on with Shāh Djahān, he was transferred and made governor of Kābul. When Shāh Djahān rebelled in 1622, Mahābat Khān was called upon by Djahāngir and the Empress Nūr Djahān to command the imperial troops. He was awarded the highest possible rank for a noble, viz. 7,000/6,000. He pursued Shāh Djahān to the Deccan, with a force under the titular command of Prince Parwīz and then marched across the empire to eastern India in order to expel Shāh Djahān from that region. He then returned with Parwīz to the Deccan. Although his enhanced power and prestige aroused much jealousy at the court, he was now appointed to Bengal. Provoked by certain demands for accounts and by the humiliation of his son-in-law, he suddenly carried out a coup (March 1626), capturing the person of Empero Djahāngīr, who now appointed him *wakīl*. His power, however, came to an end within three months. He fled and was on the run when Djahāngīr died (1627).

Mahābat Khān in the meantime made his peace with Shāh Djahān, who after his accession (January 1628) appointed Mahābat Khān governor of Adjmēr and then in the same year sent him to the Deccan as viceroy. In 1629 he was appointed governor of Dihlī, and in 1632 again viceroy of the Deccan. Mahābat Khān won a signal success when he captured Dawlatābād in 1633, but lost much prestige when he failed before Parenda next year, being censured and recalled. He died in 1634 and was buried in Dihlī at the Ḳadamgāh of Shāh-i Mardān.

Mahābat Khān considered himself an opponent of both the dominant Īrānī and Tūrānī factions in the Mughāl nobility; his troops consisted in a large part of Rādjputs. Though lacking a religious education, he was said to be skilled in astronomy and astrology, and to have embraced Shīʿism in his old age. His eldest son Amān Allāh Ḥusaynī (Khān Zamān) was also an important commander; and another son, Lahrāsp, rose to occupy high office under both Shāh Djahān and Awrangzīb, enjoying the title of Mahābat Khān II.

(M. Athar Ali)

MAḤALL (A., lit. "place of alighting, settling, abode"), in the context of Islamic India, widely used in the sense of "palace pavilion" or "hall", and more particularly of private apartments in the palace, the *maḥall-sarā*—hence also a queen or consort. It seems not to have achieved the same currency in Iran. Here it appears as equivalent to Hindī *mandir*, *mandar* or *mandal*, sometimes replacing these in areas under strong Muslim influence such as Rādjasthān. Much palace terminology is Persian, though specialised Hindī terms like *tibāra* for a hall with three adjacent bays or doors, and *bāradarī* for one with twelve (3 each side) are applied to Muslim buildings, the latter figuratively as "summer house". Consideration of their architectural development entails a review of the palace layout in which they were set.

i. Dihlī Sultanate. Though none of the Mamlūk palaces have survived, Ibn Baṭṭūṭa [*q.v.*] has left a description of the Kushk-i Laʿl in Ḳilʿa Rāy Pithorā [see dihlī] as used by Sultan Djalāl al-Dīn Khaldjī (689-95/1290-6), comprising two great audience courtyards (*mashwar*) in sequence, with a closed building at the rear. In the first was an immense vestibule (*dihlīz*), and both were overlooked by a domed pavilion (*ḳubba*) near the gate, where the sultan sat to watch games (*Riḥla*, iii, 271). He writes of Muḥammad b. Tughluḳ's new palace (seen *ca.* 1333-41), the Dār Sarā at Djahān-panāh, in similar terms, noting the platforms (or cells? *dakākīn*) built on either side of the *dihlīz* for the guard, a platform in the second court for the masters of ceremonies, and room for the people to sit, and beyond the third gate a vast hall of private audience, the Hazār

Ustūn, with painted timber colums supporting a finely-carved roof. Each gate had provision for musicians to signal the arrival of dignitaries, and the third was controlled by clerks who registered entry (*ibid.*, iii, 217-21). His use of *mas͟hwar* for both courts and the hall is ambiguous, but he later shows that the audience was covered by a great tent (*bārga* for P. *bārgāh*) at festivals; at the Kus͟hk-i Laʿl both courts could be covered by canopies (*ṣayawān*) (*ibid.*, iii, 232, 235, 273). These successively more private areas, with formal guard posts in the first court, were to be essential features of Mug͟hal palaces two centuries later, as were raised pavilions and tentage. Of G͟hiyāt͟h al-Dīn Tug͟hluḳ I's palace at Tug͟hluḳābād we learn that its tiles (*ḳirmīd*) were gilded so as to shine in the sun (*ibid.*, iii, 214). Reference to the hall flanking his tomb shows that masonry could be extensive, with sculpted *čhad̲j̲d̲j̲ā* eaves above the lintels, sturdy pillars, and cross-bracket capitals reproducing earlier Hindu ones in timber. Fīrūz S͟hāh's description shows pictures and portraits to have decorated walls and doors. The remains of the palace of Fīrūz S͟hāh (752-90/1351-88) in his *kōṭlā* (see DIHLĪ, and J. A. Page's account, in *Memoir ASI*, lii, Delhi 1937) confirm the description by S͟hams-i Sirād̲j̲ ʿAfīf (*Taʾrīk͟h-i Fīrūz-s͟hāhī*, *ḳism* iv, *muḳaddama* 4). The Maḥall-i Ṣaḥn-i Gilīn was used for receiving dignitaries, the Maḥall-i Čhad̲j̲d̲j̲ā-yi Čūbīn for court officials, and the Maḥall-i Bār-i ʿĀmm for public audience. The sitting of this fort along the D̲j̲amnā [*q.v.*] allowed the private apartments and the *zanāna* to benefit from the cooler microclimate, the reflection and the view over the water. Its character can be inferred from the severe, utilitarian style typical of the reign, as seen at the Ḥawḍ-i K͟hāṣṣ [see DIHLĪ. 2] with plain, battered towers flanking colonnades of double squared piers, vaulted cells, multiple brackets, and a roof line relieved by pyramidally hooded roofs on projecting *d̲j̲harokhā* balconies, or an occasional dome. It was whitewashed for royal visits, presumably on stucco, and decorated with garden scenes (*ibid.*, iv, 5, and v, 2). The royal establishment extended to 36 *kārk͟hāna* handling its material needs.

The form thus established followed an international convention, for an axial recession of courts was used both in the Mongol palace at K͟hān Balïḳ (Peking) and in the dominant Muslim models at Bag͟hdād (145/762-3) and Sāmarrā (*ca.* 211/836) [*q.vv.*]. The latter had conspicuous *līwān*s and culminated in a domed throne chamber, both notably absent in Hindustān, where they were replaced by trabeated columned halls derived from a long local tradition, through hypostyle palaces such as Čilla (8th-9th century A.D., *ASI*, xxi [1885], 9 ff. and pl. v.) or the open verandahs of the Kōkāʾi Maḥall at Ranod (*ca.* 1000 A.D., *ASI*, ii [1871], 303 ff.), which already show the characteristic squared columns, crossed bracket capitals, lattices (*d̲j̲ālī*), merlons, and the eaves pent designed to shade the interior and throw off monsoon water. Muslim buildings were to combine these elements with the use of arches and vaults (the first cross vault is found at Tug͟hluḳābād) and articulate such halls into an ensemble. The elimination of the *dihlīz* as audience hall, perhaps under Fīrūz S͟hāh, facilitated the integration, though it was still used in camp. The *maḥall* as a setting for elaborate court ceremony (Ibn Baṭṭūṭa, iii, 221-42) was distinct at this time from the *kus͟hk*, a less formal pavilion, and the *sarāy*, or villa of a *malik* or *s͟hayk͟h*.

ii. Dakhan. At Bīdar [*q.v.*] the palace buildings enclosed in the south of the Fort represent the infusion of a largely Tug͟hluḳid inheritance with direct Iranian influence in a gamut of formal structures that later evoked parallels in the North. Some of the Bahmanī [*q.v.*] buildings are now disguised by Barīd S͟hāhī [*q.v.*] accretions, but most are attributed to Aḥmad S͟hāh Walī (832/1429 for nine years). They are of stone, faced with stucco and tilework, with finely carved jambs and archivolts of hornblende; traces of timber columns show they were once painted and gilded, on square hornblende bases. The great ruined court identified as the Dīwān-i ʿĀmm (Hall of Public Audience) is nearly square, the southern three-quarters paved for privileged access, with entry from east and west, and a hall placed centrally to the south seven bays wide by three deep, the middle bay being wider; this has a range of private rooms along the rear, and access to raised *d̲j̲ahrōkhā*s facing the yard, probably for ministerial interview, at each end. The court was colonnaded, with an octagonal pool, fountains, and cascade; the upper storey of the hall opened through rhythmically spaced arches filled with terracotta *d̲j̲ālī* work. Tilework on the dadoes was mainly blue, with polychrome floral designs of Tīmūrid character, as at Gāzur Gāh (828/1425) on square units [see KĀS͟HĪ] (cf. G. Yazdani, *Bidar*, Oxford 1947, 62-6 and pl. xxiii-xxx). An intermediate court, or *pīs͟hgāh*, immediately to the north, with a multi-domed annexe, leads west into a third, inscribed as the Ḳaṣr-i Sulṭān, perhaps a hall of private audience, now known as the Tak͟ht Maḥall after the turquoise throne really housed in the public hall (*ibid.*, 6, and 66-77, pls. xxxi-xlii). Here too a loggia faced north across the yard above long steps, only three bays wide by two deep, but with wider spans at 5.03 m/16′6″. The broad central bay led to a magnificent octagonal royal hall, once domed 30.50 m/100′ above the floor, on the caliphal model. Painted in vermilion and gold, it had Hindu niches, and fine tiling, some in relief, and a little in mosaic, framed by the massive arches. A varied but symmetrical complex of rooms around the court includes a *masd̲j̲id* [*q.v.*] opening through three bays on the west side, and another octagon north of it behind an arcuate *pis͟htāḳ*. The royal hall opens westward to a private court with a tank, alcoves, a *tibāra* hall (bedroom?) and an elaborate *ḥammām* [*q.v.*] on two levels. Most of the spaces are linked axially, and long rooms are flanked by service spaces or contrasting, smaller rooms; the surfaces are carefully articulated with recesses.

An east-west axis links these to another series of courtyards, the main halls invariably facing northwards. The largest, the Laʿl Bāg͟h, runs north and south, with baths to the north, the D̲j̲āmiʿ Masd̲j̲id along the west, and the three storeys of the Tarkes͟h Maḥall to the south, notable for panels of carved stucco (*ibid.*, 57-9, pls. xix-xxi) and multiple niches. In the Gagan Maḥall, two courts are set side-by-side, and the halls are partially embedded in the masonry of the ramparts, with ranges of plastered vaults (*ibid.*, 60-2, pl. xxii). In a cluster of small but exquisite rooms rebuilt by ʿAlī Barīd (949-87/1542-79) as the Rangīn Maḥall, a loggia of three bays by two is prolonged by two enclosed bays at each end, and the roof is still upheld by squared timber pillars with tiered capitals in Hindu style, and deep brackets with pendant Hindu bosses at each step, but with arabesques carved on the sides and an early cusped arch where they meet. On the central axis, an arch of black stone inlaid with mother-of-pearl leads through a square

tiled anteroom to a star-shaped chamber inscribed as a *shāh-nishīn* (royal seat) or *khalwat-gāh* (cabinet), with a cusped basin, and a semi-octagonal exedra projecting through the bastion. Such placing of retiring rooms behind loggias, the use of octagonal tower rooms, and the integration of water and architecture were to reappear in Shāhdjahān's schemes, perhaps following his successes in the Dakhan of 1039/1629-30. The use of evocative names became a convention among the rival rulers, attested in contemporary records.

The Gagan Maḥall at Bīdjāpūr [*q.v.*] (968/1561) is an audience hall of a new but related type. An arched *tibāra* hall open to the north, once with two timber columns framing the wide central bay, is flanked by narrower rooms of the same depth, and stairs in the length of the rear wall led to a similar upper storey. In front of these rises a hall of double height opening through three immense arches; the central one spanning the full width of the *tibāra*, 60′9″/18.5 m, provides a dramatic setting for the king in state, while those at the ends, the same height, effectively limit the composition (see Cousens, in *ASI*, *NIS* xxxvii [1916], pl. xvi-xvii). Ibrāhīm II ʿĀdil Shāh adapted the form for his audience hall (1000/1591), now the Āthār Maḥall, doubling the end rooms, adding a long hall with end galleries behind, and substituting four slender octagonal timber columns for the arches, reflected in a pool in markedly Iranian style (*ibid.*, pl. lxxvii-lxxx). This in turn was developed in Mahisur [*q.v.*]. The Sāt Manzil (*ca.* 994/1585-6), an arched tower of five (*sic*) diminishing storeys, houses pools with small service rooms, an attractive environment behind wooden trellises (*ibid.*, pls. xxvi, xxx-xxxiii).

iii. Mālwā. The surviving 9th/15th century buildings at Māndū [*q.v.*], formerly Shādīābād, reflect Tughluḳ influence, but in a distinctly local manner; their dating remains uncertain. The plainness of fine ashlar surfaces, the proportions, and careful placing of openings within the mass, generate a robust and remarkably direct architecture ennobled by its restraint. It thus stands apart from the Hindu tradition, while owing it certain features. The great size of the fort allows the advantage of naturally beautiful sites. The Djahāz Maḥall, extending 122 m down a causeway between two lakes, presents a range of arched openings to the path, overshadowed by a long *čhadjdjā* halfway up the façade, and a register of blind arches above with a tiled parapet; as at Gwāliyār [*q.v.*], this suggests two storeys when in fact it conceals vaulting over the series of spacious halls inside, each with six domes alternately carved as lotus corollae. The pavilions ranged deftly along the skyline are *tibāras*, with pyramidally hipped Indian vaults, read from the lake as crowning massive towers broken forward from the front. Water is tanked at three levels, twice in pools with graciously curved stepped verges. More typically Muslim are the extensive use of pointed arches, the three long, open halls linked by lobbies in between, and their symmetry about a central entry. The grouping of forms on the skyline is Islamic in its aplomb. A local and successful element is the use of long flights of steps to enhance the massing. The building was plastered, and set off with blue and yellow tiles. The effect now is calm, but full of entertaining variety (see G. Yazdani, *Mandu, the City of Joy*, Oxford 1929, 63-8).

The *darbār* hall nearby, the Hindōlā Maḥall, is by contrast serious, but superbly accomplished. The walls of its T-shaped mass are emphasised by a very pronounced batter, and pierced so deeply by a range of recessed arches rising the full height that the masonry between reads as raking buttresses. The single hall is spanned by six arches carrying cross walls; whether the fallen roof was flat or, as Creswell suggested, vaulted like the Khān al-Mardjān at Baghdād (*Indian Antiquary*, xlvii [1918], 169 ff.), the conception of the audience hall as a closed volume is new. The transverse arm in two stories (integral, rather than an addition as Brown proposed) has a three-aisled hall in one wing above, with fine *djharōkhās* (one to the hall below), and an axial entry beneath (Yazdani, *op. cit.*, 70-3). A similar but larger hall, "Gadā Shāh's Shop", ascribed to Maḥmūd II (916-37/1510-31), is also roofless, but bears traces of triple longitudinal vaults. A third example is at Warangal [*q.v.*] in the Dakhan, attributed to Shitāb Khān *ca.* 905/1500 (*Annual Report*, Hyderabad Archaeological Dept. 1925-6, 11-12). The Kūshk Maḥall at Fatḥābād near Čandērī, identified as the seven-storied palace built *ca.* 849/1445 by Maḥmūd I, has comparable transverse arches spanning two tall galleries which cross at right angles, dividing the square plan into four equal halls that open onto the galleries through three tiers of arcades, rather than the outside: a device for procuring shade and cooler air.

The Palace of Nāṣir Shāh (*vulg.* Bāz Bahādur) at Māndū, dated 914/1508-9, is more orthodox with three courtyards, a lateral one for entry and two square ones on axis, their rooms set symmetrically behind arcades with *čhadjdjās* overhead; in the larger, the alternately broad and narrow spans of a gallery are reflected in a pool, while overlooking a garden far below from a polygonal marble *djarōkhā* projecting at the centre (Yazdani, *op. cit.*, 92-7).

iv. Gudjarāt. In this rival kingdom, the palace at Sarkhēdj was also built along the stepped margins of an immense tank by Maḥmūd I Begṛā (861-917/1458-1511). The buildings are essentially trabeate, their colonnades united by the *čhadjdjā* line. In the best preserved, the colonnade at ground level is matched by one below, with a single bay broken forward as a belvedere facing the water towards either end; the upper level, only one bay deep, opens through onto a courtyard flanked by blank walls. The structure is enlivened by subtle details, largely derived from Hindu prototypes, and an evident delight in building. Arches appear in a secondary role, as infilling in the belvederes, where the spandrels were once fretted. Open *bāradarīs* of 16 or 24 pillars and a hemispherical dome over each bay also rely on systems of lintels. At Čāmpānēr [*q.v.*], Maḥmūd built another palace of seven stories (post-889/1484), the Sāt Manzil, in steps on the edge of a cliff; only the lower level remains.

v. The emergence of other forms may be glimpsed in the palace of Čihil Sutūn built at Djawnpur [*q.v.* for illustration] by Fīrūz Shāh's governor, where the square building surrounded by a verandah rises to a terrace carrying a large *čhatrī* whose ridged vault has gently curving hips. A *bāradarī* attributed to Sikandar Lōdī at Sikandra (900/1495) (*ASI*, OS, iv [1871-2], 99; cf. *ARASI* [1910-11], 94-6) may form the basis of the tomb of Maryam al-Zamānī (d. 1032/1623): square in plan, it is ventilated by four corridors crossing at right angles to form nine blocks of rooms, with a central entry on each face, and a flat roof over cross vaults, domes, and barrel vaults.

vi. Mughal. Buildings from Humāyūn's reign

(937-47/1530-40) are described by Khwāndamīr (*Ḳānūn-i Humāyūnī*, ed. M. Hidayat Hosain, Calcutta 1940, Bibl. Ind. no. 260, 63-4, 68, 78) as a series of innovations, mostly incorporating astrological symbolism and a preoccupation with polygonal forms no doubt related to the Tīmūrid tradition. A portable timber palace in three stories, the Ḳaṣr-i Rawān, used at Āgra and Gwāliyār in 940/1533, was hexagonal and was elaborately painted in a different colour each side. He constructed a palace inside the Lōdī fort at Āgra [*q.v.*] and a Dawlat-khāna-yi Ṭilism on the bank of the Djamnā, built around a central octagonal reception hall with a sunken tank, flooded at will, and a central platform (cf. Gulbadan Begam, *The history of Humāyūn*, ed. and tr. A. Beveridge, London 1902, text 31-4, tr. 118-24). A smaller octagon adjoined the north, with alcoves, and the *dīwān-khāna* the west, facing the *ḳibla* [*q.v.*], with a garden to the east. Above these were a further three rooms (*bālā-khāna*); the Khāna-yi Dawlat containing the ninefold Čingizid panoply, the Khāna-yi Saʿādat for prayer, books and portfolios, and the Khāna-yi Murād with a jewelled bedstead. There was also a forecourt, *pīsh-gāh*, where a throne could be set. Remarkably, internal stairs assumed no architectural importance until the end of the 18th century.

The one remaining building from the citadel of Purānā Ḳilʿa, [see DIHLĪ. 2] begun by Humāyūn but finished by Shēr Shāh, is perhaps in the same tradition, as a two-storeyed octagon of sandstone crowned by a kiosk, about 18 m tall, the Shēr Manḍal. The space inside rises as one volume, painted with coloured designs, punctuated by a gallery. It was used as a library and observatory.

A Mughal view of indigenous building may be found in Bābur's comment (935/1528) on the Palace of Mān Singh (1486-1516) at Gwāliyār [*q.v.*] Fort, that it was wonderful, but "solidly subdivided and without regularity" compared to Tīmūrid models (*Bābar-nāma*, ed. A. Beveridge, Leiden and London 1905, fol. 340 ff.). Such over-compactness and lack of axial development were to be corrected.

vii. Akbar (963-1014/1556-1605 [*q.v.*]) initiated a prolific programme of palace building when he was twenty-two. The camp, in which the court spent much time [see MANZIL] can be taken as an idealised palace plan, to be modified according to the site, but not achieved in solid form until the reign of Shāhdjahān. As described by Abu 'l-Faḍl (*Āʾīn-i Akbarī*, i, *āʾīn* 16-18), the royal precinct was a rectangle accessible from the western end, where a great forecourt, flanked by stables and a records office (*daftar-khāna*), led up to a rectangle roped off for the court of public audience (*dīwān-khāna-yi ʿāmm*); beyond this was a private audience hall (*dawlat-khāna-yi khāṣṣ*) within its own enclosed court, and then another court (*mahtābī*) where the Emperor received his closest courtiers in the evening. Still further east, beyond a small guard court, lay the women's quarters (*shabistān-i iḳbāl*) with private dwellings, a hall, and a two-storied wooden oratory from which he received the acclaim of the people each morning in *darshan*. All lay on one axis, with a drum house (*naḳar-khāna*) far on the approach. Both camp and palace were a setting for a strict routine of ceremony and administration observed daily (see *Āʾīn*, i, nos. 72-4; Ibn Hasan, *The central structure of the Mughal empire*, Oxford 1936, 65 ff.; Sir J. Sarkar, *Mughal administration*, Calcutta 1935, 19-21).

Akbar's first palace at Āgra [*q.v.*], the hunting lodge at Nagar Čayn near Kakralī, was started in 1564. From 972/1564-5 to 980/1572-3 Āgra Fort was rebuilt as Akbarābād, in red sandstone in place of the crumbling Lōdī brickwork; the massive ashlar was to characterise future Mughal work [see BURDJ. iii, 4]. In this case, the optimum position along the eastern parapet overlooking the Djamnā and the main approach from the Dihlī Gate in the west allowed the favoured axis, modified by extension along the river. There were "more than 500 buildings of masonry, after the beautiful designs of Bengāl and Gudjarat" (*Āʾīn*, tr. ii, by H. S. Jarrett, Calcutta 1891, 180), and in 1626 Pelsaert confirms that it was built over like a city with streets and shops, princely buildings and residences, with *maḥalls* for the ladies (ed. W. H. Moreland and P. Geyl as *Jahangir's India*, repr. Delhi 1972, 3-4) leaving little room. This aesthetic eclecticism, consistent with the policy of *ṣulḥ-i kull* ("universal toleration") must have profited from an influx of craftsmen from both regions, then disrupted, and from Gwāliyār, recaptured in 965/1558. The synthesis is evident in the two buildings, known as the Djahāngīrī Maḥall and the Akbarī Maḥall (such names in India are unreliable) remaining from Akbar's private apartments, which seem to have extended to the Muthamman Burdj corner in a symmetrical group. Pelsaert (*loc. cit.*) mentions the *maḥall* of the Queen Mother, three others, and a Bangālī Maḥall, with which one of these may be identified; if so, it was built before 977/1569 (see R. Froude Tucker, in *ASIAR* [1907-8], 8-22, but cf. Sir J. Marshall in *ASIAR* [1902-3], 62, and Nur Bakhsh in *ASIAR* [1903-4], 169-71). The trabeated "Akbarī Maḥall" ran in two stories round a square courtyard with flat roofs; a hall was set at the centre of three sides with an axila entry on the west; in the riverside *tibāra*, windows overlooking the water corresponded to doorways onto the courtyard, a scheme much used subsequently. The gridded exterior with blind niches is Bengālī in character, like that of the Dihlī Gate. This closed format is repeated in the "Djahāngīrī Maḥall" where many features of scale, construction and decoration show derivation from Gwāliyār, though the vigorous Hindu style is blended with Islamic arches on the upper floor, and lightened by *čhatrī*s and latticed balustrades; the interior is remarkable for dramatic brackets supporting the ceiling. The buildings east of this court are in a markedly more Iranian style, dominated by four-centred arches and alcoves, with slender columns to the portico; this elegance, and that of the entrance façade, resembles work of the early 1560s at Dihlī (the formal grouping of *īwān*s around a waterside terrace was reiterated at Māndū around the Nīl-kanṭh shrine dated 982/1574-5). On the Shāh Burdj was a small pavilion, uniquely of marble.

Work on the Fort at Lāhawr [*q.v.*], in burnt brick, is recorded in 974/1566, and Akbar's hall of public audience (*dawlat-khāna-yi ʿāmm*) was in use by 996/1587, with an open rectangular courtyard of 114 bays, as confirmed in a plan of the Sikh period. Its raised *djharōkhā*, from which the King held audience, survives as a projection from a former bracketed colonnade (cf. scenes in the *Pādshāh-nāma* in the Royal Library, Windsor, set in Āgra, showing a very similar arrangement; see B. Gray (ed.), *The arts of India*, Oxford 1981, fig. 127). The courtyard subsequently built by Djahāngīr immediately north of this, probably for private audience, completed this axial scheme up to the river Rāwī; the private apartments were to extend from there westward.

The most extensive palace remaining from Akbar's

reign, at Fatḥpūr Sīkrī [*q.v.*], was officially founded in 979/1571, and it seems that most of the work, all in red sandstone, was finished within a year. The trabeation allowed the prefabricated panelled technique essential to such rapid erection, and the stone was, as claimed, "wrought with the ease of turning wood" in traditional Indian techniques apparently derived from Bayānā not far away (fieldwork by M. Shokoohy, 1981). The site on a ridge running northeast and southwest requires a layout in a series of steps to the south, culminating in the great mosque at the western (i.e. *ḳibla*) end near the house, *khānaḳāh*, and *masdjid* of Shaykh Salīm Čishtī. Nearby, the oldest royal building, the Rang Maḥall (976/1568-9) is traditional in its introverted courtyard plan, with colonnades in two storeys, but the fusion of Islamic and Hindu detail is experimental. The saint's own house (971/1563-4?) initiates a pastiche resumed in the main buildings; its stonework is carved in imitation of a framed hut with cabled angle shafts, perhaps as used in camp. The Dīwān-khāna-yi ʿĀmm, placed at the north of the ridge has a trabeate colonnade of 111 bays with a deep *čhadjdjā* all round, and the royal *djharōkhā* is expanded in a pavilion of five bays broken forward into the court on a podium, with a hipped roof and fine *djālī*s. Its surprisingly modest scale is typical of the whole palace, where imaginative massing and exquisite carving achieve delight rather than grandeur. The organisation of the remainder of the palace, now weakened by the absence of the courtyard walls, must have been informal, with frequent lack of symmetry, overlapping masses, and half-closed spaces, and an intentness on individual buildings which suggest that the architects as well as the craftsmen worked in a Hindu tradition (cf. Kumbhā Rāṇā's palace at Čitawr Fort, taken in 975/1568). The purpose of several buildings is uncertain, and their fanciful names are best used for reference alone. The "Ānkh Mičawlī" is a *tibāra* flanked by two wings, themselves *tibāra*s turned outwards, offering three aspects with double walls for insulation, and with the central roof strutted as at Āgra. The "Dīwān-i Khāṣṣ", a four-square building, contains a single column supporting a circular estrade on astonishing radial brackets, joined to a peripheral balcony by catwalks: an embodiment of the *axis mundi* carrying the seat of the *čakravartin* or world ruler. A group of buildings around the Anūp Talāʾō, a square tank with a *čabūtrā* platform, may be compared with the camp *mahtābī*; the colonnaded "Khāṣṣ Maḥall" with its mezzanine is broken forward as at Sarkhēdj, and the *shāh-nishīn* above is a *bāradarī* whose verandah is carefully articulated to the mass by alternately wide and narrow bays, under a roof carved to simulate tiles. A room with a raised throne platform has a *djharōkhā-yi darshan* in the rear overlooking the records office courtyard to the south (Rizvi and Flynn, *op. cit.*, 24-40). The Daftar-khāna there is the first surviving statement of the classical Mughal pavilion form. A low podium carries a rectangular *tibāra* surrounded on three sides by broad *čhadjdjā*s over a colonnade of tall paired columns (outer and inner), grouped in fours to turn the corner; a wider bay accents the corner. The front doorways with arched, latticed lunettes are matched by a triad of windows at the back. The usual coved vault carries a flat roof terrace over the whole (*ibid.*, 41-2). The principal Ḥaram Sarāy, larger than those at Āgra, develops the courtyard plan on a single storey, the taller hall on each face rising through it, advanced between walls housing stairs to an upper storey, vaulted in keel form; two are roofed with azure tiles from Multān [*q.v.*]. A "Panč Maḥall" of four diminishing rectangular floors topped by a *čhatrī* forms a set of well ventilated platforms, whose screens were destroyed in 1869-72 (*ibid.*, 46-53). Broad expanses of paving set off these buildings throughout, and stone rings for tent ropes appear on parapets and at ground level. The awnings for festivals were of velvet, gold brocade, and gold embroidery. The sandstone was picked out in colour, the effect of which can still be seen in the "Nadān Maḥall" at Lakhnaw [*q.v.*].

The Fort at Adjmēr [*q.v.*], 978-81/1570-3, displays much stronger Iranian influence in a highly coherent, symmetrical plan. A strictly rectangular enclosure with a great octagonal bastion at each corner, and a single polygonal gateway broken out on the south, contains one building at the centre. This has a tall, three-bayed *īwān* on all four faces, with paired square pillars supporting the *čhadjdjā* and ceiling beams on cross brackets. Four square rooms fill the corners in two stories. The central space, which may have served for audience, is bridged by the upper storey; the lack of division between *mardāna* and *zanāna* is puzzling. The proportions are Persian, enhanced by panelling of the yellow brown Khattu limestone with simple pointed arches, whose archivolts are in the style of Mālwā or Khāndēsh, while the interior had tilework chased into geometric friezes.

At Allāhābād [*q.v.*], in the fort founded in 991/1583, only a *bāradarī*, the "Zanāna Palace", has survived. A peristyle of double columns surrounds a central hall, and the terraced roof is set off by latticed kiosks.

viii. The buildings of Djahāngīr [*q.v.*] at Āgra have been obliterated. His *djharōkhā-yi darshan* is described as near the Shāh Burdj (later Muthamman Burdj), where he had marble halls built on three sides of Akbar's pavilion. The court of public audience was customarily divided by railings into three areas: that nearest the throne for the nobility, the next three steps lower for lesser officials, and the remainder for retainers. In his eighth year he introduced silver casings for the inner rails, the outer remained red. (A description cited by Nūr Bakhsh, in *ASIAR* [1903-4], 171, is based on a spurious ms.) His courtyard at Lāhawr [*q.v.* for plan], completed by Maʿmūr Khān in 1027/1617-18, is defined east and west by two ranges of single-storeyed *tibāra* halls two and three aisles deep, alternating with smaller rooms; their tall porticoes recall those of Adjmēr. A pavilion to the north, perhaps contemporary, is also a three-bayed hall, flanked by two turned outwards as at Fatḥpūr, though with an arched verandah in front. The garden, centred on a square tank with fountains, introduces another element of the classical palace plan. This court was probably the private audience hall, then known as the Ghusl-khāna (bathroom) through an accident of nomenclature explained by ʿAbd al-Ḥamīd Lāhawrī (*Pādshāh-nāma*, i, 148); there is a bath just to the west.

ix. In the reign of Shāhdjahān [*q.v.*], Akbar's *djharokhā* for public audience and the old private audience hall at Āgra were pulled down: "all abominations escaped into non-existence, and lovely things reached the zenith of perfection" (*ibid.*, i/2, 236). If, as it seems, the replacements were built on the same sites, then the old private hall lay against the riverside wall ranged with the private apartments, with the public one in front,

at a Lāhawr. The latter was approached from the Dihlī Gate down the Mīnā Bāzār with its rows of shops and square *čahār sūḳ*, and entered from the north on the cross axis by the Akbarī Darwāza. The Amar Singh Gate to the south was primarily for access to the private apartments, like the Hāthī Pōl at Lāhawr.

Shāhdjahān adjusted this layout. In his first year (1037/1628), he had ordered halls of forty columns (*čihil sutūn*) at Āgra, Lāhawr and Burhānpur [*q.v.*] to protect his nobles at public audience instead of the tents used previously. As that at Burhānpur is ruined, and that at Lāhawr only roughly reconstructed, the hall (*īwān*) at Āgra, renamed the Dawlat-khāna-yi Khāṣṣ u ʿĀmm, is the remaining prototype for his court buildings, which thenceforward follow its format as an arched, hypostyle loggia, rectangular in plan and set on a podium, with a flat roof, *čhadjdja*, and *čhatrī*s at the corners. The work, in red sandstone dressed with polished marble stucco, and with details picked out in gold, is strikingly different from its forerunners. It retains such features as doubled peripheral columns, quadrupled at the corners, and dodecagonal shafts with linked *muḳarnaṣ* capitals and pyramidal bases. The innovations are the preference for a marble surface, the "structural" use of cusped arches in tall framed spandrels, the medium height of the columns, and a consonance of curvilinear detail; the construction is actually still trabeate. Here the hall, nine bays by three, is open on three sides, and arcades on both axes intersect to support coved roof panels. A central, raised *djharōkhā* opens through three rounded trefoil arches in the rear wall, its marble intricately inlaid with pietra dura (*parčīn-kārī* [*q.v.*]). The great courtyard is surrounded with an arcade of simpler cusped arches. The silver rail now fenced the loggia, and the red rail was of stone.

The courtyard of the Dawlat-khāna-yi Khāṣṣ, dated 1045/1635, is confined on three sides by two storeys of cusped arcades serving rooms for the treasury; the upper floor continues as an open riverside terrace to the east, and the audience hall is now turned at right angles to face down this, with its back to the private apartments. It has no internal columns, being smaller, and backs on to an inner hall (*ṭambī-khāna*) through three pointed arches. This has a great alcove (*shāh-nishīn*) at either end. The marble of both spaces is panelled above florally carved dadoes, matched by floral *djālī*s in arched clerestories, and netted coving surrounds ceilings once plated in gilded silver leaf. The terrace was used at night; baths [see ḤAMMĀM] at its end were set with glass mosaic. Just behind this hall, the Shāh Burdj bastion was rebuilt with an octagonal vaulted chamber in two storeys, the Muthamman Burdj, used for conference with ministers. Below, a balcony surrounds a central apsed cell which opens on the landward side to a matching *tibāra* with a foliate pool facing a terrace screened by exquisite arched *djālīs*; above is a *čhatrī* with a gilded dome. Beneath the audience hall is a *tah-khāna*, the Shīsh Maḥall, of two rooms in glass mosaic with a cascade and running water: a cool and gently lit *sardāb* [*q.v.*].

Immediately south of this complex is an extension of the riverside terrace carrying the Ārāmgāh (bedchamber), built in the same idiom but with piers instead of columns. In front is a pool with boldly sculpted trefoil margins, and on either side, a flawlessly simple screen, behind which is a *tibāra* pavilion with the high arched, ridged roof derived from Bengal, stopped by a hipped dome at each end, and gilded. The northern one, in marble, was the Bangla-yi Darshan, which replaced the earlier *djharōkhā*, followed by a *banglā* tent on the site. These symmetrical but contrasting masses formed a new type of composition; they face a *čār bāgh* below with its original parterres, surrounded by the harem quarters in two stories, served by a balcony, and with a *tibāra* on each axis. The new aesthetic included three mosques of appropriate sizes for the two audience halls and the court.

At Lāhawr Fort [*q.v.* for plan], Shāhdjahān's buildings were coeval with those at Āgra, beginning with a very similar Čihil Sutūn. The suite of private apartments set within the great Shāh Burdj, *ca.* 131′/40 m across internally, was completed in 1041/1631; it is more accomplished in the Iranian linkages of its planning than in elevation, where it is unresolved. The small *ṭambī-khāna* is flanked by domed octagonal rooms leading to semi-octagons with apses filling the angles (plan in E. La Roche, *op. cit.*, v, 202). The *banglā* "Nawlakha" to one side of the court, a *čawčāla* with eaves curved on both axes, is possibly the first of the genre (internal work above the dado is Sikh work). The royal bedchamber (*khʷābgāh*) lay behind a range of shallow rooms facing the Burdj (*Pādshāh-nāma*, i, 223-5). Eastward of this group, along the river front, are three further courts: one opening to the entrance yard, *čowk-i dyōrhī* and the Hāthī Pōl, one marked Khilwat-khāna on the Sikh map (not Khilʿat as cited by Vogel) which may have been harem quarters, with baths, a small mosque, and a small marble *banglā* on the parapet dated 1055/1645, and one with ranges grouped around a *čār bāgh* including the Čhōṭī Khʷābgāh believed to be one of the buildings for *khʷābgāh* and *ghusl-khāna* (see viii. above) ordered in 1043/1633-4 (*ʿAmal-i Ṣāliḥ*, cited by Nūr Bakhsh, *op. cit.*, 1902, 223-4). Djahāngīr's court ends the row, thus reversing the Āgra plan. At Adjmēr, the five white marble pavilions along the margin of the Āna Sāgar lake (1047/1637) show the idea of the waterside terrace at its most perfect, as the climax of the Dawlat Bāgh; the new style is at its most precise, though the column groupings recall Fatḥpūr Sīkrī. The prominent Hindu brackets are found too in the black marble pavilion carried out by Ẓafar Khān at Shālamār (formerly Fayḍbakhsh) in Kashmīr in 1039/1630 [see BUSTĀN].

The Lāl Ḳilʿa at Dihlī [*q.v.* for plan and details], being founded *de novo* in 1048/1638, allowed free development of a riverside palace within the walled format of a rectangle set along the Djamnā to the east. The main approach axis from the Lāhawr Gate in the west passes through a long, vaulted bazaar street with an open octagonal court, of Iranian pattern, to a great square guard court, with a tank at its centre and a *nawbat-khāna* over a triple gate at the far side. This led to the still larger courtyard, a rectangle set athwart this axis, and surrounded by arcades (*īwān*) of separate cells for the *umarāʾ*, serving the Dawlat-khāna-yi Khāṣṣ u ʿĀmm opposite. Neither court is extant. The north and south sides of the guard court received the transverse axis of an open arcaded street, with a canal, running from the southern Dihlī Gate. Beyond the audience hall, the main axis ended in a third court in front of the Imtiyāz Maḥall (Rang Maḥall) on a riverside terrace, the first of a line of harem buildings extending south along the cross axis of the Nahr-i Bihisht canal, once fronting garden courts that

provided privacy and accommodation. To the north, however, a group of administrative buildings was inserted on the terrace, offset to the left of the main axis, behind their own courts, an arrangement probably intended to combine the advantages of the microclimate with easier access for the emperor to both halls.

The new building types are elaborated. The public audience hall in red sandstone, once plastered, still has the nominal forty columns, but the detail is more florid; a raised *dj̲harōkhā* recess under a round arch has a (later?) *čawčāla* of marble advanced forwards. The Imtiyāz Maḥall has three aisles of intersecting cusped arches on cruciform piers; the canal runs down the centre between vaulted rooms at the corners, which form visual stops. In the S̲h̲āh Maḥall (now Dīwān-i K̲h̲āṣṣ), also piered, the canal is marked by the insertion of narrower and lower bays in the end elevations of the hall and its matching peristyle; the peacock throne was once housed here. The K̲h̲āṣṣ Maḥall (dated 1058/1648), comprising private apartments (K̲h̲wābgāh) linked to the Mut̲h̲amman Burdj̲, faces each of these with a corresponding elevation. The later Mug̲h̲al style is represented in the S̲h̲āh Burdj̲ pavilion, with baluster columns, depressed arches, and an upward arch of the *čhadjdjā* over the centre bay (see plan in Reuther, *op. cit.*, pl. 60).

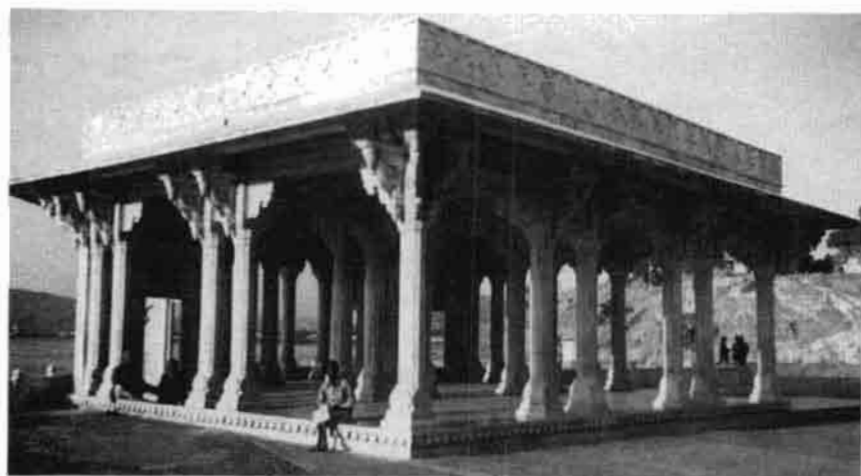
x. Further elaboration of these elements can be seen in the Rādjpūt work at Ambēr under the direct influence of Āgra and Dihlī, and in the Dj̲āṭ palaces of Dīg (*ca.* 1725) near Bharatpūr. The transition to the frivolities of later Mug̲h̲al palaces is marked by the Ḳudsiyya Bāg̲h̲ at Dihlī, built for the mother of Aḥmad S̲h̲āh (1161-7/1748-54), of which fragments remain (cf. a print by T. Daniell, *Oriental scenery*, London 1795, i, 3). It was built rapidly from brick and plaster, with applied stucco ornament; the river elevation is in two storeys of arcading, blind below, and with balustered openings on to her apartments above. Octagonal towers at each corner are fully latticed above, with oriels set on lotus calyces, and capped by bulbous semidomes with vestigial *banglā* eaves; these and other features form the vocabulary of subsequent domestic architecture at Lak̲h̲naw [*q.v.*]. The tradition was to continue with greater vigour in the gradual accretions of Rādjpūt palaces, and in Sikh buildings, until the present century.

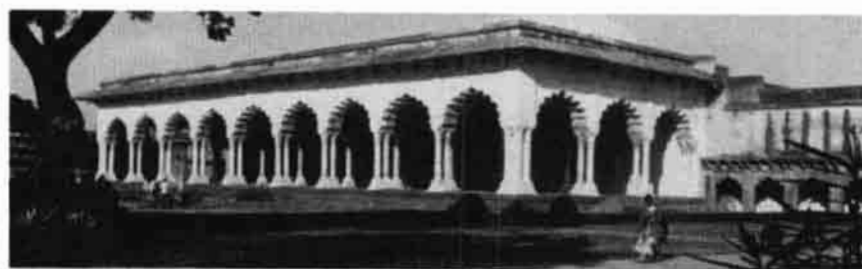
Bibliography: for general works see HIND. Far the best specific work is still O. Reuther, *Indische Paläste und Wohnhäuser*, Berlin 1925, with excellent illustrations; these are supplemented by E. La Roche, *Indische Baukunst*, Munich 1922, Bd. v-vi. For Dihlī Sultanate work, see Yamamoto, M. Ara and T. Tsukinowa, *Architectural remains of the Delhi Sultanate period*, Tokyo 1967, 3 vols. [in Japanese], and for Tug̲h̲luḳābād excavations, see *ASIAR* (1923-4), 141, (1925-6), 199, (1926-7), 245. See also J. A. Sanderson, *A guide to the buildings and gardens, Delhi fort*, Delhi 1937 (beware of inaccurate plan). For Adjmēr, see notes by Nicholls in *ARASI* (1904-5), 23, (1905-6), 31-2, and A. L. P. Tucker, in *ibid.* (1902-3), 81-4. For the Ḳudsiyya Bāg̲h̲, see H. Goetz, *The Qudsia Bagh at Delhi*, in *IC*, xxvi/1 (1952), 132-52. For the camp plan, and details of Mug̲h̲al palace tentage, see P. A. Andrews, *The felt tent in Middle Asia*, unpublished Ph.D. thesis, London 1980, 633 ff. etc. For stylistic development, see MUG̲H̲ALS. Architecture. (P. A. ANDREWS)

MAḤALLA (A.), a noun of place from the verb *ḥalla*, which means notably "to untie (a knot, luggage, etc.)", and by extension, "to make a halt", whence the meaning of "a place where one makes a halt, where one settles (for a longer or shorter time)".

This term constitutes the first element of names of towns or villages in Egypt, where a hundred places were designated by an expression formed from Maḥalla followed by an adjective or a proper noun; ʿAlī Pas̲h̲a Mubārak cites more than thirty of them in al-*K̲h̲iṭaṭ al-djadīda* (xv, 21 ff.), apart from the city of al-Maḥalla al-Kubrā [*q.v.*].

Maḥalla also took on the meaning of a "quarter of a town" [see MADĪNA], especially in Turkish (see MAḤALLE), Persian and Urdu. Dozy (*Suppl.* s.v.) even sees in the name of the Jewish quarter of the towns of North Africa, the *mallāḥ*, a metathesis of *maḥalla* (but cf. MALLĀḤ).

Furthermore, the original meaning of "a place where one makes a halt" was preserved in the Mag̲h̲rib (with a pl. *amḥāl*) to designate a movable camp, then, by extension, the troops on campaign within the territory at least nominally dependent on the sovereign who commands them or entrusts the command to the heir apparent, another member of the family or, exceptionally, to a confirmed war commander. This change in the meaning appears quite early, since it was attested under the Ḥafṣids (see R. Brunschvig, *Ḥafṣides*, ii, 90) in Tunisia, where, as in Morocco, before the institution of the protectorate, expeditions so-named were organised periodically. In Tunisia, the *maḥalla* (in French, *méhalla*) was principally formed from auxiliaries levied more or less easily among the tribes; it used to leave the capital following a ceremony of which we possess some detailed descriptions (see e.g. V. Serres and M. Lasram, in *RT* [1895], 333; Ibn Abī Dīnār, *Muʾnis*, Tunis 1967, 303), and it was




generally received with marks of honour by the subject tribes who, moreover, hated to see it strike camp, for it was they who had to provision the troops on campaign.

The *maḥalla* constituted an instrument of government. It performed in effect a triple function: to consolidate the authority of the sovereign over the provinces, to ensure the levying of taxes and to suppress rebellions or the insubordination of local chiefs. In the ordinary way, it performed a simple route march, but the collection of taxes sometimes proved difficult and necessitated more than a simple demonstration of force; when the launching of a *maḥalla* had been provoked by the agitation of a tribe, it was settled on its territory, from which it put pressure on the population; finally, when serious troubles broke out, real war operations had to be mounted against the rebels, as for example in 1864 (see Kh. Chater, *Insurrection et répression dans la Tunisie du XIX*e *siècle: la Méhalla de Zarrouk au Sahel (1864)*, Tunis 1978).

In Morocco, the *maḥallas* performed almost the same functions as in Tunisia, with this difference, however, that a good part of the territory totally escaped the authority of the sultan, who was furthermore constrained in organising one since, from Fez or Meknès, he used to make his way to his southern capital, Marrakesh, via Rabat.

In a general fashion, the Moroccan *maḥalla* comprised elements of the three corps of the regular army [see DJAYSH], to which were added some contingents designated by the name of *ḥarka* (*ḥaraka*) and supplied by tribes subject to the sultan. The latter formed the vanguard (or the rearguard where an attack on the rear was repulsed) and explored the terrain, spreading out over a wide area; then came the regular troops charged with protecting the sovereign (who rode under a parasol) and his entourage, who preceded the standards and musicians.

At its resting place the camp contained in its centre the tents of the Sultan, his wives and eunuchs, surrounded by a linen screen, which, in Tunisia, bore the Berber name *afrag* (transcribed as *āfrāg* [*q.v.*]). Outside this enclosure were placed the ministers, secretaries, musicians, around whom the troops formed a square; within this apparatus, wandering merchants established a market, where all kinds of articles and foodstuffs were to be found, for provisioning was not ensured by regular supervision; it was the tribes who had to supply what was called the *mūna* (*muʾna*), i.e. the provisioning, and it was not uncommon for this to be insufficient, in spite of the sacrifices of the populations subject to this obligation, which often reduced them to misery. Nevertheless, some of them preferred to remain dissident, at the risk of possibly seeing a *maḥalla* settle on their territory and help itself to their flocks and cereal resources without pity.

Most of the Europeans who visited Morocco before the Protectorate had occasion to describe a *maḥalla*, in particular the one mounted to suppress the rebellion of Bū Ḥmāra [*q.v.*], but the richest source with reference to this is the work of Dr. L. Arnaud, *Au temps des "Mehallas"*, IHEM, Notes et Documents, fasc. no. xii, Cadablanca 1952.

Bibliography: given in the text.

(CH. PELLAT)

AL-MAHALLA AL-KUBRĀ or MAḤALLA KABĪR is the modern name of an important town in the Delta of the Nile at some distance to the west of the Damietta arm, north-east of Ṭanṭa. It lies on the Turʿat al-Milāḥ canal, a branch of the Baḥr Shībīn.

In view of the large number of Egyptian geographical names compounded with Maḥalla (see these listed in Muḥammad Ramzī, *al-Ḳāmūs al-djughrāfī li 'l-bilād al-Miṣriyya*, Cairo 1953-68, i, 404-9), the identification of the town with the names mentioned by earlier Arabic writers is a matter of some difficulty. Maspero and Wiet identify it with the Coptic Tishairi (Amélinau, *La géographie de l'Égypte à l'époque copte*, Paris 1893, 262), but this identification is rendered doubtful by the fact that al-Maḥalla is a purely Arabic name (and it also remains to be proved that it is a rendering of the Coptic name just mentioned), and because the work of Abū Ṣāliḥ on the Christian buildings of Egypt makes no mention of this town. The earliest author who knew a town called al-Maḥalla or al-Maḥalla al-Kabīra is al-Muḳaddasī (55, 194, 196, 200); he tells us that it was a town of al-Rīf built in two parts, one called Sandafā (or Ṣandafā), but the statement that the town was situated on the river by Alexandria (200) seems to be an error. Al-Bakrī seems to know the same town under the name Maḥallat Maḥrūm (*Kitāb al-Masālik wa 'l-mamālik* Brit. Libr. ms.). Idrīsī, *Description de l'Afrique*, 158, calls the town simply al-Maḥalla and knows a canal called after it. Yāḳūt's statements are confused, for he speaks of a town called Maḥallat Daḳalā and of another Maḥallat Sharḳiyūn (iv, 428), both of which seem to refer to the same place. Maḥallat Sharḳiyān in Yāḳūt—which he also calls al-Maḥalla al-Kubrā—forms one town with Sandafā and on the other hand he says that Maḥalla Daḳalā between al-Ḳāhira and Dimyāṭ is the largest of the Maḥallas that he knows (cf. also Abu 'l-Fidāʾ, ii, 160), while the geographer al-Dimishḳī (231) knows Maḥalla Daḳalā as the capital of the *kūra* of Daḳahla; Ibn Duḳmāḳ (v, 82) says that the governorship of this town was regarded as "the little vizierate" (*al-wizāra al-ṣaghīra*). Under the Mamlūk sultan Barḳūḳ's administrative reorganisation at the end of the 8th/14th century, al-Maḥalla al-Kubrā became the centre of the *wilāya* of the Gharb, under an *amīr ṭablkhāna* (see H. Halm, *Ägypten nach den mamlukischen Lehensregistern. II. Das Delta*, Wiesbaden 1982, 311, 519).

The name Maḥallat Sharḳiyūn is again found in al-Maḳrīzī (ed. Wiet, iii, 207). It is clear from these writers that the town was an important commercial centre from the 4th/10th century onwards. It does not seem however to have played any considerable part in history, although ʿAlī Pāsha Mubārak quotes some events that took place there, from al-Maḳrīzī and al-Djabartī. In Egypt in the 19th century, the town had to give way to Ṭanṭa, which became the capital of the *mudīriyya* of al-Gharbiyya, while al-Maḥalla became the capital of a smaller administrative area; ʿAlī Mubārak estimates its inhabitants at 50,000, while the 1914 Baedeker gives it only 33,500. It is at present a centre of the cotton trade; raw cotton is there cleaned in the factories. Of the many individuals who bore the *nisba* al-Maḥallī, the most celebrated is Djalāl al-Dīn al-Maḥallī [*q.v.*], who was born here.

(J. H. KRAMERS*)

MAḤALLĀTĪ, ĀGHĀ KHĀN, Sayyid Ḥasan ʿAlī Shāh, last of the Nizārī Ismāʿīlī *imāms*

to reside in Iran and the first of them to bear the title of Āg͟hā (less commonly but more correctly, Āḳā) K͟hān. Born in 1219/1804 in the village of Kahak near Maḥallāt in central Iran, he succeeded to the imāmate in 1233/1817 when his father, S͟hāh K͟halīl Allāh, was murdered in Yazd. Fatḥ ʿAlī S͟hāh, the Ḳād͟jār ruler, amply compensated the young *imām*. His lands at Maḥallāt were extended by royal decree; he was given a daughter of Fatḥ ʿAlī S͟hāh in marriage; and he was made governor of Ḳum, despite his extreme youth. With this appointment came the title Āḳā K͟hān, subsequently used as a hereditary title by the Nizārī Ismāʿīlī *imāms*.

Āg͟hā K͟hān Maḥallātī led an apparently loyal and tranquil existence until the death of Fatḥ ʿAlī S͟hāh in 1250/1834, and the favour with which the court regarded him was confirmed when the new ruler, Muḥammad S͟hāh, appointed him governor of Kirmān. But when, in 1252/1836, an attempt was made to replace Maḥallātī with Fīrūz Mīrzā, a Ḳād͟jār prince, he forcefully resisted his dismissal and embarked on a career of rebellion that ended with his fleeing to India by way of Afg͟hānistān. Despite initial success, Āg͟hā K͟hān Maḥallātī was soon obliged to withdraw to the citadel at Bam, where he surrended after a siege lasting fourteen months. There followed eight months of captivity in Kirmān and a period of retreat at the shrine of S͟hāh ʿAbd al-ʿAẓīm before he was able to plead for mercy at the court. He was pardoned on condition that he retire to Maḥallāt. This he did, but in the space of two years he gathered there an army of Ismāʿīlīs and non-Ismāʿīlī mercenaries that enabled him to resume his rebellion. Claiming that he wished to go to Bandar ʿAbbās in order to embark for the Ḥid͟jāz, Āg͟hā K͟hān Maḥallātī left Maḥallāt in Rad͟jab 1256/September 1840, striking out with his force south-east across the desert to Yazd and Kirmān. Again he won a number of preliminary engagements, but in 1258/1842 he was decisively worsted in a large battle outside Kirmān and soon after he crossed into Afg͟hānistān.

Āg͟hā K͟hān Maḥallātī's motives for rebelling against the Iranian central government are unclear. They may have been connected in part with rivalries surrounding the Niʿmatallāhī Ṣūfī order. Despite the paradox involved in an Ismāʿīlī *imām*'s submission to the guidance of a Ṣūfī *s͟hayk͟h*, Maḥallātī was the *murīd* of Zayn al-ʿĀbidīn S͟hirwānī, a claimant to leadership of the Niʿmatallāhī order. When another Niʿmatallāhī affiliate, Ḥād͟jd͟jī Mīrzā Āḳāsī, who was Muḥammad S͟hāh's chief minister, sought to displace Zayn al-ʿĀbidīn, Āg͟hā K͟hān Maḥallātī espoused the cause of his master with vigour. Ḥād͟jd͟jī Mīrzā Āḳāsī is said to have avenged himself by dismissing Maḥallātī from the governorship of Kirmān, and Maḥallātī to have responded by rebelling (see Masʿūd Mīrzā, *Sargud͟has͟ht-i Masʿūdī*, Tehran 1325/1907, 197-8). It is also possible that the British encouraged him to rebel, for at the time of his second uprising an Iranian army was advancing on Harāt in defiance of British wishes, and a diversion of Iranian attention to the south was clearly welcome in London (see *Correspondence relating to Persia and Afghanistan*, London 1839, 64).

Maḥallātī's links with the British, whom he calls "the people of God" (*k͟halḳ Allāh*) in his memoirs (*ʿIbrat-afzā*, ed. Ḥusayn Kūhī Kirmānī, Tehran 1325 s͟h./1946, 56), become fully evident with his arrival in Afg͟hānistān. He was assigned a daily allowance by the British force occupying Ḳandahār, and his troops aided in the evacuation of the British garrison which took place soon after his arrival.

Accompanying the British to Sind, he continued to supply them with mercenary services, and was instrumental in securing the cession of Karachi to the British by Nāṣir K͟hān, ruler of Kalāt [see KILĀT] (William Napier, *History of Sir Charles Napier's administration of Scinde*, London 1851, 75).

After a brief stay in Calcutta, during which the British authorities fruitlessly tried to secure him a pardon and safe return to Iran, Āg͟hā K͟hān Maḥallātī took up residence in Bombay, where he acquired extensive properties and began to accumulate a vast fortune. In this undertaking he was significantly aided by a ruling, handed down by the Bombay High Court in 1866, that placed all the community property of the Nizārī Ismāʿīlīs in the name of their *imām* and under his absolute control. Maḥallātī died in April 1881, and was buried in a lavish shrine at Ḥasanābād in the Mazagon area of Bombay. He was succeeded by the eldest of his four sons, Āḳā ʿAlī S͟hāh, Āg͟hā K͟hān II.

Bibliography: Āg͟hā K͟hān Maḥallātī wrote an autobiography, *Taʾrīk͟h-i ʿIbrat-afzā*, which was first published in Bombay in 1278/1861, and reprinted in 1325 s͟h./1946 by Ḥusayn Kūhī Kirmānī in Tehran. A Gud͟jarātī translation of this work exists. W. Ivanow has cast doubt on the authenticity of the *Taʾrīk͟h-i ʿIbrat-afzā*, but his arguments are not convincing (Ivanow, *Ismaili literature: a biobibliographical survey*, Tehran 1963, 148-9). (H. ALGAR)

MAḤALLE, a term commonly used in Ottoman administrative parlance for a ward or quarter of a town. As listed in the Ottoman registers [see DAFTAR-I K͟HĀḲĀNĪ], the *maḥalle*s are of various kinds. Characteristically, the Ottoman *maḥalle* consisted of a religious community grouped around its mosque (or church or synagogue) and headed by its religious chief.

In addition to its place of worship, the *maḥalle* normally had its own market, school and water fountain, these normally being supported by pious endowments. In many provincial towns, the *maḥalle* also had its own outer wall with a limited number of controlled points of access. Often the *maḥalle* had its own militia and some form of internal police. At times of weakened central authority, rivalries and even armed clashes between *maḥalle*s were not uncommon. The strong sense of corporate identity of the *maḥalle* is also indicated in a number of other ways, as for example in processions and ceremonies, with music, torches and flags. These were frequently linked with the Ṣūfī brotherhood [see ṬARĪḲA] with which the inhabitants of the *maḥalle* were associated.

Often the *maḥalle*s bear ethnic or denominational names, e.g. of Kurds, Turkomans, Christians, Jews; where Christians and Jews are numerous, they may

be subdivided by communities, e.g. Orthodox, Copts, Armenians, or, in the case of Spanish Jews, by their cities or provinces of origin. While many quarters are inhabited by homogenous ethnic, religious, or, sometimes, occupational groups, this is not always so, and the registers list many quarters in which different elements live side-by-side. The quarters inhabited by Sunnī Muslims are normally designated by some topographical name, often that of the main mosque of the quarter. The listing of the adult male inhabitants of the quarter often begins with the *Imām* and other religious functionaries, and ends with an indication of the numbers of religious and other tax-exempt (e.g. blind, mad or maimed) persons. In many dealings with authority, the *Imām* of the mosque, or his equivalent, was the representative head of the *maḥalle*. In some documents, the *maḥalle* appears to be headed by a *shaykh*, responsible to and appointed by the Ottoman authorities, possibly on the recommendation of the inhabitants of the quarter. In 1242/1826 a new system was introduced, with the election of a *mukhtār* [*q.v.*] as headman for urban districts as well as villages.

AL-**MAḤALLĪ**, ABŪ ʿALĪ DJALĀL AL-DĪN MUḤAMMAD B. AḤMAD B. MUḤAMMAD B. IBRĀHĪM AL-ANṢĀRĪ AL-SHĀFIʿĪ, Egyptian scholar who was born and died in Cairo (b. 791/1389, d. 1 Muḥarram 864/28 October 1459). He is known above all as co-author of the famous Ḳurʾān commentary called the *Tafsīr al-Djalālayn* because it was completed by another Djalāl al-Dīn, the famous al-Suyūṭī (849-911/1445-1505 [*q.v.*]), who had been his pupil for some time. According to the latter, al-Maḥallī had commented on the sūras from XVIII (*al-Kahf*) to CXIV (*al-Nās*), as well as I (*al-Fātiḥa*) and a few verses of II (*al-Baḳara*).

Al-Maḥallī, who earned his living as a trader, is said to have had such an acute intelligence that it could "pierce a diamond" and a strict morality so rigorous that he attacked abuses of all kinds and refused the office of chief *ḳāḍī* when it was offered to him. He taught law in the two Muʾayyadiyya and Barḳūḳiyya *madrasas*, and furthermore utilised his wide and varied knowledge in *kalām*, grammar, logic, *uṣūl*, etc., in a series of works and above all commentaries, none of which, except for the *Tafsīr al-Djalālayn*, have been published, but of which various mss. are extant, since they had a certain success in scholarly circles. These include *al-Badr al-ṭāliʿ fī ḥall Djamʿ al-djawāhir*, comm. on the *Djamʿ* of al-Subkī [*q.v.*], of which there exist (as also of others of his works) several mss. in the B.N. Paris (see also Brockelmann, II, 89, II², 109; the Baghdād journal *al-Mawrid*, i/1-3, 212, iii/1, 229, iii/3, 287, v/2, 214); this *sharḥ* was itself made the subject of glosses by al-Wallālī (see Lévi-Provençal, *Chorfa*, 291) and by al-Laḳānī (see Brockelmann, II², 109). One should further mention a commentary on the *Burda* of al-Būṣīrī [*q.v.* in Suppl.] (see Brockelmann, I, 265, I², 309, S I, 69); one on *al-Hudā al-nabawī* by Ibn Ḳayyim al-Djawziyya [*q.v.*] (see Brockelmann, II², 138, S II, 127); one on the *Minhādj al-ṭālibīn* of *al-Nawawī* [*q.v.*] (see Brockelmann, I², 497); *al-Ḳawl al-mufīd fi 'l-Nīl al-saʿīd* (collection of verses, quotations, etc., in part, after al-Masʿūdī; see Brockelmann, II, 114, II², 138); *al-Ṭibb al-nabawī* (see Brockelmann, II, 114, II², 138, S II, 127; cf. M. S. Belguedj, *La médecine traditionnelle dans le Constantinois*, Strasbourg 1966, 40); and a commentary on *al-Waraḳāt fī uṣūl al-dīn* by al-Djuwaynī [*q.v.*] (see Brockelmann, I 389, I², 487).

Bibliography: The most detailed biography of al-Maḥallī is in Suyūṭī's *Ḥusn al-muḥāḍara*, i, 232, borrowed by Ibn al-ʿImād, *Shadharāt*, vii, 303-4; see also Sakhāwī, *Ḍawʾ*, ii, 39-41; Ibn al-Ḳāḍī, *Durrat al-ḥidjāl*, i, 269; M. (CH. PELLAT)

MAḤAMMAD AL-ḤĀDJDJ. [see AL-DILĀʾ, in Suppl.].

MAHARI OR **MAKARI** [see KOTOKO].

AL-**MAḤĀSIN** WA-'L-**MASĀWĪ** (A.) "merits and faults", a literary genre which developed in the course of the first centuries of the Islamic period, having originated within the Arabo-Muslim cultural heritage, although some scholars (Inostranzev, *Iranian influence on Moslem literature*, tr. from Russian by G. K. Nariman, Bombay 1918, 79-85; G. Richter, *Studien zur Geschichte des älteren arabischen Fürstenspiegel*, Leipzig 1932, 37-8; H. Massé, *Du genre littéraire débat en arabe et en persan*, in *CCM*, iv (1961), 137; I. Muḥammadī, *al-Adab al-fārisī fī ahamm adwārih wa-ashhar aʿlāmih*, Beirut 1967, 136-7) have concluded, ill-advisedly, that it was inspired by an ancient Iranian model *shāyist nā-shāyist* ("auspicious/inauspicious"). This period witnessed the proliferation of debate, a genre well-known among the Arabs before the advent of Islam (*munāfarāt* and *mufākharāt*: bragging contest; see al-Sharīshī, *Sharḥ Maḳāmāt al-Ḥarīrī*, Cairo 1952, iii, 33, 55-6; M. Shukrī al-Ālūsī, *Bulūgh al-arab*, Cairo 1924, i, 278-307; A. al-Hāshimī, *Djawāhir al-adab*, Cairo 1969, i, 224-37, 237-54; Massé, *op. laud.*, 137-47; Ṭ. al-Ḥādjirī, *al-Djāḥiẓ*, Cairo 1962, 41-56; Sh. Ḍayf, *al-ʿAṣr al-ʿabbāsī al-awwal*, Cairo 1972, 457-64, al-*ʿAṣr al-ʿabbāsī al-thānī*, Cairo 1975, 535-40; I. Gériès, *Un genre littéraire arabe, al-Maḥāsin wa-l-masāwī*, Paris 1977, 6-12). Two categories of debate may be distinguished:

1. Theological debates (*munāẓarāt*), where the Muʿtazilīs were pre-eminent, not only in their combat with other sects and religions, but also in their internal dialectic, prompted, no doubt, by their admiration for plausible reasoning and influenced by the Sophists and by Greek philosophers in general. They made use of dialectic as a very efficacious instrument of analysis, a means of distinguishing absolute truth from relative truths.

2. Secular debates (*mufākharāt*, *munāẓarāt*) on a broad range of subjects coming to the fore in a new civilisation loaded with contrasting elements, particularly the conflict between the Shuʿūbīs and the believers in the supremacy of the Arabs, among whom al-Djāḥiẓ (see Gériès, *op. laud.*) is a distinguished example. The antagonists were numerous. Some of them exploited every opportunity for debate, even on trivial questions, a fact which led al-Djāḥiẓ (*K. al-Ḥayawān*, i, 11-25, vii, 7-8) to

describe them as *aṣḥāb al-khuṣūmāt*, declaring that he had no involvement with them.

This state of affairs inevitably had the effect of throwing doubt on the real worth of every idea and every concept, especially in a milieu where rationalism and Greek influence were the dominating forces. This fact was to influence ideas and literature, both in form and in content, most of all among the rationalists and in the case of al-Djāḥiẓ especially.

In his writings, this author shows an expert knowledge of the milieu, in all its aspects and contradictory tendencies. The characteristics of the milieu become associated with ideas borrowed from Greek philosophy, and it is these which must have led al-Djāḥiẓ to the concept which enable him to reply both to dualists and to determinist Muslims and which was to be one of the fundamentals of his doctrine: the relativity of good and evil in this world and the necessity of their co-existence for the optimum benefit (*al-aṣlaḥ*) of creation and especially for intelligent life.

The desire to illustrate and popularise his relativist conception of good and evil induces him to prepare, on the basis of the controversies of nis time, a fairly long literary text where there is discussion of the merits and faults of the cock and the dog (*maḥāsin al-dīk wa-masāwīh, wa-manāfiʿ al-kalb wa-maḍārruh*). This is presented to the reader in the form of a debate between two highly distinguished Muʿtazilīs. One of them (al-Naẓẓām [*q.v.*]) favours and defends the cock (*ṣāḥib al-dīk*), while the other (Maʿbad [*q.v.*]) favours and defends the dog (*ṣāḥib al-kalb*); both are vehemently criticised by a certain accuser (*ʿāʾib*) who also censures the two animals and enumerates their vices.

It is not difficult to prove that this innovative debate is the invention of al-Djāḥiẓ himself, seeking out the merits and faults of the cock and the dog and simultaneously prompting the replies made to the accuser (see Gériès, *op. laud.*, 27, 34). He offers this controversy to the reader in a very amusing and attractive literary form. He is the first to present the opportunity of reading, in a book of *adab*, a text of reasonable length commenting on the *maḥāsin* and the *masāwī* of the subject under discussion. Al-Djāḥiẓ does not confine himself to talking of the cock and the dog: he exposes the merits and faults of many other objects known in his time, such as the pig, the monkey, the eunuch and fire (*Ḥayawān*, iv, 36, i, 106-77, iv, 35, v, 5; Gériès, 44-5, 53-4).

With the aid of these examples he aims to convince his readers that everything is relative. And this, he hopes, will make his task easier when he comes to expounding and explaining theoretically and logically, in the course of literary texts discussing the *maḥāsin* and *masāwī* of the cock and the dog, his thesis on the relativity of good and evil with reference to creatures and the necessity of their co-existence, thus proving that they are intrinsically good, in relation to creation and insofar as they are works of God. This enables him simultaneously to destroy the dualist thesis and to prove two of the fundamental Muʿtazilī principles: *al-tawḥīd* and *al-taʿdīl* (divine unity and divine justice) with everything that proceeds logically therefrom, and most significantly of all, free will (see I. Gériès, *Quelques aspects de la pensée muʿtazilite d'al-Ǧāḥiẓ*, in *SI*, lii [1980], 73-5). It should be emphasised that this philosophical treatise is presented in the form of a direct response by al-Djāḥiẓ to the attacks mounted by the accuser against the two Muʿtazilīs for having discussed the merits and the faults of the dog and the cock (*Ḥayawān*, i, 203-4; cf. Gériès, 35-54).

The method which consists of praising or censuring a certain object is thus nothing more than a logical and natural evolution from debate, owing to the contribution of al-Djāḥiẓ who sought to use it for a theological purpose. This is why the affirmation of the existence of good and of evil (*maḥāsin* and *masāwī*) in every thing is imbued, in his work, with a philosophical and theological significance: all is relative and all is important, and each creation has its place. It is in this sense that the *K. al-Ḥayawān* is to be understood, as it deals with various despicable elements of creation, the wisdom that they contain and their importance for the optimum state of the world. Similarly, in his books and his letters he deals with different social groups, stressing the important and indispensable role that each plays and concluding that each social group has its place (*Ḥaywān*, i, 43-4, 204-10; *al-Maʿāsh wa 'l-maʿād*, in *Rasāʾil al-Djāḥiẓ*, ed. Hārūn, Cairo 1964, i, 117; cf. Gériès, 44-54). This realisation comes to be applied in the Djāḥiẓian ethic, which in its principles is reminiscent of the Aristotelian ethic (see Gériès, 54-7).

The composition of literary texts containing praise and censure of the same object is therefore not, in the case of al-Djāḥiẓ, a worthless and insignificant game which seeks only to prove the verbal abilities of a skilful advocate. However, this will not be understood without a detailed study of the corpus of al-Djāḥiẓ's work, especially the *K. al-Ḥayawān*, the readers of which seem to have been attracted or shocked and even scandalised by the form and content of these texts. Al-Djāḥiẓ immediately acquired a renown which finds expression as much in the very violent attacks of certain later writers (Ibn Ḳutayba, *Taʾwīl mukhtalif al-ḥadīth*, Fr. tr. G. Lecomte, Damascus 1962, 73) as in the imitation of his method, although his imitators failed to understand the philosophical and theological significance implicit in this method and did not include it.

According to the periods in which works adopting the characteristic structure of certain writings of al-Djāḥiẓ were composed, the content and the form vary subject to the influence of the contemporary milieu and accented by dominant trends.

One of these writers who seems to be the most attracted by the Djāḥiẓian method is Ibrāhīm b. Muḥammad al-Bayhaḳī (3rd-4th/9th-10th century), author of a sizable book of *adab* entitled *al-Maḥāsin wa 'l-masāwī* (ed. Schwally, Giessen 1902; ed. Abu 'l-Faḍl Ibrāhīm, Cairo 1961). Al-Bayhaḳī is unknown to the ancient Arab biographers; all that can be added to the material contained in the article AL-BAYHAḲĪ in *EI*², is that he was a moderate Shīʿī (Zaydī) and that he ascended the social scale to the point where he was a *nadīm* or companion of kings. Ibn al-Rūmī, who allows him this distinction, composed numerous satires (*hidjāʾ*) against him (see Gériès, 74-9; Ibn al-Rūmī, *Dīwān*, ed. M. Sh. Sālim, Beirut n.d., ii, 28-9, ed. M. Kaylānī, Cairo 1924, 202-6, poem no. 233; R. Guest, *Life and works of Ibn Er-Rumi*, London 1944, 29, 133; S. Boustany, *Ibn ar-Rūmī, sa vie et son œuvre*, Beirut 1967, index).

The subjects discussed in the *K. al-Maḥāsin wa 'l-masāwī* and the ideas which it reveals are virtually identical to those of Ibn Ḳutayba in the *ʿUyūn al-akhbār*, with the exception of the politico-religious tendencies which are to be perceived in the first part (see Gériès, 80-3). The factor which makes this book unique and different from other works of

adab is the precise method with which the writer deals with his subjects and his technique of revealing to the reader his own feelings towards them (*ibid.*, 79-89). Each chapter (*bāb*) is divided into two opposing sections: *maḥāsin* of . . ./ *masāwī* of . . . The contrast concerns either one single object possessing both merits and faults (e.g. *maḥāsin al-faḳr*/*masāwī al-faḳr*: poverty; see the *K. al-Maḥāsin wa 'l-masāwī*, 98-107, 170-8, 297-307, 364-73, 386-92, 464-9, 599-605, 609-12, 619-22; cf. Gériès, 87-9), or, as is more common, two objects of which one is positive, praiseworthy and full of merit, the other negative, reprehensible and full of fault (*maḥāsin al-rasūl*/*masāwī man tanabbaʾa*, *maḥāsin al-s͟hidda*/*masāwī 'l-d͟jubn*: the Prophet/false prophets, courage/cowardice; see 16-34, 111-32, 518-22; Gériès, 85-7).

Thus the terms *maḥāsin*/*masāwī* are not limited to a single connotation; in the first category, they signify merits/faults, good/bad examples, praise/censure; in the second: good, positive, virtuous, proper, laudable, qualities and merits of that which is *ḥasan* (good)/bad, negative, vicious, improper, despicable, vices and faults of that which is *ḳabīḥ* (bad).

In his introduction (16; cf. Gériès, 91-3), which in general terms is nothing more than a collection of remarks of al-D͟jāḥiẓ in praise of books and of writing, al-Bayhaḳī explains the motives that have led him to give this title to his book and thus to follow this method of exposition. He says: "We have entitled it *al-Maḥāsin wa 'l-masāwī* because the optimal interest of the world, from the beginning to the end of time, resides in the co-existence of good and bad, of harmful and useful, likable and detestable. For if only bad existed, creatures would annihilate one another. And, if there were nothing but good, affliction would disappear and reasoning would have no value . . .".

This explanation is nothing other than the opening of the philosophical treatise presented by al-D͟jāḥiẓ in the *K. al-Ḥayawān* as a reply to the accuser. Al-Bayhaḳī, although he reproduces only the first few lines and seems to dissociate himself from its theological purpose, thus proves that it is precisely the *K. al-Ḥayawān* and the justification advanced for the debate by al-D͟jāḥiẓ that inspire him. His book represents the historic moment at which a logical approach, itself already appearing in a literary form typical of *adab*, became transformed into an independent literary genre (see Gériès, 91-7, 151).

However, as has been seen, al-Bayhaḳī does not in the majority of cases apply the D͟jāḥiẓian procedure which consists of praising or censuring an object or a subject of some kind; he distorts it whenever it seems to endanger his ideological interest, using the terms *maḥāsin* and *masāwī* as a means of proclaiming in advance, in chapter-headings, his feelings and attitudes towards the subjects discussed.

The criteria which govern his choice of subjects and dictate the positions that he adopts are: his politico-religious principles, moral principles and the socio-cultural and literary tendencies, already given definitive form by al-D͟jāḥiẓ and Ibn Ḳutayba in the *adab* of the 3rd/9th century, whose books are also his primary sources (see Gériès, 79-89).

The author of *al-Maḥāsin wa 'l-masāwī* supports his thinking and his judgments, expressed in advance in the titles, with the aid of chosen fragments of *adab* which illustrate them: quotations in prose and verse, anecdotes, lengthy narratives and traditions (*maḥāsin al-ak͟hbār wa-ṭarāʾif al-āt͟hār*, as he himself calls them). Except in the titles, which are the only reflection of his thinking, he makes no personal intervention in the text.

The reader of al-Bayhaḳī's book will be confronted with a testament of the practical philosophy of a 3rd/10th century Zaydī connoisseur of *adab*. It is as a result of the method of contrasting good with evil that we are able to arrive at an understanding of this philosophy, although, for others, who do not seem to have studied the work in detail, this method excludes the true position of the author and signifies, in their opinion, praising and censuring (thesis and antithesis) one single object (see A. Ḍayf, *al-ʿAṣr al-ʿabbāsī al-t͟hānī*, 540-7; Gériès, 90, n. 2).

This false interpretation is doubtless based on the fact that in a large number of chapters, the opposition of the two sections is a function of the antonymous terms *maḥāsin* and *masāwī* and not of the subjects under discussion, which gives the impression that this is an example of the D͟jāḥiẓian procedure of praising and censuring every thing.

This false interpretation of the *maḥāsin*/*masāwī* contrast is not new. It appears in as early a work as the pseudo-D͟jāḥiẓ's *al-Maḥāsin wa 'l-aḍdād* (ed. G. van Vloten, Leiden 1898, German tr. O. Rescher, ii. *Über guten und schlechten Seiten der Dinge*, Stuttgart 1922, i. *Das K. al-Maḥāsin wa-l-masāwī*, Constantinople 1926; the Arabic text has been reprinted in Cairo in 1324/1906-7 and in Beirut in 1969). This author, who seems to have been well-acquainted with al-D͟jāḥiẓ, is the first to imitate al-Bayhaḳī, going so far as to reproduce a substantial part of his work. In fact, the first part of *al-Maḥāsin wa 'l-aḍdād* is found in al-Bayhaḳī's work, but in a more complete, exact and correct form (see introd. by van Vloten, pp. ix-x, xiv; cf. Gériès, 102-10, 112-15). The anonymous author reproduces none of the chapters dealing with politico-religious subjects which reflect the tendencies of al-Bayhaḳī. The modifications which he introduces into the plagiarised chapters and passages show that he has not properly understood the method followed by this author and that he has been seduced by the D͟jāḥiẓian procedure of bestowing praise and censure.

Significantly, he has substituted for *masāwī* the term *ḍidduhu* (its opposite). Thus for him the opposition is: *maḥāsin* of . . ./*ḍidduhu*. This means that he systematically contrasts the sub-chapters *maḥāsin* of . . . with their opposites, without allowing the reader to deduce whether he will find under the title *ḍidduhu* censure of the same subject praised under the heading *maḥāsin* (good/bad sides of the subject) or a subject antithetical to that which has been praised (praise of the good and of the proper/censure of the bad and of the improper). Thus in the example *maḥāsin al-wafāʾ*/*ḍidduhu* (70-6), it is difficult to decide whether it is a case of: "praise of fidelity/censure of fidelity" or of "praise of fidelity/censure of infidelity", a confusion which arises from the ambiguity of the pronoun *hu* in *ḍidduhu*. Furthermore, there is the fact that the book is attributed to al-D͟jāḥiẓ, with the object of creating in the reader the impression that he is confronted by the D͟jāḥiẓian method, consisting of praising and censuring every notion, and that there is nothing here but a simple literary game. This, it seems, is the anonymous author's conception of this method.

This is why care should be taken to avoid attributing to him the same intentions and the same motives as those of al-Bayhaḳī. The things that interest him, besides the method of contrasting, are entertaining subjects and literary texts. The desire to distract and to entertain is even more evident in

the second part of his book, which is borrowed not from al-Bayhaḳī but from other sources (see introd. by van Vloten, pp. xii-xiv; Gériès, 116-18). Here, with the exception of the last two chapters which deal with Persian feasts and with gifts, the subject most prominently discussed is that of women: women famous for various reasons, their beauty, examples of romantic intrigues, their fidelity and their infidelity, their wiles and their relationships with men, etc.

Nevertheless, the author applies the contrasting method in only five of the twenty-one subjects tackled in this part of the book, and he confines himself, in the others, to presenting the *maḥāsin* (which here signifies the fine examples or beauties) of the subjects under discussion.

Curiously, he uses the method of contrasting in three cases to present that which to him appears good and praiseworthy in opposition to that which seems evil and culpable: fidelity/infidelity of women, reasonable jealousy/excessive jealousy, copulation/impotence. Furthermore, he uses the terms *maḥāsin/masāwī* to reveal, in the title, his judgments and feelings regarding the subjects in question. He does the same in the two other cases, whose titles give the impression that he is conforming to the method which consists of attacking and defending every notion: *maḥāsin/masāwī makr al-nisā'* (intrigues of women) and *maḥāsin/masāwī 'l-dabīb* (stealthy approach of a man seeking to seduce a woman: 263-72, 348-56). In the first case, intrigues performed for a reputable purpose are commended with the term *maḥāsin* (good intrigues), and those of which the objective is vicious and reprehensible are deplored (wicked intrigues). It is not impossible that the author intended, in this way, to expose the ambivalent attitude of *adab* and of the Muslim ethic towards intrigue. However, the terms *maḥāsin/masāwī* cannot here be translated by praise and blame. In the second case, a short tale of a successful *dabīb* is classed under the heading of *maḥāsin*; on the other hand, attempts which end in failure are classified as *masāwī*. Thus favourable/critical judgment depends on the result of the adventure and not on the conduct itself; in other words, there is no place here for praise and censure of the *dabīb*.

These two connotations of opposition characterise the majority of the chapters of al-Bayhaḳī. Thus the anonymous author has brought no innovation to the contrasting method itself; he has however varied the range of themes tackled, placing the accent on amusing, piquant and even erotic subjects, which brings his book closer to the genre of *belles-lettres* than to work of al-Bayhaḳī.

The literary and entertaining aspect which characterises *al-Maḥāsin wa 'l-aḍdad*, whose overall title is also that of the majority of its chapters, and the fact that it bears the name of al-Djāḥiẓ, serve to reinforce the impression that one is faced with the method of praising and censuring every notion, and this element has enhanced the renown acquired by it within this genre.

This reputation seems to have been very widespread in the 4th/10th and 5th/11th centuries, as is expressed through the attribution to al-Djāḥiẓ of a letter (ed. Pellat, in *Machriq* [1956] 70-8; cf. Gériès, 120-5) bearing the title *Fī dhamm al-ʿulūm wa-madḥihā* ("Censure and praise of the sciences"). Its author systematically applies the original Djāḥiẓian method; one by one he censures and praises various sciences and professions with the aid of phrases of *waṣf* (description and evaluation) in rhymed prose which he has drawn from books of *adab*, including those of al-Djāḥiẓ. Analysis of the letter shows that this author is seduced by the effects of style and form involved in the method and not by its philosophical and theological connotations, an attitude thoroughly typical of his age.

The same pre-occupation comes to light soon after in the work of one of the most prolific of 5th/11th century authors, al-Thaʿālibī. Living in a period where Arabic culture was shaped by rhymed prose and by systematic pursuit of form and virtuosity, and in a milieu whose sole concern was with the invention of harmonious forms and formulas for the expression of every thought, he found that the Djāḥiẓian method was the best formula for supplying the needs of the *kātib* (scribe and functionary) and the *adīb* ("gentleman") of his age in their professional lives and in their encounters: stereotyped expressions finely-composed in prose and poetry, bearing on the main subjects of *adab* and expressing the two contrary views which people might take towards them or, more accurately, which *adab* had already taken towards them.

To this effect, al-Thaʿālibī, in his two identical books *al-Ẓarā'if wa 'l-laṭā'if fī 'l-aḍdād* and *Yawāḳīt fī baʿḍ al-mawāḳīt fī madḥ kull shay' wa-dhammih* (which a certain Aḥmad b. ʿAbd al-Razzāḳ al-Maḳdisī brought together in a single edition, published several times in Baghdād and Cairo; the Cairo edition of 1324/1906-7 is the one used here), tackles each of the eighty subjects that are discussed in a chapter divided into two: *madḥ* . . ./*dhamm* . . .; in the first part he offers elegant quotations in praise of the subject, and in the second he gives those which censure it (for example: *madḥ/dhamm al-ʿaḳl*, reason; of *al-ghinā*, fortune, etc., 16-18; cf. Gériès, 122, 126-39).

This fundamental pre-occupation of the author excludes the anecdotes and lengthy narrations which characterise al-Bayhaḳī's book and that of pseudo-Djāḥiẓ. For al-Thaʿālibī, passing praise and censure on every subject is a proof of virtuosity and the witness to a great talent (*balāgha*), as well as evidence of a profound knowledge of the Arabic literary heritage (18). It is for this reason that he composes several books following this method, in which he repeats himself, to such an extent that in two of them he even reproduces the same themes and the same quotations, while giving to each of them a different title. Furthermore, he dedicates them to two different persons, adding, in the introduction to each, the pretence that in this book he has invented material that is original and totally unprecedented (2-4; cf. Gériès, 132-3).

In addition, he reproduces a large proportion of the materials presented in these books in a third which he entitles *al-Taḥsīn wa-l-taḳbīḥ* (mss. Istanbul, Rāghib Pasha 1473, Fayḍ Allāh 2133, edition of the text in preparation), and in which the opposition is presented in a new form: he praises that which is generally regarded as bad and passes censure on that which is generally regarded as good, apparently seeking, once again, to present a book which may appear new and unique in its genre.

In these three books of al-Thaʿālibī, there is nothing to confirm the view that the author was acquainted with the work of al-Bayhaḳī or of pseudo-Djāḥiẓ. On the other hand, it is the direct or indirect influence of the Djāḥiẓian corpus that seems to be acting upon him, impelling him to follow the method which involves praising and censuring every notion (see Gériès, 138-41).

One of the books of al-Tha'ālibī has been abridged, in the form of an entertainment, by a certain Shihāb al-Dīn al-Ibshīrī, who presents his work (unpublished; a single manuscript is known, preserved in Leiden Or. 1454) as the abridgement of the *K. al-'Umda fī madḥ al-shay' wa-ḍiddihi*; the work involved is probably the *Yawāḳīt*, of which one of the copies bears the name retained by al-Ibshīrī (see Gériès, 141-2).

The procedure, which consists of praising and censuring every thing and which has become synonymous with the display of literary talent, is encountered among numerous authors of *adab* subsequent to al-Tha'ālibī, who apply it sporadically in their books. Thus, al-Azdī in the *Ḥikāyat Abi 'l-Ḳāsim* (ed. Mez, Heidelberg 1902, 21-6, 105-6) and al-Ḥarīrī in his *Maḳāmāt* (*al-maḳāma al-dīnāriyya*, 27-30 of the Cairo 1326/1908-9 edition).

One of these authors, Djamāl al-Dīn al-Waṭwāṭ (631-718/1234-1318) seems to be the most attracted by al-Tha'ālibī's method in its two forms: praise/censure on the one hand, on the other, praising that which is bad, censuring that which is good (see Gériès, 145-8). He applies this method systematically throughout his work of *adab* (*Ghurar al-khaṣā'iṣ al-wāḍiḥa, wa-'urar al-naḳā'is al-fāḍiḥa*, Cairo 1318/1900), dealing with sixteen ethical themes: eight virtues (*khiṣāl*) and their opposites (*naḳā'iṣ*). Each of the first eight chapters is subdivided into three parts: 1. Praise of the virtue with the aid of chosen texts; 2. Anecdotes, stories and poetry concerning individuals who are endowed with this virtue or have become famous for having displayed it; 3. Censure of the virtue. Similarly, each chapter of *naḳā'iṣ* is subdivided into three parts: 1. Censure of the vice; 2. Anecdotes, stories and poems concerning individuals who are afflicted with this vice or have become famous for having displayed it; 3. Praise of the vice.

Thus, with the aid of chosen extracts, he discusses the major ethical themes, showing evidence of a well-informed acquaintance with the ambivalent attitudes expressed in *adab* towards the virtues and vices in question, an attitude due not only to Aristotelian thought, which characterises the Djāḥiẓian ethic, but also to the contradiction of tendencies and concepts encountered in the bosom of Islamic civilisation and expressed in the writings of authors of *adab* since the time of al-Djāḥiẓ and Ibn Ḳutayba, precisely by means of this procedure consisting of exposing the merits and faults of the subject in question (see G. Lecomte, *Ibn Qutayba*, Damascus 1965, 462-5; Gériès, 65-6).

This literary genre has no doubt attracted many other authors, but, at this time, their writings are still unknown to us.

Bibliography: Given in the text.

(I. GÉRIÈS)

MAHĀT (A., pl. *mahā*ⁿ, *mahawāt*, *mahayāt*), a feminine noun denoting the large oryx and the addax antelope. Both these meanings merge in the expression *baḳar waḥshī*, *baḳar al-waḥsh* (coll. *baḳara waḥshiyya* (sing.) "wild cattle" [see BAḲAR]).

The root *m-h-w* suggests sparkling whiteness, and *al-mahā* is applied to rock crystal (*billawr*), pearl (*durr*, *lu'lu'*) and any bright star (*kawkab*). The almost-immaculate coat of these beautiful, desert antelopes certainly warrants the description *al-mahā'*, the word used to describe *māriyya*/*munriya*, *layāḥ*, *lahaḳ*/*lahāḳ*, *kawkab*.

The oryx and the addax live in small herds which are dominated by one of the males. From time to time they gather to migrate, and can be observed among the dunes by the Bedouin from a distance. They seem to have reminded them of their own flocks, for they call them *ni'ādj al-raml* "sand ewes". At first sight, male and female are hardly distinguishable, but they do differ slightly in height and in horn thickness; *mahāt* and the other names are used without gender distinction, as are the poetical descriptions of them like *'aynā'*, (pl. *'īn*) "with big, black eyes" and *khansā'* "with a flat muzzle". The desert folk are very acute in their observations, and they use a more precise vocabulary to describe the animals at different stages of their development. The calf at birth is *bahzadj* or *barghaz*, but if it is completely white, *mārī* is used. As it grows and up to the time of its weaning (*fiṭām*), it is called *fazz*, *farīr*, *farḳad* and *djawdhar*. A male (bull) calf has the name *arkh*/*irkh*/*urkhī*, and the adult male *shāt*; in the rutting season, its restless and skittish manner is aptly described as *nāshiṭ* "lively" and *mikhrāḳ* "pawing the ground". The old bull, *ḳarhab*, is often found living alone.

1. The oryx. In the semi-desert areas of Africa, Syria and Arabia, several species of oryx are found. Even some of the rare white oryx (*Oryx algazel algazel*) have survived on the northern edges of the Sahara, where it is called *waḥsh* in Chad, *warḳ*/*warḳ*/*ūrgiyya* (pl. *ūrg*) in Mauretania (in the Egyptian Sudan, it is called *abū ḥarāb*, and in Tamahaḳḳ of Ahaggar, *ezam*/*izem*/*texemt*, pl. *izemmen*/*tizemmin* and *ehem*/*tehemt*, pl. *ihemmen*/*tihemmin*). The last specimen in Tunisia was killed south of Douz in 1906, but in ancient times it was said to be common in southern Morocco, the high Algerian plains and southern Tunisia. From murals in ancient Egyptian tombs, there is evidence that it was domesticated under the Pharaohs and used as a draught animal. Pliny says ... *orygem appellat Aegyptus*, which, considering how Latin was pronounced then, suggests that the name should be compared with Moorish *ūrgiyya*.

In the Middle Ages, the animal was known in the Sahara by the name of *lamṭ*, and its skin was used to make the famous shields [see LAMṬ].

Now the white oryx has almost completely disappeared from the Sahara. This has been caused in fairly recent times by the increasing number and better quality of firearms in the area, and also by the ploughing-up of the desert by incessant motorised traffic. The oryx is, after all, a big, heavy creature, short-winded and not very fierce; it used to be that a good mehari camel was all that was needed to catch it quickly. Saharan travellers in the last century found great herds of oryx which, they said, could be numbered in hundreds, but that now seems an age ago.

There are two other species in Africa, with darker coats and clear black stripes, the *oryx gazella* in the south-west and the *beisa* (perhaps derived from *bayḍā'* "white") oryx which includes the *oryx beisa beisa* of Abyssinia, *o.b. gallarum* of Mozambique, *o.b. annectens* and *o.b. callotis* in the south-east and Kilimanjaro. None of these brightly-marked antelopes are, however, found in Arabic-speaking countries. There has always been a distinct species in Arabia, the *oryx leucoryx* (formerly *beatrix*) known as the sabre-horned or Arabian oryx, which is found as far as the borders of Syria and 'Irāḳ, and which was the first species to be called *al-mahāt* by the Arabs. Their tapering black horns are ringed, and curve back majestically like those of their African cousins. They are usually more than a metre long and are perfectly parallel, so that when

seen from the side the animal seems to have just one horn. That is why the oryx was thought, wrongly, to have connections with the unicorn, but that mythical animal is in fact to be connected with the rhinoceros [see KARKADDAN].

Probably no other desert wild animal, except the onager (*ḥimār al-waḥsh*), has been described more than the sabre-horned antelope by the pre-Islamic poets and their later imitators. The animal was not used as a principal theme in their *ḳaṣā'id*, but as a background image of the hard desert life and the difficulties in it that the poet would have experienced himself. There are long descriptions of hunting for the oryx and of its death (*ṭarad*), which, incidentally, show how abundant it must have been. The poet, wishing to emphasise the high moral qualities of the huntsman, by a literary device transfers these qualities to the brave, hunted animal. The scene itself is conventional, but it reflects an idyllic picture of violent hunting in all its details. Sometimes the poet mounts a horse, and then the oryx is soon caught, after a terrifying chase in which as often as not three salukis participate, and is brought down at the point of a lance. Eulogies of the horse like this are common in Imru' al-Ḳays, Zuhayr b. Abī Sulma, ʿAlḳama al-Faḥl and a number of others when they write lamentations. On other occasions, he will mount a she-camel, and then the story of the chase ends differently, for the oryx becomes the symbol of this matchless she-camel and it triumphs over all its adversaries by its speed and endurance; it will stop only to rip open a dog or two with its terrifying horns. Such poems are accordingly panegyrics, and al-Djāḥiẓ has carefully discussed this mechanical literary device in archaic poetry in his *Ḥayawān*, ii, 20, where he says, "when the poem is a lamentation or exhortation, it is usual for poets to let the dogs kill the oryx, but in panegyrics, where the camel is said to be an oryx with certain special qualities, it is the dogs that are killed. That is not to say that such events are poetic fabrications, for oryx bulls have often killed or injured dogs, but it usually happens that the hunted animal is the victim in the end, the dogs emerge safe and well and their master has found his quarry."

A more romantic picture is sometimes drawn to show the effect of the four seasons of the life of the oryx, each with its own particular difficulties, struggles and hardships. Such pictures represent the challenges the pre-Islamic Bedouin faced in their daily life, whether they were real or not.The bull, for example, is shown as wandering far in search of a mate and as confronting many rivals in tests of his prowess; here is a picture of the marriage difficulties of an old desert dweller, who could well have turned to abducting young girls. Then there is the agonising plight of the mother who goes lowing after her young calf which has been devoured (*masbūʿa*) by beasts of prey. Her search is vain, and she strays from her herd (*idjl, rabrab, ṣuwār/ṣiwār, sirb*) and thus puts her own life at risk. Images like this are used frequently by Labīd b. Rabīʿa al-ʿĀmirī and by al-Nābigha al-Dhubyānī among others. They evoke the cruel distress of so many mothers who have wept over the loss of a son killed in a raid, or over the loss of a daughter snatched forcefully away by a hostile clan. Clearly, images like this are not devised by town dwellers, but they are an essential feature of the distant experiences of their nomadic ancestors. Such nostalgic reminiscences of desert life are usually found in poetry up to the time of the ʿAbbāsid dynasty, and one of the last to use them in his poetry was Dhu 'l-Rumma.

In the Yemen during the Ḥimyaritic period, the ibex (*waʿil*) and the oryx were game animals which were hunted in accordance with ancient cultic rites. Archaeologists have excavated many bas-reliefs on which they are depicted (see in the *Bibl.* the important works here of M. Höfner, R. B. Sergeant and J. Ryckmans). Before the dawn of Islam, in the northerly regions of the peninsula the oryx had a special position as a sacrificial beast (*ʿatīra*) in the ritual, idolatrous offerings performed by the Arabs in the month of general truce, Radjab; the oryx was included with domestic cattle in the list of *radjabiyyāt* (*Ḥayawān*, vi, 511).

There were still about a thousand oryx in Arabia in 1950, but nine years later only about a hundred were left, in the remote regions of the "Empty Quarter" (*al-Rubʿ al-khālī*) to the north-west of Aden. Seventy of these were destroyed by motorised safaris with automatic weapons in 1960-1. Faced with such a serious situation, the World Wild Life Fund organised a rescue mission under Major I. R. Grimwood in 1962 and three animals were captured. To these were added one offered by the Kuwaiti ruler and four from King Ibn Saʿūd. These eight survivors formed the nucleus of a small breeding herd set up in a desert preservation in Phoenix, Arizona. At present there is just one small protected herd in a *shaykh*'s park, but apart from these animals, the white oryx, locally the *wuḍayḥī* or *abū sūlaʿ*, can be considered an extinct species in Arabia and the Near East. Some of the *amīr*s have introduced as a substitute in some areas the oryx-gazelle, which is native to Africa.

2. The addax. In North Africa, *mahāt* also denotes the addax (*Addax nasomaculatus*), a cousin of the oryx. This animal is extremely rare, and is found in a narrow strip of land in the Sahara, from Mauretania to the western edge of the Nile. At the beginning of this century, it could also be found in Palestine and Arabia, and it is recorded in ancient Syria and Mesopotamia. The main distinction between the addax and the oryx is the absence of any brownish-red markings on the neck and breast. Other distinguishing marks are its brown forehead, its white tear-pit, its reddish nose and its noticeably long horns (*ṣīṣa/ṣīṣiyya*, pl. *ṣayāṣī*). These are straight with a slight backward slope and a two-and-a-half turn spiral; they are fully annulated. Both antelopes enjoy the same habitat and display the same behaviour, but the addax seems generally better adapted to its environment than the oryx. It is more resistant to thirst for, like the camel, it carries a special sac containing an aqueous, slightly acidulous liquid in its belly, and this has been the salvation of many a waterless hunter (Pliny refers to it in *Nat. Hist.*, xi, 27); moreover, its wide, spongy hoof is a great help when it comes to long, sustained journeys across the dunes.

Two vernacular Arab names for the animal are in use, *mehā* and *bger el-waḥsh*, and perhaps echoes of an earlier African term, taken into Latin by Pliny as *addax*, are to be found in its Sudanese and Upper Egyptian names *ʿakash/ʿakaṣ, bū ʿakash, bū ʿaddas*; the origin and meaning of these names is still uncertain. The Touareg call it *amellal/tamellatl*, pl. *imellalen/timellalin* (from the verb "to be white"), and thus draw attention to the whiteness of its coat. They regard the addax as a choice game animal, and hunt it as soon as the herds mass together in the spring. Observers in the last century said that there could be as many as 300 animals in such gatherings (see G. Nachtigal, *Sahara und Sudan*, Berlin

1879-89, i, 551). Ibn Baṭṭūṭa, travelling five centuries earlier in the spring of 753/1352 from Tāsarahla to Iwālaten (Walata), was amazed at the abundance of the herds and by their evident fearlessness of man. He noted that the people of the region hunted the addax with dogs and shot them down with arrows. He added that they were very fond of the stomach liquid, and that they used to slake their thirst from their victims. For his own part, he did not find the meat enjoyable, saying that it was dry and tasteless (*Riḥla*, ii, 190). Because it was relatively slow-footed, it was easy to capture, and the antelope offered the hunter not just venison as his prize but also leather and the stomach liquid. This liquid was said to possess many virtues, and it commanded a high price in the markets in large centres as far away as Tunis. There was also the attraction of extracting bezoars [see BĀZAHR[known locally as *biḍ el-mehā* "antelopes' eggs", from the viscera. These biliary concentrations occur very frequently in the digestive systems of ruminants, and the preparation was greatly valued in the mediaeval pharmacopoeia for its supposed qualities as an antidote and a aphrodisiac. Jewish pharmacists and druggists from the cities of the Maghrib went about collecting them eagerly from the nomads and then sold them speculatively to sultans and persons of high rank. The addax skin was, by contrast, much less valuable than that of the oryx; it was used only for shoe-making and saddlery. Of course, the trick was not unknown of substituting addax-leather for oryx-leather for making the famous impenetrable shields mentioned above.

Before fire-arms and motor-cars arrived, the addax was hunted with dogs, and it was also caught in traps (the spiked-wheel trap and the crossbow trap). The Tibbu of Tenere would encircle a herd and catch beasts in nets in order to eat the succulent marrow from the large bones. To-day there is no longer any question of hunting the addax, for the species has been so drastically reduced. It has disappeared from the vast Western Erg, but there may be an occasional specimen to be found between Ouargla and Ghadamès, and others to the south of Hamada of Tinghert and to the north of Timbuctu and in the regions of Termit and Agadem to the south of Tenere and in the Nubian Desert.

It is surprising to find that the great Arab naturalists have said very little about these two important antelopes, *mahā'*. Al-Djāḥiẓ makes a few remarks about them, but these last are only hearsay. One feature which he notes is that the bull is very vulnerable under pursuit because prolonged running triggers off urine retention (*ḥuḍr*), which can prove fatal. He goes on to say that the oryx likes to crunch colocynth (*ḥanẓal*) because its bitter taste helps prevent thirst, that genies may ride it at night, and that it will grow tame in captivity (*Ḥayawān*, ii, 118; vi, 23, 46, 316; vii, 187). Al-Ḳazwīnī seems to have ignored them altogether, and under the rubric *baḳar al-waḥsh* (*ʿAdjāʾib al-makhlūḳāt*, ii, 203-4), he speaks only of the axis deer (*Cervus axis*), the Persian *gāv-i zan*, with its antlers which fall off each year. Al-Damīrī follows him and reproduces the earlier remarks, but seems not to know which animal he is speaking about. Under the rubric *al-baḳar al-waḥshī* (*Ḥayāt al-ḥayawān*, i, 142-3), he states that this name denotes all four species: *mahā* "oryx-addax"; *ayyil/uyyal* "cervidae"; *yaḥmūr* "roe-deer"; *thaytal/taytal* "bubalis". Under the heading *al-mahā*, he simply describes the ardour (*shabaḳ*) of the male in the rut, and then recounts word-for-word what al-Ḳazwīnī had mentioned about the "particular virtues" ascribed to the organs of the cervidae; he drew particular attention to the antlers, which were supposed to be useful as an aphrodisiac when powdered (ii, 330-1). The poet Kushādjim [*q.v.*] says, in his *Maṣāyid*, 160-2, that the lowing (*khuwār ghamghama*) of the oryx cow is very much louder than that of the bull and that oryx venison has warming qualities; it makes the blood thick and black, and it should always be boiled with plenty of vinegar. The first Arab, he adds, who hunted the oryx on horseback was, according to tradition, Rabīʿa b. Nizār b. Maʿadd b. ʿAdnān. All this information is repeated in the writings of al-Ḳalḳashandī (*Ṣubḥ*, ii, 44). The Mamlūk Ibn Manglī [*q.v.* in Suppl.], a writer on cynegetics and a huntsman himself in the 8th/14th century, give some "helpful advice" (*Uns al-mala'*, ms. Paris B.N., Ar. 2832, fols. 11b, 21a) on how to bring the oryx down once it has been stopped: to thrust obliquely with a sabre, cutting at random, and immediately lifting the blade again in order not to wound the horse. He then recommends trying to hamstring the animal: hurl a missile (*ḥadhāfa*), one which has a head bristling with spikes and a long haft, between the legs of the galloping animal. The animal should not be killed outright, for there must be a chance of strangling it ritually so that its meat can be eaten licitly. They may also be hunted with a cheetah [see FAHD]. In his *Djamhara fī ʿulūm al-bayzara* (ms. Escurial, Ar. 903, fol. 143a-b) Ibn Manglī repeats the sayings of his esteemed master from the preceding century, ʿĪsā al-Asadī, that good results with cheetahs can be obtained only in Syria, where they are more robust and aggressive.

The Touareg of the Aïr believe that the addax is a good predator on snakes for, according to legend, it is completely immune to vipers' venom. That is why many natives wear a piece of addax skin as a talisman, and they decorate their tents with its horns, skin and fat, which ward off all kinds of reptiles (see H. Lhote, *La chasse chez les Touaregs*, Paris 1951, 75-87).

The gleaming bright, black pupil of the oryx and the addax (*ḥadaḳ al-mahā*), in contrast to the white of the eye, was an image dear to poets. It has earned them the title *al-ʿīn*, associated with *aḥwar*, pl. *ḥūr* "very white". It is in fact well-known that the houris (*al-ḥūr al-ʿīn* [*q.v.*]), the wives of the elect in paradise, have languorous antelopes' eyes set in a face with the complexion of pearl or milk. That is the mark of perfect feminine beauty as judged by the Arabs. The Greeks had already expressed their similar aesthetic delight when they gave "great cows' eyes" to their goddess Hera (corresponding to Roman Juno), queen of Olympus, daughter of Kronos, wife of Zeus (Ἥρα Βοῶπις). The Greek adjective could metaphorically apply to any beautiful woman, as could the Arabic *mahāt/mahān*. It is the opinion of philologists that, if the whiteness of the complexion is being described, the comparison suggests the whiteness of pearl or crystal; but if there is a description of beautiful eyes with pupils dark as night set in a milky white complexion, then it is from the oryx and the addax that the image is borrowed (see *LA*, s.v. *m-h-w*).

To conclude, after all this information, it is really frightening to think that the zoological term *mahāt* may soon be no more than a word in the dictionary, reminding us of a species which will have vanished from the lands of Islam, like *naʿām* "ostrich" and *ḥimār al-waḥsh* "onager"; it will have vanished

just because of man's insatiable, thoughtless greed.

In astronomy, the star al-Farḳad (= Phercad) "the oryx calf", is γ *Ursae minoris*; this star and the associated β *Ursae minoris* together form *al-farḳadayn* (= Elfarcadin) "the two calves", the "guardians" of the North Pole.

MAḤBŪB B. AL-**RAḤĪL** AL-ʿ**ABDĪ**, ABU SUFYĀN, Ibāḍī theologian and historian, originally from the Arabic tribe of the Banū ʿAbd al-Ḳays, who lived in the 2nd/8th century and who is cited in the *Kitāb Ṭabaḳāt al-mashāyikh* of al-Dardjīnī (d. 670/1227 [*q.v.*]) amongst the scholars of the fourth *ṭabaḳa* or class. His family came originally from ʿIrāḳ (his grandfather al-Malīḥ al-ʿAbdī was one of the close friends of the head of the Ibāḍī community in Baṣra, the famous Abū ʿUbayda Muslim b. Abī Karīma al-Tamīmī [see AL-IBĀḌIYYA]), and he first lived in ʿUmān. Then he settled in Baṣra, where he became a pupil of Abū ʿUbayda. After the death of al-Rabīʿ b. Ḥabīb al-Baṣrī, head of the Ibāḍī community in Baṣra after Abū ʿUbayda, spiritual supremacy in the Ibāḍī world passed to Abū Sufyān Maḥbūb b. al-Raḥīl. In effect, he acted as arbiter over the schism of Khalaf b. al-Samḥ in the Maghrib [see AL-KHALAFIYYA] during the reign of the Rustamid *imām* ʿAbd al-Wahhāb b. ʿAbd al-Raḥmān b. Rustam, and wrote a *risāla* (or *ʿahd*) to the Ibāḍī chief ʿAbd Allāh b. Yaḥyā al-Kindī, called Ṭālib al-Ḥaḳḳ (d. 129/747), who set up in South Arabia the first Ibāḍī imāmate and who occupied Mecca and Medina. Maḥbūb b. al-Raḥīl became especially known as a historian, and it is to him that we owe the greater part of the traditions about the oldest Ibāḍī *shaykhs*. His historical work, mentioned in al-Barrādī's catalogue (9th/15th century) under the title of *Kitāb Abī Sufyān*, served as al-Dardjīnī's basis for the putting-together of the first four classes of his *K. Ṭabaḳāt al-mashāyikh*, where he is cited several times.

LEWICKI)

MAHDAWĪS, a sectarian group in Indian Islam, the followers of Sayyid Muḥammad Mahdī (847-910/1443-1505) of Djawnpur [*q.v.*], near Benares, who declared that he was the promised Mahdī [*q.v.*] and by his preaching gained a number of adherents in Aḥmadābād [*q.v.*] and other parts of Gudjarāt. He was compelled to leave India, however, and died at Farāh in what is now western Afghānistān, where he was buried. His followers credited him with the power of working miracles, raising the dead, healing the blind and the dumb, etc. For a time, they were allowed to profess their faith without official harassment; but in the reign of Muẓaffar II, Sultan of Gudjarāt (917-32/1511-26) they were persecuted, and many of them put to death. The Mughal prince Awrangzīb [*q.v.*] also moved against them when in 1055/1645 he became governor of Aḥmadābād. In consequence of these persecutions, most Mahdawīs began to practise *taḳiyya* [*q.v.*] and tried to pass as orthodox Muslims. Their exact number, therefore, remains today uncertain. They are found in small groups in some parts of Gudjarāt, in Bombay, in the Deccan, in Uttar Pradesh and also in Sind, where they are known as Zikrīs [see DHIKRĪS in Suppl.]. They believe that Sayyid Muḥammad was the last Imām, the promised Mahdī, and in consequence of his having come they are said by their religious opponents neither to repent for their sins nor to pray for the souls of their dead. They observe certain ceremonies peculiar to themselves at marriages and funerals, and are often lax in observing the five canonical pillars of Islam. By their enemies they are styled Ghayr-Mahdīs, i.e. those who do not believe in a Mahdī still to come; but the Mahdawīs themselves apply this designation to other Muslims, charging them with failure to recognise the Mahdī who has already appeared.

AL-**MAHDĪ** (A.), "the rightly guided one" is the name of the restorer of religion and justice who, according to a widely held Muslim belief, will

rule before the end of the world. The present article will trace the history of this belief and will deal with the political history of Mahdist movements only in so far as relevant (for the Sudanese movement, see AL-MAHDIYYA).

Origin and early development during the Umayyad age. The term *mahdī* as such does not occur in the Ḳur'ān; but the name is clearly derived from the Arabic root *h-d-y* commonly used in it in the meaning of divine guidance. As an honorific epithet without messianic significance, the term was employed from the beginning of Islam (references gathered by Goldziher, *Vorlesungen*, 267). Ḥassān b. Thābit thus applied it to the Prophet, and Djarīr to Abraham. Sulaymān b. Ṣurad referred to al-Ḥusayn, after his martyrdom, as "Mahdī son of the Mahdī", and al-Farazdaḳ called al-Walīd in a panegyric the sixth of six caliphs of ʿAbd Shams from ʿUthmān who were *hudāt mahdiyyūn* (*Dīwān al-Farazdaḳ*, ed. al-Ṣāwī, Cairo 1936, 88). During the Second Civil War, after the death of Muʿāwiya, the term came first to be used for an expected ruler who would restore Islam to its original perfection. ʿAbd Allāh b. al-Zubayr claimed the caliphate as such a restorer. Though he does not seem to have been given the epithet al-Mahdī, his career substantially shaped the later image of the expected Mahdī. In Kūfa, al-Mukhtār proclaimed Muḥammad b. al-Ḥanafiyya as the Mahdī in this heightened sense. Among his opponents of the Kūfan nobility who fled from him to Baṣra was Mūsā, son of the Companion Ṭalḥa. He was viewed there as the expected Mahdī by many people who hoped that he would claim the caliphate, but he refused to engage himself in the *fitna*, pointing to the example of ʿAbd Allāh b. ʿUmar in the First Civil War (Ibn Saʿd, v, 120 f.). Among the Umayyad caliphs, Sulaymān (96-9/715-17) seems to have been the first one to have encouraged the belief that he was the Mahdī who would restore justice after oppression had become widespread under his predecessors. He is often addressed as the Mahdī in this sense in the panegyrics of Djarīr and al-Farazdaḳ. The latter affirmed specifically that the spine of the religion had been straightened after having become crooked and that all grievances (*maẓālim*) had been removed by the Mahdī, meaning Sulaymān (*Dīwān*, 638, 801). The apocalyptic aspect of al-Farazdaḳ's concept of the Mahdī is revealed by his statement that so many priests (*ḳass*) and rabbis (*ḥibr*) had foretold the caliphate of the Mahdī (*Dīwān*, 327). Sulaymān's successor, ʿUmar II, was also addressed as the Mahdī by Djarīr and, because of his recognised piety, was widely regarded so in religious circles. Of the later Umayyad caliphs, Hishām was called the Mahdī by Djarīr. Less emphatically, al-Farazdaḳ speaks of Yazīd II as a rightly-guided one (*mahdī*) (*Dīwān*, 544) and of his son al-Walīd II as al-Mahdī (*Dīwān*, 7).

Among the religious scholars, discussions about the Mahdī and his identity can be traced back to the time after the Second Civil War. These discussions developed in different directions in the different centres of learning and influenced the later beliefs about the Mahdī to varying degrees. They were in turn influenced by some related beliefs already accepted and supported by *ḥadīth*s attributed to the Prophet. Thus it had been accepted that ʿĪsā [*q.v.*] would descend from Heaven before the end of the world to rule and lead the Muslim community in prayer. A *ḥadīth* on the authority of Djābir al-Anṣārī and Abū Saʿīd al-Khudrī, spread in Medina probably in early Marwānid times, quoted the Prophet as stating that "at the end of my community there will be a caliph who will pour out the money without counting it". According to another early Medinan *ḥadīth*, on the authority of Abū Hurayra, the Prophet had said "The Hour will not come until a man from Ḳaḥṭān will come forth leading the people with his staff". Predictions concerning this Ḳaḥṭānī were evidently known before the rebellion of ʿAbd al-Raḥmān b. al-Ashʿath in 80/699, who according to al-Masʿūdī (*Tanbīh*, 314) and Ibn Ṭāhir al-Maḳdisī, called himself al-Ḳaḥṭānī and Nāṣir al-Muʾminīn.

In Medina, conservative religious opinion generally accepted ʿUmar II as the Mahdī. This acceptance was facilitated by the fact that ʿUmar II was descended through his mother from ʿUmar I who, together with his son ʿAbd Allāh, enjoyed the highest religious authority among conservative Medinan scholars. Statements attributed to ʿUmar I and ʿAbd Allāh b. ʿUmar were circulated to the effect that the former had predicted the advent of a descendant of his who would fill the earth with justice. These statements reflect an earlier expectation that a descendant of ʿUmar I through male lineage would become the restorer of justice, but they were now applied to the Umayyad (Ibn Saʿd, v, 243). Saʿīd b. al-Musayyib (d. 93 or 94/712-13) was alleged to have identified ʿUmar II as the Mahdī while the latter was still in Medina long before his reign. A particular effort was made to counter Kūfan claims that the Mahdī would be an ʿAlid. Thus Muḥammad b. al-Ḥanafiyya was reported in Medina to have said that if there was to be a Mahdī he would belong to the ʿAbd Shams. Muḥammad al-Bāḳir, the *Imām* of the Imāmī Shīʿa, was quoted as stating during the caliphate of ʿUmar II: "The Prophet belongs to us, and the Mahdī belongs to the Banū ʿAbd Shams. We do not know him to be anyone but ʿUmar b. ʿAbd al-ʿAzīz" (Ibn Saʿd, v, 245).

In Mecca, on the other hand, Ṭāwūs b. Kaysān (d. 106/724-5), a respected *mawlā* traditionist residing in the Yemen, was quoted expressing himself more reservedly that ʿUmar II was rightly guided but not the Mahdī (*kāna mahdiyyan wa-laysa bih*); for in the time of the Mahdī, the benefactor would be outdone by the rewards for his good acts and the evildoer would be called to repent. Abū Maʿbad Nāfidh (d. 104/722-3), a *mawlā* of ʿAbd Allāh b. al-ʿAbbās, quoted his master as asserting that the Mahdī would be a young man (*shābb*) of the *Ahl al-Bayt*. The report was transmitted by the highly respected Meccan traditionist ʿAmr b. Dīnār (d. 126/744).

In Ḥims, Syrian loyalty to the Umayyad caliphate was expressed in a tradition attributed to Kaʿb al-Aḥbār neutralising the *ḥadīth* of the Ḳaḥṭānī: "The Mahdī will be only of Ḳuraysh and the caliphate will be among them only. He will, however, have a root and a pedigree in the Yemen (*ghayra anna lahū aṣlan wa-nasaban fī 'l-Yaman*)". The tradition, related by Shurayḥ b. ʿAbīda al-Ḥimṣī (d. after 108/726-7), may go back to the time of the revolt of Ibn al-Ashʿath.

In Baṣra, Abū Ḳilāba (d. *ca.* 107/725-6), a prominent traditionist with ties to Syria, supported the view that ʿUmar II was truly the Mahdī. He was indirectly contradicted by Abū Naḍra (d. 109/727-8) and Abu 'l-ʿAlāʾ al-ʿĀmirī (d. 108/726-7) who, reporting the *ḥadīth* of the generous caliph in Baṣra, stated that they did not think ʿUmar II was meant. Al-Ḥasan al-Baṣrī (d. 110/728) opposed the belief in a Muslim Messiah, maintaining that ʿĪsā was the Mahdī. He is also quoted as stating that he did not believe in a Mahdī, but if there was one it was ʿUmar

II. His contemporary and rival in the religious leadership in Baṣra, Muḥammad b. Sīrīn (d. 110/728) maintained that there would be a Mahdī of the Muslim community (*umma*) and that ʿĪsā, after descending from heaven, would pray behind him. He further affirmed that the Mahdī would be more excellent than Abū Bakr and ʿUmar and would equal a prophet in rank. According to another report, he held that the Ḳaḥṭānī was identical with the Mahdī. Ḳatāda (d. 117 or 118/735-6), prominent disciple of al-Ḥasan, spread the following *ḥadīth* of the Prophet: "There will arise a difference after the death of a caliph, and a man of the people of Medina will go forth fleeing to Mecca. Then some of the people of Mecca will come to him and make him rise in revolt against his will, and they will pledge allegiance to him between the *rukn* and the *maḳām*. An expedition will be sent against him from Syria but will be swallowed up (*yukhsafu bihim*) in the desert between Mecca and Medina. When the people see this, the righteous (*abdāl*) of Syria and the groups of horsemen (*ʿaṣāʾib*) of ʿIrāḳ will come to him and swear allegiance to him. Thereafter a man of Ḳuraysh will arise whose maternal uncles are of Kalb. He will send an expedition against them but they will defeat them. This will be the expedition of Kalb, and disappointment will be for those who will not witness the booty of Kalb. He will then divide the wealth and act among them according to the sunna of their Prophet. Islam will become firmly established (*yulḳī bi-djirānih*). He will remain seven (var. nine) years and then die, and the Muslims will pray over him". This *ḥadīth*, whose first part is patterned upon the revolt of ʿAbd Allāh b. al-Zubayr, may conceivably go back to ʿAbd Allāh b. al-Ḥarith b. Nawfal b. al-Ḥārith b. ʿAbd al-Muṭṭalib, who appears in its *isnād* and claimed to have heard it from Umm Salama, widow of the Prophet. ʿAbd Allāh b. al-Ḥārith, called "Babba", was chosen by the people of Baṣra as their governor in 64/684 after the death of the caliph Yazīd and the flight of his governor ʿUbayd Allāh b. Ziyād. But he held aloof from all the violent events in Baṣra at this time (cf. Ch. Pellat, *Le milieu baṣrien et la formation de Ǧāḥiẓ*, Paris 1953, 268-9); hence it is in fact unlikely that he was responsible for this *ḥadīth*, which aimed at stirring up support for the cause of Ibn al-Zubayr. The latter part of it, including the rise of an Umayyad whose "maternal uncles were of Kalb" and who would send an army of Kalbīs against Ibn al-Zubayr, reflects the expectations at the time which were not fulfilled by history. The element of the swallowing up of a Syrian army, based on Ḳurʾānic warnings of a *khasf*, was incorporated from slightly earlier *ḥadīth*s spread by ʿAbd Allāh b. al-Zubayr himself and by two prominent supporters of his, ʿAbd Allāh b. Ṣafwān and al-Ḥarīth b. Abī Rabīʿa al-Makhzūmī, as war propaganda during the campaign of Yazīd's army against Medina and Mecca (see Muslim, *Ṣaḥīḥ*, *K. al-fitan*, *bāb al-khasf*). Though it does not mention the Mahdī, the *ḥadīth* of Ḳatāda was later generally taken to refer to him, while his Syrian rival became the prototype of the Sufyānī [*q.v.*], the traditional opponent of the Mahdī. Much of later tradition about the career of the Mahdī and the Sufyānī is an elaboration of the various elements of this *ḥadīth*.

In the late Umayyad age, Maṭar b. Ṭahmān al-Warrāḳ (d. 125/743?), a Khurāsānian resident in Baṣra and senior disciple of Ḳatāda, rejected the view that ʿUmar II was the Mahdī, stating that the Mahdī would do something ʿUmar II had not done: he would refuse to accept money returned to the treasury by someone who, after requesting it, found that he had no need of it. Maṭar also transmitted traditions attributed to Kaʿb al-Aḥbār to the effect that the Mahdī was named so because he would be guided (*yuhdā*) to find copies of the original text of the Torah and the Gospel concealed in Antioch. The same Kaʿb tradition seems to have been known also in Kūfa at this time, where ʿAbd Allāh b. Bishr al-Khathʿamī is reported to have transmitted it in the following form: "The Mahdī will send (an army) to fight the Rūm, will be given the knowledge (*fiḳh*) of ten, and will bring forth the Ark of the Divine Presence (*tābūt al-sakīna*) from a cave in Antioch in which are the Torah which God sent down to Moses and the Gospel which he sent down to Jesus, and he will rule among the People of the Torah according to their Torah and among the People of the Gospel according to their Gospel". The following *ḥadīth* was circulated in late Umayyad Baṣra on the authority of Abū Saʿīd al-Khudrī: "The Prophet said: There will be in my community the Mahdī, if for a short time, seven (years), otherwise nine. My community will then enjoy prosperity as they have never enjoyed. The earth will bring forth its fruit for them and will not hoard anything away from them. Money will at that time be in heaps, and whenever a man will get up and say 'O Mahdī, give me', he will say 'Take'." This *ḥadīth*, which identifies the Mahdī with the generous ruler predicted earlier, was spread, with variants, by Zayd al-ʿAmmī but may in substance go back to his authority, the Baṣran Abu 'l-Ṣiddīḳ al-Nādjī (d. 108/726-7). Another variant of it was transmitted by Sulaymān b. ʿAbīd al-Sulamī, a Baṣran contemporary of Zayd al-ʿAmmī. Of late Umayyad Baṣran origin is also the topos that the Mahdī would have an aquiline nose and a bald forehead (*aḳnā adjlā*).

Kūfan tradition insisted that the Mahdī would be one of the *Ahl al-Bayt* of the Prophet or a descendant of ʿAlī. ʿĀṣim b. Bahdala (d. 127 or 128/744-6), the famous Kūfan Ḳurʾān reader, disseminated the following *ḥadīth* with a Kūfan *isnād* going back to ʿAbd Allāh b. Masʿūd: "The Prophet said: The world will not pass until a man of my family (*ahl baytī*) will rule the Arabs whose name will coincide with my name (*yuwāṭiʾ ismuh ismī*)". The claim that the name of the Mahdī would agree with that of the Prophet was no doubt made in the time of al-Mukhtār's rebellion in favour of Muḥammad b. al-Ḥanafiyya, who is reported, when addressed as the Mahdī, to have referred to his privilege of bearing the name and *kunya* of the Prophet (Ibn Saʿd, v, 68). The *ḥadīth* of ʿĀṣim thus probably goes back to ʿĀṣim's authority, Zirr b. Ḥubaysh, who was known for his pro-ʿAlid sentiment. By the time of the revolt of Zayd b. ʿAlī in Kūfa in 120/738, the thesis of the identity of names was evidently already well-established there, since his supporters did not try to identify him with the Mahdī but with the Manṣūr (al-Ṭabarī, ii, 1676), a messianic figure originating in Yemenite beliefs. In Kūfa was also spread the following *ḥadīth* related by Ibrāhīm, son of Muḥammad b. al-Ḥanafiyya, on the authority of his father on the authority of ʿAlī: "The Prophet said, 'The Mahdī will be from us, the *Ahl al-Bayt*. God will give him success in a single night (*yuṣliḥuhū fī layla*)'." The descent of the Mahdī from the Prophet was also affirmed in the *ḥadīth*: "The Messenger of God said, 'Even if only a single day of the earth were left, God would send a man from us who will fill it with justice as it had been filled with oppression'." Though the *ḥadīth* was widely spread

among the traditionists only by the Kūfan Fiṭr b. Khalīfa (d. 153/770), it may well go back to the Companion Abu 'l-Ṭufayl ʿĀmir b. Wāthila (d. *ca.* 100/718-19), known for his support of ʿAlī and his Shīʿī sympathies, who claimed to have heard it from ʿAlī. The theme of the generous ruler was taken up in Kūfa by ʿAṭiyya b. Saʿd b. Djunāda al-Ḳaysī (d. 111/729-30 or 127/744-5), considered a Shīʿī, who related the following *ḥadīth* on the authority of Abū Saʿīd al-Khudrī: "The Prophet said, 'A man will come forth from my family after an interval of time (*ʿinda 'nḳiṭāʿⁱⁿ min al-zaman*) and the appearance of civil wars (*fitan*) whose liberality will be in throwing about (*ḥathyᵃⁿ*) [money]. He will be called al-Saffāḥ (= the generous)'."

The early ʿAbbāsid age until the time of the canonical collections of *ḥadīth*. The ʿAbbāsid revolutionary movement aroused and was supported by messianic expectations and the hope for a restorer of religion and just rule from among the *Ahl al-Bayt*. The first ʿAbbāsid caliph gave himself the Kūfan messianic name al-Saffāḥ in his inaugural sermon in the mosque of Kūfa in 132/749. He was addressed as the Mahdī of the Hāshimīs by the poet Sudayf (*Aghānī*[1], iv, 93). The second ʿAbbāsid caliph, Abū Djaʿfar, was also called the Mahdī by his court poet, Abū Dulāma. During his reign, the ʿAbbāsid claim to the Mahdīship faced a severe challenge in the rising of the Ḥasanid Muḥammad b. ʿAbd Allāh in 145/762, who, having long been announced by the propaganda of his supporters as the expected Mahdī, appeared in Medina in accordance with the *ḥadīth* predictions. After the suppression of his revolt, the caliph adopted the messianic name al-Manṣūr and gave his son and crown prince Muḥammad b. ʿAbd Allāh the surname al-Mahdī, presenting him to the public as the promised restorer. The latter after his accession sought to live up to the expectations concerning the Mahdī by releasing political prisoners and handing out liberal gifts, especially in the holy cities.

Traditions about the Mahdī going back to this time reflect these developments. In support of the ʿAbbāsid revolutionary movement in Khurāsān, the Shīʿī Yazīd b. Abī Ziyād (d. 136/753-4) spread the following *ḥadīth* in Kūfa with an *isnād* going back to ʿAbd Allāh b. Masʿūd: "While we were with the Messenger of God, there came some youths of the Banū Hāshim. When he saw them his eyes flowed with tears and his colour changed. We said, 'O Messenger of God, we have for some time seen in your face something we dislike'. He said, 'God has chosen for us, the People of the House, the hereafter over this world. The People of My House shall meet misfortune, banishment, and persecution until people will come from the east with black flags. They will ask for charity but will not be given it. Then they will fight and be victorious. Now they will be given what they had asked for, yet they will not accept it but will finally hand it (sc. the earth) over to a man of My Family. He will fill it with justice as they had filled it with injustice. Whoever of you will live to witness that, let him go there even though it be by creeping on snow (*ḥabwᵃⁿ ʿala 'l-thaldj*)'." Even though this tradition, known as the *ḥadīth* of the flags, was recognised by *ḥadīth* experts to have been fabricated by Ibn Abī Ziyād, it greatly influenced the later expectations about the career of the Mahdī and was accepted by Ibn Mādja in his *K. al-Sunan*. A parallel version with a Baṣran *isnād* was disseminated in Baṣra by Khālid al-Hadhdhāʾ (d. 141-2/758-60): "The Messenger of God said, 'Three men, each one the son of a caliph, will fight at your treasure (*ʿinda kanzikum*). None of them will obtain it. Then black flags will arise from the east. Two of them will kill you [brutally] as no people has even been killed'. Then he mentioned something I do not remember. He added, 'When you see him, pledge allegiance to him, even though it be by creeping on snow. For he is the vicegerent of God, the Mahdī'."

The ʿAbbāsid claim to the Mahdīship found some marginal support among mostly Kūfan traditionists. The following statement ascribed to ʿAbd Allāh b. al-ʿAbbās was spread by ʿAbd al-Malik b. Abī Ghaniyya al-Khuzāʿī, a Kūfan originating from Iṣfahān, presumably towards the end of the caliphate of al-Manṣūr or the beginning of the reign of al-Mahdī: "By God, after that (namely after the twelve caliphs predicted in a *ḥadīth* of the Prophet) there will be from us the Saffāḥ, the Manṣūr, and the Mahdī who will hand it (sc. the caliphate) over to ʿĪsā b. Maryam". Probably also a Kūfan was Ibn Djābir al-Aʿmash, who about the same time transmitted a *ḥadīth* ascribed to Abū Saʿīd al-Khudrī: "I heard the Messenger of God say, 'The Ḳāʾim is from us, from us is the Manṣūr, from us the Saffāḥ, and from us the Mahdī. As for the Ḳāʾim, the caliphate will come to him without his spilling a cupping glass [of blood]. As for the Manṣūr, no flag of his will be turned back. As for the Saffāḥ, he will pour out money and blood in abundance; and the Mahdī will fill it (the earth) with justice as it had been filled with oppression'." Ibn Djābir added that he thought the Manṣūr was Abū Djaʿfar (al-Manṣūr) and the Saffāḥ the caliph al-Mahdī. The tradition was probably, however, not originally coined for the ʿAbbāsids and may well be late Umayyad Kūfan, going back to Ibn Djābir's authority, the Kūfan Abu 'l-Waddāk al-Hamdānī. A prediction that the Mahdī would be of the descendants of al-ʿAbbās was in the early ʿAbbāsid age attributed to Kaʿb al-Aḥbār by an otherwise unknown Yazīd b. al-Walīd al-Khuzāʿī and transmitted by Muḥammad b. al-Walīd al-Baghdādī, a *mawlā* of the Banū Hāshim.

The predominant mood among the traditionists, however, turned quickly against the ʿAbbāsid pretensions to the Mahdīship in favour of ʿAlid hopes. Traditions supporting the view that the Mahdī would be a descendant of Muḥammad and his daughter Fāṭima spread in the early ʿAbbāsid age outside Kūfa also. In Baṣra, ʿImrān al-Ḳaṭṭān, a supporter of the revolt of Muḥammad b. ʿAbd Allāh and of his brother Ibrāhīm, circulated the following *ḥadīth* on the authority of Ḳatāda: "The Messenger of God said, 'The Mahdī will be from me, with a bald forehead and an aquiline nose. He will fill the earth with equity and justice as it was filled with injustice and oppression and will rule seven years'." Similar *ḥadīth*s were spread, on the authority of Abu 'l-Ṣiddīḳ al-Nādjī, by the pro-Shīʿī Ḳadarī ʿAwf al-Aʿrābī (d. 146/763-4) and other Baṣrans. In al-Raḳḳa, Ziyād b. Bayān about this time disseminated the *ḥadīth* of the Prophet, "The Mahdī will be of my family from the descendants of Fāṭima".

Support for the Ḥasanid Muḥammad b. ʿAbd Allāh is reflected in the addition of "and his (the Mahdī's) father's name will agree with my father's name" to the *ḥadīth* of ʿĀṣim by some Kūfan transmitters. Most likely in his favour the following tradition was circulated by Shuʿayb b. Khālid, a Kūfan residing in Rayy: "ʿAlī said while looking at his son al-Ḥasan, 'Verily, this son of mine is a lord as the Prophet called him, and from his spine

will come forth a man who will be called by the name of your Prophet. He will resemble him in character but will not resemble him in shape. He will fill the earth with justice as it was filled with injustice" '.

The Mahdī was, however, identified as a descendant of al-Ḥusayn in a tradition attributed to ʿAbd Allāh b. ʿAmr b. al-ʿĀṣ and spread at this time by ʿAbd Allāh b. Lahīʿa (d. 155/772) in Egypt: "A man of the offspring of al-Ḥusayn will come forth from the east. Even if towering mountains were to confront him, he would raze them and take paths in them". This tradition already reflects the expectation of a second rising, after the ʿAbbāsid revolt, in the east. This expectation was now expressed in predictions about an army in white clothes with small black flags led by a man, or a client, of Tamīm named Shuʿayb b. Ṣāliḥ, coming from Khurāsān or Rayy to prepare the way for the Mahdī. The earliest prophecies of this type seem to have originated in ʿIrāḳ but the bulk of them, often greatly elaborated, came from Egyptian and Syrian sources. In Egypt, ʿAbd Allāh b. Lahīʿa fabricated numerous such traditions providing them with various fictitious *isnāds*. In Syria, similar traditions were related on the authority of Arṭāt b. al-Mundhir of Ḥimṣ (d. 162 or 163/778-80), sometimes with an *isnād* going back to Kaʿb al-Aḥbār. Others were spread by the Damascene Abū Bakr b. Abī Maryam (d. 156/773). Further traditions of this type, known apparently in both Syria and Egypt, came from a transmission of Djābir (al-Djuʿfī) from Abū Djaʿfar (Muḥammad al-Bāḳir), perhaps in book form. Since Djābir died in 132/750 at the latest, it is evident that this attribution is spurious. Some of these traditions describe in considerable detail the rise and career of the Sufyānī, his conquest and sacking of Kūfa, his defeats at the hands of Shuʿayb, and the joining of the black flags from the Mashriḳ with the yellow flags from the Maghrib at the navel (*surra*) of Syria, i.e. Damascus. The death of Muḥammad b. ʿAbd Allāh is reflected in predictions, contained in the accounts ascribed to Djābir and Arṭāt, that the Pure Soul (*al-Nafs al-Zakiyya*), a descendant of the Prophet, would be killed in the strife about Medina on the Aḥdjār al-Zayt. The Mahdī will appear in Mecca, receive the allegiance of Shuʿayb, and after further fighting will defeat the Kalbī army and kill the Sufyānī. According to some Syrian prophecies, he will reside in Jerusalem. His reign will last 24, 30, 39, or 40 years and he will be succeeded by caliphs of his family or by the Ḳaḥṭānī. The Mahdī thus is not closely associated in these traditions with the end of the world, but some of them predict a second Mahdī who would conquer Constantinople and surrender the rule to Jesus upon his descent from heaven.

Despite the rapid spread of traditions about the coming of the Mahdī, opposition to the belief in him as expressed earlier by al-Ḥaṣan al-Baṣrī did not entirely disappear among the *ḥadīth* scholars. The Yemenite Muḥammad b. Khālid al-Djanadī clad this opposition into a *ḥadīth* of the Prophet, providing it with an *isnād* through al-Ḥasan al-Baṣrī to the Companion Anas, "Matters will only grow in hardship, the world will only increase in backward movement, and the people in greed. The Hour will rise only on the worst of people. There will be no Mahdī but ʿĪsā b. Maryam". The *ḥadīth* was given added prestige by the fact that al-Shāfiʿī (d. 204/820) transmitted it from al-Djanadī. Included by Ibn Mādja in his *Sunan*, it was later interpreted by supporters of the belief in the Mahdī as meaning that no-one spoke in the cradle (*mahd*) except Jesus or that the Mahdī would rule only in accordance with the instructions of Jesus since only the latter, as a prophet, was infallible (*maʿṣūm*). Many *ḥadīth* experts, among them al-Nasāʾī, and Ibn Ḳayyim al-Djawziyya, rejected it as inauthentic. Lingering doubts concerning the Mahdī may partly account for the absence of any traditions about him in the *Ṣaḥīḥs* of al-Bukhārī and Muslim. The Mahdī traditions contained in the canonical Sunnī *ḥadīth* collections of Abū Dāwūd, al-Tirmidhī, Ibn Mādja, and al-Nasāʾī as well as the *Musnad* of Ibn Ḥanbal were, however, numerous enough to provide a solid basis for the popular belief in the Mahdī.

Later developments. Traditions about the Mahdī were gathered also in the post-classical collections of *ḥadīth* like those of al-Ṭabarānī, al-Ḥākim al-Naysābūrī, and al-Bayhaḳī. The eschatological rôle of the Mahdī became generally more pronounced. The view that the Mahdī would rule the Muslim community at the time of the descent of Jesus was commonly accepted doctrine now that he was identified with the leader of the prayer of the Muslims mentioned anonymously in earlier traditions who would offer to surrender his leadership to Jesus. Abu 'l-Ḥasan al-Āburī (d. 363/959) in his book on the merits (*manāḳib*) of al-Shāfiʿī could claim a broad, successive transmission (*tawātur*) of Mahdī traditions giving certainty that he would be of the Muslim community and that Jesus would pray behind him. Some of the acts which, according to earlier traditions, Jesus was to perform after his descent were now ascribed to the Mahdī, who would also aid him in the killing of the Dadjdjāl [*q.v.*]. The Mahdī was more and more associated, too, with the great Muslim conquests predicted in *malāḥim* traditions for the final time of the world, especially those of Constantinople and Rome (Rūmiyya), and was described as the ruler of the whole world. These tendencies are apparent in the traditions quoted by Abū Nuʿaym al-Iṣfahānī (d. 458/1066), who composed at least three different collections of *ḥadīths* on the Mahdī.

A new dimension in the career of the Mahdī appeared in the *K. al-Tadhkira* of Abū ʿAbd Allāh al-Ḳurṭubī (d. 671/1272) who quoted some traditions according to which he would first appear in Māssa in the Sūs in the Extreme Maghrib and only later would receive a second oath of allegiance in Mecca. He would, moreover, gather an army of Berber tribes and cross the straits to al-Andalus, whose earlier plight and spoliation at the hands of the infidels is graphically described. The Mahdī would then preach in the mosque of Seville, receive the allegiance of all the Muslims and conquer seventy towns of the Rūm. Finally, he would sack the Church of Gold (*kanīsat al-dhahab*), but as his followers would quarrel over the division of the staff of Moses found there, the Rūm would gain the upper hand and pursue the Muslims as far as al-Fayyūm in Egypt before the final victory of the Mahdī. These traditions, according to one of which the Mahdī was to appear in 599/1202-3, are of late origin. They probably reflect the appearance of the Mahdī Ibn Tūmart (d. 524/1130 [*q.v.*]) but express the hope for another Mahdī to reconquer al-Andalus. Ibn Tūmart does not mention or allude to them in his description of the Mahdī. Ibn Khaldūn, however, describes some similar beliefs propagated by western Ṣūfīs, Ibn Ḳasī (d. 536/1141), Ibn al-ʿArabī (d. 638/1240), Ibn Sabʿīn (d. 623-4/1226-7) and his disciple Ibn Abī Wāṭīl, quoting a work of the latter. These Ṣūfīs,

according to Ibn Khaldūn, predicted that the Mahdī would appear in the Maghrib. He further reports that many people until his own time expected the advent of Mahdī at the fortress (*ribāṭ*) of Māssa and travelled there in the hope of meeting him and pledging allegiance to him. At the beginning of the 8th/14th century, a man pretending to be the Mahdī had gained some support there, but had soon been killed by the chiefs of the Maṣmūda. Belief that the Mahdī would arise in Morocco remained widespread there until modern times.

Eastern and Egyptian tradition largely ignored this development. Treatises dealing specifically with the Mahdī, assembling large numbers of traditions from the earlier collections, were produced by late traditionists like Yūsuf b. Yaḥyā al-Maḳdisī al-Sulamī al-Dimashḳī, author of a *ʿIḳd al-durar fī akhbār al-muntaẓar* composed in 658/1260; al-Suyūṭī (d. 911/1505), who in his *al-ʿArf al-wardī fī akhbār al-Mahdī* used Abū Nuʿaym al-Iṣfahānī's "Forty *ḥadīths* on the Mahdī" as a base, adding to it extensively from other sources; and Ibn Ḥadjar al-Haytamī (d. 973/1565) who, besides writing two treatises on the Mahdī, of which *al-Ḳawl al-mukhtaṣar fī ʿalāmāt al-Mahdī al-muntaẓar* is extant, included a discussion of the subject in his anti-Shīʿī polemic *al-Ṣawāʿiḳ al-muḥriḳa*. The general tendency of these treatises was to harmonise the divergent traditions. A few questions still aroused controversy. While Abū Nuʿaym al-Iṣfahānī had clearly favoured belief that the Mahdī would be a descendant of al-Ḥusayn, Ibn Ḳayyim al-Djawziyya, followed by Ibn Ḥadjar al-Haytamī, held the traditions affirming that the Mahdī would be a Ḥasanid to be better authenticated and argued that God preferred the descendants of al-Ḥasan in this respect since the latter had voluntarily renounced the caliphate out of compassion for the Muslim community while al-Ḥusayn had waged a war coveting it. This argument was refuted by ʿAlī al-Harawī al-Ḳārī (d. 1014/1606) in his *al-Mashrab al-wardī fī madhhab al-Mahdī*, and ʿAbd al-Raḥmān al-Aydarūsī (d. 1192/1778), himself a descendant of al-Ḥusayn, supported the view that a Ḥusaynid would become the Mahdī. A theological problem arose about the prediction that Jesus would pray behind the Mahdī. Al-Taftazānī (d. 792/1390) argued in his commentary on the creed of al-Nasafī that, according to the sounder view, the Mahdī would follow Jesus in prayer since the latter, as a prophet, excelled him in religious rank. This view was rejected by Ibn Ḥadjar al-Haytamī and others with the argument that the initial prayer of Jesus behind the Mahdī was meant to signify his subjection to the *sharīʿa* of Islam, not the superiority of the Mahdī. The latter might therefore, as some traditions indicated, later pray behind Jesus. On the other hand, al-Suyūṭī, followed by al-Haytamī, objected to the traditions raising the Mahdī in rank above Abū Bakr and ʿUmar as in conflict with the consensus that the two caliphs were the most excellent of mankind after the prophets. The objection was rejected by ʿAlī al-Ḳārī and Muḥammad b. ʿAbd al-Rasūl al-Barazandjī in his *al-Ishāʿa fī ashrāṭ al-sāʿa* (finished in 1076/1665-6) with the argument that the consensus in this matter did not extend to the future. Influenced by Ṣūfī ideas, they maintained that the Mahdī, being infallible (*maʿṣūm*) in his judgement, would excel the two caliphs.

A Ṣūfī doctrine on the Mahdī had been expounded by Ibn al-ʿArabī in chapter 366 of his *al-Futūḥāt al-Makkiyya*. He described the expected Mahdī, a descendant of al-Ḥasan, as the Seal of the Saints (*khatm al-awṣiyāʾ*), just as Muḥammad had been the Seal of the Prophets. The Mahdī would impose the law of Islam with the sword and Jesus would be one of his *wazīrs*. He would be infallible in his *idjtihād* without relying on legal analogy (*ḳiyās*), and the *fuḳahāʾ* of the schools would be his opponents while the Ṣūfī saints would be his natural supporters. These views were further elaborated in the Ṣūfī circles dependent on Ibn al-ʿArabī's thought. A different Ṣūfī doctrine, refuted at length by ʿAlī al-Ḳārī, was that of the Indian Shaykh ʿAbd Allāh al-Hindī Makhdūm al-Mulk [see ʿABD ALLĀH SULṬĀNPŪRĪ in Suppl.], who taught that both the Mahdī and Jesus would apply the legal doctrine of Abū Ḥanīfa. This view was still propagated by a Ḥanafī *shaykh* in Medina in the time of al-Barazandjī, who succeeded in discrediting him. ʿAlī al-Ḳārī also censured the doctrine of the Mahdiyya who believed that their former *shaykh*, who had died in Khurāsān, had been the Mahdī and considered all Muslims denying this claim as infidels [see MAHDAWIYYA].

In spite of the support of the belief in the Mahdī by some prominent traditionists and Ṣūfīs, it never became an essential part of Sunnī religious doctrine. Sunnī creeds mention it but rarely. Many famous scholars like al-Ghazālī avoided discussing the subject. This attitude was often probably less motivated by doubts concerning the truth of the belief than by fear of encouraging politically disruptive movements in the Muslim community. Open criticism of the belief like that of Ibn Khaldūn who, in his *Muḳaddima*, undertook to refute the authenticity of all *ḥadīths* concerning the Mahdī, was exceptional.

Shīʿī doctrine. Among the Shīʿa, especially the more radical groups, longing for a restorer of justice and religion has usually been most intense. Belief in the coming of the Mahdī of the Family of the Prophet became a central aspect of the faith in radical Shīʿism in contrast to Sunnism. Distinctively Shīʿī was also the common belief in a temporary absence or occultation (*ghayba*) of the Mahdī and his eventual return in glory. As various members of the *Ahl al-Bayt* were identified as the Mahdī but failed to fulfill the expectations about him in their lifetime, their followers transferred their hopes to a second coming. The pattern was already set in regard to Muḥammad b. al-Ḥanafiyya, whose death was denied by the Kaysāniyya [*q.v.*]. They believed that he was hidden in the mountains of Raḍwā and would return to rule the world. Similar beliefs arose around Muḥammad b. al-Ḥanafiyya's son Abū Hāshim (d. 98/716), the Djaʿfarid ʿAbd Allāh b. Muʿāwiya (d. *ca.* 130/748), Muḥammad b. ʿAbd Allāh al-Nafs al-Zakiyya (d. 145/762), Djaʿfar al-Ṣādiḳ (d. 148/765) and numerous other ʿAlids during the next centuries. The Shīʿī Mahdī was commonly given the epithet al-Ḳāʾim, the first one perhaps Muḥammad b. al-Ḥanafiyya in his occultation. It has been suggested that the term may be connected with the epithet *ḳāʾem* found in Aramaic Samaritan texts and translated into Greek as ἑστῶς (see G. Widengren, *Muhammad the Apostle of God and his ascension*, Uppsala 1955, 79; P. Crone and M. Cook, *Hagarism*, Cambridge 1977, 165). In Samaritan and gnostic usage, the term appears to have the meaning of "the living one". Whatever the origin of the Arabic term, it is clear that in Shīʿī usage it came to be understood as the one who will rise and rule [see ḲĀʾIM ĀL MUḤAMMAD]. It was in common use before the end of the Umayyad age and largely replaced the term Mahdī in Imāmī tradition.

Doctrine on the *ghayba* of the Mahdī was greatly developed after the death of the seventh *Imām* Mūsā al-Kāẓim (183/799) among the Wāḳifa [*q.v.*], who considered him the last *Imām* and expected his return as the Mahdī. While most of them believed that he had not died and was alive hiding, others held that he had died and would rise from death. They relied on statements attributed to Imām Djaʿfar to the effect that the Mahdī was called the Ḳāʾim because he would rise (*yaḳūm*) after having died. A book on the *ghayba* was written by one of the founders of the Wāḳifa in Kūfa, al-Ḥasan b. ʿAlī b. Abī Ḥamza al-Baṭāʾinī. Other books on the *ghayba* are known to have been written by the Kūfan Wāḳifīs ʿAbd Allāh b. Djabala (d. 210/834), ʿAlī b. ʿUmar al-Aʿradj, ʿAlī b. al-Ḥasan al-Ṭāṭarī (d. 263/876-7), and al-Ḥasan b. Muḥammad b. Samāʿa (d. 263/876-7). A Wāḳifī was perhaps also Ibrāhīm b. Ṣāliḥ al-Anmāṭī (Kūfan, first half of the 3rd/9th century), author of a *K. al-Ghayba*. Books on the *ghayba* were, however, in the same period also composed by some Imāmī scholars who believed in the continuation of the imāmate after Mūsā, like al-ʿAbbās al-Nāshirī (d. 219 or 220/834-5) and the Kūfan Faṭḥī ʿAlī b. al-Ḥasan b. Faḍḍāl.

The doctrine of the *ghayba* was thus well-documented by traditions of the *Imāms* before the occultation of the Twelfth *Imām* whom the majority of the Imāmiyya came to consider as the Mahdī after the death of the eleventh, al-Ḥasan b. ʿAlī al-ʿAskarī, in 260/874. Such earlier traditions could now be used and adapted to support the doctrine of the Mahdīship of the Twelfth *Imām*. Of Wāḳifī origin was, for instance, the tradition attributed to *Imām* Muḥammad al-Bāḳir and transmitted by al-Ḥasan b. ʿAlī b. Abī Ḥamza and now applied to the Twelfth *Imām*: "In the Lord of this Order (*ṣāḥib hādhā al-amr*) there will be a precedent (*sunna*) from Moses, a precedent from Jesus, a precedent from Joseph, and a precedent from Muḥammad. As for the precedent from Moses, he will be afraid and watchful (*khāʾif yataraḳḳab*); as for Jesus, it will be said about him what was said about Jesus; as for Joseph, imprisonment and concealment (*al-sidjn wa 'l-ghayba*); as for Muḥammad, his rising with the sword, following his conduct and explaining his traditions. . ." The tradition clearly refers to the imprisonment of Mūsā al-Kāẓim and to the false claim that he had been killed by his enemies. Also of Wāḳifī origin were traditions attributed to *Imām* Djaʿfar about the two occultations (*ghaybatān*) of the Mahdī like the following: "The Master of this Order will have two occultations. One will be longer so that it will even be said, 'He has died'; and some will say, 'He has been killed'. No one but a few of his followers will remain loyal to him. None of his sons nor anyone else will have knowledge of his place except the client in charge of his affairs". The two absences referred to the two arrests of *Imām* Mūsā who had been briefly imprisoned under the caliph al-Mahdī before his final imprisonment by Hārūn al-Rashīd from which he did not return. Such traditions were now interpreted as referring to the Lesser and the Greater *ghayba* [*q.v.*] of the Twelfth *Imām*. Twelver Shīʿī doctrine on the Ḳāʾim-Mahdī and on his Occultation, based on traditions attributed to the *Imāms*, was authoritatively elaborated by Muḥammad b. Ibrāhīm al-Nuʿmānī (middle of the 4th/10th century) in his *K. al-Ghayba*, by Ibn Bābūya (d. 381/991) in his *Ikmāl al-dīn*, and by Shaykh al-Ṭūsī (d. 460/1068) in his *K. al-Ghayba*.

Imāmī traditions about the career of the Mahdī after his advent largely reflect Sunnī traditions. He will be the lord of the sword and rule the world. Jesus will pray behind him after his descent from heaven. This did not raise a theological problem as in Sunnism, since the Mahdī, like all other *Imāms*, according to prevalent Imāmī doctrine, excels all prophets except Muḥammad in religious rank. Specifically Shīʿī is the expectation that the Mahdī will force all Muslims to accept the Shīʿī belief. Imām Djaʿfar is quoted as stating: 'When the Ḳāʾim of us rises, he will offer the faith to every opponent (i.e. of ʿAlī, *nāṣib*). Either he will enter in it truly, or he will cut his neck or force him to pay the *djizya* as the non-Muslims (*ahl al-dhimma*) pay it now. He will gird himself with a travel bag and expel them from the towns to the countryside (*sawād*)". The Ḳāʾim will also enforce the law as laid down by the *Imāms*, and accordingly prevent Muslims from repudiating their wives except by the *ṭalāḳ al-sunna*. The Mahdī thus was expected to restore the *sharīʿa* of Islam integrally, and this has always been orthodox Imāmī doctrine. More radical doctrine was propagated by the Ḳarāmiṭa [see ḲARMAṬĪ], who held that the Mahdī would abrogate the *sharīʿa* and bring a new message. According to al-Nawbakhtī (*Firaḳ al-shīʿa*, ed. H. Ritter, Istanbul 1931, 62), they interpreted a statement ascribed to *Imām* Djaʿfar, "If our Ḳāʾim were to rise you would learn the Ḳurʾān anew", in that sense. Similar ideas appear to be expressed in another statement ascribed to *Imām* Djaʿfar, "When our Ḳāʾim rises, he will bring a different order than what was before (*djāʾa bi-amr^in ghayri 'l-ladhī kāna*)".

Countering Sunnī criticism, Imāmī apologetics endeavoured to prove that the description of the Mahdī contained in Sunnī *ḥadīth*s applied to the Twelfth *Imām* and that the longevity of the Mahdī implied in the doctrine of the *ghayba* was not unreasonable in view of revealed data about Khiḍr, Jesus, and the Dadjdjāl, and secular reports about long-lived men (*muʿammarūn*). Such apologetics gained considerable momentum in the middle of the 7th/13th century when several Sunnī scholars supported the Imāmī belief that the Twelfth *Imām* was the Expected Mahdī. In 648/1250-1 the Syrian Shāfiʿī traditionist Muḥammad b. Yūsuf al-Gandjī al-Ḳurashī, later (658/1260) murdered in Damascus for co-operation with the Mongol conquerors, composed a *K. al-Bayān fī akhbār ṣāḥib al-zamān* in which he proved the Mahdīship of the Twelfth *Imām* relying solely on Sunnī traditions. In 650/1252 Kamāl al-Dīn Muḥammad b. Ṭalḥa al-ʿAdawī al-Niṣībīnī, a Shāfiʿī scholar and former vizier of the Artuḳid al-Malik al-Saʿīd of Mārdīn, completed in Aleppo his *Maṭālib al-suʾūl fī manāḳib āl al-rasūl* in which he supported the imāmate of the Twelve *Imāms* and answered Sunnī objections to the belief that the Twelfth *Imām* was the Mahdī. The Sibṭ Ibn al-Djawzī, shortly before his death in 654/1256 in Damascus, wrote his *Tadhkirat khawāṣṣ al-umma bi-dhikr khaṣāʾiṣ al-aʾimma* assembling reports from Sunnī sources about the virtues of ʿAlī and his descendants, especially the Twelve *Imāms*, and at the end affirmed that the Twelfth *Imām* was the Lord of the Time, the Expected Ḳāʾim and Mahdī. In support, he quoted the following *ḥadīth*, terming it well-known (*mashhūr*), "The Messenger of God said, 'At the end of time, a man of my descendants will come forth whose name is like my name and whose *kunya* is like my *kunya*. He will fill the earth with justice as it was filled with injustice. That is the Mahdī' ". He thus avoided one of the major Sunnī objections

to the Mahdīship of the Twelfth *Imām*, Muḥammad b. al-Ḥasan, viz. that the *ḥadīth* of ʿĀṣim in its expanded form stipulated the identity of the father's name of the Mahdī with that of the Prophet's father. Al-Gandjī, on the other hand, quoted the testimony of al-Āburī that this stipulation had been added to the *ḥadīth* by the Kūfan transmitter Zāʾida (d. 160-1/777-8). A problem arose also about the Sunnī *ḥadīth*, related by Ibn Ḥanbal and others, "The Prophet said, 'A community will not perish among whom I am the first, Jesus is the last, and the Mahdī is in the middle (*fī wasaṭih*)'". This implied that Jesus would remain after the Mahdī and there would be no *Imām* before the end of the world, as against a cardinal Imāmī dogma. Al-Gandjī therefore interpreted the *ḥadīth* as meaning that Jesus should be the last caller (*dāʿī*) inviting mankind to accept Islam but would not survive the Mahdī.

Testimony in support of the Mahdīship of the Twelfth *Imām* by these Sunnī authors, as also of later ones like the Mālikī scholar Ibn al-Ṣabbāgh al-Isfāḳusī al-Makkī (d. 855/1451), a Maghribī resident in Mecca, and, more recently, the Ḥanafī Naḳshbandī Shaykh Sulaymān b. Ibrāhīm al-Ḳundūzī al-Balkhī (d. 1294/1877 in Istanbul), was regularly noted by Imāmī apologists. The works of al-Gandjī and Kamāl al-Dīn Ibn Ṭalḥa were extensively quoted already by ʿAlī b. ʿĪsā al-Irbilī (d. 692/1293) in his *Kashf al-ghumma fī maʿrifat al-aʾimma*, which in turn won positive comment from Sunnī authors because of its extensive reliance on Sunnī sources. Further support for the Mahdīship of the Twelfth *Imām* came from Ṣūfī circles. Already Abū Bakr al-Bayhaḳī (d. 458/1066) had noted that some Ṣūfī gnostics (*djamāʿa min ahl al-kashf*) agreed with the Imāmī doctrine about the identity of the Mahdī and his *ghayba*. The Persian Ṣūfī Ṣadr al-Dīn Ibrāhīm al-Ḥammūyī (late 7th/13th century) supported Imāmī doctrine on the Mahdī in his *Farāʾid al-simṭayn*. The Egyptian Ṣūfī al-Shaʿrānī, while generally showing no sympathy for Shīʿism, affirmed in his *al-Yawāḳīt wa 'l-djawāhir* (written in 958/1551) that the Mahdī was a son of *Imām* al-Ḥasan al-ʿAskarī born in the year 255/869 and would remain alive until his meeting with Jesus. His advent could be expected after the year 1030/1621. He based his assertion on the testimony of the Ṣūfī Shaykh Ḥasan al-ʿIrāḳī, who claimed to have met the Mahdī, and on a spurious quotation from Ibn al-ʿArabī's *al-Futūḥāt al-Makkiyya* identifying the Expected Mahdī with the Twelfth *Imām*. This quotation of Ibn al-ʿArabī was noted and accepted by both Imāmī and Sunnī scholars. The Egyptian Shaykh al-Ṣabbān (d. 1206/1792), in his *Isʿāf al-rāghibīn fī sīrat al-Muṣṭafā wa-faḍāʾil ahl baytih al-ṭāhirīn*, censured Ibn al-ʿArabī for supporting such a view against the clear evidence of the traditions accepted by Sunnī scholars. Al-Ṣabbān was in turn taken to task for criticising Ibn al-ʿArabī by Ḥasan al-ʿIdwī al-Ḥamzāwī [*q.v.* in Suppl.], who in his *Mashāriḳ al-anwār* (first published in 1275/1858-9) maintained that the Ṣūfī gnostics were the most truthful interpreters of the prophetic tradition. In order to blunt the Shīʿī implications of al-Shaʿrānī's statement, al-ʿIdwī quoted it, adding a thousand years to the birthdate of the Mahdī and suppressing both the date for his advent and Shaykh Ḥasan al-ʿIrāḳī's claim to have met him. The Mahdī thus was born in 1255/1839 and was merely a descendant of the eleventh *Imām*, not the Twelfth *Imām* of the Shīʿa. Al-ʿIdwī's false quotation of al-Shaʿrānī was copied by the Egyptian Shaykh al-Shablandjī in his *Nūr al-abṣār fī manāḳib al-nabī al-mukhtār* composed in 1290/1873.

In pre-Fāṭimid Ismāʿīlism, the terms Mahdī and Ḳāʾim were both used, as in Imāmī Shīʿism, for the expected messianic *Imām*. After the rise of the Fāṭimids, some of the predictions concerning the Mahdī were held to have been realised by the Fāṭimid caliph al-Mahdī, the founder of the dynasty, while others would be fulfilled by his successors. This theory was elaborated by the Ḳāḍī al-Nuʿmān (d. 363/974) in his K. *Sharḥ al-akhbār* where he quoted numerous traditions about the Mahdī from Sunnī, Imāmī, and Zaydī sources and applied them to al-Mahdī and his successors, partially by interpreting them figuratively (see W. Ivanov, *Ismaili tradition concerning the rise of the Fatimids*, London 1942, 97-122, Ar. texts, 1-31). The name al-Mahdī was henceforth reserved to the first Fāṭimid caliph, while the eschatological *Imām* and Seventh Apostle still expected for the future was only called the Ḳāʾim.

Among the Zaydīs, whose doctrine did not raise the nature of the *Imām*s to a superhuman level, Mahdī expectations have generally been weak or marginal. The heresiographer Abū ʿĪsā al-Warrāḳ reported that some Zaydī groups (Djārūdiyya) expected the return of Muḥammad b. ʿAbd Allāh al-Nafs al-Zakiyya, Muḥammad b. al-Ḳāsim Ṣāḥib al-Ṭāliḳān (d. 219/834), or Yaḥyā b. ʿUmar, who led a popular revolt in Kūfa in 250/864. Their views have, however, left no trace in Zaydī tradition. A more serious Mahdistic movement arose in the Yaman around the Zaydī Imām al-Ḥusayn b. al-Ḳāsim al-ʿIyānī (401-4/1010-13), who claimed to be the Expected Mahdī. His death was denied by his family and followers, known as the Ḥusayniyya, and his successors did not claim the title of *Imām* in expectation of his return. The sect of the Ḥusayniyya, opposed by the majority of the Zaydīs, survived until the 8th/14th century. It is characteristic for the insignificance of Mahdī expectations among the Zaydīs that the Sayyid Ḥamīdān (7th/13th century), representing Zaydī orthodoxy, could recognise al-Ḥusayn b. al-Ḳāsim as the Mahdī, who had appeared at the time predicted by the Prophet, while censuring those of his supporters who raised his rank above that of the Zaydī *Imām*s before him and refused to recognise those after him (see W. Madelung, *Der Imam al-Qāsim ibn Ibrāhīm*, Berlin 1965, 198-201).

Bibliography: The richest early collection of *ḥadīth*s on the Mahdī is contained in Nuʿaym b. Ḥammād (d. 227/842), *K. al-Fitan*, ms. Brit. Libr. Or. 9449, from which much material for the present article has been derived. References to traditions in the canonical collections are given by Wensinck, *Handbook*, s.v. Mahdī. Classical Sunnī primary sources: ʿAbd al-Razzāḳ b. Ḥammād, *al-Muṣannaf*, ed. Ḥabīb al-Raḥmān al-Aʿẓamī, Beirut 1970-2, xi, 371-3; Ibn Ṭāhir al-Maḳdisī, *al-Badʾ wa'l-taʾrīkh*, ed. Cl. (W. MADELUNG)

AL-MAHDĪ, ABŪ ʿABD ALLĀH MUḤAMMAD, the third ʿAbbāsid caliph.

The son of the caliph al-Manṣur, he was born, probably in 126 or 127/743-5 in Īdhadj in Khūzistān when his father was involved in the ill-fated rebellion of ʿAbd Allāh b. Muʿāwiya [*q.v.*] against the Umayyads in that area. As soon as he was of age, his father began to train him in political affairs. In 141/758-9 he was sent to Rayy as governor of Khurāsān. He did not settle in Marw himself or take an active part in the campaigns against the various rebels in the area, but remained in Rayy acting as an intermediary between the Khurāsāni supporters of the régime and the caliph in ʿIrāḳ. This role enabled him to build up a substantial following among the Khurāsānīs, who were to be his main supporters in his struggle to secure the succession to the caliphate. In 144/762 he visited ʿIrāḳ briefly to marry his first cousin Rayṭa, daughter of the first ʿAbbāsid caliph al-Saffāḥ, before returning to Khurāsān, where he remained until 151/768. He had his own court in Rayy, and a new administrative quarter was added to the city during the period of his residence.

Al-Saffāḥ had laid down that al-Manṣūr should be succeeded as caliph by his nephew ʿĪsā b. Mūsā, but after his accession al-Manṣūr worked to secure a position for al-Mahdī; in 141/758-9 he was made ʿĪsā's heir, while in 147/764 pressure from the caliph, and from the Khurasānī soldiers stationed in ʿIrāḳ, forced ʿĪsā to resign his position and accept al-Mahdī as heir-apparent.

On the death of al-Manṣūr, on the Pilgrimage of 158/October 775, al-Mahdī, who was already in Baghdād, succeeded to the throne without opposition. Al-Mahdī's policies were in many ways a continuation of his father's, and like al-Manṣūr he continued to rely on the Khurāsānī army and members of the ʿAbbāsid family as the main supporters of the régime. He seems to have emphasised more strongly than his two predecessors the religious nature of his office and the role of the caliph as the champion of Islam. His regnal title of al-Mahdī, a title previously adopted by ʿAlid pretenders to the caliphate, was an indication of this. He also showed his concern for religion by the enlargement of mosques, at Mecca and Baṣra and the Aḳṣā in Jerusalem, by improving the water supply on the Pilgrimage route from ʿIrāḳ to the Ḥidjāz and by organising expeditions against the Byzantines. The concern for the *ḥadjdj* and the *djihād* was part of a policy to establish the caliph as leader of the Muslim community as a whole. He also sought to maintain the purity of the religion by vigorous suppression of the *zindīḳs* [*q.v.*], dualist or gnostic heretics, some of whom were executed.

He attempted to heal the rift which had developed in the family of the Prophet between the ʿAbbāsids and the ʿAlids and which had led to the rebellion of Muḥammad "the Pure Soul" in 145/762. He invited members of the ʿAlid family to court and granted them pensions, as well as trying to reconcile their traditional supporters among the people of Medina by recruiting a guard of *Anṣār* and by the distribution of largesse. In the main, this policy seems to have been successful and there were no large-scale ʿAlid disturbances during the reign.

Al-Mahdī's main adviser in his relations with the ʿAlid was the *wazīr* Yaʿḳūb b. Dāwūd, who had made contacts with members of the family in prison and who in 160/777 placed his services at the disposal of the caliph. Yaʿḳūb succeeded in reconciling with the caliph some prominent ʿAlid dissidents, and in doing so acquired enormous power, supervising almost the entire administration and most government appointments. He failed however, to win over the most active and militant ʿAlid, ʿĪsā b. Zayd, who continued in hiding as a focus for opposition and this failure, coupled with resentment felt by many others at court against his influence, led to his fall and imprisonment in 166/782-3.

The power attained by Yaʿḳūb points to the general increase in power of the bureaucracy and the secretaries (*kuttāb*, sing. *kātib* [*q.v.*]) during the reign of al-Mahdi. Until this time, the *kuttāb* had acted as individual secretaries to rulers but now, under the leadership of the Barmakid [see AL-BARĀMIKA] family, they came to form an important pressure group at court. From 161/777-8, Yaḥyā b. Khālid al-Barmakī became tutor and adviser to the young prince Hārūn, later the caliph al-Rashīd, thus becoming one of the most influential figures at court. The rise of the *kuttāb* at this time provoked a reaction among the leaders of the Khurāsānī army, who felt that their position was being threatened, and the caliph was warned that he was in danger of losing the support of his army by his great-uncle ʿAbd al-Ṣamad b. ʿAlī. The tension between the bureaucrats and the military which originated at this time was to be a continuing feature of ʿAbbāsid politics.

Al-Mahdī's reign was in the main a period of peace and prosperity. There were disturbances in Khurāsān, notably the prolonged rebellion of al-Muḳannaʿ [*q.v.*] between about 159/775-6 and 163/780,

which was only suppressed by considerable military effort. Elsewhere, Muslim armies expanded the influence of the caliphate; on the eastern frontiers of Khurāsān, Farghāna [q.v.] was attacked, and al-Yaʿḳūbī gives a somewhat fanciful list of eastern monarchs who are said to have acknowledged the caliph's authority, including the Kings of Tibet and China. There was also a maritime expedition against the unbelievers in Sind. As usual, however, the main military effort was concentrated on the Byzantine frontier. In 162/778-9 the Byzantines destroyed the Muslim outpost of al-Ḥadath [q.v.], and the caliph responded by sending his son Hārūn on two expeditions in 163/780 and 165/782, which raided the empire without making any lasting territorial gains.

Al-Mahdī designated as his heirs two of his sons by his favourite wife al-Khayzurān [q.v.], Mūsā, who took the title of al-Hādī, and Hārūn, who took the title of al-Rashīd. Both these were given responsibilities in their father's lifetime, Mūsā in Baghdād, where he developed close links with the Khurāsānī soldiery, and Hārūn in Syria and the Byzantine frontier regions. The arrangement was that Mūsā should succeed and be followed by his brother Hārūn, but there were indications that the caliph, persuaded by al-Khayzurān, was about to change these dispositions at the time of his death. Nothing had been done, however, when he died on 22 Muḥarram 169/4 August 785 at Māsabadhān, probably as the result of a hunting accident.

AL-**MAHDĪ** [See IBN TŪMART; AL-MAHDIYYA].

AL-**MAHDĪ**, MUḤAMMAD B. HISHĀM B. ʿABD AL-DJABBĀR B. ʿABD AL-RAḤMĀN AL-NĀṢIR, ABU 'L-WALĪD, eleventh Umayyad caliph of Spain. He held power on two occasions, first as successor to Hishām II al-Muʾayyad [q.v.], and again in Sulaymān b. Ḥakam al-Mustaʿīn's [q.v.] place in the period of general rebellion which at the end of the 4th-beginning of the 5th/11th century immediately preceded the establishment throughout Muslim Spain of petty independent rulers, the *Mulūk al-Ṭawāʾif* [q.v.].

The third of the ʿĀmirid *ḥādjibs*, ʿAbd al-Raḥmān b. al-Manṣūr, surnamed Sanchol, from the moment he succeeded his brother ʿAbd al-Malik al-Muẓaffar, abandoned himself to all sorts of excesses and was able to take advantage of the weakness of the titular caliph, Hishām II al-Muʾayyad, to get himself designated heir-apparent. This decision at once aroused the indignation of various members of the caliph's family, thus excluded from the throne; they arranged that one of their number, Muḥammad b. Hishām b. ʿAbd al-Djabbār, a great-grandson of ʿAbd al-Raḥmān III al-Nāṣir, who had many followers among the mob of Cordova, should head a rebellion. Advantage was taken of an expedition, which ʿAbd al-Raḥmān Sanchol was to lead in person against the Christians of Galicia, to raise the standard of rebellion. On 16 Djumāda II 399/15 February 1009, Muḥammad b. Hishām attacked the palace of Cordova, where the caliph Hishām was with a small number of followers who had remained faithful to him. He captured the palace and at once took steps to make Hishām sign his abdication and had himself proclaimed caliph. The whole population of Cordova was in arms and plundered the ʿĀmirid town of al-Madīna al-Zāhira [q.v.]. All the treasure accumulated there, including a vast sum in money, was seized and brought to the new caliph who, to destroy ʿĀmirid power for ever, demolished completely and set fire to the town which the great *ḥādjib* al-Manṣūr had built only a few years before. At the same time, Muḥammad b. Hishām, who had adopted the honorific *laḳab* of al-Mahdī, took steps to meet the counter-attack expected from ʿAbd al-Raḥmān Sanchol. Warned of what had happened in Cordova and of the destruction of al-Madīna al-Zāhira, the *ḥādjib*, full of anxiety, pitched his camp at Calatrava (Ḳalʿat Rabāḥ [q.v.]) and endeavoured to secure the fidelity of his troops, who were mainly Berbers. He was soon forced to witness their defection and went to Cordova in the hope of finding new partisans there. But on the way back he was captured by emissaries of al-Mahdī in a monastery of the Sierra Morena and executed at the end of Djumāda II 399/1 March 1009. His body was crucified in Cordova.

Muḥammad al-Mahdī, once the power was in his hands, soon alienated the principal Berber chiefs of his army as well as his relatives of the Umayyad house. A rebellion against him was planned by his adversaries. The Berbers put at their head an Umayyad pretender, Hishām b. Sulaymān b. al-Nāṣir, whom they proclaimed caliph with the title al-Rashīd, and laid siege to Cordova. Al-Mahdī made a sortie, routed them and the pretender was killed. The Berbers then chose a new Umayyad prince, Sulaymān b. al-Ḥakam, and at the same time appealed for assistance to Sancho Garcez and his Castilians. In spite of all the efforts of al-Mahdī, the blockade of Cordova became more and more strict. He then tried to put on the throne the caliph Hishām II b. al-Muʾayyad whom he had himself deposed and then given out as dead, but this was in vain. On 16 Rabīʿ I 400/2 November 1009 the palace of the caliph was in the hands of the besiegers. Al-Mahdī's only hope was to hide himself. The pretender of the Berbers, Sulaymān, received the oath of alligiance at Cordova and assumed the honorific title of al-Mustaʿīn bi'llāh.

In the following month, al-Mahdī was able to leave Cordova secretly and seek refuge in Toledo, where he was well received by the inhabitants. He then sought and obtained an alliance with the Catalans (*Ifrandj*) who marched with him on Cordova in Shawwāl 400/May-June 1910. The town was taken and the second reign of al-Mahdī began with a bloody persecution of all the Berbers in Cordova. To avenge the wrongs of their fellow-countrymen in the capital, the Berbers in the army of Sulaymān al-Mustaʿīn returned to besiege the city. Al-Mahdī, betrayed by his retainers, was slain during the siege

in the palace in Cordova by some ʿĀmirid slaves on 8 Dhu 'l-Ḥidjdja 400/23 July 1010. His first reign had lasted nine months, the second less than two.

MAHDĪ ʿALĪ KHĀN, the most outstanding vizier of the later Nawwābs of Awadh.

He started his career from the early reign of Nawwāb Saʿādat ʿAlī Khān (1798-1814) as a *čhakladār* (an officer of one of the revenue districts) of *čhakla* Muḥammadī and then of Fayḍābād. His administration made the *čhaklas* under his control exceedingly prosperous. He himself became fabulously rich and was made a minister. Early in the reign of Saʿādat ʿAlī Khān's successor Ghāzī al-Dīn Ḥaydar (1814-27), Mahdī ʿAlī lost his position because of his resentments at the interference of the Awadh Resident Colonel Baillie with the Awadh administration. Much of his property was seized and he was imprisoned. After his release from prison, he moved to the British territory at Fatḥgaṙh in 1824 and began to live in a grand style. After the death of Ghāzī al-Dīn Ḥaydar in October 1827, his son Naṣīr al-Dīn Ḥaydar appointed Mahdī ʿAlī as his *nāʾib* (chief minister). The Governor-General Lord William Bentinck was highly impressed by Mahdī ʿAlī's administrative abilities and supported his schemes. Mahdī ʿAlī reduced the salaries of undeserving favourites of the court, slashed the stipend of the ladies of the palace and even curtailed the expenses of the King. After four years of strong rule he was dismissed in 1832 on the pretext of behaving arrogantly towards the Queen Mother and an incompetent minister called Rawshān al-Dawla was appointed in his place. The reforms introduced by Mahdī ʿAlī were speedily reversed and the prosperity of the kingdom declined. Mahdī ʿAlī retired to Farrukhābād and died in obscurity.

MAHDĪ KHĀN ASTARĀBĀDĪ, MĪRZĀ (MUḤAMMAD), court secretary and historian of Nādir Shāh of Iran (reigned 1148-60/1736-47), author of the *Taʾrīkh-i Nādirī* (also known as *Djahāngushā-yi Nādirī*).

Little is known for certain about the life of Mīrzā Mahdī Khān, not even the dates of his birth and death. The *takhalluṣ* by which he is sometimes called, Kawkabī, is likewise disputed (Shahīdī, pp. *md*). He was presumably born at Astarābād, the son of one Muḥammad Naṣīr, and apparently moved to the capital Iṣfahān during the twilight of the Ṣafawid dynasty or the Afghān occupation of Iran. According to documents in his collected official correspondence (*Munshaʾāt*; see Anwār, pp. *sih*, *pandj*; *Shahīdī*, pp. *mdj*), he wrote a formal congratulation to Nādir on his capture of Iṣfahān in 1142/1729. For the next seventeen years he served Nādir as head of the secretariat (*munshī al-mamālik*), then after his coronations as official historian (*waḳiʿa niwīs*). In spring of 1160/1747 he was sent together with Muṣṭafā Khān Bīgdilī Shāmlū on an embassy to the Ottoman court in order to ratify the peace treaty recently concluded by Nādir. They had gone no farther than Baghdād when the news of the Shāh's assassination overtook them, and the embassy was discontinued. Mīrza Mahdī returned to Iran and spent the remainder of his life in retirement —whether at Mashhad, Tabrīz or elsewhere is uncertain—completing the historical and philological works which he had begun during his service with Nādir. He died some time between 1162/1749 and 1182/1768.

Mīrzā Mahdī is chiefly remembered for his two histories of Nādir Shāh, the *Djahāngushā-yi Nādirī* and the *Durra-yi nādira*. The former is a detailed year-by-year record of Nādir's career, particularly of his military campaigns, though marred by an expedient eulogy of his patron; it became the inspiration and model for several histories of the subsequent Afshārid and Zand periods, notably the *Taʾrīkh-i Gītī-gushā* of Mīrzā Ṣādiḳ Nāmī. The *Durra-yi nādira* ("Rare pearl") treats the same material in the florid and abstruse style initiated by the Īl-Khānid historian Waṣṣāf, as a tour-de-force of forced metaphors and Arabic quotations. Mīrzā Mahdī also made valuable contributions to Turkish studies with his *Sanglākh*, a Persian dictionary of eastern Turkish (Čaghatāy) based on the poetry of Mīr ʿAlī Shīr Nawāʾī, and with his Čaghatāy grammar, *Mabānī al-lugha*.

Bibliography: Mīrzā Mahdī's works have been published in the following editions, which provide further information about the manuscripts available and the author's life and works: *Durra-yi nādira*, ed. Sayyid Djaʿfar Shahīdī, Tehran 1341/1963; *Djahāngushā-yi Nādirī*, ed. Sayyid ʿAbd Allāh Anwār, Tehran 1341/1963 (this work was translated by Sir William Jones into French as *Histoire de Nader-Chah*, Paris 1770, and into English in an abridged version, *The history of the life of Nadir Shah*, London 1773—both versions being uncritical and inaccurate); *Mabānī al-lugha*, ed. E. Denison Ross, Calcutta 1910; *Munshaʾāt-i Mahdī*, Tehran 1285/1868-9; *Sanglax*, ed. Sir Gerard Clauson, GMS N.S. v, London 1960. See also L. Lockhart, *Nadir Shah*, London 1938, 292-6. (J. R. PERRY)

AL-MAHDĪ LI-DĪN ALLĀH AḤMAD, a title and name of a number of Zaydī *imāms* of the Yemen.

About 250 years after al-Hādī ila 'l-Ḥaḳḳ Yaḥyā, the founder of the Zaydiyya in the Yemen, his direct descendant, al-Mutawakkil ʿala 'llāh Aḥmad, had, between 532/1137 and 566/1170, restored Zaydī territory to its extent in al-Hādī's time, with Ṣaʿda, Nadjrān and, for a time, also Zabīd and Ṣanʿāʾ. A generation later (593-614/1197-1217) the mountainous region from Ṣaʿda in the north to Dhamār, south of Ṣanʿāʾ, was again ruled by the Zaydī al-Manṣūr bi'llāh ʿAbd Allāh b. Ḥamza, not a direct descendant of al-Hādī, but of the latter's brother, ʿAbd Allāh. Al-Manṣūr was twice able to enter Ṣanʿāʾ, but his power was severely limited by the last Ayyūbid ruler of the Yemen, al-Malik al-Masʿūd Yūsuf (612-26/1215-29). After the death of al-Manṣūr in

614/1217, the Zaydī house was split, al-Hādī Yaḥyā b. al-Muḥsin, a descendant of al-Hādī ila 'l-Ḥaḳḳ Yaḥyā, declaring himself *imām* in Ṣaʿda, while al-Manṣūr's sons asserted their right to the imāmate further south. An attempt to heal this long-standing rift within the dynasty was made by

1. AL-MAHDĪ LI-DĪN ALLĀH AḤMAD B. AL-ḤUSAYN. His genealogy would appear to have been clearly established by the usually reliable Rasūlid genealogist, al-Malik al-Ashraf ʿUmar b. Yūsuf (*Ṭurfat al-aṣḥāb*, 101-2), as follows: Aḥmad b. al-Ḥusayn b. Aḥmad b. al-Ḳāsim b. ʿAbd Allāh b. al-Ḳāsim b. Aḥmad b. Ismāʿīl b. Abi 'l-Barakāt b. Aḥmad b. al-Ḳāsim b. Muḥammad b. al-Ḳāsim Tardjumān al-Dīn b. Ibrāhīm Ṭabāṭabā b. Ismāʿīl b. Ibrāhīm b. al-Ḥasan b. al-Ḥasan b. ʿAlī b. Abī Ṭālib.

In 646/1248 Aḥmad proclaimed himself *imām* in the fortress of Thulā, north-west of Ṣanʿāʾ, with the support of the Banū Ḥamza Zaydīs, his father's family, and with the possible connivance of the Rasūlid fief-holder of Ṣanʿāʾ, the sultan's nephew, Asad al-Dīn Muḥammad b. al-Ḥasan, whose loyalty to his family was at best only lukewarm. Aḥmad's position was strengthened by the murder in 647/1250 of Nūr al-Dīn ʿUmar, the Rasūlid sulṭān, a crime which may have had the support of Asad al-Dīn Muḥammad. The latter continued his fickle behaviour into the sultanate of al-Muẓaffar Yūsuf, son of Nūr al-Dīn ʿUmar, at times appearing to support his family, the Rasūlids, against the Zaydī *imām* al-Mahdī Aḥmad, at times flirting with the latter and showing open rebellion against the Rasūlids. The mystery is why such an astute leader as al-Muẓaffar Yūsuf put up with such behaviour, for his nephew seems to have been able to patch up his quarrels and disloyalties with his uncle, the sultan, with no difficulty on more than one occasion. The position of al-Mahdī Aḥmad improved for a time, for he was able to take Ṣanʿāʾ in 648/1250; although harrassed by Asad al-Dīn, who held the fortress of Birāsh close by, he was able to extend his influence south as far as Dhamār. But within the year al-Mahdī Aḥmad had to abandon Ṣanʿāʾ. Asad al-Dīn sold him Birāsh, but it was on account of this that the final breach between them occurred. Asad al-Dīn yet again made his peace with his uncle, al-Muẓaffar Yūsuf. Al-Mahdī Aḥmad's fate, however, was not to be decided by the Rasūlids but within the Zaydī camp. Quarrels arose and a rival *imām*, Shams al-Dīn Aḥmad, was announced in 652/1254 in Ṣaʿda. In the next year a Zaydī assembly pronounced Aḥmad's deposition. He fought on with the remainder of his followers, but was killed in 656/1258 and buried in Dhu Bīn (invariably written Dhībīn in the sources).

Shams al-Dīn Aḥmad, who adopted the official title of al-Mutawakkil and recognised the Rasūlids as his overlords, was at once challenged by a rival *imām* in the person of Abū Muḥammad al-Ḥasan b. Wahhās. A number of other *imāms* were recognised before

2. AL-MAHDĪ LI-DĪN ALLĀH AḤMAD B. YAḤYĀ B. AL-MURTAḌĀ b. Aḥmad b. al-Murtaḍā b. al-Mufaḍḍal b. Manṣūr b. al-Mufaḍḍal b. al-Ḥadjdjādj b. ʿAlī b. Yaḥyā b. al-Ḳāsim b. Yūsuf al-Dāʿī b. Yaḥya al-Manṣūr b. Aḥmad al-Nāṣir. The last named was the son and second successor of al-Hādī ila 'l-Ḥaḳḳ Yaḥyā. After the death of the *Imām* al-Nāṣir Ṣalāḥ al-Dīn, killed in 793/1391 when thrown from his mule which had been frightened by a bird, a *ḳāḍī*, ʿAbd Allāh b. al-Ḥasan al-Dawwārī, with other Zaydī notables, continued the Zaydī administration for a time on behalf of his sons who were all minors. The Zaydī *ʿulamāʾ*, however, assembled in the Djamāl al-Dīn mosque in Ṣanʿāʾ and appointed Aḥmad b. Yaḥyā as *imām*. ʿAbd Allāh al-Dawwārī thereupon had ʿAlī, the son of al-Nāṣir, proclaimed *imām*, and al-Mahdī Aḥmad and those supporting him left for Bayt Baws where they were immediately besieged by the rival *imām*, ʿAlī. For the remainder of that year and into 794/1392 the two claimants to the Zaydī imāmate fought for supremacy. Al-Mahdī Aḥmad was caught in Maʿbar, south of Ṣanʿāʾ, by forces of his rival, ʿAlī, and languished in prison until 801/1399, a period of over seven years. In that year he was freed with the help of his jailers. He lived on, however, until 840/1437, when he died near Ḥadjdja of the plague. Ironically, enough, his erstwhile rival the *Imām* ʿAlī died in Ṣanʿāʾ of the plague in that same year.

The choice of Ibn al-Murtaḍā as *Imām* was a mistake, inasmuch as he lacked the necessary military and administrative ability. On the other hand, he had another qualification in perfection. As a result of a careful education and a thirst for learning from his youth upwards, he wrote a great deal, dogmatic, legal and paraenetic; he was also a poet and worked at grammar and logic. The kindness of his warders, who supplied him with ink and paper, enabled him to compose the law book *al-Azhār fi fiḳh al-aʾimma al-aṭhār* (Berlin ms. 4919) on which he wrote a commentary. His most valuable work is still his theological and legal encyclopaedia, *al-Baḥr al-zakhkhār* (Berlin mss. 4894-4907) on which he likewise wrote a commentary. Although not the work of an original scholar, it is a rich and well-arranged compilation, which deserves attention, if only for the part of the introduction which compares the various religions, as the distinctions between them are seen from quite a different point of view to that of al-Ashʿarī or al-Shahrastānī.

About 80 years after al-Mahdī Aḥmad b. Yaḥyā, from 922/1516 onwards, the Turks had begun to occupy Yaman and to hold it with varying fortunes (see Ḳuṭb al-Dīn al-Makkī, *al-Barḳ al-yamānī fi 'l-fatḥ al-ʿUthmānī*, in S. de Sacy, in *Notices et extraits*, iv, 412-504, and A. Rutgers, *Historia Jemanae sub Hasano Pascha*, Leiden 1838). In his struggle with them al-Manṣūr bi'llāh al-Ḳāsim b. Muḥammad, a descendant of al-Hādī in the seventeenth generation, was able in *ca.* 1000/1591 to restore the present imāmate in Ṣanʿāʾ (see A. S. Tritton, *The rise of the Imams of Sana*, Oxford 1925). Of his sons, Muḥammad al-Muʾayyad succeeded him. Even in his reign, but still more after his death in 1054/1644, when his successor Ismāʿīl, another son of al-Ḳāsim, was making his way with difficulty against his many brothers and nephews, one of al-Ḳāsim's grandsons began to come to the front, afterwards the *Imām*

3. AL-MAHDĪ LI-DĪN ALLĀH AḤMAD B. AL-ḤASAN B. AL-ḲĀSIM. His father was not *Imām*, but distinguished himself in the wars against the Turks and was also a scholar. In 1048/1639 Aḥmad appeared in the hills of Wuṣāb; in 1051/1641 he was in Mecca with many members of his family on the pilgrimage. Just at the accession of Ismāʿīl, he set out with another cousin against Ṣanʿāʾ. At first he came to terms with the *Imām*, but then fought in different places for his own hand, e.g. at Thulā and again in the Djabal Wuṣāb. In 1070/1659 he won Ḥaḍramawt for Ismāʿīl, to which the Zaydīs had been summoned by the disputes for the throne. When in 1087/1676

on the death of Ismāʿīl he himself assumed the imāmate, a nephew, al-Ḳāsim b. Muḥammad al-Muʾayyad, proclaimed himself *imām* and was recognised particularly in the remoter territory in the south towards Tihāma. A Zaydī assembly of leading Sharīfs and *ʿulamāʾ* met, at which Aḥmad was with some difficulty recognised as the legitimate *imām*. Although this did not mean that he enjoyed the authority of a sovereign, since his rivals and the other *amīrs* remained as independent as before, yet peace and security reigned in the country. But Aḥmad b. al-Ḥasan died soon afterwards in 1092/1681 in al-Ghirās near Shibām, which had been built by the first Turkish conqueror Ḥasan Pasha, possibly from a bullet wound, sustained in action against a recalcitrant tribe. A notable feature of his comparatively uneventful imāmate was his banishment of the Jews from Ṣanʿāʾ, the razing of their synagogue and the building of the Djalā mosque on its site (1090-1/1679-80). After the short and weak reign of his son al-Mutawakkil Muḥammad (to 1097/1686), family feuds broke out again. Among the later *imāms* of this Ḳāsimid dynasty another Aḥmad b. al-Ḥusayn b. al-Ḳāsim (from 1221/1806) again bore the official title of al-Mahdī li-Dīn Allāh.

(R. Strothmann-[G. R. Smith and J. R. Blackburn])

AL-MAHDĪ ʿUBAYD ALLĀH, the first "manifested" (*ẓāhir*) Ismāʿīlī *Imām* and the first caliph of the Fāṭimid dynasty in Ifrīḳiya; while the historicity of this fact is conclusively established, there is doubt as to the Fāṭimid origin of ʿUbayd Allāh and subsequently as to the authenticity of his imāmate in the Ismāʿīlī line.

It would be pointless however, before giving an account of his activity as a sovereign, to digress upon the thorny subject of the *nasab* of the first Fāṭimid monarch, to which the author of the present article has, moreover, elsewhere devoted substantial consideration (see *Bibl.*). This study will be confined therefore to exposing the essential features as a means of bringing to light the political and social conditions in which the Ismāʿīlī *daʿwa* developed in the Orient even before the imamāte fell to ʿUbayd Allāh, then in the Maghrib, on the eve of the foundation of the Fāṭimid caliphate.

The question is whether ʿUbayd Allāh—ʿAbd Allāh according to the Ismāʿīlīs, who reject the diminutive form of his name on which Sunnī and Khāridjī authors agree—possessed an ʿAlid ascendancy through a family relationship with Ismāʿīl, the seventh hidden *Imām*, or whether he was quite simply the great-grandson of the *dāʿī* Maymūn al-Ḳaddāḥ [see ʿABD ALLĀH B. MAYMŪN]. The documentation currently available is insufficient to provide a conclusive answer. It may nevertheless be asserted definitely that it was the seventh *Imām*, Ismāʿīl (d. *ca.* 145/762) who laid the foundations of the Ismāʿīlī movement, then his son Muḥammad b. Ismāʿīl who elaborated the doctrine and organised the preaching (*daʿwa*) with the valuable assistance of the *dāʿī* Maymūn al-Ḳaddāḥ. It could be concluded that this *daʿwa* in favour of the ʿAlid descendants of the Ḥusaynid branch was thus initiated in the period of secrecy (*satr*), that is, at the beginning of the second half of the 2nd/9th century, and continued until the end of the 3rd/9th century, to be concluded finally with the "manifestation" (*ẓuhūr*) of the *Imām* al-Mahdī.

No sure light can be thrown upon the order of certain succession in which the imāmate was transmitted during this long period of secret preaching, and how the imāmate effectively passed from the line of Ismāʿīl to that of the family of al-Ḳaddāḥ, because of the variety of contradictory and impassioned opinions which our Sunnī and Khāridjī sources have reproduced with the obvious zeal of their authors. Among the Ismāʿīlī authors themselves, profound disagreements have survived, depending on whether the sources consulted are works of doctrine intended for public consumption (*ẓāhir*) or esoteric texts reserved for the initiates (*bāṭin*).

However, whether al-Mahdī be an authentic ʿAlid or a descendant of al-Ḳaddaḥ, it is appropriate to stress the importance of his role in the considerable development of the *daʿwa* at the moment that he was obliged to make it public, beginning from his home in Salamiyya and promulgating it across Persia, Lower Mesopotamia, Syria, Baḥrayn, Yemen, Egypt and even the distant Maghrib.

Nourished by the political and social unrest fomented among the Nabataean, Aramaean and Zandj masses in the East, Copts in Egypt and Berbers in Ifrīḳiya; strengthened, at the time of the decline of the ʿAbbāsid empire, as a result of the spectacular development of the Ḳarmaṭī or Carmathian movement which extolled the same revolutionary ideal of political reform and egalitarian justice; perfectly organised and covering the various "constituencies" of the Islamic world (*djuzur*), the Ismāʿīlī preaching ultimately entered, just at the time that al-Mahdī acceded to the imāmate in 285/898, a decisive phase, that of its Maghribi diversion.

Two decisive events influenced this movement of the *daʿwa* in the direction of the Maghrib; the Ḳarmaṭī dissidence in the East and the successes of the apostleship of the *dāʿī* Abū ʿAbd Allāh in Lesser Kabylia in the West. As for the schism between the Ḳarmaṭī movement and the centre of the *daʿwa*, it took place at the same time that the imāmate fell to al-Mahdī, whose authority the new Ḳarmaṭī chief, Zikrawayh, refused to recognise. It was thus to fend off the formidable threat posed to Salamiyya that al-Mahdī resigned himself to fleeing this town and setting out towards the far Maghrib at about the end of summer 299/902.

In fact, the apostleship undertaken on behalf of the *Imām* by the *dāʿī* Abū ʿAbd Allāh in this country, among the Kutāma Berbers of Lesser Kabylia,

developed into an open insurrection against the Ifrīḳiyan kingdom of the Aghlabids. Al-Mahdī made his way to Sidjilmāssa, in the furthest Maghrib, there to await the final victory of Abū ʿAbd Allāh and his Kutāmī partisans. His stay in this town was to last five years, until the day that Abū ʿAbd Allāh, having conquered on his behalf the kingdom of the Banu 'l-Aghlab, arrived there solemnly to present him with power and to escort him to Ifrīḳiya, where he took possession of the throne at Raḳḳāda on Thursday 20 Rabīʿ II 297/6 January 910.

On his accession, the first Fāṭimid sovereign was 36 or 37 years old, having been born at ʿAskar Mukram in 259 or 260/873 or 874. Ismāʿīlī and Sunnī authors agree in attributing to him qualities of tenacity and prudent wisdom which proved to be of great benefit to him in the course of various vicissitudes between the time of his flight from Salamiyya and his triumphal entry into Raḳḳāda.

Al-Mahdī was officially proclaimed caliph on the day following his arrival, Friday 21 Rabīʿ II 297/7 January 910. The edicts of enthronement and proclamation emphasised the restoration of the imāmate in the line of descent of the Prophet and of his heir (*waṣī*), through his daughter Fāṭima, and the recovery of the caliphate usurped by the Umayyads and the ʿAbbāsids.

Immediately upon his enthronement, al-Mahdī took in hand the responsibilities of state, letting it be known that he intended to exercise personally the power gained on his behalf by Abū ʿAbd Allāh. He thus eclipsed the prestige of the latter, his brother Abu 'l-ʿAbbās and certain Kutāma chieftains who, offended, were not slow to foment a conspiracy against him. But, assisted in his role as sovereign by Arab dignitaries who rallied to his cause, having earlier served the Aghlabid *amīrs*, al-Mahdī did not hesitate to rid himself of the *dāʿī* Abū ʿAbd Allāh, who was executed along with his brother and their Kutāmī accomplices.

With the same determination, al-Mahdī set about consolidating his authority through energetic suppression of the internal agitation provoked by the elimination of Abū ʿAbd Allāh. He quelled in rapid succession an attempted insurrection at al-Ḳaṣr al-Ḳadīm, a riot at al-Ḳayrawān, a rebellion in Tripoli, a revolt by the clan of the Māwatnaṭ in the land of the Kutāma and an uprising in Sicily. Having thus pacified his territories, taken firm control of his Arab and Berber subjects and contained the threat of Khāridjī tribes (especially the Zanāta) hostile to his régime, he rapidly set about establishing on the foundations of the former Aghlabid kingdom a stable and powerful state which he was careful to endow, at an early stage, with a new capital, al-Mahdiyya [*q.v.*]. Built as a fortress, this coastal site was designed to ensure the security of the sovereign and to serve as an instrument for his policy of prestige and hegemony. For, in order to bring to a successful conclusion his twofold function of *Imām* and caliph, the first Fāṭimid monarch was obliged at once to conduct outside his frontiers a tireless campaign on three fronts simultaneously: against his two Muslim rivals, the ʿAbbāsids in Egypt and the Umayyads of Spain in the western Maghrib, and the Christian enemy, the Emperor of Byzantium, in Sicily and Calabria.

In view of the fact that the proclamation of the Fāṭimid caliphate imposed on him the obligation to overthrow both the Umayyad and ʿAbbāsid "usurpers", al-Mahdī no doubt at first contemplated invading Muslim Spain, where the power of his Cordovan rival had been considerably weakened by the revolt of Ibn Ḥafṣūn. Since the latter had been quick to pledge obedience to him, on his entry into Raḳḳāda, the Fāṭimid sovereign sent substantial troops to the western Maghrib to bring the area under his authority and to spread fear on the threshold of the Iberian Peninsula. But internal difficulties and his inability to impose lasting authority on the unruly tribes, especially those of the Zanāta group, beyond Tāhart, seem to have tempered his ambitions towards al-Andalus, the conquest of which represented an unacceptable risk.

Egypt, on the other hand, offered an easier prey and to invade it was indubitably a less perilous enterprise. Also, it was only natural that al-Mahdī's attention should be drawn towards the East, where he felt the equally imperious obligation to combat his other rival, the ʿAbbasīd sovereign.

So al-Mahdī was not slow to launch against Egypt, in 301-2/914-15, a powerful force commanded by his son and heir presumptive, Abu 'l-Ḳāsim, the future al-Ḳāʾim bi-amr Allāh. Initially, the course of the expedition proceeded in his favour. But after capturing Alexandria, Abu 'l-Ḳāsim failed before al-Fusṭāṭ, and not being capable of confronting the army of the ʿAbbāsid general Muʾnis, he retraced his steps towards Ifrīḳiya.

Despite its lack of success on the military level, this expedition was to prove beneficial to the prestige of the Fāṭimid cause through the dissemination of Ismāʿīlī propaganda on the banks of the Nile and in other provinces of the ʿAbbāsid empire. Al-Mahdī returned to the attack in 307-8/919-21 with a second expedition commanded by the same Abu 'l-Ḳāsim. At first, this project developed as favourably as the preceding, with the capture of Alexandria and the occupation of the Fayyūm. But when the Fāṭimid fleet encountered disaster at Rosetta, and the battles before al-Fusṭāṭ turned to the advantage of the troops of Muʾnis, Abu'l-Ḳāsim was forced for the second time to retreat and return to Ifrīḳiya. However, the heir to the Fāṭimid throne took the opportunity afforded by this incursion to the banks of the Nile to assert afresh his family's claim to the caliphate and to call on the peoples of the East to rebel against the ʿAbbāsid "infidels" and to support the cause of the descendants of Fāṭima.

Al-Mahdī seems to have organised, shortly before his death, a third expedition against Egypt. In fact, this third attempt, attributed to the year 323/935, took place at the very beginning of the reign of his successor, al-Ḳāʾim, who must have held very dear to his heart the sending of troops against the country where he had suffered two consecutive defeats. In any event, this third Fāṭimid raid against Egypt was, on the military level, as fruitless as its predecessors. Before his death, al-Mahdī must have realised how inadequate his forces were compared with those of his two Muslim rivals, being forced to admit that the new Fāṭimid state was not yet sufficiently strong to overturn either of its hereditary enemies.

To satisfy the sacred obligation of *djihād* against the Christian enemy, al-Mahdī displayed the same amount of energy in campaigning against the Rūm in Sicily and in Calabria. The first raid against the south of the Italian peninsula took place during the year 306/918. The Fāṭimid troops captured Reggio and returned with much booty and many captives. The second incursion was launched from al-Mahdiyya in the summer of 310/922. With a fleet

of twenty galleys, the Fāṭimid officer Masʿūd b. Ghālib al-Wāsūlī took possession of the fortress of St. Agatha and made prisoners of its inhabitants.

Two years later, the chamberlain Djaʿfar b. ʿUbayd, known as "Ṣuʿlūk", led the third raid, with Palermo as his starting-point. He captured Bruzzano and Oria and returned to al-Mahdiyya with vast riches. The resounding success of this campaign had the effect of inducing Byzantium to conclude a treaty. But the annual tribute agreed for Calabria was slow to reach al-Mahdiyya, and hostilities resumed in 315/927. Continuing until 318/930 under the command of the slave Ṣābir, the Fāṭimid incursions proceeded victoriously against Tarento, Salerno, Naples and Termoli. Eventually the tribute was paid, hostilities were suspended and the treaty remained in force until the death of al-Mahdī. Preoccupied by Bulgarian imperialism, Byzantium allowed the Fāṭimid sovereign to subjugate Apulia and Calabria and to reinforce the supremacy of Islam in Sicily.

Al-Mahdī died in al-Mahdiyya on 15 Rabīʿ I 323/3 March 934. On the eve of his death, he could congratulate himself on having successfully performed his double task as *Imām* and as first Fāṭimid caliph. Under his aegis, the *daʿwa* emerged from its secular period of "secrecy" (*satr*), and flourished rapidly in the East and in the Maghrib. He had the skill and energy to conduct moderate but firm policies within his provinces, and to wage tireless warfare beyond his frontiers to affirm the right of the descendants of Fāṭima to lead the Muslim world. Thus, under his rule, the Fāṭimid empire embarked successfully on the first phase of its long history.

MAHDIDS, a dynasty of Zabīd in the Yemen claiming descent from the pre-Islamic Tubbaʿs of Ḥimyar.

1. History. The family took its name from the father of its first leader, ʿAlī b. Mahdī, who died in 554/1159. ʿAlī was brought up with a strong traditional Islamic education by his father in Tihāma. Though much given to quiet meditation, ʿAlī also acquired a reputation for eloquence. He travelled widely too, performing the pilgrimage each year and meeting *ʿulamāʾ* from all corners of the Islamic world. The famous historian-poet, ʿUmāra, is our earliest source for the Mahdid period. He tells us that he was much attracted by ʿAlī's early teachings and visited him personally every month (Kay, *Yaman*, 92). During the period 531-6/1136-42, ʿAlī preached openly in Tihāma. So sympathetic to his words was the Nadjāḥid queen in Zabīd, ʿAlam, that he and his followers were exempted from the *kharādj* normally payable on land. In 538/1143 ʿAlī felt sufficiently strong to attack the Nadjāḥid town of al-Kadrāʾ, north of Zabīd, but he and his supporters were driven off. They fled to the mountains where they remained until 541/1146. In that year ʿAlam, the Nadjāḥid queen in Zabīd, against the advice of her advisers, allowed ʿAlī and his supporters to return to Tihāma. ʿAlam died in 545/1150, an event which signalled the opening of a long, ruthless and extremely cruel campaign conducted by the Mahdids against Zabīd and the surrounding area of Tihāma from the mountains above. The town stood firm against appalling acts of terror. ʿAlī was compelled in 549/1154 to journey to the court of the Zurayʿid ruler in Dhū Djibla, Muḥammad b. Sabaʾ. ʿUmāra too was present at the meeting and tells us that ʿAlī left empty-handed. The Zurayʿid refused to assist him against Zabīd (Kay, *Yaman*, 94-5). ʿAlī began to intrigue among the Nadjāḥid *amīrs* and in 551/1156 he engineered the murder of Surūr al-Fātikī, a key figure in the declining Nadjāḥid house. Despite the brave resistance of its inhabitants, Zabīd finally fell to ʿAlī b. Mahdī in 554/1159. The latter had just only established himself in the town, however, when he died.

The events which followed the death of ʿAlī are difficult to unravel and our sources differ in their accounts. He was succeeded either by two sons jointly, Mahdī b. ʿAlī and ʿAbd al-Nabī b. ʿAlī, or by the former only. Whatever the truth of the matter, the Mahdids consolidated former Nadjāḥid territory in Tihāma, made peace with the Zurayʿids based in Aden and al-Dumluwa, and raided other areas in the south, notably Laḥdj and al-Djanad. Mahdī died in 559/1163.

ʿAbd al-Nabī assumed full control for the Mahdid house, and the plundering and looting begun under his father, ʿAlī, continued with renewed vigour. Not only the southern areas of Laḥdj and Abyan were attacked, but also raids were made north in Tihāma into the territory of the Sulaymānī *sharīf*s. In such a raid Wahhās b. Ghānim, the Sulaymānī leader, was killed in 560/1164, an act which may well have helped to bring about the Ayyūbid conquest of the Yemen nine years later by Tūrān Shāh b. Ayyūb, the brother of Saladin (Smith, *Ayyūbids and early Rasūlids*, ii, 32-3, 41-2, 46). ʿAbd al-Nabī's thirst for territorial gain continued. Taʿizz and Ibb fell in 561/1165 and he moved on to besiege Aden in the same year. The siege dragged on until 568/1172, when the Zurayʿid ruler of Aden, Ḥātim b. ʿAlī, arrived in Ṣanʿāʾ to beg for assistance to raise the siege from a fellow Ismāʿīlī, the ruler of Ṣanʿāʾ, ʿAlī b. Ḥātim of Hamdān. The latter agreed to help, and with strong tribal support, the Zurayʿid-Hamdān alliance put the Mahdids to flight in 569/1173, thus relieving Aden. ʿAbd al-Nabī and his battered forces retired to Zabīd. Soon afterwards Tūrān-Shāh arrived in northern Tihāma with his Ayyūbid forces from Egypt. Joining up with the Sulaymānīs, who were eager to avenge the Mahdid killing of their leader, the Ayyūbids swept southwards through Tihāma, taking Zabīd and arresting ʿAbd al-Nabī and his brother Aḥmad. Both were executed by strangulation by the Ayyūbids in 571/1176, after what appears to have been a Mahdid attempt to regain control of Zabīd.

2. Religious doctrines. ʿUmāra's account of Mahdid doctrines is perhaps an oversympathetic one. He tells us that ʿAbd al-Nabī followed the Ḥanafī *madhhab*, but regarded sin as infidelity (a view which inevitably led to the charge that he was a Khāridjī) and thus punishable by death. Capital punishment was also prescribed for all those who opposed his teachings, as well as for wine drinking, singing and unlawful sexual intercourse. Property was held in common and a communal pool of horses, military equipment etc. was maintained. All other sources took a less charitable view of ʿAbd

al-Nabī's politico-religious leanings. He is painted as a man of great evil, plundering and looting in a mad attempt to conquer the world. Rather than punish wine-drinkers, he was himself a drunkard, they inform us, and a womaniser into the bargain. Certainly, the Khāridjī label stuck and ʿAbd al-Nabī is depicted in Yemeni and non-Yemeni sources alike as a fanatic whose removal from power in the Yemen was of sufficient importance to Saladin in Egypt to bring about the Ayyūbid conquest under his brother, Tūrān-Shāh, in 569/1173. The causes of the Ayyūbid conquest were of course numerous and complex (cf. Smith, *op. cit.*, ii, 31-49), but it is not beyond the realms of possibility that the presence of this "evil Khāridjī" in the Yemen did add weight to the argument in favour of bringing the Yemen under Ayyūbid control.

Bibliography: The earliest source of Mahdid activities is ʿUmāra's *Taʾrīkh*, found in H. C. Kay, *Yaman, its early mediaval history*, London 1882, with English translation: a whole section of chapter 3 of the present writer's *The Ayyūbids and early Rasūlids in the Yemen*, GMS, XXVI/2, London 1978, 56-62, with full references, is devoted to the Banū Mahdī, and the references to them in a section on the reasons for the Ayyūbid conquest of the Yemen is given in the text above; other important sources, mainly still in ms. form, for the Mahdid period are as follows: al-Djanadī, *al-Sulūk fī ṭabaḳāt al-ʿulamāʾ wa 'l-mulūk*, Chester Beatty ms. 3110, i and ii; al-Khazradjī, *al-Kifāya wa 'l-iʿlām*, *etc.*, Leiden ms. 805, and *al-ʿIḳd al-fākhir al-ḥasan*, *etc.*, Cambridge U.L., ms. King's 72; ʿImad al-Dīn Idrīs, *Kanz al-akhyār fī maʿrifat al-siyar wa 'l-akhbār*, British Library ms. Or. 4581; Ismāʿīl b. al-ʿAbbās, *Fākihat al-zaman, etc.*, Rylands ms. 253; Ibn al-Daybaʿ, *Ḳurrat al-ʿuyūn fī akhbār al-Yaman al-maymūn*, now published in 2 vols., ed. Muḥammad b. ʿAlī al-Akwaʿ, Cairo 1977; the late Zaydī chronicle of Yaḥyā b. al-Ḥusayn, *Ghāyat al-amānī*, etc., ed. S. ʿA. F. Ashour, Cairo 1968, 2 vols., is occasionally of value; the principal non-Yemeni sources which mention the removal of ʿAbd al-Nabī as being a cause of the Ayyūbid conquest of the Yemen are Abū Shāma, *Rawḍatayn*, i, 552; Ibn al-Athīr, xi, 261; Ibn Wāṣil, *Mufarridj*, i, 238; Ibn Khallikān, tr. de Slane, i, 284, iv, 504; Maḳrīzī, *Khiṭaṭ*, ii, 37. (G. R. SMITH)

AL-MAHDIYYA, formerly called AL-MAʿMŪRA, a town of Morocco, on the Atlantic coast at the mouth of the Wādī Sabū (Sebou), built on a rocky promontory which dominates the valley of the river. Situated on the southern extremity of the plain of Gharb and 20 miles to the north-east of Salé (Salā), it enjoys a geographical position of the first importance. A port has been created here for ships of heavy tonnage, which cannot sail up the Wādī Sabū as far as the river port of Ḳnīṭra (al-Ḳunayṭira, Kénitra [see ḲANṬARA]) situated 6 miles as the crow flies from the mouth of the river.

It is generally agreed that the site of al-Mahdiyya corresponds to that of one of the earliest Phoenician settlements founded by Hanno in the 5th century B.C. on the Atlantic coast of Morocco, sc. the factory of Thymiateria. Nothing is known of the later history of this foundation and we have to wait till the 4th/10th century to get the first mention in Arab writers of the town at the mouth of the Wādī Sabū under the names al-Maʿmūra ("the populated, the flourishing"), Ḥalḳ ("the mouth") al-Maʿmūra or Ḥalḳ Sabū. According to the chronicler Abu 'l-Ḳāsim al-Zayyanī, the modern town was founded by the short-lived dynasty of the Banū Ifran [*q.v.*] which settled on the Atlantic side of Morocco at the end of the 4th/10th century. In the second half of the 6th/12th, the Almohad sultan ʿAbd al-Muʾmin built there one of his dockyards for his navy (*dār al-ṣināʿa*). Later, down to the 10th/16th century, al-Maʿmūra's history is obscure; it was a small trading centre to which a few European ships came for the products of the country.

Al-Maʿmūra, when the Christians of the Iberian peninsula made their offensive against Morocco, was one of their first objectives; on 24 June 1515 a large Portuguese fleet anchored at the mouth of the Wādī Sabū and a landing force of 8,000 men occupied the town without a blow being struck. The Portuguese made themselves a strong base in al-Maʿmūra, built fortifications there, remains of which still exist, but they were only able to hold it for a short time. The Muslims drove the Christians out of al-Maʿmūra at the end of the same year, inflicting very heavy losses upon them.

Al-Maʿmūra re-enters history when at the end of the 10th/16th century it became a formidable nest of European pirates, who, under the leadership of an English captain, Mainwaring, practised piracy along the whole Atlantic coast and became a terror to the seafaring centres of Europe. This state of things was put an end to when Spain, which in 1610 had occupied the port of Larache (al-ʿArāʾish [*q.v.*]), a little farther north, made a landing at al-Maʿmūra in Radjab 1023/August 1614, after negotiations with the Moroccan ruler, the Saʿdid Mawlāy Zaydān. The town was taken and the Spanish fleet withdrew, leaving a strong garrison of 1,500 men. The captured town was given the name of San Miguel de Ultramar.

The Spanish occupation of al-Maʿmūra was to last 67 years, during which it was several times fiercely attacked by the Muslims, particularly the "volunteers of the faith" (*mudjāhidūn*), who mobilised to drive the Christians from the various points on the coast where they had established themselves under the active leadership of the chief al-ʿAyyāshī of Salé. The principal attacks on San Miguel de Ultramar were delivered in 1628, 1630 and 1647. In 1092/1681, the ʿAlawid sultan Mawlāy Ismāʿīl laid siege to the town and finally took it by storm. He then gave it the name of al-Mahdiyya; the name of al-Maʿmūra only survived as that of the great forest of cork oaks which lies between Salé and the lower valley of the Wādī Sabū.

It may be noted that, for a few years at an earlier date, the name al-Mahdiyya had been borne in Morocco by the little military station founded by the Almohad caliph ʿAbd al-Muʾmin on the site of the future Ribāṭ al-Fatḥ (Rabat), on the south bank at the mouth of the Wādī Salā (the modern Wād Bū-Regreg). Al-Mahdiyya was occupied by French troops in 1911.

Fairly important remains survive at al-Mahdiyya, dating from the brief Portuguese occupation, the Spanish occupation or from the time when it was definitely retaken by the Muslims. Around the citadel (*ḳaṣba*) runs a continuous rampart with a ditch. These defences are entered by two gates; one, very massive and with two Arabic inscriptions, dates from the 11th/17th century. The other, a simple postern, dating from the Spanish occupation, opens on the steep slope which runs down to the sea. Inside are the ruins of the Muslim governor's palace of the 18th century. Between the foot of the citadel and the bank of the Wādī Sabū for a length of 200 m.

and a breadth of about 40 m. might still be seen buildings consisting of a series of square chambers completely isolated from one another and each protected by a double wall. These were probably granaries, which need not be earlier than the end of the 11th/17th century, and are not, as has been suggested, of the Phoenician period.

(E. Lévi-Provençal)

AL-MAHDIYYA, a town in Tunisia which owes its name to its founder ʿUbayd Allāh al-Mahdī (297-322/909-34 [*q.v.*]); situated on the coast 200 km. to the south of Tunis, it is the regional capital of a province of which the population, 218,000 inhabitants at the time of the 1975 census, is estimated in 1980 at 247,000. The population of the town, numbering 12,000 inhabitants in 1905, has grown steadily to 14,937 (1946 census), 18,494 (1956) and 21,788 (1966).

Foundation.

The creation of al-Mahdiyya by the Fāṭimids responded to a need which had already made itself felt since the end of the previous epoch, that of the Aghlabids. The last *amīr*s of this dynasty had in fact left Kairouan (al-Ḳayrawān) for Tunis. When prospecting along the coast beyond Tunis, which did not attract his choice, in the search for the site to be selected for the creation of his new capital, the Ismāʿīli Shīʿī Mahdī followed the same motivations, with the additional concern of security. A *post eventum* prediction has him prophesying the insurrection of Abū Yazīd al-Nukkārī [*q.v.*], the violent thrust of which was broken only by the ramparts of al-Mahdiyya, and thus gives a hagiographical explanation of its foundation. In fact, besides considerations of prestige and the constant concern of founders of dynasties throughout Muslim history to mark the new order through the creation of a new capital, the preoccupations of the Mahdī were more immediate: to build defences, at a good distance and in a secure place, against an eventual assault by Sunnīs implacably hostile to the Shīʿīs, a storm whose epicentre could be nowhere other than Kairouan. The Khāridjī menace was at that time less predictable.

The chosen site offered ideal security safeguards for a dynasty possessing a powerful navy, this being inherited from the Aghlabids. Built on a spur projecting some 1,400 m. into the sea, and approached by "a road narrow as a shoe-lace" (al-Muḳaddasī, *Aḥsan al-taḳāsim*, partial ed.-tr. Ch. Pellat, Algiers 1950, 17), the town was impregnable from the land, which explains the choice of ʿUbayd Allāh who, after the failure of his attempted invasions of Egypt, was obliged to secure his bases, for an indefinite duration, in Ifrīḳiya.

Numerous written and archeological sources indicate that ancient settlements, Punic and Roman, preceded the Fāṭimid occupation of the region. Arabic texts preserve the memory of Djumma, usually identified with the ancient Gummi. But there is nothing to suggest that the peninsula itself had been "occupied by an urban settlement before the 4th/10th century" (A. Lézine, *Mahdia*, Paris 1965, 17). ʿUbayd Allāh thus chose to build, in 300/912-13 (Ibn ʿIdhārī, *Bayān*, ed. Colin and Lévi-Provençal, Leiden 1948, i, 169), on a virgin site and, the work completed, he inaugurated his new capital on 8 Shawwāl 308/20 February 921 (Ibn ʿIdhārī, *Bayān*, i, 184; al-Ḳāḍī al-Nuʿmān, *Iftitāḥ*, ed. W. al-Ḳāḍī, Beirut 1970, 275, ed. F. Dachraoui, Tunis 1975, 372-8).

A city of refuge, al-Mahdiyya was surrounded by a defensive wall of unusual thickness (8.30 m.), which followed the coast and of which a long section to the north is still recognisable. A rampart 175 m. in length barred the entrance to the isthmus, and was preceded, at a distance of 40 m., by an outer wall. Access to the town was gained by means of an iron gate decorated with bronze lions, leading through a domed vestibule 35 m. long by 5.10 m. broad. Only this vestibule, known as *al-Saḳīfa al-Kaḥla*, is still today entirely upright. The new capital comprised a palace for the Mahdī and another for his son and successor al-Ḳāʾim, administrative buildings, subterranean storehouses for cereals, wells, cisterns, and one mosque which, eroded by the sea and disfigured by extraneous constructions, fell into ruin; recently—in the 1960s—it has been completely restored to its original state under the direction of A. Lézine. The town was also equipped with an arsenal and, on the southern side, a fortified and sheltered inland port, a port which, although not necessarily a reconstructed ancient installation, as might be supposed, was probably designed on the model of a Carthaginian harbour.

History.

A royal town and a citadel, al-Mahdiyya was never heavily populated, being limited by its narrow intra-mural space. The bulk of the population resided in the suburb of Zawīla, which was also the commercial sector. Al-Ḳāʾim (322-34/934-46) encircled this suburb with a ditch. In 332/943 there broke out the revolt of the Nukkārī Khāridjī Abū Yazīd, nicknamed the "Man on the Donkey." The latter, having stormed Kairouan, laid siege to al-Mahdiyya (Djumādā II 333—Ṣafar 334/January-October 945), its ramparts saving the Fāṭimids from a defeat which seemed certain. After the final suppression of the revolt, Ismāʿīl al-Manṣūr (334-41/946-53) nevertheless abandoned the town, which thus lost its capital status, and moved, towards the end of Ṣafar 337/September 948, to his new residence of al-Manṣūriyya, built in the outskirts of Kairouan "on the very site of his victory over the Man on the Donkey" (F. Dachraoui, *Le califat fatimide au Maghreb*, Tunis 1981, 217).

Al-Mahdiyya regained its role as capital, for the last time, as a result of the Hilālian invasion which forced the Zīrid al-Muʿizz b. Bādīs to take refuge there (27 Shaʿbān 449/29 October 1057). It became, from this time onward, a capital under threat, and danger also came from the sea. In 480/1087 "Pisans and Genoans conquered Mahdia and Zawila, which they pillaged and burned" (H. R. Idris, *Zirides*, Paris 1962, i, 288). In 517/1123, the town was attacked, unsuccessfully, by the Normans. In 529/1134, it was subjected to a sea and land assault by the Ḥammādids. Finally, with the treaty of 536/1140-1, the Normans of Sicily imposed harsh conditions on the town, a prelude to its seizure by Roger II (2 Ṣafar 543/22 June 1148), which marked the end of the Zīrid dynasty.

Blockaded, from 12 Radjab 554/30 July 1159,

by sea and land by the fleet and army of ʿAbd al-Muʾmin b. ʿAlī, the Normans were forced to capitulate 10 Muḥarram 555/21 January 1160, and al-Mahdiyya was ruled by an Almohad governor. Four decades later, Muḥammad b. ʿAbd al-Karīm al-Radjrādjī al-Kūmī—of the tribe of ʿAbd al-Muʾmin—allied himself with the Banū Ghāniya, declared himself independent at the beginning of the caliphate of al-Nāṣir (595-610/1199-1213), and took the title of al-Mutawakkil ʿalā 'llāh. In 602/1205, the town was recaptured, along with the whole of Ifrīḳiya, by the caliph, who restored its fortifications.

Under the reign of the Ḥafṣids, during the years 658 and 686/1286 and 1287, numerous towns in the Sahel, including al-Mahdiyya, were sacked by the Admiral Roger of Lauria, acting on behalf of the Aragonese. Then, from 718 to 723/1318-23, Abū Ḍarba, a son of Ibn al-Liḥyānī, ruled the town as an independent possession. In 739/1338-9, al-Mahdiyya was recaptured from the hands of a certain Ibn ʿAbd al-Ghaffār who had taken possession of it, and in *ca.* 761/1360 its fortifications were again restored by the Ḥafṣid minister Ibn Tafrādjīn. In 1390, between 20 July and 20 September, it was subjected to attack by a veritable crusade conducted by the Genoese with support from French and English knights. The town resisted, but was obliged to pay tribute to have the siege raised.

At the end of the reign of the Ḥafṣids, the town was the object of bitter contention between the Turks and the Spanish. The latter besieged it in 1509, then established a garrison there in 1539 after the capture of Tunis by Charles V. But Dragut took possession of it the following year. Temporarily driven from the town, he returned and remained in control until 8 September 1550, on which date the admiral Andrea Doria captured the place on behalf of Charles V, who destroyed the town's defences in 1554 before abandoning it.

In 1689 there was an outbreak of plague in the city, and in 1740 it was deserted by its population, a population severely punished by ʿAlī Pasha for its loyalty to his uncle. In 1848, the Christian population of the city was judged sufficiently important to justify the creation of a parish. In 1856, an outbreak of cholera claimed many victims. In spite of its cautious stance during the uprising of 1864, incited by the doubling of the *mejba* tax, "Mahdia, a city without defences, was pillaged on 25 April by the neighbouring villagers" (J. Ganiage, *Les origines du protectorat français en Tunisie (1861-1881)*, Paris 1959, 228), and was ruined, as was the whole of the Sahel, by the combined effects of the expedition of Zarrouk and the depredations of creditors and usurers.

After the establishment of the Protectorate, al-Mahdiyya was endowed with its first French school in 1884, became a judicial seat in 1885, and was not slow to participate actively in the nationalist movement. On 6 August 1920, a demonstration against the cost of living developed into a riot; on 21 March 1925, the city responded to the call for a general strike demanded throughout the country by the Destour in protest against reforms which were judged insufficient; and from 18 to 20 April 1933, again at the behest of the Destour, there were new demonstrations against the burial in Muslim cemeteries of naturalised French Tunisians.

The urban development of al-Mahdiyya naturally corresponded to the fluctuations in its history. The suburb of Zawīla, obliterated by the Hilālian assault, was rebuilt in *ca.* 597/1200, and in the same period, a little further to the north-west, there is the first mention of the village of Hibūn. Then from the 16th century onward, the character of the town was changed completely as a result of the ethnic element introduced by Turkish garrisons, with the additional influx, after 1609, of Moors driven out of Spain. Today, 60% of the urban population of al-Mahdiyya is composed of descendants of Kouloughlis [see Ḳul-oghlu], representing, in this respect, the highest proportion in Tunisia, with perceptible effects on names and customs.

The two principal riches of al-Mahdiyya consist of olive-growing and fisheries. The cotton plantations, mentioned in the 18th and 19th centuries (Lucette Valensi, *Fellahs tunisiens* ..., Lille 1975, 219), have today disappeared. Industries associated with olive-growing and fisheries—the sardine industry in particular—have on the contrary undergone large-scale expansion, and activities such as oil-extraction, refining, soap manufacture and the canning of food, etc., are flourishing.

The city has today overflowed its original isthmus and is developing along two arterial axes: towards Sfax, and especially in the direction of Sousse. Its leading literary figures, dating from the early Ḥafṣid era, are two poets, Abū ʿAmr ʿUthmān al-Ḳaysī, known by the name of Ibn ʿUrayba (d. 659/1260), and Ibn al-Simāt (d. 690/1291). Also worthy of mention, from the point of view of Ṣūfism, is the *ḳuṭb* [*q.v.*] al-Dahmānī (d. 621/1224), a disciple of Abū Madyan [*q.v.*].

al-**MAHDIYYA**, a movement in the Egyptian Sudan, launched in 1881 by Muḥammad Aḥmad b. ʿAbd Allāh (Muḥammad al-Mahdī) for the reform of Islam. It had from the outset a political and revolutionary character, being directed against the Turco-Egyptian régime (*al-Turkiyya*), which it overthrew, establishing a territorial state. Under the Mahdī's successsor, the Khalīfa ʿAbd Allāh [see ʿAbd Allāh b. Muḥammad al-Taʿāʾishī, and Khalīfa. iv], this developed essentially into a traditional Islamic monarchy until its existence was

terminated by the Anglo-Egyptian reconquest (1896-8).

1. Mahdist antecedents. Only one previous mahdist claimant seems to have originated in the Nilotic Sudan before the *Turkiyya*, a 17th-century Ṣūfī ascetic, Ḥamad al-Naḥlān alias Wad al-Turābī. His claim was rejected by the Fundj [*q.v.*] king of Sinnār, Bādī II. He is represented as clashing with the tax-gatherers of Bādī III (cf. S. Hillelson, *Sudan Arabic texts*, Cambridge 1935, 174-93). The immediate antecedents of the Sudanese Mahdiyya are to be found in a mood of eschatological expectation, which appears first in Egypt in the late 18th and 19th centuries, reflecting the popular consciousness that traditional Islamic society was threatened both by infidels from without and despots within. Mahdist expectations were thus attached to Djezā'irli Ghāzī Ḥasan Pasha [*q.v.*] during his expedition against the duumvirate of Ibrāhīm Bey [*q.v.*] and Murād Bey (Djabartī, *ʿAdjāʾib*, ii, 114), while an insurrection against the French in 1799 was headed by a mahdist claimant of Maghribī origin (*ʿAdjāʾib*, iii, 58). A revolt in Upper Egypt against Muḥammad ʿAlī Pasha in 1822-3 was led by another mahdist claimant (ʿAlī Mubārak, *al-Khiṭaṭ al-djadīda*, xiv, 76). A manifesto against the Sudanese Mahdī mentions a predecessor in Khartoum (al-Khurṭūm [*q.v.*]), Ibrāhīm al-Sūdānī, of whom nothing further is known (Shuḳayr, *Taʾrīkh al-Sūdān*, iii, 379): the name suggests a person of southern Sudanese origin. The Sudanese Mahdiyya was thus the latest and most successful of a cluster of mahdist movements which, while formally presenting themselves in religious terms, had markedly social and political aims.

2. The revolutionary situation in the Egyptian Sudan. During the sixty years preceding the outbreak of the Mahdiyya, profound changes had affected the traditional society and Islam of the Nilotic Sudan, culminating in a revolutionary situation. Muḥammad ʿAlī Pasha's conquests (1820-1) ended the independence of numerous sedentary and nomadic groups. His establishment of a centralised and autocratic administrative system with its unaccustomed fiscal burdens (undoubtedly aggravated by corruption and extortion) had a traumatic effect. Moreover, the demands of modernisation in Egypt meant that the officials in the Sudan were rarely of high quality or integrity.

One group whose political and social status declined under the *Turkiyya* was that of the indigenous men of religion (sing. *fakī* < *faḳīh*), who during the previous three centuries had fulfilled a range of functions as teachers of the Ḳurʾān and *Sharīʿa*, Ṣūfī leaders, arbitrators, and intercessors with the rulers. The establishment of an orthodox hierarchy of *ʿulamāʾ*, serving in government mosques, and integrated into the judicial system, created a rival group of religious leaders. Although individual members of the old *fakī* families took advantage of the greater opportunities to study at al-Azhar and enter the official hierarchy, there remained a fundamental incompatibility between the *fakī*s and the government-supported *ʿulamaʾ*, whom the Mahdī was to designate *ʿulamāʾ al-sūʾ*.

Developments in the two decades preceding the Mahdiyya heightened the tension between the *Turkiyya* and the inhabitants of the Egyptian Sudan. The vigorous autocracy of Khedive Ismāʿīl (1863-79) [*q.v.*] made the power of government felt once more after the comparative laxity which had begun in Muḥammad ʿAlī Pasha's last years and continued under his successors. The former sultanate of Dār Fūr [*q.v.*] was annexed in 1874. Since the middle of the century, traders seeking ivory and slaves had thrust into unexplored regions far up the White Nile and the Baḥr al-Ghazāl [*q.v.*], outside the Muslim and arabised northern Sudan, and completely beyond the control of the Turco-Egyptian officials. The slave-trade that was fed from these regions was a scandal to Europe. To bring the south and west under his administration, and thereby to suppress the slave-trade, was a principal aim of the khedive.

The implementation of this policy would in any event have antagonised vested interests, particularly the diaspora of northern Sudanese, the Danāḳla and Djaʿaliyyūn [*q.v.*], who were involved in the slave-trade, and who ranged from petty dealers (*djallāba*) to merchant-princes such as al-Zubayr Raḥma Manṣūr, the master of the western Baḥr al-Ghazāl and the conqueror of Dār Fūr. The situation was rendered more critical by the khedive's recruitment of Europeans and Americans to carry out his plans; this employment of Christians in high office shocked the conservative piety of the Sudanese. Chief among these expatriates was the British officer Charles George Gordon (cf. Bernard M. Allen, *Gordon and the Sudan*, London 1931), who as governor of the Equatorial province (1873-6) and governor-general of the Sudan (1877-9) played a leading part in the attempts to establish khedivial administration in the south and to suppress the slave-trade. With their inadequate resources, Gordon and his colleagues attained only limited success. The deposition of Ismāʿīl (June 1879) was followed by Gordon's withdrawal, and the comparative feebleness of their successors in Cairo and Khartoum facilitated the drift towards insurrection in the Sudanese provinces.

3. The early career of Muḥammad al-Mahdī (1844-81). Muḥammad Aḥmad b. ʿAbd Allāh was born in 1844 in the province of Dongola [*q.v.*]. His father was a boat-builder, and when Muḥammad Aḥmad was a child the family moved to Kararī on the Nile, a few miles north of Khartoum, where there was an adequate supply of timber. After their father's death, Muḥammad Aḥmad's brothers followed his trade, but he himself underwent a traditional religious education within the Egyptian Sudan. He early showed a propensity towards asceticism and Ṣūfism, and in 1861 he attached himself to Shaykh Muḥammad Sharīf Nūr al-Dāʾim, the grandson of the founder of the Sammāniyya *ṭarīḳa* in the Sudan. When his brothers moved for timber to Abā island in the White Nile, he accompanied them, and from 1870 made his headquarters there. His pious reputation gained him many followers, a development which was the probable cause of a breach with Shaykh Muḥammad Sharīf, in consequence of which Muḥammad Aḥmad attached himself to a rival leader of the Sammāniyya, Shaykh al-Ḳurashī wad al-Zayn (d. 1878). In 1881 he was joined by the man who was to become his most intimate disciple and his successor as head of the Mahdist state, ʿAbd Allāh b. Muḥammad [*q.v.*], who came from the Taʿāʾisha Baḳḳāra [*q.v.*], cattle-Arabs of Dār Fūr. A mahdist expectation was abroad in the Egyptian Sudan, and was shared by Muḥammad Aḥmad himself. There was evidence of it in Kordofan (Kurdufān) [*q.v.*], which he visited about his time. ʿAbd Allāh b. Muḥammad had, some years previously, saluted al-Zubayr Raḥma as *mahdī* —a role which the conqueror of Dār Fūr declined. It is probable that ʿAbd Allāh played a decisive part in the spiritual crisis of which the outcome was Muḥammad Aḥmad's claim to be the Expected

Mahdī. This was first secretly communicated to his disciples at Abā (March 1881), and then to other adherents during a second visit to Kordofan. The public manifestation (*ẓuhūr*) of the Mahdī took place on 29 June 1881. Letters were sent to various notables urging them to rally to him, and he announced his divine mission in a telegram to the governor-general.

While the Mahdiyya had in its origins many characteristics of a movement of social and political protest, these aspects were subsumed in the founder's primary aim: the reform of Islam, encompassing both the cult and the society. Like previous reformers, notably Ibn ʿAbd al-Wahhāb [*q.v.*], he envisaged the restoration of the primitive Islamic *umma* governed by the Ḳurʾān and the Sunna. Unlike Ibn ʿAbd al-Wahhāb, however, Muḥammad Aḥmad was deeply impregnated by the emotional and imaginative quality of Ṣūfism. He saw his movement not merely as the revival of Islam, but as the recapitulation of the life and order of the primitive *umma*: a divinely ordained correspondence between *Urzeit* and *Endzeit*. He presented himself as appointed to the supreme succession (*al-k͟hilāfa al-kubrā*) as Successor of the Apostle of God (*K͟halīfat Rasūl Allāh*), while his leading disciples were the successors of the Rightly-guided Caliphs. Three of these were appointed soon after the Manifestation. ʿAbd Allāh b. Muḥammad's status was recognised in his title of *K͟halīfat al-Ṣiddīḳ*, i.e. the successor of Abū Bakr. An early follower, ʿAlī b. Muḥammad Ḥilū (ʿAlī wad Ḥilū) was appointed the successor of ʿUmar (*K͟halīfat al-Fārūḳ*), and the Mahdī's young son-in-law, Muḥammad S͟harīf b. Ḥāmid, was appropriately named the successor of ʿAlī (*K͟halīfat al-Karrār*). The appointment of successor of ʿUt͟hmān was offered to the contemporary head of the Sanūsiyya, Muḥammad al-Mahdī, whose co-operation Muḥammad Aḥmad was anxious to obtain, but the offer, made in May 1883, was ignored. By another parallelism with the Prophet, the Mahdī styled his followers Anṣār.

The official *ʿulamāʾ* endeavoured to confute the mahdist claims of Muḥammad Aḥmad by stating the orthodox Sunnī doctrine of the *mahdī* and demonstrating Muḥammad Aḥmad's failure to conform to the criteria laid down in *Ḥadīt͟h*. He defended his position by reasserting his divine election, conveyed in a colloquy (*ḥaḍra*) by the Prophet. At the same time, he emphasised where possible points of conformity with *Ḥadīt͟h*. Thus he adapted his name to Muḥammad b. ʿAbd Allāh, emphasised his descent from the Prophet, and changed the name of his rendez-vous in Kordofan from D͟jabal Ḳadīr to Māssa.

4. **The Mahdī's *hid͟jra* and *d͟jihād*** (1881-5). The authorities at first underestimated the Mahdī's challenge, but when a small military expedition sent to arrest him was routed (August 1881), the matter was taken seriously. The Mahdī and his Anṣār meanwhile made a withdrawal (the *hid͟jra*) to D͟jabal Ḳadīr in the Nūba Mountains. The remoteness of this place rendered military operations by the government difficult (two expeditions were defeated in December 1881 and May 1882), while it formed an appropriate base for attacks on government positions in Kordofan. From southern Kordofan and Dār Fūr the Mahdī could draw on a vast reserve of Baḳḳāra tribesmen, whose propensity to raiding found a sanctified outlet in this warfare. Since the Mahdī regarded only those who accepted his mission as true Muslims, such fighting was designated *d͟jihād* [*q.v.*]. The government troops were, however, capable of prolonged resistance in fortified positions, and an attempt to storm the provincial capital El Obeid (al-Ubayyiḍ) on 8 September 1882 was a failure. Henceforward the Mahdī relied upon siege-tactics, and the tribal forces were supplemented with a corps known as the *d͟jihādiyya*, largely recruited from captured government troops of southern Sudanese origin. They were provided with firearms, which the Mahdī was anxious to keep out of the hands of the undisciplined tribal warriors.

The surrender of El Obeid (19 January 1883) gave the Mahdī an administrative centre, and Kordofan formed the nucleus of a territorial Mahdist state. In the meantime, khedivial control had been further weakened by the British occupation of Egypt (September 1882) and the reluctance of the British government to undertake commitments in the Sudan. An Egyptian expeditionary force was, however, organised with Col. William Hicks, a retired Indian Army officer, as chief of staff. Advancing through difficult country from the White Nile into Kordofan, it was annihilated by the Anṣār at S͟haykān (5 November 1883). The Mahdī was now the master of the west. Dār Fūr and Baḥr al-G͟hazāl were surrendered by their European governors in December 1883 and April 1884 respectively. Meanwhile, ʿUt͟hmān Diḳna (Osman Digna), from a mercantile family of Suakin (Sawākin) had been sent (May 1883) to raise the Bed͟ja [*q.v.*] of the Red Sea hills, a mission in which he was largely successful through the support of an influential *faki*, S͟hayk͟h al-Ṭāhir al-Mad͟jd͟hūb, so that by the end of February 1884 only Suakin itself remained in Egyptian hands.

Khartoum and the riverain areas to the north were now threatened. At this juncture, Gordon was sent out by the British government, primarily to report on the military situation, but he was also appointed (at his own request) governor-general by the khedive. Arriving at Khartoum (February 1884), he produced a succession of plans for the future of the Sudan while the Anṣār closed in on the city. ʿUt͟hmān Diḳna's successes closed the route from the Red Sea to the Nile, while the fall of Berber [*q.v.*] to an army of Anṣār (May 1884) cut the river line to Egypt. Military pressure on Khartoum itself was increasing, and between April and October 1884 the Mahdī brought up his main forces from El Obeid to Omdurman (Umm Durmān) opposite the capital. Weakened by siege, the city fell on 25 January 1885, Gordon being killed in the fighting.

The fall of Khartoum marked for all practical purposes the end of the Mahdī's *d͟jihād*. He was now the ruler of the chief provinces of the Egyptian Sudan from Dongola to Baḥr al-G͟hazāl, and from the Red Sea to Dār Fūr. He ordered the evacuation of Khartoum, and made his own capital at Omdurman, where he died after a short illness (22 June 1885).

5. **The rule of the K͟halīfa ʿAbd Allāh** (1885-98). The Mahdī's death confronted the Anṣār with two problems, one practical, the other ideological. First, who was to take the Mahdī's place as ruler of the nascent state? Secondly, how was the Mahdī's death to be explained, since he had claimed a universal mission to restore Islam, but had achieved only a conquest within the boundaries of the Egyptian Sudan? The problem of the succession was in appearance quickly solved when a council of notables in the Mahdī's house immediately after his death gave their allegiance (*bayʿa*) to ʿAbd Allāh b. Muḥammad. Already in the critical period of political development following the fall of El Obeid, the Mahdī had conferred plenary powers on ʿAbd Allāh,

so that he was henceforward the deputy of the Mahdī (*khalīfat al-Mahdī*), although he did not use this title until after the Mahdī's death. He was, furthermore, the commander of the largest body of tribal warriors concentrated in Omdurman. His political and military pre-eminence was recognised in his election as the Mahdī's successor. This event suggested how the ideological problem arising from the Mahdī's death could be handled. A proclamation stressed the parallel between the succession of Abū Bakr al-Ṣiddīḳ to the Prophet and that of *Khalīfat al-Ṣiddīḳ* to the Mahdī, and urged the Anṣār to follow the example of the early Muslims, who had fought for their faith after the Prophet's death. There was other propaganda, much of it of a visionary or mystical nature, to legitimise ʿAbd Allāh's succession.

His position was not, however, uncontested. *Khalīfat al-Karrār* Muḥammad Sharīf was the ostensible leader of the Ashrāf (i.e. the kinsmen of the Mahdī), a group whose overweening pretensions the Mahdī himself had rejected in his last days. The Ashrāf were the élite of the sedentaries from the northern riverain areas and their diaspora, known as *awlād al-balad* [*q.v.*]. This comparatively sophisticated group had little in common with the Baḳḳāra tribal warriors, whose ascendancy was assured by the accession of the Khalīfa. Within twelve months he had defeated a conspiracy hatched by the Ashrāf in Omdurman and their kinsman Muḥammad Khālid, the governor of Dār Fūr. The Khalīfa's fellow-tribesmen or their clients replaced the Mahdī's appointees in the provincial governorships, with the exception of ʿUthmān Diḳna, who was essential to handle the Bedja. In 1888-9 the Khalīfa enforced a mass emigration of the Taʿāʾisha, who were settled in Omdurman and its vicinity. Although *awlād al-balad* continued to be indispensable in the civil service and judiciary of the Mahdist state, they had lost political power, and a dangerous rift opened between them and the ruling Baḳḳāra.

Having established his authority, the Khalīfa sought to fulfil the programme of conquest which had been cut shortly by the Mahdī's death. The *djihād* was actively pursued for several years at heavy cost to a people suffering from the effects of the revolutionary war and population movements. The Christian kingdom of Ethiopia under John IV was a principal theatre of the *djihād*, although the fighting should be seen in the historical context of conflicts going back to the Fundj period. A successful raid by Ḥamdān Abū ʿAndja, one of the Khalīfa's clients, penetrated to Gondar (January 1888), and took booty and slaves, while in the following year (after Abū ʿAndja's death) King John was killed in battle at al-Ḳallābāt (March 1889), a victory which was widely publicised by the Khalīfa. These were however incidents in border-warfare, resulting in no significant territorial gains.

The second main objective of the *djihād* was Egypt, now firmly under British military and political direction. An invasion had been planned before the Mahdī's death, the Djaʿalī general ʿAbd al-Raḥmān al-Nudjūmī being its intended commander. The project hung fire for several years, although al-Nudjūmī made his headquarters at al-ʿUrḍī (New Dongola) in Nov. 1886. The Khalīfa's mistrust of *awlād al-balad* led to encroachments on al-Nudjūmī's command, which he was compelled to share with a Taʿāʾishī. In the summer of 1889 the Mahdist force at last advanced on Egypt, but on 3 August was annihilated at Toski (Ṭūshkī), north of Wādī Ḥalfā, al-Nudjūmī himself being killed in the fighting. There was no further attempt at invasion, although there were raids, sometimes serious, into Egyptian-held territory.

A similar stalemate developed in the west and south. The Fūr had never been reconciled to the recent loss of their independence, and after the withdrawal of Muḥammad Khālid, a member of the old royal clan sought to re-establish the sultanate (1887). He was overthrown by the new governor, ʿUthmān Ādam alias Djānū, a young kinsman of the Khalīfa, who in the following year suppressed a still more dangerous revolt. This was headed by a charismatic leader known as Abū Djummayza, who claimed the vacant position of successor of ʿUthmān. Abū Djummayza's death from smallpox somewhat relieved the position of the Anṣār, who defeated the insurgents outside El Fasher (al-Fāshir [*q.v.*]), the provincial capital (February 1889). Djānū showed himself to be a competent governor, but on his early death (September 1890), the combined provinces of Dār Fūr and Kordofan passed into the less capable management of another of the Khalīfa's kinsmen, Maḥmūd Aḥmad.

The pagan southern regions, so recently brought under the khedivial administration, were never integrated into the Mahdist state. Although (as mentioned above) Baḥr al-Ghazāl had fallen in 1884, its governor Karam Allāh Muḥammad Kurḳusāwī, a Dunḳulāwī trader by origin, withdrew his troops in October 1885 to fight the Rizayḳāt Baḳḳāra of Dār Fūr. Thereafter, Baḥr al-Ghazāl drifted out of Mahdist control. The Equatorial province was even more remote from the centre of the Mahdiyya. Its governor since 1878 had been Emīn Pasha (Eduard Schnitzer, of Silesian Jewish origin, and the last of Khedive Ismāʿīl's expatriate officials), who in spite of mutiny and two Mahdist invasions (1885, 1888) held out until forcibly rescued by H. M. Stanley (1889). The second invading force, however, established a garrison at al-Radjdjāf, which maintained sporadic contact with Omdurman by steamer. The Mahdists held little more than the river line, and their position was challenged by former government troops, who had refused to be evacuated by Stanley, and who were led by Faḍl al-Mawlā Muḥammad, an officer of southern Sudanese origin. Al-Radjdjāf became a place of banishment for political and other prisoners.

The year 1889 marks the end of the militant phase of the Mahdiyya. The following period saw the stabilisation of the Khalīfa's autocracy within a territorial state limited for all practical purposes to the Muslim and arabised regions of the northern Sudan. A factor in the decline of militancy was the great famine of 1888-90, the effects of which were aggravated by the migration of the Taʿāʾisha to Omdurman. For the second time, the Khalīfa's authority was challenged by a revolt of the Ashrāf in Omdurman under the leadership of Muḥammad Sharīf (November 1891). After some desultory firing and a few casualities, a formal reconciliation was effected by *Khalīfat al-Fārūḳ* ʿAlī b. Muḥammad Ḥilū on terms advantageous to the Ashrāf. The danger once past, the Khalīfa proceeded to destroy his opponents piecemeal. Muḥammad Sharīf himself was arrested in March 1892, and sentenced to imprisonment by a special tribunal. Thereafter the Khalīfa's autocracy was unchallenged. His only intimates in matters of government were his half-brother Yaʿḳūb, who acted as his *wazīr* (but without the title), and his son ʿUthmān, who about this time received the honorific

of *Shaykh al-Dīn*, and was trained for the eventual succession.

While the Khalīfa thus strengthened his position internally, there was increasing European pressure on the frontiers of the Mahdist state. Suakin, which alone among the garrisons of the Red Sea area had not fallen to ʿUthmān Diḳna, formed the base for a campaign against the local Anṣār after the Anglo-Egyptian victory at Toski. The operations, early in 1891, culminated in the capture of ʿUthmān Diḳna's headquarters at Tokar (Tūkar) in Feb. 1891. Although still a nuisance, he was no longer a threat to the Anglo-Egyptian forces in the vicinity. In the previous year Eritrea had been constituted an Italian colony. A Mahdist raid into the territory was routed (December 1893), and in July 1894 the Italians with the prior agreement of the British government occupied Kasala [*q.v.*]. The loss of this important strategic position was even more serious than that of Tokar, but in spite of making a threatening demonstration in Omdurman, the Khalīfa did not take the offensive. The Italian presence in Eritrea was equally threatening to Menelik II, who had emerged as the ruler of Ethiopia after the death of John IV. In 1895 he sought to establish friendly relations with the Khalīfa, but his overtures were repulsed. He repeated them in 1896 after his victory over the Italians at Adowa, and further embassies were received in Omdurman in 1897 and 1898, but no practical military or political co-operation resulted.

A more remote European danger appeared in the far south, when Belgian expeditions from the Congo Free State began to advance towards the Upper Nile and Baḥr al-Ghazāl. In 1892 Faḍl al-Mawlā Muḥammad and his followers entered the service of the Congo Free State, he himself being recognised as the governor of the Equatorial province. In the following year, a Mahdist force was sent to strengthen the garrison at al-Radjdjāf. Its commander, ʿArabī Dafaʿ Allāh defeated and killed Faḍl al-Mawlā (January 1894), and combated the Belgians with some success. His isolated position and precarious communications with Omdurman were, however, insuperable difficulties, and in February 1897 he lost al-Radjdjāf to a Belgian force.

By his time the final assault on the Mahdist state was developing. In March 1896 the British government authorised an advance by the Egyptian army into the Mahdist province of Dongola. While the pretext for the invasion was afforded by the Italian defeat at Adowa, the real reasons lie in British foreign policy and the international situation at the time (see G. N. Sanderson, *England, Europe and the Upper Nile, 1882-1899*, Edinburgh 1965). The Egyptian expeditionary force, commanded by Sir H. H. Kitchener, constructed a railway as it advanced up the Nile from Wādī Ḥalfā. By the end of September 1896 the province was completely occupied. In the following year, Kitchener was authorised to make a further advance. A second railway was constructed across the Nubian desert, reaching the Nile at Abū Ḥamad, and was extended southwards as the Anglo-Egyptian force advanced. Warned by the loss of Dongola, the Khalīfa summoned Maḥmūd Aḥmad with the bulk of his forces from the west to defend the approaches to Omdurman. He proved to be an irresolute commander, lacking in all initiative. His base was al-Matamma [*q.v.*] in Djaʿalī territory. Its inhabitants refused to evacuate their town, which Maḥmūd Aḥmad took by force of arms—an incident which confirmed the hatred of *awlād al-balad* for the Taʿāʾisha. Once established there, Maḥmūd Aḥmad was reluctant to move northwards to confront the invaders, who were steadily advancing along the river-line. Abū Ḥamad fell in August 1897, and the important route-centre of Berber was evacuated in the same month. Maḥmūd Aḥmad, faced with increasing desertions and shortage of supplies, was ultimately goaded to advance. His army (augmented by troops brought in by ʿUthmān Diḳna) was overwhelmed on 8 April 1896 at the battle of the Atbara [*q.v.*], and he himself was taken prisoner. The Anglo-Egyptian advance continued, and the Mahdist state received its death-blow at the battle of Karrarī, often called the battle of Omdurman (2 September 1898). Yaʿḳūb died in the fighting but the Khalīfa escaped, and remained a fugitive for over a year. Finally, he and a handful of Anṣār were defeated by Sir Reginald Wingate in a skirmish (24 November 1899) at Umm Diwaykarāt on the White Nile, in which he was killed. ʿUthmān Shaykh al-Dīn was made prisoner, and died in the following year.

6. Institutions of the Mahdiyya. The rapid development of the Mahdiyya into an armed rebellion, then into a territorial state, necessitated the improvisation first of a command-structure, and secondly of an administrative system. During the lifetime of the Mahdī, the key position in both these respects was occupied by the Khalīfa ʿAbd Allāh. He commanded the Black Flag (*al-Rāya al-Zarḳāʾ*), the largest of the three divisions of the army, consisting of the western Baḳḳāra tribesmen, and in addition he held the title of *amīr djuyūsh al-Mahdiyya*, implying an oversight of the fighting forces as a whole. His two colleagues commanded smaller divisions, the Khalīfa ʿAlī the Green Flag (*al-Rāya al-Khaḍrāʾ*) composed of Baḳḳāra from Kordofan and the White Nile, and the Khalīfa Muḥammad Sharīf the Red Flag recruited from *awlād al-balad*. As previously mentioned, the Mahdī conferred plenary powers on the Khalīfa ʿAbd Allāh in January 1883. The title of *amīr* was held by subordinate officers, who in the early stages of the Mahdiyya had commanded virtually autonomous tribal or local contingents. In May 1884 the Mahdī ordered this term to be discontinued, probably because of its overtones of worldly rank, and substituted *ʿāmil*, but *amīr* has remained in popular usage until the present. With the emergence of a territorial state, the chief officers became military governors of provinces (sing. *imāra*, later *ʿimāla*).

The successes won in the *djihād* made the establishment of a financial system urgently necessary, since the Mahdī had constant difficulty in preventing the tribesmen from appropriating the booty. A treasury (*bayt al-māl*) had probably been organised at Ḳadīr, and after the fall of El Obeid, the Mahdī formally appointed his friend Aḥmad Sulaymān as its commissioner (*amīn bayt al-māl*). The sources of revenue at this time were two: booty (*ghanīma*) and a levy of grain and cattle, to which the term *zakāt* was applied. As under the *Turkiyya*, Ottoman, Egyptian, Austrian and Spanish coins were in circulation. After the taking of Khartoum, the Mahdī minted gold pounds and silver dollars. He was the first Sudanese ruler to exercise this prerogative.

Although the Mahdī envisaged a restoration of the primitive Islamic *umma*, he soon found himself obliged to give judicial decisions and to promulgate administrative regulations which were in effect legislative acts. Many of these resulted from the revolutionary war, e.g. rulings concerning broken marriages and irregular unions, and questions of

landownership. Undesirable customs regarded as repugnant to Islam were prohibited. The Mahdī's judicial functions were widely delegated to his officials, and one specifically judicial officer was appointed with the title *ḳāḍī al-Islām*. Aḥmad ʿAlī, who held this post for twelve years (1882-94), had been a judge in Dār Fūr under the *Turkiyya*.

These military and administrative institutions developed further during the reign of the Khalīfa. A detachment of the *djihādiyya*, the regular corps first formed during the siege of El Obeid, was stationed in the Kāra, i.e. Fort Omdurman of the *Turkiyya*. After the revolt of the Ashrāf in 1891 the Khalīfa felt the need of a reliable bodyguard. This was created by expanding a corps of orderlies, the *mulāzimiyya*. By 1895 it consisted of 9,000 or more troops under the general command of ʿUthmān Shaykh al-Dīn. A civil service, recruited chiefly from *awlād al-balad* and Copts, staffed the departments and treasuries of the capital and the provinces. Many of its members had occupied similar posts under the *Turkiyya*; some went on to serve the Condominium. Already in the Mahdī's time a regular chancery procedure had been established, and the surviving archives of the Mahdiyya as a whole have been estimated at 50,000 pieces. The bulk of them are now in the Central Records Office in Khartoum (see P. M. Holt, *The Mahdist archives and related documents*, in *Archives*, v/28 [1962], 193-200). Despatches were sometimes exchanged almost daily between the ruler and his provincial governors. The provinces fell into two categories; an outer circle under military governors with their own fiscal and judicial establishments and garrison troops, and a core of metropolitan provinces, which were fiscal areas rather than administrative units, and were tributary to the treasury in Omdurman.

The history of the office of *amīn bayt al-māl* illustrates both the institutional elaboration and the increasing autocracy of the Khalīfa's reign. Aḥmad Sulaymān, the first *amīn*, was a partisan of the Ashrāf, and was disgraced in April 1886. His successor, Ibrāhīm Muḥammad ʿAdlān, had been a merchant in El Obeid. His reluctance to extort grain for the soldiery during the great famine led to a clash with the Khalīfa and his execution (February 1890). His successor, al-Nūr Ibrāhīm al-Djirayfāwī, was another former merchant. Tenure of office became increasingly precarious: one commissioner was twice appointed and twice removed, and the last year of the reign saw three treasurers. At the same time special treasuries were established, of which the most important were the treasury of the *mulāzimiyya* and the Khalīfa's privy treasury. The sources of revenue had meanwhile changed. With the ending of the *djihād*, *ghanīma* sank into insignificance. *Zakāt* continued to be levied and also *fiṭr*, a poll-tax paid at the end of Ramaḍān. *Zakāt* was also paid as customs-dues, originally at the rate of 2½%, but al-Djirayfāwī imposed a further 10%, and this might indeed be taken at several points on the route. Fines were imposed on smoking and drinking, and the goods of other offenders were liable to confiscation. In addition, merchants and others might be required to pay "contributions" (*tabarruʿāt*) to the treasury. The minting of dollars at Omdurman continued, but the silver was increasingly debased. The minting of gold had ceased with the Mahdī's pounds, which were soon driven out of circulation by Gresham's Law.

The history of the judiciary is similar. Aḥmad ʿAlī held office as *ḳāḍī al-Islām* until May 1894, when he lost the Khalīfa's confidence, and was thrown into prison. His successor, al-Ḥusayn Ibrāhīm wad al-Zahrāʾ, had been trained at al-Azhar, but his over-zealous adherence to the principles of the *Sharīʿa* led to a clash with Yaʿḳūb. He was imprisoned and put to death, probably in the summer of 1895. The title of *ḳāḍī al-Islām* seems to have died with him. Already in the time of Aḥmed ʿAlī there was a deputy-judge (*wakīl al-maḥkama*), and the two seem usually to have acted in concert. By the end of the Khalīfa's reign, the chief judge had six deputies (*nuwwāb*), two of whom had special duties in connection with the *mulāzimiyya*. In addition, there were special courts in Omdurman for the market, the quay and the treasury. Both in the capital and the provinces, the judicial officers were dependent on the Khalīfa and his governors, and were deferential to their wishes.

7. Subsequently developments. Although the Anglo-Egyptian reconquest overthrew the Mahdist state, Mahdism continued to be a powerful force, particularly in the west. The movement was virtually proscribed in the early years of the Condominium by Wingate, who was governor-general from 1899 to 1916. The surviving leaders were held in prison, the use of the Mahdī's devotional manual (*rātib*) was forbidden, and several religious risings were suppressed. The revival of the Mahdiyya in a new form was the achievement of a posthumous son of the Mahdī, ʿAbd al-Raḥmān (1885-1959), whose considerable political talent found opportunity in changing political circumstances during and after the First World War. To many Anṣār he was a charismatic figure, regarded by some as *al-Nabī* ʿĪsā, and hence as having an eschatological role. To his westernised followers, he was rather a nationalist leader, the patron of the Umma Party, which was founded in 1945, and has continued to play a leading part in Sudanese politics. In one modern view, the Mahdī is seen as a *mudjaddid*, and the Mahdiyya as a reformist but essentially orthodox movement.

AL-**MAHDJAR** (sometimes in the plural, *al-Mahādjir*), name given in Arabic to places in Northern, Central and Southern America to which Lebanese, Syrians, Palestinians and other Arabs have emigrated (*hādjara*). The towns whose names recur most often in modern Arabic literature are New York, Sao Pāolo, Rio de Janeiro and Buenos Aires; there has developed there, in the first half of the present century, a characteristic literary movement, the vestiges of which have not yet been completely effaced; but these are not the only locations on the American continent where emigrants from the Near East have settled and where they have published, in Arabic or in the national languages (English, Spanish or Portuguese), bulletins, journals, periodicals and books with the object of promoting understanding of the Arabs and their heritage, or in furtherance of their political causes of the moment.

The flow of emigration towards the New World originated in what was then known as Syria (the land currently comprising Lebanon, Syria and Palestine) at the end of the 19th century and the beginning of the 20th, attaining its highest point in North America in 1913; the tide began to ebb in the period following the First World War as a result of obstacles placed by the United States in the way of immigration, with the limitation on numbers of immigrants and with legislation on nationality, passed in 1924, which almost put an end to it, although the influx of emigrants into South America continued.

The causes of the emigration were primarily economic. Among the Lebanese—who left their country in the greatest number—the inhabitants of the mountain region were deprived of agricultural land after the establishment of the régime of the *mutaṣarrifiyya* [see LUBNĀN], inaugurated in 1861 (and modified in 1864) in the wake of the inter-community religious disturbances of 1860 and following intervention by the European states, and by France in particular. This régime accorded administrative autonomy to the mountain region, which possessed meagre financial resources, having first detached from it its fertile plains and sea ports. A section of the population was thus forced to leave the mountain region and to seek employment in Beirut and other Lebanese towns. This was the first phase; subsequently, some individuals left their homeland and made their way to Egypt and other African countries. When emigration to America became possible, some groups of Lebanese, insignificant in size, travelled there. After 1881 the scale of the movement accelerated, as the first emigrants enticed their compatriots with glowing reports of the financial opportunities that existed in America, while tourists, shipping companies and their agents added further encouragement, to such an extent that at the beginning of the 20th century a virtual epidemic had arisen and almost half the inhabitants of Lebanon left their country. The contagion spread to the cities of the interior (Homs, Damascus and Aleppo) and to the mountains occupied by the ʿAlawites, whence it is estimated that a seventh of the population chose to become exiles. Some Palestinians had preceded the Lebanese, and others accompanied them. By the final phase of the movement, the total number of immigrants from Greater Syria who were settled in the United States and Canada exceeded half a million, attaining close to double this figure in the cities of Central and South America.

At the time, the movement was encouraged among the Christian population of Syria not only by economic factors—including the oppression of the peasants by their feudal lords, the monopoly over lands and goods exercised by the monastic communities, the oppressive burden of taxation, disastrous crop-failures, the slump in the natural silk market caused by the success of artificial Japanese silk sold cheaply and the diversion of international trade-routes following the excavation of the Suez Canal—but also on account of psychological factors aroused by a hated social and political situation; detestation of the foreign authority which governed them and always regarded them with suspicion, religious conflicts which culminated in the events of 1860, persistent sectarianism, corruption of an administration in which bribery was rife, the subjection of the faithful to religious leaders who collaborated with the feudal lords in oppressing and robbing them, the suppression of public liberties, the alienation experienced by the entire population in the time of ʿAbd al-Ḥamīd, the posting of young Arabs to distant theatres of war, widespread ignorance and the rule of anarchy in all facets of existence.

On the other hand, there was talk of those advantages of emigration which constituted powerful incentives: the prospect of making a fortune, numerous opportunities for finding work, respect for public liberties, the acceptance by society of personal ambitions, the judgment of people by their actions and their abilities rather than on the basis of their origin and class, concern for the rights and dignity of all citizens without discrimination and the rule of order and of law.

The Syrians in general and the Lebanese in particular had been in contact with the West and its culture since Bonaparte's expedition to Egypt (1798-1801) and the creation of scientific institutions in this country in the time of Muḥammad ʿAlī [*q.v.*]. These contacts had been reinforced by the religious missions which began to arrive in Lebanon in the period when the son of the ruler of Egypt, Ibrāhīm Pasha [*q.v.*] was governor of Syria (1832-40), and which expanded their activities following the installation of the régime of the *mutaṣarrifiyya* (1861),

founding schools, cultural associations and charitable societies, importing presses, translating and publishing books. These contacts were also encouraged by the presence of tourists and members of the French expedition who stayed on in Lebanon for a full year after the events of 1860. These constant contacts with the West and the learning of the languages spoken there, in addition to the common religion which it shared with the majority of the future emigrants, reinforced their admiration for this part of the world and its principles, in particular those of the French Revolution and its well-known slogan, and strengthened their desire to migrate to it.

When these factors are considered in conjunction with the geographical position of Lebanon and Syria, facing the West from the opposite shore of the Mediterranean, and the hereditary zest for trade and travel characteristic of the Lebanese, descendants of the Phoenicians as they are, and also their eagerness to travel far in search of favourable opportunities, it is possible to understand the deep significance of this quasi-collective migration towards the New World and the dispersal of this race throughout the globe.

In the first instance, the emigrants were attracted to the United States; subsequently, they turned their attention towards the South, still virgin territory and offering greater employment opportunities than the North, on account of sparseness of population, the vast areas of agricultural land requiring manpower, emergent industry and the wide range of opportunities for commerce. Opportunities for emigration to South America were enhanced following the visits to Palestine and Lebanon undertaken in 1877 and 1887 by the Emperor of Brazil Dom Pedro II and the conclusion, in 1892, of an agreement between the Ottoman and Brazilian governments establishing the conditions of immigration. This emperor, who spoke Arabic, favoured the settlement of emigrants in his country as a means of contribution towards its prosperity and furthering the exploitation of agricultural land, and he promised them aid and assistance. Argentina offered similar attractions with its enormous tracts of land requiring cultivation and its untapped material resources. Waves of immigrants therefore made their way towards South America, to such an extent that their number amounted to 300,000 in Argentina alone, and Brazil accepted more than half a million. For their part, the Palestinians preferred the states of Central America or Chile and Mexico.

After disembarkation, these foreigners settled in the poorer quarters of the towns which they had chosen, usually because they had relatives there, and attempted to make a living through street-trading and hawking. Those who succeeded (the minority), would open a small shop, and some found opportunities for expansion, in some cases even becoming industrialists or prosperous merchants [see DJĀLIYA].

The people among whom they lived had little respect for them. They called them Turks, because they came from a land dependent on the Ottoman Turkish state, and in some instances they were treated in the same light as the Mongols, members of the yellow race; the immigrants themselves were aware of the need to correct the image which had formed in the minds of Americans.

Initially, they believed that their exile was temporary and would last no longer than the time needed to amass sufficient money to support themselves and their families at home; this same time-period, it was hoped, would see changes in living conditions in their own country. But once settled and accustomed to their new existence, seeing their businesses prosper and their children growing up in this new milieu, learning its language and becoming attached to it, they contemplated staying there permanently, in spite of the pain involved in the awareness of exile and in spite of the bitter nostalgia that they felt for their country and families.

There can be no doubt that it was in response to the need to communicate among themselves in their exile, and on the other hand to follow events occurring at home, that they were led to produce a number of minor Arabic newspapers; these began to appear with the arrival of the first waves of immigrants in the closing years of the 19th century, but in the South and the North of the continent.

It was in New York in 1892 that the first newspaper, *Kawkab Amirika*, appeared, followed by *al-ʿAṣr* (1894), *al-Ayyām* (1897), *al-Hudā* (1898) and *Mirʾāt al-Gharb* (1899). In Brazil, the oldest one, *al-Fayḥāʾ* (1895), was followed by four others: *al-Raḳīb* (1897), *al-Ṣarāzil* (1898), *al-Manāẓir* (1899) and *al-Ṣawāb* (1900).

Subsequently, the need was felt to form associations and literary societies to serve the interests of the immigrants, unite their energies and support their social institutions. *Al-Djamʿiyya al-sūriyya al-muttaḥida* came into existence in New York in 1907, and other associations followed. In Brazil, numerous clubs were founded, of which the most important was *al-Nādī al-ḥimṣī*, and literary societies subsequently came into being. But literary life prospered at an earlier stage in North America, for the following reasons: immigration there had a longer history, printing-presses had been established there at a relatively early date and writers of talent had been living there since the end of the previous century. Amīn al-Rīḥānī [see AL-RĪḤĀNĪ] arrived in New York in 1888, followed by Djabrān Khalīl Djabrān [*q.v.*] in 1895, the poet Nudra Ḥaddād in 1897, then, at the beginning of the century, the two poets Nasīb ʿArīḍa and Rashīd Ayyūb in 1905, Nudra's brother, the journalist ʿAbd al-Masīḥ Ḥaddād in 1907, Mikhāʾīl Nuʿayma [*q.v.*] and Īliyyā Abū Māḍī [*q.v.* in Suppl.] in 1911. Printing-presses proliferated to such an extent that six were in existence by 1910, producing, besides newspapers, some remarkable literary reviews, such as *al-Funūn* (1913) which was edited by Nasīb ʿArīḍa, and *al-Sāʾiḥ* (1912) edited by ʿAbd al-Masīḥ Ḥaddād.

Amīn al-Rīḥānī began to write in newspapers at the end of the last century; his extremely vivid language had an oratorical nature and displayed a marked penchant for innovation. He had published three of his books before Djabrān's first, *al-Mūsīḳā*, appeared in 1905. The concerns of his people, both in the *mahdjar* and in their homeland, pre-occupied him, and he set himself to preaching liberation in the widest sense of the term, political, social and intellectual, and to attacking in his articles and books (*al-Muḥālafa al-thulāthiyya, al-Mukārī wa 'l-kāhin, Zanbaḳat al-fawr, Khāridj al-ḥarīm*) inertia, bigotry and religious sectarianism. It is, moreover, entirely symptomatic that his first work published in the *mahdjar* is intitled *Taʾrīkh al-thawra al-firansiyya.*

For his part, Djabrān began in 1903, while still residing in Boston (which he did not leave for New York until 1912) to publish his articles in the newspapers *al-Muhādjir* (1903), *al-Hudā* and *Mirʾāt al-Gharb*. He appears to have been more forceful than al-

Rīḥānī and more inclined to challenge traditions directly. Because he loved painting, imagery dominated his writing, and his education and experience endowed him with burning zeal and a penchant for idealism. His style reveals a poetic soul close to the sources of an Oriental mysticism inherited in the West by the various romantic movements. He put together in his first books *ʿArāʾis al-murūdj* (1906), *al-Arwāḥ al-mutamarrida* (1908), *al-Adjniḥa al-mutakassira* (1912) and *Damʿa wa-btisāma* (1913), his articles and novels which had been published in the newspapers of the *mahdjar* and in the two reviews *al-Funūn* and *al-Sāʾiḥ*.

Like al-Rīḥānī and Djabrān, Nuʿayma also possessed a pronounced taste for innovation. He retained from his theological studies, undertaken in Russia between 1906 and 1911, a profound religiosity and, like Djabrān, a tendency towards mysticism; he considered it necessary to go beyond the sensory organs in order to arrive at the reality of things, but he did not have the same ardour of feeling and he was sometimes more capable of effecting a synthesis. After theology, he turned to the study of law and literature at an American university. This training enabled him to improve his precision of expression and to attain a better equilibrium between the elements of the work of art; his knowledge of Russian literature also enhanced his aptitude for psychological analysis.

In this way, these men of talent, as well as the writers and poets who joined them later, were able to prove their literary abilities and, almost forty years after the arrival of the first waves of immigration in New York they found the means enabling them to found, after the end of the First World War, an association which had the object of "stimulating the literary spirit" and of establishing the norms of literary work. In 1920 they formed *al-Rābiṭa al-ḳalamiyya*, entrusting the presidency to the "doyen" Djabrān and the post of secretary to the "counsellor" Nuʿayma. Included among its members were the poets Īliyya Abū Māḍī (1890-1957), Nasīb ʿArīḍa (1887-1946), Rashīd Ayyūb (1871-1941), Nudra Ḥaddād (1881-1950) and his brother ʿAbd al-Masīḥ (1890-1963) and a number of less prolific writers, of whom the best known was William Catzeflis (1879-1950), treasurer of the *Rābiṭa*. They decided to make the review *al-Sāʾiḥ* the pulpit from which to address the public.

Literary reviews in Lebanon and South America soon began reprinting specimens of their work in verse and in prose, delighting in the strong innovatory tendency that they revealed, to such an extent that their reputation became wider and their influence on the literary life of the Arabs was accentuated.

But after the formation of the *Rābiṭa*, Djabrān wrote nothing more in Arabic, except for a few articles, and he turned to the English language in which he composed eight books, of which *The Prophet* is considered the most significant work of his entire corpus. He gives his prophet the name *al-Muṣṭafā* and, in a very engaging poetic style, puts into his mouth, in the manner of Nietzsche with Zarathustra, the outcome of his interpretation of existence and of man.

The other members of the *Rābiṭa* continued to write in Arabic. Mīkhāʾīl Nuʿayma collected his articles of criticism and published them in a book intitled *al-Ghirbāl* (1923); from this work it is possible to draw all the rules of criticism representing the most important characteristics of the writing of the *Rābiṭa*: to preach innovation, to uphold the truth, to relate literature to life and always to make it revolve around man and his vital problems. Nuʿayma is also the author of a series of short stories and articles which he subsequently inserted in his narrative collection, *Kān mā kān* (1937), in the *Kitāb al-Marāḥil* (*ca.* 1936) and in the first part of his philosophical novel *Mudhakkirāt al-Arḳash* (1949). Before the formation of the *Rābiṭa*, he had published his only dramatic work, *al-Ābāʾ wa 'l-banūn* (1917), in which he took the part of the younger generation and attempted to reconcile classical and dialectal forms in dialogue.

The majority of the members of the *Rābiṭa* wrote in verse and in prose, but it is the poets among them who still occupy the prominent place. Īliyyā Abū Māḍī, whose collections of verse composed in the *mahdjar* were published before (vol. ii of his *Dīwān*, 1919) and after the formation of the *Rābiṭa* (*al-Djadāwil*, 1927 and *al-Khamāʾil*, 1946) was a poet of such fecundity, such ardour of feeling, such penetrating sensibility and appealling style that he continues to enjoy the widest reputation. He is followed by Nasīb ʿArīḍa, all of whose poetry was published in his single *dīwān*, *al-Arwāḥ al-ḥāʾira* (1946), who displays a very sensitive and troubled soul. For their part, Rashīd Ayyūb, author of *al-Ayyūbiyyāt* (1916), of *Aghānī 'l-darwīsh* (1928) and of *Hiya 'l-dunyā* (1939), and Nudra Ḥaddād, whose single *dīwān* is intitled *Awrāḳ al-kharīf* (1941), their poetry reveals the weight of nostalgia, anguish and love of mankind which essentially characterises the literature of the *mahdjar* and the charm of style which marks its form.

However, the *Rābiṭa* did not monopolise the entire immigrant literary movement in North America, and there remained, outside it, renowned men of letters and journalists including Amīn al-Rīḥānī, pioneer of the literature of the *mahdjar*, the poet Masʿūd Samāḥa (1882-1946), whose poetry was powerful, versatile and rich in metre, the historian Philip Hitti (Ḥittī), who contributed, through his historical works composed in English, to making the Arabs, their history and their civilisation known to the West, the journalist Naʿūm Mukarzal, proprietor of *al-Hudā*, his brother Sallūm who published numerous periodicals, and many other poets and writers.

The *Rābiṭa* lasted more than ten years (1920-31); with the death of its doyen Djabrān (1931) and the return of Nuʿayma to his homeland (1932), it was dispersed, but other members continued their literary production for a certain length of time.

To give due credit to the *Rābiṭa*, it must be recalled that the literary press which made known to the world the best of the production of the *mahdjar* is owed to three of its members, *al-Funūn* to Nasīb ʿArīḍa (1913), *al-Sāʾiḥ* to ʿAbd al-Masīḥ Ḥaddād (1912) and *al-Samīr* to Īliyyā Abū Māḍī (1929); that, through the combined action of all its members, there came into being the first modern literary movement to present to readers of Arabic a kind of literary school, in spite of individual disagreements; that genres such as biography, the short story and the philosophical novel only became known in Arabic literature as a result of the artistic form that these writers gave to them; that one of its members, ʿAbd al-Masīḥ Ḥaddād, preserved in his original histories published under the title *Ḥikāyāt al-mahdjar* (1931), documents relating to the first phase of the immigration which contain precise and living details with which history is not normally concerned; that the effects of their reformist move-

ment on Arabic society are almost as important as its consequences in the literary domain, since they aimed to reconstruct the Arabic personality on new social foundations characterised essentially by love, a principle drawn from the Gospel; and that their activity in the cause of renewal gave firm support to that which came into existence in the Near East through the influence of the *Dīwān* of Muṭrān, of the *Apollo* group and its disciples, and that the latter movement perhaps thereby gained a stronger voice, clearer views and greater homogeneity.

With the demise of the *Rābiṭa*, the centre of gravity of literary activity shifted towards Brazil, where the first association had been founded under the name *Riwāḳ al-Maʿarrī* (1900) by Naʿūm Labakī, but had ceased to exist long before the First World War when its founder returned to his homeland in 1908; its members then took to holding in their homes what could be described as literary salons. Subsequently, in 1933 Michel al-Maʿlūf [see AL-MAʿLŪF] succeeded in founding an association which took the name *al-ʿUṣba al-andalusiyya*; this title was chosen by the members of the group because they were conscious of the fact that they lived among a people originally from the Iberian peninsula, in the south of which their Muslim Arab ancestors had been assimilated with the population, and they believed that they were rediscovering al-Andalus in this "New Andalusia". It seems to be an established fact that numerous Muslims of Spain, who had been forced to convert to Christianity after the end of their rule in 1492 and the decision of Philip III in 1609 to expel the Arabs and to try them before the courts of the Inquisition, took part in campaigns of exploration and conquest in the New World. The peoples of South America thus retain in their culture and their blood traces of the civilisation and the blood of the Arabs of al-Andalus; these are visible in their languages, appearance, customs and social traditions, which are familiar to Arab immigrants and encourage them to believe that here they can become attached to their roots.

The *ʿUṣba* fulfilled its linguistic and literary mission with the aid of important societies founded by the immigrants, numerous schools established for teaching the Arabic language (for example, some fifteen thousand pupils were educated at the school of the *Muʿallim* Wadīʿ al-Yāzidjī), various social institutions sponsored by clubs which organised, for their support, festivals in the course of which members of the *ʿUṣba* delivered speeches and recited their poetry, in addition to the festivals which took place on the occasion of various national ceremonies; it was also assisted by journals and reviews of which the most important were *al-Sharḳ*, edited by Mūsā Kurayyim and *al-Andalus al-djadīda*, edited by Shukr Allāh al-Djurr, which published the literary work of its members, sometimes also campaigning on behalf of opposing political opinions and thus supplying other motives for original creation to men of letters whether they belonged to the association or not.

At first, the latter had chosen as its platform *al-Andalus al-djadīda* which one of its members, Shukr Allāh al-Djurr, published in Rio de Janeiro; two years after its foundation, in 1935, it established its own organ to which it gave its name, *al-ʿUṣba*, and of which the editor-in-chief was another of its members, Ḥabīb Masʿūd. The *ʿUṣba* and its review lasted until 1953, by which time it had been considerably enfeebled by death and by the return of the exiles to their homeland. With it, there came to an end the second literary movement of the *mahdjar* and the torch of *mahdjarī* literature was extinguished; all that remains of it today are a few timid flames here and there on the American continent which still resist the assaults of time.

In North America, the *mahdjar* built up the prestige which it enjoys both there and in the Near East on prose rather than poetry, in spite of the influence exercised by the *Mawākib* of Djabrān, the *Hams al-djufūn* of Nuʿayma and the poetical works of Īliyyā Abū Māḍī and Nasīb ʿArīḍa, in turning the modern poetic movement towards the heart and the soul of man and in reforming the linguistic form and the music of verse, in spite also of the debt owed to the pioneers, al-Rīḥānī and Djabrān, for the development of the "poem in prose" which is highly regarded in certain Arab circles. In the domain of Arabic rhetoric, Djabrān created a kind of school of his own, with his style that was harmonious, warm and wrapped in a maze of symbols and colourful images, both pleasing and elusive to the senses. His prose and that of Nuʿayma are applied, on the other hand, to major subjects concerning man, society and criticism, for which versification is inappropriate on account of the concentrated texture of Arabic verse; in addition, they tackled in prose the majority of literary genres. It is by means of this depth and this universality that their prose and with it, the *Rābiṭa ḳalamiyya* and the works of the *mahdjar* as a whole, have acquired the prestige that they enjoy in modern Arabic literature.

In the case of the *ʿUṣba*, it is verse which absolutely dominates the work of its members, under the influence of the inherited taste of the Arabs for poetry, in a milieu constantly looking back towards its Andalusian past. It is by means of this poetry that the activity of the *mahdjar* occupies a place in modern Arabic literature for which the credit belongs to the most prolific and gifted poets of the *ʿUṣba*: al-Shāʿir al-Ḳarawī (Rashīd Salīm al-Khūrī, born in 1887, emigrated to Brazil in 1913), Ilyās Farḥāt (born in 1893, emigrated in 1910), Shafīk al-Maʿlūf (born in 1905, emigrated in 1926) and Shukr Allāh al-Djurr (born in 1905, emigrated in 1919).

It may be noted, in general, that the poets and writers of South America were deeply attached to their literary and general intellectual heritage on account of the admiration that they felt for it; this is why they kept their eyes fixed upon it when seeking inspiration for their poetic works, while Djabrān and Nuʿayma, in the North, showed little interest in this heritage and Abū Māḍī, ʿArīḍa, and the other poets of the *Rābiṭa* ignored it completely, even if they read ancient works. Al-Rīḥānī appreciated the latter and translated some fragments into English, without, however, allowing himself to be bound by literary tradition. In addition, their works were dominated, in a general manner, by the originality and innovation which earned them their reputation and enabled them to exert their influence on modern Arabic literature. It seems in fact that these two tendencies were caused by the influence of the milieu; in the North, American society removed authors from their literary heritage, while those in the South were brought closer to it, as has been shown. This also accounts for the fact that the most eminent writers of the North have displayed linguistic weaknesses, amounting in some cases to misunderstanding of the rules of Arabic (see the article intitled *Naḳīḳ al-ḍafādiʿ*, in *al-Ghirbāl*), while in the South there were poets (Ilyās Farḥāt in

particular) who imitated the glories of the past and celebrated the Bedouin life, camels and tents; and even those who are distinguished by clarity and sensitivity of expression (e.g. al-Shā'ir al-Ḳarawī and Shafīḳ al-Maʿlūf, have never lapsed into the use of excessively affected language, even though the nature of Lebanon and the poetry that emanates from its atmosphere have exerted their influence on their poetic images.

This difference between the North and South is revealed in the content as well as in the form. In North America, men of letters are for the most part interested in general human problems, both in their verse and their prose; they are broadly concerned with the destiny of man whose soul they wish to save from the oppression of material civilisation. Christianity and the ancient oriental religions, western romanticism, the works of which they have read in part and the writers of mystical tendency (Blake, Emerson, Whitman and Thoreau) have left their mark on their literature, while those of South America address themselves to national questions and the interests of their compatriots who had stayed in their homeland, to such an extent that they commemorated some national festivals and honoured past and present rulers and writers of their country. But this did not prevent the poets of the South from writing historical dramas and excelling in long compositions, for example *ʿAlā bisāṭ al-rīḥ* by Fawzī al-Maʿlūf, *ʿAbḳar* by his brother Shafīḳ or *Muʿallaḳat al-arz* by Niʿma Ḳāzān.

In Buenos Aires, the poet Georges Ṣaydaḥ (1893-1978) attempted in 1949 to establish a new literary association to which he gave the name *al-Rābiṭa al-adabiyya*, but it ceased to exist two years later. Literary production in Argentina has remained limited to the personal and prolific efforts of the poet and prose-writer Ilyās Ḳunṣul (1914-81) who has been succeeded in this respect by his younger brother Zakī (emigrated to Argentina in 1928). The work of these two writers and that of George Ṣaydaḥ is dominated, like the literary output of all men of letters of the South, simultaneously by concern for the national problems of their country of origin and by the desire to respect the purity, versatility and correctness of expression.

A few further remarks should be made concerning the efforts still being exercised today by immigrants in South and Central America, but also in the North, to spread through the American continent awareness of numerous aspects of their general literary heritage, ancient as well as modern, with books such as *Kalīla wa-Dimna*, the *Muḳaddima* of Ibn Khaldūn, the *Muʿallaḳāt*, the *Riḥla* of Ibn Baṭṭūṭa, the *Luzūmiyyat* and the *Risālat al-Ghufrān* of al-Maʿarrī, and the *Iklīl* of al-Hamdānī, as well as certain works of Djabrān, of Nuʿayma, of Abū Māḍī, of al-Shāʿir al-Ḳarawī, of Fawzī al-Maʿlūf and of his brother Shafīḳ and of others. Philip Hitti has also edited Arabic texts (including the *Kitāb al-Iʿtibār* of Usāma b. Munḳidh, 1930) and has written in English his *History of the Arabs* (8th ed., 1963), *History of Syria* (2nd ed., 1957) and *Lebanon in history* (1957). Certain of his colleagues have applied themselves to making known the heritage of the Arabs, their customs, their legends and their stories. Arabs who emigrated to other states of the continent (Canada, Mexico, Venezuela, Chile and the republics of Central America) have left a large number of books and periodicals in Arabic and Spanish which also have the purpose of making known the Arabs and their culture; in addition, they translated English, Spanish and Portuguese texts and in this respect played an important role in the cultural exchanges necessary between peoples.

In a general fashion, the influence of the *mahdjar* on Arabic literary thinking remains alive today, since its poets and its writers are still read; most of all, they have influenced authors of romantic tendency, both in the Maghrib and in the Mashriḳ, Manfalūṭī and Shābbī for example. Their critical thinking, represented in particular in *al-Ghirbāl* by Nuʿayma, has contributed to the moulding of one of the most eminent modern critics, Muḥammad Mandūr (1907-64) [*q.v.*].

It is now possible to summarise the common characteristics of the literature of the *mahdjar* in North and South America in the following fashion: dominance of the sentimental tendency of the authors on account of their expatriation and nostalgia for their native land; love of nature to the extent that it is made an object of worship, through the images of its beauty and serenity that they have brought with them and the consolation that they find therein in their distant exile; a penchant for reflection on the things of this world with poetic insight and lyricism in the manner of treating them.

With these specialities and with the individual and collective differences revealed by their works, the emigrants have conferred on some of them a world-wide renown (especially *The Prophet* by Djabrān, which has been translated into more than fifty languages, and *ʿAlā bisāṭ al-rīḥ* by Fawzī al-Maʿlūf) and a special place in modern Arabic literature. This particular and singular nature of their literary production is due to the particular and singular violence of their experience.

(ʿAbd al-Karīm al-Ashtar)

MAHĪM, Maham, a town in the district and

taḥṣīl of Rohtak in India, on the road connecting Dihlī and Hānsī, situated in lat. 28° 58′ N. and long. 76° 18′ E.; it was formerly in the Pandjāb, but since 1947 has fallen within the Indian Union (Hariana State). It was probably founded by Rādjpūt princes, but was allegedly destroyed at the end of the 12th century by Muʿizz al-Dīn Muḥammad Ghūrī [see GHŪRIDS]. The Djāmiʿ Masdjid has an inscription from the reign of Humāyūn, recording its construction by Bēgam Sulṭān in 1531, and another from Awrangzīb's time, recording its completion or restoration in 1667. In 1732, Mahīm and its district passed to the Nawwābs of Farrukhnagar, and later in the century it was harried by the Sikhs and Marāṭhās. From 1793 it was the centre of a petty principality carved out by an Irish adventurer George Thomas, but passed into the control of the British East India Company in 1803. The population of the Rohtak District according to the 1971 Census of India was 1,785,534, 98.49% of which was Hindu and 0.62% Muslim.

(C. E. BOSWORTH)

MĀHĪM, a port of India, with an island fort and two creeks forming a harbour, about 60 miles/90 km. north of Bombay. The large village of Kēlvē on the opposite bank of one creek is now incorporated with it in one municipality named Kēlvē-Māhīm, which distinguishes it from the suburb of Māhīm on Bombay island. The name is also spelt Mahīm and, in Bahmanī records, Mahāʾim.

It was known to have been included in the possessions of the Dihlī sultanate in the mid-8th/14th century, from which it passed to the Gudjarāt sultanate, of which it became the southernmost port on the north Konkan coast. At the time of Gudjarāt-Bahmanī friction, in 833/1430, the Bahmanī governor of Dawlatābād, Khalaf Ḥasan, Malik al-Tudjdjār, occupied it, on receipt of a report that its Gudjarātī commander had died. At that time, the Bahmanī northern maritime outpost was Thānā; but a counter-attack by the Gudjarātīs was successful, thanks to the first recorded serious clash between Dakhnī and Āfāḳī elements in the Bahmanī armies, and not only was Māhīm regained but Thānā also taken.

In 896/1490 a Bahmanī rebel *amīr*, Bahādur Gīlānī, *kotwāl* of Goa, engaged in piracy and predations on the north Konkan coast up to Cambay, sent a fleet of 200 raiding ships to attack Māhīm, which caused the sultan Maḥmūd I of Gudjarāt [*q.v.*] to request the Bahmanī sultan to put an end to Bahādur's depredations (text of letter in ʿAlī Ṭabāṭabā, *Burhān-i maʾāthir*, 147). (He was eventually defeated in 900/1494 by that Sulṭān-Ḳulī, who thereby received the title of Ḳuṭb al-Mulk and later became the first ruler of the Ḳuṭb-Shāhī sultanate [*q.v.*]).

In 920/1514 the Portuguese, negotiating with the Gudjarāt sultan for permission to establish a base at Diu, were offered instead sites elsewhere, including Māhīm (Afonso d'Albuquerque, *Commentaries*, Eng. tr. W. de G. Birch, Hakluyt Soc. 1875-84, iv, 93-105); these they refused, but by 938/1532 Māhīm was in their possession, and they are recorded as successfully defending it against the Mughals in 1021/1612. It eventually fell to Shivādjī [see MARĀṬHĀS] by 1068/1658, but in 1101/1689 Sīdī Yāḳūt Khān, the Mughal (Ḥabshī) admiral at Djandjīra, engaged against the Marāṭhās, took Māhīm among other coastal forts (J. Grant Duff, *History of the Marhattas*, Bombay 1878, 274-6).

(J. BURTON-PAGE)

MAHISUR, MAYSŪR, conventional spelling MYSORE, a former princely state of British India, now the core of a component state of the Indian Union called Karnataka, with its capital at Bangalore, and also the name of the town which was the dynastic capital of the state.

The native state was a landlocked one of South India, lying between lats. 11° 36′ and 15° 2′ N. and longs. 74° 38′ and 78° 36′ E. and with an area of 29,433 sq. miles. Its population in 1941 was 7,329,140, over 90% of this being Hindu; the Muslim minority was overwhelmingly Sunnī. Mysore city, the seat of the Mahārādjās of Mysore, lies in lat. 12° 18′ N. and long. 76° 39′ E at an altitude of 2,493 feet. The principal language of the princely state and also of the present Karnataka was and is Kanarese or Kannada, spoken by approximately 65% of the population today, but Telugu, Tamil, Hindi and Marathi are also spoken on the fringes.

1. Geography and history. Geographically, the Mysore princely state boundaries comprised what is essentially an undulating table land, with rocky hills and ravines, and with the steep mountain barrier of the Western Ghats forming the western limits and the Nilgiri Hills the southern ones. Mulainagiri rises to 6,317 feet; the mountains are lushly forested, the timber being exploited commercially, and rainfall can be as high as 360 inches per annum at the crest of the Western Ghats. This heavily-wooded hill country of western Mysore has traditionally been known as the Malnād, whereas the more open country of valleys and plains in the east, where rainfall may be as low as 20 inches per annum, is known as the Maydān or Bayalshīme. Drainage here is mainly eastwards to the Bay of Bengal, with the main river systems of the Kaveri or Cauvery in the south and the Kistna or Krishna in the north; none of these rivers or their tributaries is navigable within the boundaries of the princely state, but they have always been used, e.g. by the use of dams, for irrigation purposes and, in the present century, for hydro-electric power generation.

Popular etymology connects the name Mahisur with Skr. *mahiṣa-* "buffalo" (lit. "powerful"); the name of the town is certainly old. The first contacts with the Muslims were in the time of the local Hindu dynasty of the Hoysalas (*ca.* 1022-1342), chieftains from the Western Ghats region with their capital at Dvārasamudra (see on them, J. D. M. Derrett, *The Hoysalas, a mediaeval Indian royal family*, Madras 1957). In 1310-11 the Dihlī Sulṭān ʿAlāʾ al-Dīn Khaldjī's general Malik Kāfūr or Malik Nāʾib marched into South India and made the Hoysala ruler Vira Ballāla III tributary to Dihlī [see KHALDJĪS], and Dvārasamudra was sacked and razed by an expedition sent by Ghiyāth al-Dīn Muḥammad b. Tughluḳ [*q.v.*] in 1327.

After 1336 there arose in the southern tip of India the last great Hindu dynasty there, that of Vidjayanagara, and the rādjās gradually took over Mysore after the disappearance of the Hoysalas. This involved disputes with the Muslim kingdom to the north of the Bahmanīs [*q.v.*], and after the break-up of the Bahmanī state in the early 16th century, disputes with the successor-state of the ʿĀdil-Shāhīs in Bīdjāpūr [*q.vv.*]. The rādjās of Vidjayanagara were generally successful in keeping the Muslims ou of Mysore till 1565, when a coalition of the sultan

of Bīdjāpūr, of Golkondā (the Ḳuṭb-Shāhīs [*q.vv.*]), of Aḥmadnagar (the Niẓām-Shāhīs [*q.vv.*]) and of Bīdar (the Barīd-Shāhīs [*q.vv.*]) defeated Rāma Rādjā at the battle of Tālikota, leading to the sack of Vidjayanagara itself.Nevertheless, his descendants established the Rāma Rādjā dynasty in Mysore, and it was from one of these that English merchants in 1639 secured the grant of what became Fort St. George at Madras on the Coromandel coast in place of the earlier site at Masulipatam.

Mysore now flourished under the *wodiyar* feudatories, who gradually assumed *de facto* power, acquiring in 1610 Shrīrangapaṭṭanam (Seringapatam). The power of the Muslims in Bīdjāpūr was withstood, until in 1686-7 the Mughal Emperor Awrangzīb [*q.v.*] crushed the independent power of the Bīdjāpūr and Golkondā sultanates. Mysore, was, however, able to establish a *modus vivendi* with Awrangzīb on a basis of common hostility to the rising power of the Marāṭhās [*q.v.*].

The mid-18th century years saw the rise in Mysore of the Muslim general Ḥaydar ʿAlī, who under the commander-in-chief or *dalawāyī* Nandjarādj acquired an access of prestige through his repelling Marāṭhā incursions. Ḥaydar ʿAlī's prestige became such that in 1760 his help against the British was sought by the Comte de Lally in the French possession of Pondicherry, and he became virtual ruler of Mysore under the Rādjā, withstanding the British and the forces of the Niẓām of Ḥaydarābād [*q.v.*] till his death in 1782 [see ḤAYDAR ʿALĪ KHĀN BAHĀDUR for details]. His son and successor in office Tīpū Sulṭān instituted a strongly Muslim policy, including the forcible conversion of Hindus and measures against the production of alcohol and opium. On the death of the Rādjā in 1796, the traditional ruling family was suppressed by Tīpū Sulṭān. His policy against Britain and her ally the Niẓām involved a continuation of his father's alliance with France, and diplomatic approaches were made as far afield as to Bonaparte in Egypt and to the courts of Kābul and Istanbul. His ambitions were, however, ended at the battle of Seringapatam in May 1799 [see TĪPŪ SULṬĀN for details].

The line of the Mysore Rādjās was now restored in the person of the five-year old Krishna Rādjā Wadiyar (June 1799) under British protection and with Col. Arthur Wellesley (subsequently the first Duke of Wellington) as civil and military ruler during his minority (sc. till 1811). The Rādjā's later extravagance and misgovernment brought about an internal revolt in 1830 at Nagar (Ḥaydar ʿAlī's old foundation of Ḥaydarnagar), which led to the Governor-General of India, Lord William Bentinck, appointing a Mysore Council, with commissioners to exercise the substance of power there. Krishna Rādjā did not die until 1868, when his adopted son was recognised as his valid successor, and in 1881 the local dynasty recovered responsibility for administration, the civil and military station of Bangalore alone remaining in British hands.

Over the next decades, internal growth brought rising prosperity to Mysore state, with expenditure on roads, metre gauge railways and irrigation, together with the first electric power station in the subcontinent at the Cauvery Falls. In 1947 Mysore acceded to the Indian Union, and the Mahārādjā Sri Jayachamaraja Wadiyar became the new Mysore State's first governor. With the administrative reorganisation of 1953 and 1956, under the pressure of South Indian demands for ethnic and linguistic administrative units, the State (as that comprising essentially Karanese speakers) received additional territories in the west which gave it a coastline on the Arabian Sea and it acquired the name of Karnataka; the much-increased area is now 74,037 sq. miles/ 191,757 km². The total population is 37,043,451 (1981 estimate), and the population of the state capital Bangalore is 1,540,741 and of Mysore city 355,685 (both 1971 census figures). The state is one of the most educationally advanced in the Union, with four universities and 31% of the population literate in 1971.

2. Monuments. The only significant building to survive from the Bīdjāpūrī incursions, a mosque at Sante Bennūr (*ca.* 1047/1637) in Shimoga District, owes little to ʿĀdil Shāhī influence as it was built from the granite of a temple to Ranganātha on the same site, with a groined roof and pointed arches. It is most remarkable for a stepped square tank surrounded by eight towers, with another at the centre, in the mixture of Hindu and Islamic forms characteristic of Vidjayanagara. The building is said to have been desecrated, and became known as a *musāfir-khāna*. The subsequent, but limited development of Muslim architecture did not begin until the Mughal invasion of 1098/1687, when it can be traced from the Djāmiʿ Masdjids at the new administrative centre of Sira and at Hiribidanur near Gauribidanur, and some tombs at both places. At the latter, where the mosque faces the Dargāh of Niyāmat Bī (properly the tomb of Ḥusayn Shāh) across a pool, the influence of Bīdjāpūr [*q.v.*] is evident in the careful modulation of the four-square tomb walls with panelled arches, the prominent *guldastas* at the corners, the shape of their finials, and the dome set on a lotus-petal base, with a hemispherical profile above; the mosque dome too is bulbous in the other Bīdjāpūrī fashion, though here given a different, turnip-like profile, and it has a tall minaret shaft engaged at each frontcorner with lesser ones at the back. The merlons are articulated with smaller *guldastas* at intervals, and the front wall by blind arches pierced by openings below. The combination of *masdjid*, tank, and mausoleum is repeated at Kolar, where the *maḳbara* [*q.v.*] or cemetery houses twelve members of Ḥaydar ʿAlī's [*q.v.*] family, but the building, with six internal pillars and a dome placed off-centre over Ḥaydar's father, is of little interest.

Although the Sangīn Djāmiʿ Masdjid at Taramandalpet, Bangalore, follows the earlier pattern, with a prominent fretted parapet around the prayer-hall roof, and minarets at the front corners taller than these at the rear, these may not be original, as the roof was damaged in action and restored in 1836. The substructure is attributed

to the Mughal period. The Masdjid at the hill fort of Midigeśi has its strongly tapered minarets set on massive square towers at the front corners of the hall, with battered angles framing a well-proportioned, three-arched façade. The relatively tall upper works are again crowned with a fretted parapet. Such *minārs*, with domical finials, have become symbolic, like their ʿĀdil Shāhī counterparts, rather than functional. The Masdjid-i ʿĀlī at Shrīrangapaṭṭanam represents the culmination of this type, as built by Tīpū Sulṭān [*q.v.*] (dated 1201/1786-7). The rectangular precinct wall, which houses an internal verandah, encloses a high terrace with a row of rooms at the front, and the prayer hall at the back. Though the flat roof of the hall is raised on multi-cusped arches, and the panelled wall outside is relieved by blind arches to match, its front is trabeated, with slender columns supporting a neat entablature. This runs between the squared bases of two immense minarets which rise in three octagonal stages, with elaborately pinnacled balconies, to prominent bulbous domes. The facets are set off by diagonal and vertical rows of small openings, and the domes are gadrooned. A small room to the west forms the *miḥrāb*. The unusual plan is due, again, to the re-use of a temple site. The interior carries five Ḳurʾānic inscriptions.

Tombs of a square format surmounted by a dome are again found at Čannapaṭṭana. In that of Sayyid Ibrāhīm the small central cell is surrounded by a flat-roofed verandah on simple octagonal stone columns of Hindu derivation; the dome is only slightly bulbous, and its pointed profile is distinctly Iranian. The Sālār Masʿūd Dargāh at Tonnūr is a more ambitious example of the same type, with a flat roof sustained by four pillars, and a peristyle of six fluted and tapering ones each side, surmounted by a latticed parapet that almost conceals the dome. There were baluster-like *minārs* at each corner of the terrace. The Maḳbara of Ibrāhīm Khān Ḳilaʿdār at Kumbarpet in Bangalore, dating from Ḥaydar ʿAlī's rule, has a particularly squat bulbous dome on a square chamber, surrounded by merlons on fretted bases. Baluster columns with matching *guldastas* are engaged at each corner, and two smaller ones at mid-side. In the Mausoleum of Ḥaydar ʿAlī and Tīpū at Shrīrangapaṭṭanam, dated 1195/1782 (the year of Ḥaydar's death), the two types of tomb are combined: the cubic mass of the walls rises through a verandah of black serpentine columns to more than twice its height, with a large bulbous dome above. Both the verandah and the central block have *čhadjdjas* surmounted by slotted parapets and the usual panoply of bulging *guldastas*; those below are skilfully reduced in scale. The upper walls of the block carry a single range of seven blind cusped arches on each face. The dome, though rising from a boldly scooped lotus base, and crowned with a *mahāpadma*, is flatter than those at Bīdjāpūr; even so, the tomb is clearly related to such buildings as the mausoleum of Shāh Karīm. The interior is decorated with the tiger-stripe mouchettes typical of Tīpū, and there is a eulogy in Persian inscribed on the west wall; the ebony doors inlaid with ivory are a restoration due to Lord Dalhousie.

Palaces. The Mughal Fort at Sira, with its palace and gardens (Khān Bāgh) is said to have stimulated Ḥaydar ʿAlī, who was made *ṣūbadār* of the province, to create his own retreats at Bangalore and Shrīrangapaṭṭanam; little of it now remains. The *Ḥaydar-nāma* of 1784 confirms his interest in building, naming these in particular (*ARASM* [1930], 101-2). The palace buildings, such as that below the Fort at Čitaldrug, were erected with tall timber columns; in most cases, this has unfortunately led to their destruction. That at Bangalore (built 1192-1203/1778-89, survived until 1868) had four halls on the upper storey, each opening onto two balconies. Tīpū Sulṭān held his *darbār* from a *djharokhā* looking down on his courtiers at ground level. The remaining part has fine tapering columns set on lotus bases. Paintings show that it had a lofty columned hall three bays by five open on one side, with balconies forming a mezzanine on the other, flanked by a solid, two-storied block of the same height either end; the flat roof rested on lines of cusped arches, with heavy brackets for the *čhadjdjā*, and balusters above framing the varied tracery of the parapet. Tīpū's principal palace at Shrīrangapaṭṭanam, dismantled in 1807-9, was in the middle of the north side of the Fort. The main hall was also open on one side. His private apartments, guarded by four tigers chained in a narrow passage, were on one side of a square, the other three being storehouses full of goods. The Lāl Bāgh Palace, once at the eastern end of the island, has also vanished; drawings show it to have been of the same type, though the flanking blocks are columniated with seven narrow bays traversed by balconies, and the parapet is reduced to display a studing of *guldastas*. The format seems to stem from the Bāradarī at Adjmēr via the Shīsh Maḥall at Lāhawr [*q.v.*], and may be compared with the Āthār Maḥall at Bīdjāpūr [*q.v.*] (1000/1591), as well as 18th-century parallels in the Gopal Bhawan at Dig, Bharatpūr. One fine example remains in the Daryā Dawlat Maḥall built by Tīpū as a summer palace in the Dawlāt Bāgh to the east of the Fort in 1198/1784. It is set on a substantial plinth, and the tapering wooden pillars with their prominently moulded bases and reeded shafts are used to form a verandah all round, with a deep *čhadjdjā* and a fretted parapet in four tiers punctuated by small rounded finials. The three central arches, which though cusped are almost semicircular, open on to a *tibāra* hall through a matching set on paired shafts. The two lateral bays on each side, which are wider, employ a rounded, shouldered arch to articulate the end peristyles, and the two-storeyed flanking blocks within them, here set back behind the verandah and opening onto the *tibāra* through two ranges of cusped arcades, with a flat, diapered ceiling above. The façade to the river on the north, and that to the south, are identical, the building being square. There are three rooms on each side of the upper floor, and a central hall with projecting balconies. The whole interior is panelled with small blind arches and cartouches, richly painted and gilded, and is remarkable for a series of wall paintings depicting military successes and civil ceremonies, where individuals can be identified. Buchanan's description of the gardens at Bangalore (1800) shows that they followed the usual pattern of square plots, each allotted to a different plant, with five cypresses at the sides bordering the walks. In those laid out by Tīpū, the irrigation system of masonry channels was very prominent.

Bibliography: Scattered references can be found in the *Annual reports of the Mysore Archaeological Department* (*ARMAD*), continued as the *Annual reports of the Archaeological survey of Mysore* (*ARASM*) from 1927 to 1943, though unfortunately Muslim buildings receive much

less attention than Hindu ones, and information is cursory. The most useful are, for Shrīrangapaṭṭanam, *ARASM* (1935), 51-65, with plates; for Tīpū's palace and the Fort at Bangalore, *ibid.*, 24-8; for Čannapaṭṭana and its tombs, *ibid.*, 21. For Hiribidanur, see *ARMAD* (1913-14), 20; for Kolar, *ARASM* (1930), 21-2; for Nandi, *ARASM* (1932), 57-63; for Sante Bennūr, *ARASM* (1937), 60-1; for Midigesi, *ARASM* (1938), 10-11; for Tonnūr, *ARASM* (1939), 27; and for Bangalore Fort, *ARASM* (1940), 37-9. The *Mysore gazetteer*, Bangalore 1930, ed. Rao, ii/1, 370-7, provides a little extra material, but no illustrations. Early pictures of Bangalore and Shrīrangapaṭṭanam can be found in Lt. James Hunter's paintings (1804-8) at the Government Museum, Bangalore, reproduced in M. Fazlul Hasan, *Bangalore through the centuries*, Bangalore 1970, in Charles Gold, *Oriental drawings*, London 1806, in Robert Home's *Select views in Mysore*, London 1974, and his *Description of Seringapatam*, London 1796. Further descriptions can be found in Dr. Francis Buchanan's *A journey through the countries of Mysore, Canara and Malabar*, London 1807 (repr. Madras 1970). The Daryā Dawlat Maḥall is illustrated in O. Reuther, *Indische Paläste und Wohnhäuser*, Berlin 1925, pls. 164-5. See also Ziyaud-din Desai, *Mosques of India*, New Delhi 1971, 71-2 and plate. (P. A. Andrews)

MĀHIYYA (A.) "quiddity". On the construction of this technical term, al-Tahānawī provides interesting information. There are several explanations. One of them derives this word from the interrogative *mā huwa*? ("what is it?"). In this case, it is to be noted that the *yā'* of the *nisba* has been added, the *wāw* suppressed and the *tā' marbūṭa* termination given in order to change the word from the adjectival to the substantive form. Another explanation derives it from *mā*, with the addition of the *yā'* of the *nisba* and of the *tā' marbūṭa*. The original form would then be *mā'iyya*; the *hamza* has subsequently been transformed into a *hā'* on account of the proximity of the articulation points. This *mā* would therefore not be, as in the previous explanation, the interrogative particle (*quid est*?), but that which introduces the reply to the question *quid*?: "[it is] that which ..." In the same manner, *kayfiyya* is the term for a response to the question *kayf*? ("how?"), and *kamiyya* is the response to the question *kam*? ("how much?").

The first explanation is appropriate in the context of the sense given by logicians to the word *māhiyya*; it is that which replies to the question: what is this? It expresses the genus (*djins*), while the question *ayyu shay' huwa* ("what kind of thing is it?") relates to the species (*naw'*). It is thus a case of τὸ τί ἐστι. But in fact, the *māhiyya* replies to two questions at once. In the *Kitāb al-Ḥudūd* or *Book of definitions*, Ibn Sīnā writes with regard to the *ḥadd*: "It is that which indicates the quiddity of a thing, this being the perfection of its existence in essence (*kamāl wudjūdih al-dhātī*): it is composed of the genus and of the specific difference" (Arabic text, 11). This question will be encountered again with regard to the *inniya*.

The second explanation accords better with the usage of theologians and metaphysicians. The *māhiyya* is that through which a thing is what it is (*mā bih al-shay' huwa huwa*). This is the τὸ τί ἦν εἶναι of Aristotle. In this sense, the term is synonymous with essence (*dhāt* [*q.v.*]) and with reality (*ḥaḳīḳa*, cf. *Shifā'*, *Ilāhiyyāt*, i, 31). This reality, like quiddity and essence, is beyond the universal and the particular, the existent and the non-existent, meaning that it can express not only the genus but also the individual essence, not only that which exists in beings themselves (*fi 'l-a'yān*), but that which does not exist thus, while existing in thought (*fi 'l-dhihn*; cf. *Shifā'*, *ibid.*, 32).

In the expression: "that through which a thing is what it is", the particle *bi-* (through) should be understood in the sense of causality (*al-sababiyya*): that, on account of which a thing is this thing (*al-amr alladhī bi-sababihi al-shay' dhālik al-shay'*). But this cause is not the active cause (*al-fā'il*), which is that through which a thing exists externally (*fi 'l-khāridj*), not that through which a thing is such a thing. It is thus a case of the internal cause which dictates that a thing is what it is. From this point of view, it follows that the action of the active cause (*athar al-fā'il*) is applied not to the quiddity in itself and as such, but to its relation to existence (*wudjūd*). This is the thesis of the Peripatetics and of those who say that it is not quiddity as such which is "placed in the being" (*madj'ūla*): the active cause places it in the being and clothes it with the attribute of external existence (*yadj'al al-māhiyya muttaṣifat^an bihi* [= *al-wudjūd*] *fi 'l-khāridj*). On this important notion of *madj'ūl*, cf. Fakhr al-Dīn al-Rāzī, *al-Mabāḥith al-mashriḳiyya*, i, 52. This is another case of the distinction between essence and existence which characterises the thought of Ibn Sīnā. For him, in fact, the active cause and the final cause are concerned with existences, while the material cause and the formal cause are concerned with essences. "A thing may be an effect (*ma'lūl*) in relation to its quiddity and to its reality; it may be an effect in its existence. It is possible to express this through the example of the triangle: its reality depends on the area and on the line which is its side; area and line constitute it as a triangle and it has the reality of triangularity (*ḥaḳīḳat al-muthallathiyya*), the area and the line being as its two material and formal causes. But from the point of view of its existence, it depends on yet another cause. This is neither a cause which constitutes its triangularity, nor a cause which is part of its definition; it is the efficient cause or the final cause which is the efficient cause of the causality of the efficient cause" (*Ishārāt*, iii, 441-2). "Of every thing which is such that existence does not enter into the comprehension of its essence (*dhāt*), it may be said that existence is not for it a constituent which enters into its quiddity" (*ibid.*, 474).

But when it is said that quiddity is that through which a thing is what it is, it may be objected that there is not an alterity between a thing and its quiddity of such a kind that a line of causality can be represented between the two. But what is meant by this is, that the thing, to be what it is, needs nothing other than itself. Nevertheless, if this definition of quiddity is taken literally, there is the possibility of confusion between quiddity and accident, especially particular accident, since the *risibile* (*al-ḍāḥik*) is that through which man is *risibilis*, capable of laughter. But if this definition is understood in the sense of a thing which, to be what it is, needs nothing other than itself, it applies only to quiddity, since if man is capable of laughter, it is because he is reasonable, not the reverse. Thus quiddity expresses the essence as distinct from accidents, particular or otherwise. This is why, according to al-Tahānawī, philosophers begin their researches by distinguishing clearly between quiddity

and its accidents. Ibn Sīnā writes on this subject (*K. al-Nadjāt*, 6-7): "The essential is that which constitutes quiddity from that to which it is attributed. But to define the essential (*al-dhātī*), it is not sufficient to say that it signifies that which is inseparable, since many inseparables are not essential. Neither is it sufficient to say that it signifies that which is inseparable in existence and which cannot be truly separated in the imagination (*wahm*), in such a way that if it were to be suppressed in the imagination, there would thereby be destroyed its object of attribution in existence. In fact, many inseparables are of this nature: for example, the fact that the sum of the three angles of a triangle is equal to two right-angles. This is an attribute of all triangles; it cannot be separated in existence, nor suppressed in the imagination ... And yet, it is not essential". It is a consequence of the reality of the triangle, but it does not enter into its definition. The same applies to all concomitants (*lawāzim*) "which are attached to a thing when its quiddity has been established". The essential is that which is such "that it is impossible to comprehend the essence of the object of attribution without having first comprehended that the signification of this essential belongs to it." Such is the case for "man" and "animal".

Ibn Sīnā notes that the terms *māhiyya*, *ḥaḳīḳa* and *dhāt* may be taken as synonyms. But *ḥaḳīḳa* and *dhāt* are applied most of the time to quiddity considered in its relation to existence on the exterior of thought, whether this quiddity be universal or particular. But when it is particularised, it is called ipseity (*huwiyya*). In this sense the following passage from the *K. al-Fuṣūṣ* is to be read: "All things have a quiddity and an ipseity. But quiddity is not ipseity and does not enter into it. If the ipseity of man were his quiddity, the representation that we have of the quiddity of man would be his ipseity, and when we described what man is, we would describe him in terms of "this is a man" and would know his existence: every description would imply a judgment. Nor does ipseity enter into the quiddity of these things, unless it is constitutive of it and the representation of the quiddity cannot be perfected without it. It would be impossible to suppress it from quiddity in the imagination and the relationship of ipseity to "man" would be like the relationship which corporality and animality have with him; just as if man is understood as man, it is not doubted that he is a body and an animal, so it would not be doubted that he exists. But it is not so." The *huwiyya* of Zayd is to be distinguished from that of ʿAmr. But, as noted by Fakhr al-Dīn al-Rāzī (*Mabāḥith*, i, 49), the humanity of one, in other words his quiddity, does not differ from that of the other. In denying the alterity of the humanity of Zayd in relation to that of ʿAmr, we mean only this: "Humanity as such is humanity and nothing more; where that of Zayd is other than that of ʿAmr, this is something that comes from the exterior". Thus quiddity, in the true sense of the word, must be considered in itself and for itself, as pure representation, separate from any judgment of existence or of attribution. Al-Rāzī (*ibid.*, i, 48) declares explicitly: "Equinity (*farasiyya*) as such is nothing other in itself than equinity. It is in itself neither unique, nor plural, nor existent, nor non-existent ... Unity is an attribute that is attached to it; with it, it becomes unique; and similarly, in that it corresponds to numerous things, a character of generality may be found in it. But in itself, equinity is only equinity".

Another term is related to *māhiyya*; this is *inniya*. Ibn Sīnā speaks of it at length in the *Shifāʾ* (*Madkhal*, 39-46). His thought may be summarised by means of an example which he himself employs. Take the term *ḥassās* ("endowed with sensibility"). Arising from the genus (*djism*) "body", it is interposed as a specific difference (*faṣl*) to define the animal. It is essential for the animal and for the man to be these bodies endowed with sensibility. Nevertheless, this single essential characteristic which is expressed by the term *ḥassās* does not suffice to indicate the quiddity of the animal or of the man. The same may be said of "reasonable" in relation to the definition and the quiddity of man. Now Ibn Sīnā observes that the logicians make man a species of animal, but they do not do likewise with "reasonable". The same statement applies to the terms "body", "animal", and "endowed with sensibility". However, the specific difference is important, for, if the genus and the species say what a thing is insofar as it is this thing, the specific difference is that which enables it to be distinguished (*tamyīz*) from other things and provides for an exact response to the question: what kind of thing is this? This being so, the *māhiyya* represents a notion which may be applied equally to numerous things; the *inniyya* represents the notion by which a thing may be distinguished (*yatamayyaz*) from others. The *māhiyya* expresses the genus of the species, the *inniyya* expresses the specific difference. However, Ibn Sīnā draws attention to the fact that it is by no means impossible that that which indicates the *inniyya* of certain things may indicate the *māhiyya* of certain others. For example, *ḥassās*, in relation to "man", "horse", "bull", does not indicate the quiddity, but only the *inniyya*, whereas *ḥayawān ḥassās* ("living creature endowed with sensibility") expresses it perfectly. But in relation to "endowed with sight (*baṣīr*), with hearing (*samīʿ*), with the sense of touch (*lāmis*)", this same term *ḥassās* denotes a quiddity. In spite of these distinctions, it is apparent that on occasion Ibn Sīnā uses these two words side by side in the same sense. The word *inniyya* may be translated by the Scotist term of "ecceity".

Alongside these concepts of the Peripatetics, attention must be drawn to the point of view of the philosophers who stressed the role of illumination (*al-Ishrāḳiyyūn*). For them, the action of the active agent is applied to the quiddity itself, which "follows" it as light follows the sun. It is reason which, subsequently, separates essence from existence. Thus al-Suhrawardī of Aleppo, in *Ḥikmat al-ishrāḳ* (186, § 193), explains that "that which is placed in existence (*al-madjʿūl*) is quiddity, not existence; given that existence is only a rational consideration (*iʿtibār ʿaḳlī*). It follows that a thing has its ipseity (*huwiyya*) by means of its emanent cause (*min ʿillatih al-fayyāḍiyya*) ... It can happen that a thing disappears when agents of corruption appear, while its cause in emanation remains; this is because it depends on other causes which are transient. It can happen that a thing has a cause of production (*ḥudūth*) and a cause of internal consistency (*thibāt*) which are different, as in the case of a statue: in effect, the cause of its production, which is the person who makes it, and the cause of its internal consistency, which is the dry nature of the element. But it may be that the cause of internal consistency and the cause of production are one and the same, as in the case of the receptacle which gives to the water [that it contains] its configuration. Now the Light of lights is at the same time the cause of existence of all existing things and the cause of their

internal consistency ..." In a word, there is no distinction, according to this point of view, between essence and existence other than one of reason. On the level of the Light of lights, which is the cause whence all things emanate, there is no need to distinguish the four causes of Aristotle in order to attribute to him only an efficient causality which does nothing but give existence. It is in its unity and by the same right the perfect cause of essences and existences. It is total agent which gives to each being its existence, its quiddity, its material and its end. Al-Suhrawardī has another argument besides to show that the effect of the cause through emanation is not existence without essence. We may consider for example the darkness. "If it is non-existent, it is not realised (*laysa bi-ḥāṣil*); so its existence is not an existent, since it is, itself (like the darkness) non-existent (*maʿdūm*). Now if we perceive existence and we judge that it is not an existent, that which we understand by existence is other than what we understand by existent. If we then say: the darkness exists, that which we have taken to be non-existent, of which the existence was not realised, then is realised, it follows that the realisation of existence is something other than realised existence, such that there will be an existence for the existence ..., and so on *ad infinitum*, which is absurd". (*ibid.*, 64-5, § 56). In more simple terms, if it is necessary to give existence in order for it to exist, it will be necessary to give existence to the existence of existence, and so on *ad infinitum*.

The theories of Ibn Rushd regarding quiddity are much closer to the thinking of Aristotle. They are also distinguished by his opposition to the Avicennan concept of essence and existence, and by his method which consists in leaving physical realities in order to raise oneself to metaphysical realities. He is interested primarily in the quiddities which belong to bodies and which are "attributes (*ṣifāt*) which exist in them and through which these bodies become active existents" (*Tahāfut*, 359, § 92). He writes further: "Starting with the individuals which are in conformity in species, intelligence grasps a unique signifying intention (*maʿnā*) in which they are associated. It is the quiddity of this species. But this intention is not divided by that whereby individuals as such are divided, that is by place, position, material factors, on account of which they proliferate. It is thus necessary that this intention be neither generable, nor corruptible, and that it not disappear with the disappearance of the individuals in which it exists" (*ibid.*, 573-4, § 38). Thus quiddity is distinguished from accidents: "The fundamental principle in accidents is that they depend on something other than themselves, while the fundamental principle in quiddities is that they depend on themselves, except that which happens to generable and corruptible things owing to the fact that quiddities need a subject (*mawḍūʿ*)." By virtue of the doctrine of Ibn Rushd on being, which is fundamentally and essentially by substance, the quiddities will be in the strongest sense quiddities of substances and will follow the hierarchy of substances, from sensible and mobile substances, to intelligible and immobile substances.

As for *inniyya* (which Bouyges vocalises *anniyya* in his writings), it is in beings, in the true sense, "a signifying intention of thought (*maʿnā dhihnī*), meaning that the thing on the exterior of the soul is in accordance with that which is in the soul. Consequently, that which it indicates is synonymous with truth (*ṣādiḳ*). *Inniyya* is that which is indicated by the existential copula (*al-rābiṭa al-wudjūdiyya*) in judgments of attribution (*fī 'l-ḳaḍāyā al-ḥamaliyya*).
